Praise for *The Blackwell Companion to Syntax*, Volumes I–V

"When I first started studying linguistics in 1960 it was possible for an assiduous student to read almost everything in the field. The success of the discipline has meant that those happy days are, happily, gone forever. Syntax is now so big that no one can read even a fraction of what is on offer. There have been two unfortunate results: first, today's syntacticians keep rediscovering old facts, often reinventing eccentric wheels; second, they keep complaining that other linguists ignore their work. The usual excuses are that the material we ought to have referred to is distributed, seemingly at random, among hundreds of books and articles; life is finite; institutional pressures are unrelenting; and it is hard enough keeping up with work done in one's own framework on one's own area of special interest, without trying to see what rival theorists in adjacent areas might have had to say on the matter at hand, however relevant in the long term their contribution might be.

Such excuses will no longer do. *The Blackwell Companion to Syntax* provides a comprehensive overview of the progress and achievements made in syntax over the last 35 years. A galaxy of international stars under the leadership of two distinguished linguists, Martin Everaert and Henk van Riemsdijk, has constructed an unparalleled and monumental survey of empirical facts and theoretical insights covering the entire field. Whether you are interested in parasitic gaps, Icelandic logophors, or quantifier scope ambiguity, you will find here the essential background to your own contribution. This is a major achievement and the Companion will rapidly become essential reading for all serious linguists."

Neil Smith, University College London

"*The Blackwell Companion to Syntax*, unique in character and designed with great skill and care, is sure to be a rich source of high-quality information on critically important topics, and an invaluable research tool for the study of language."

Noam Chomsky, Massachusetts Institute of Technology

"For any serious researcher interested in theoretical linguistics, this incredible companion will remain an important and extremely useful source of reference for years to come."

Yukio Otsu, Keio University, Tokyo

"The flow of linguistic theory is shaped by the empirical puzzles of the rocks and the banks of the river bed. Any particular rock will have different effects at different points in the river. This Companion assembles the empirical puzzles and that is an enormously valuable service: it enables readers to understand why particular puzzles were of interest at particular stages in the development of theory and it assembles the puzzles into a compendium, in the belief that puzzles need solutions at every point in the development of theory, even if the shape of the solutions changes significantly at different stages of theoretical development.

The compendium of puzzles will be a great resource for young investigators, joining the river at some point and wanting to know what was upstream as they find their way downstream."

David Lightfoot, Directorate for Social, Behavioral and Economic Sciences, National Science Foundation, Arlington, VA

"Looking for a topic to work on? Grab *The Blackwell Companion to Syntax* and read some articles there. Or you may try to think of a topic not covered (if that is possible). Either way, this five-volume set should be within your reach if you want to be an active researcher."

Akira Watanabe, University of Tokyo

"In a rapidly moving field, it is essential to have an accessible repository of the empirical generalizations that fueled the theoretical debates. These generalizations have not only a historical value. It is often the case that the latest theoretical constructs tend to focus on the most recent empirical issues being discussed and ignore the previous ones. In this respect, this book provides a constant reminder of what needs to be incorporated in the current debate. It can be considered the empirical memory of the field."

Joseph Aoun, University of Southern California

"*The Blackwell Companion to Syntax* will be an indispensable source for theoretical, descriptive, and applied linguists alike. Much of the syntactic knowledge accumulated since the *Aspects* is not easily accessible and some of it may even be in the world of oblivion for many linguists. Younger scholars may have difficulties to understand some of the work done in a by now obsolete theoretical framework. Others may want to have easy access to the analytic knowledge of earlier work in their daily research activities. Since the knowledge presented in the Companion is largely independent of the various stages of syntactic theorizing, it can profitably be used by researchers working on syntactic problems whatever their theoretical background may be. The contributions of the present encyclopedia have been written by top scholars in the field covering practically all important issues addressed in syntax during the last forty years or so. It will certainly serve as an essential research tool for a great number of linguists for many years to come."

Ferenc Kiefer, Hungarian Academy of Sciences, Budapest

"*The Blackwell Companion to Syntax* is a very important accomplishment. Everaert and Van Riemsdijk have brought together a large group of internationally reputed researchers, each of whom analyzes a particular empirical domain that has played a central role in the development of syntactic theory. It is a valuable reference and pedagogical tool. I have no doubt that this work will benefit not only undergraduate and postgraduate students of linguistics but anyone interested in syntax and in the remarkable intellectual history of the field."

M. Carme Picallo, Universitat Autònoma de Barcelona

"This is the most impressive collective endeavor in the field of syntax ever attempted. It summarizes the (basic) descriptive results obtained for a great many syntactic phenomena in the last fifty years of research in generative grammar. It is an indispensable work of reference for students and researchers alike."

Guglielmo Cinque, University of Venice

"Since the beginnings of generative grammar, our knowledge of the syntactic aspects of the human language faculty has increased exponentially, with every investigation giving rise to ever deeper investigations and to cross-linguistic research. Every time I write a paper, prepare my lectures, or advise students on their research, I am confronted with the problem of accessing a vast body of syntactic knowledge. With 77 case studies written by leading syntacticians, *The Blackwell Companion to Syntax* is certain to help address this fundamental problem."

Christopher Collins, Cornell University and New York University

"The past 30 years have seen an explosion in the breadth and depth of linguistic research, as focused theoretical perspective has sharpened empirical investigations. The Companion is a time capsule for the results of empirically significant projects, ensuring that the results of the past are not lost in the future. Any scholar who opens the volumes will find there a wealth of wide-ranging, scholarly, and theoretically informed discussion of just about every syntactic phenomenon currently known to the field – from double nominatives to topicalization; from the spray/load alternation to SOV languages. The insightful and rich chapters come from some of the extraordinary researchers of the time period. If the next generation of scholars does not utilize this marvelous resource, it will not be the fault of the editors and authors, and they can be sure that current researchers will profit immediately from this outstanding project."

Jane Grimshaw, Rutgers University

The Blackwell Companion to Syntax

Volume I

Blackwell Handbooks in Linguistics

This outstanding multi-volume series covers all the major subdisciplines within linguistics today and, when complete, will offer a comprehensive survey of linguistics as a whole.

Already published:

The Handbook of Child Language
Edited by Paul Fletcher and Brian MacWhinney

The Handbook of Phonological Theory
Edited by John A. Goldsmith

The Handbook of Contemporary Semantic Theory
Edited by Shalom Lappin

The Handbook of Sociolinguistics
Edited by Florian Coulmas

The Handbook of Phonetic Sciences
Edited by William J. Hardcastle and John Laver

The Handbook of Morphology
Edited by Andrew Spencer and Arnold Zwicky

The Handbook of Japanese Linguistics
Edited by Natsuko Tsujimura

The Handbook of Linguistics
Edited by Mark Aronoff and Janie Rees-Miller

The Handbook of Contemporary Syntactic Theory
Edited by Mark Baltin and Chris Collins

The Handbook of Discourse Analysis
Edited by Deborah Schiffrin, Deborah Tannen, and Heidi E. Hamilton

The Handbook of Language Variation and Change
Edited by J. K. Chambers, Peter Trudgill, and Natalie Schilling-Estes

The Handbook of Historical Linguistics
Edited by Brian D. Joseph and Richard D. Janda

The Handbook of Language and Gender
Edited by Janet Holmes and Miriam Meyerhoff

The Handbook of Second Language Acquisition
Edited by Catherine J. Doughty and Michael H. Long

The Handbook of Bilingualism
Edited by Tej K. Bhatia and William C. Ritchie

The Handbook of Pragmatics
Edited by Laurence R. Horn and Gregory Ward

The Handbook of Applied Linguistics
Edited by Alan Davies and Catherine Elder

The Handbook of Speech Perception
Edited by David B. Pisoni and Robert E. Remez

The Blackwell Companion to Syntax, Volumes I–V
Edited by Martin Everaert and Henk van Riemsdijk

The Handbook of the History of English
Edited by Ans van Kemenade and Bettelou Los

The Blackwell Companion to Syntax

Volume I

Edited by

Volume I

1 The Accusative Plus Infinitive Construction in English: Jeffrey T. Runner 1

2 Adjectival Passives: Joseph Emonds 16

3 Adjectives: Order within DP and Attributive APs: Daniel Valois 61

4 Adverb Classes and Adverb Placement: Denis Delfitto 83

5 Affectedness: Mona Anderson 121

6 Analytic Causatives: Maria Teresa Guasti 142

7 A-not-A Questions: Paul Hagstrom 173

8 Bare Plurals: Denis Delfitto 214

9 Binding Theory: Terms and Concepts: Eric Reuland 260

10 Bridge Phenomena: Nomi Erteschik-Shir 284

11 Case (with Special Reference to Japanese): Kazuko Inoue 295

12 Chinese *Ba*: Yen-Hui Audrey Li 374

13 Clitic Climbing: Reineke Bok-Bennema 469

14 Clitic Doubling: Elena Anagnostopoulou 519

15 Comparative Deletion and Subdeletion: Norbert Corver 582

16 Conditionals: Rajesh Bhatt and Roumyana Pancheva 638
17 Contraction: Grant Goodall 688

Index to all Volumes 705

Volume II

18 Copular Sentences: Andrea Moro 1
19 Derived Nominals: Bożena Rozwadowska 24
20 Double Nominatives in Japanese: Koichi Tateishi 56
21 Double Object Constructions: Joseph Emonds and Rosemarie Whitney 73
22 Ellipsis in DP: Anne Lobeck 145
23 Embedded Root Phenomena: Caroline Heycock 174
24 Existential Sentences and Expletive *There*: Andrea Moro 210
25 Extraposition: Mark Baltin 237
26 Focus Movement (with Special Reference to Hungarian): Kriszta Szendrői 272
27 Free Relatives: Henk van Riemsdijk 338
28 Freezing Effects: Norbert Corver 383
29 Gapping: Kyle Johnson 407
30 Gerundive Nominalizations: Gary Milsark 436
31 Grammatical Verbs (with Special Reference to Light Verbs): Tara Mohanan 459
32 Honorifics: Nobuko Hasegawa 493
33 Icelandic Logophoric Anaphora: Eric Reuland 544
34 Implicit Arguments: Rajesh Bhatt and Roumyana Pancheva 558

Preface

Generative grammar has always set its aims high. From its inception in the 1950s, the ambition has been to go beyond observational and descriptive adequacy to reach explanatory bliss. Important work would be about 'conditions on transformations' rather than on 'some properties of *wh*-movement in English', about the 'transformational cycle' rather than on verb clusters.[1] This is what science should be like. And while earlier attempts at achieving a semblance of an explanatory theory were often clumsy and inadequate, these past forty or so years have shown that truly fundamental questions can now be asked and addressed.[2] This emphasis on theory has not, of course, altered the fact that linguistics is a thoroughly empirical science, but data and analyses are seen as what they are: tools to help us understand the structure and properties of the human language faculty. It is the fate of tools that when the product is finished they are put away. When some (as it turns out controversial) data from Italian had suggested that the notion of bounding node should be parameterized, we then forgot about the Italian data and happily proceeded with the idea of parameters.[3] Numerous other examples could be added.

More generally, the data and analyses that at some point in the history of generative grammar played an important, sometimes even a crucial, role have a tendency to fade into the background rather quickly.[4] This effect is particularly strong when the piece of theorizing they helped to establish becomes obsolete, but it is even true when the theoretical insight persists over time. As time went on, and as generative grammar (using the term in the broad sense, including all its theoretical diversity), in its explosive success, expanded to dozens of countries, hundreds of universities and colleges, and many hundreds of researchers, the muckheap of once useful but then discarded empirical material continued to grow. Old hands in the field may still be served by a good memory, helping them to dig out some of these rejects if they seem useful at some later stage, but successive new generations of young linguists simply don't have access to the wealth of data, generalizations, and analyses that might be terribly important to their research if only they knew about them.

But it is not only a problem for younger generations. Researchers who like to keep track of developments, particularly (but not only) in those subfields that are not directly related to their own research, or who work in closely related disciplines such as, for instance, psycholinguistics or sociolinguistics, find it increasingly difficult to keep track. Current handbooks are often concerned with current theorizing, but only marginally with the history of the various versions of the theory and even less with the empirical generalizations underlying those theories. As a consequence, an ever smaller percentage of the potentially useful empirical material is treated in standard textbooks, and hence the rest is not part of the knowledge that researchers and students in the field may be expected to possess.

It might be objected that the articles in which all this wisdom is stored are, after all, still around in the journals, in the books, in the libraries. But given their theoretical focus, the titles are often unrevealing as far as the empirical domain is concerned, keywords are notoriously absent or unreliable, relevant data are scattered over several articles, and, most importantly, the presentation of the data in these articles is subservient to the theoretical claims that are made and hence not presented in succinct, didactically useful ways.[5] So searching for the relevant materials, even if you know what to look for, is often hard. For young researchers, such a search task is doubly difficult because very often the descriptive generalizations are presented in a jargon and formalism that were characteristic of the theoretical framework at the time, sometimes decades ago. Who thinks to look up the term 'backward equi' when looking for data relevant to what we now call exceptional case marking (ECM)?[6]

Having a good, theoretically oriented mind is not enough. You cannot gain an understanding of the abstract properties of Universal Grammar without having any ideas about interesting empirical areas that might provide the crucial evidence (or counter-evidence) for your claims. But these flashes of empirical insight can only come if you have enough knowledge in your head to start the neurons firing away. And you can only have that knowledge if you have been taught about a certain range of phenomena in a variety of languages, or if you have had access to a repository of such materials to work through by yourself. The problem is that such courses are rarely taught, the reason being more often than not that the relevant data are not available in a form that is didactically usable.

This is the lacuna that we are hoping to fill with *The Blackwell Companion to Syntax*. In these five volumes, we offer you 77 case studies of syntactic phenomena that should, at least partly, fill the gap and constitute an important research tool for the working linguist and for teachers and students of syntax (and its interfaces). In bringing these chapters together, we were guided by a working definition of what a syntactic case study was supposed to be. The following properties were thought to be central: *a well-delimited empirical area (both as to the construction(s) involved and as to the languages in which the phenomena are found) whose analysis has, at one time or another in the history of generative grammar, played an important role in the theoretical debates at that time*. More often than not, we will find that such results are relatively robust in the sense that they will stand and

be interpretable regardless of various innovations or adaptations of the version of the theory in which they first saw the light.

The so-called 'verb-raising' construction in Continental-West Germanic languages (chapter 75) will serve as an example. Much has been published on this subject, a reasonable degree of consensus exists about the most important properties of the construction, its analyses have been frequently used to support theoretical proposals, etc. Nevertheless, the existence of this complex of facts is hardly known outside the small group of specialists in this field, the main properties cannot be presupposed as common knowledge, and no one in the field can be properly held responsible for ignoring the verb-raising construction. In a situation like that, the chapter's presentation will be oriented toward combining views and formulating them in such a way that they will be accessible to researchers from various approaches to the theory of grammar.

In addition, of course, the delimitation had to be such that the empirical subdomain in question could be treated in manageable chapters. It would have been unthinkable to include a case about relative clauses: even a thick monograph would not do such a topic justice. But the subtopic of free (headless) relative clauses (chapter 27), a topic that in the late 1970s and the 1980s generated a considerable literature, is a typical example of what we had in mind.

What about the theory? We wanted to make the empirical generalizations, the insights into the properties of constructions, the main focus of each chapter. But wherever useful and possible, of course, reference can be and is made to the theoretical issues that the phenomena in question were or even are relevant to. This introduces a certain bandwidth, and indeed some of our authors stress the empirical side more strongly while others swerve more easily into theoretical discussions. With a project this size it has been impractical to impose more uniformity than we have achieved here. It was, frankly, not always easy to convince our authors to take time away from their primary theoretical research to write the chapters we asked them to. And it was also on occasion hard to curb the attention that they tended to give to theoretical issues and their own role in those theoretical developments. More generally, wherever possible we suggested that theoretical issues be addressed in robust, sustainable ways, not in terms that would reflect the fads and the terminological peculiarities typical of a specific brief period in the short history of generative grammar.

It does not take a great deal of knowledge of the field to realize that an enterprise such as the present one is a highly open-ended affair. Even if we had achieved complete coverage at the time of appearance, new cases would soon present themselves. But complete coverage is unattainable in the first place. It is always possible to come up with other potential cases, not represented in the present work. Even now we already have a number of ideas about cases that might be added and which may at some point be added to the present collection. Nevertheless, we believe that the coverage that the present collection achieves is very considerable. So much ground is covered that already it seems doubtful that future graduate students of linguistics could be expected to work through all of this material. If a student manages part of it and has the rest at his or her disposal

as an encyclopedia of linguistic phenomena, we feel certain that his or her research will greatly benefit. As teachers we are frequently confronted by a big question mark in the faces of students or even fellow faculty members when we use terms like 'contraction', 'subdeletion', or 'freezing effect'. And when asked "Where can I read up on this?" we are often faced with our own bad memory and the virtual impossibility of pointing toward one representative text that will concisely and competently explain what kind of phenomena are hiding behind these terms. This, we feel sure, is now a problem of the past.

If, as we are convinced, this *Companion* will become an important research tool in linguistics, a pressing need will also be felt for additional case studies to be added. While it may well be possible to project further volumes in the future, or an updated or extended version of the present publication, it has been clear to us from the start that the best way to make this an incremental enterprise is to publish these cases electronically. This would allow the possibility of reviewing cases now published, adding new cases relatively easily, and allowing discussion fora, etc. When that happens, the way to expanded coverage of the field will be paved. For the moment we refer you to www.syntaxcompanion.org to keep you informed on developments in this area.

One point to make about the references: every individual chapter has a reference section; the consolidated reference list is in volume V, and in the XML CD version the links are to the consolidated list rather than to the end-of-chapter lists. So in the chapter references you may find entries with a, b, etc. after the date even if there is only entry with that author and date in that chapter, because there is more than one entry in the whole five volumes with the same author and date. For example, even if there's only one Chomsky 1995 cited in any one chapter, it will appear as Chomsky 1995a or 1995b or 1995c, because there are three Chomsky 1995 entries in the consolidated references for the whole five volumes, identified as a, b, and c.

As editors of this encyclopedia of case studies, we have had to make many choices. In doing so we were greatly helped by the project group at NIAS, the Netherlands Institute for Advanced Study in the Humanities and Social Sciences, at Wassenaar, in the dunes lining the Dutch coast, in 1996/1997. The definition of what we would consider a typical case study was intensively discussed and ultimately fixed by that group: Reineke Bok-Bennema, Norbert Corver, Denis Delfitto, Joe Emonds, Martin Haiden, Itziar Laka, Eric Reuland, Tim Stowell, Sten Vikner, and, to some extent, Ian Roberts. We were also fortunate to have good input and feedback from Hagit Borer, Jan Koster, and Edwin Williams, our special outside consultants. The original list of cases was also compiled by that group. First sample chapters were produced during that year. And we brainstormed a lot about who would be the ideal author for which chapter. Nevertheless, we accept full responsibility for all the choices that were made.

We do wish to emphasize, however, that it has never been our intention to suggest that the present collection could be interpreted as a kind of canon, in the literary sense of the word (to the extent that literary scholars are still prepared to advocate such a notion). What we say above about the open-ended character of

an enterprise such as this should underline the fact that nobody could pretend that it is at all possible to establish such a canon, even if one tried to.

The first plans for this project were made in 1993. That is when we decided to apply to NIAS to see if we could get together a team of colleagues with whom to discuss the scope, the objectives, and the realization of the present work. The application was approved. We gratefully acknowledge the generous support, financial, logistic, and otherwise, of NIAS and, in particular, Dick van de Kaa and Wouter Hugenholtz, respectively the rector and the director of the institute. The group convened in the splendid isolation of NIAS in the academic year 1996/1997. There, we were happy to be able to work together with the colleagues mentioned above. Ilke van den Ende joined us as a student trainee. We were also happy to be able to organize two workshops at NIAS during that year. A third was held in Los Angeles at USC with the help and support of Hagit Borer and Tim Stowell in 2001. We wish to thank the participants at these workshops for their contributions, and LOT (the Dutch National Graduate School of Linguistics) as well as NWO and KNAW (the Netherlands Organization for Scientific Research and the Dutch Royal Academy of Sciences respectively) for financial support for these workshops. We also wish to thank the BSGM Foundation for an additional grant to the NIAS group. Last but not least we wish to thank those who have assisted us with the administration and correspondence, with the copy-editing and the HTML-conversion and the maintenance of the website: Jenny Doetjes, Bart Hollebrandse, Rob Goedemans, and Hannah de Mulder. Without them we literally and figuratively could not have managed. Thanks are due to NWO and the Utrecht Institute of Linguistics OTS (Language in Use project) for grants that made this assistance possible.

Finally we would like to thank all those at Blackwell who, over the years, have helped us realize this project – Ada Brunstein, Philip Carpenter, Sarah Coleman, Tami Kaplan – and the copy-editing team – Fiona Sewell, Anna Oxbury, Peter Kahrel – for doing such a wonderful job.

5 Conclusion

1 Introduction

This chapter focuses on the English construction illustrated in (1). It has traditionally been called the accusative plus infinitive construction, and that term will be used pre-theoretically here; in the generative literature it has been called the raising to object construction and the exceptional case-marking construction.

(1) Cindy believes Marcia to be a genius.

The accusative plus infinitive (A+I) construction displays a number of properties. It involves a verb (here, *believe*) followed by a noun phrase (*Marcia*) and then an infinitival predicate (*to be a genius*). It can usually be paraphrased by a similar sentence containing a fully inflected complement clause:

(2) Cindy believes (that) Marcia is a genius.

In (2) *Marcia* would uncontroversially be analyzed as the subject of the embedded predicate *is a genius*. Given the rough synonymy of (1) and (2) analyses of (1) have tried to account for the fact that at some level of analysis *Marcia* is the subject of *to be a genius*.

Indeed a range of expressions typically thought to be associated with subjects can appear in the postverbal position in the A+I construction. Some examples include existential *there*, weather *it* and idiom chunk subjects:

(3) a. Greg believes there to be no solution to this problem.
b. Peter believes it to be raining cats and dogs.
c. Alice believes the shit to have finally hit the fan.

Besides these subject properties, however, the postverbal NP in the A+I construction in (1) displays several properties often associated with direct objects. First, if the full NP *Marcia* is replaced with a pronoun, it takes the objective or accusative form instead of the nominative form the subject of (2) would take:

(4) a. Cindy believes her/*she to be a genius.
b. Cindy believes (that) she/*her is a genius.

Second, if *Marcia* in (1) is replaced with an anaphoric element coreferential with the subject of *believe* then it takes the reflexive form, not the pronominal form the subject of (2) would take:

(5) a. Cindy_i believe herself_i/*her_i to be a genius.
b. Cindy_i believes (that) she_i/*herself_i is a genius.

Third, if (1) is passivized *Marcia* can become the subject of the passive verb *believe*; this is not possible if (2) is passivized:

(6) a. Marcia is believed (by Cindy) to be a genius.
b. *Marcia is believed by Cindy (that) is a genius.

The postverbal NP in the A+I construction, then, has mixed properties, some subject-like and some object-like. This state of affairs has led to controversy in the generative literature: is the postverbal NP a subject or an object or both? To answer this question we will need a better understanding of the construction itself and of the factors that make an NP subject-like and/or object-like.

Before turning to these issues, there is one other classic property of the A+I construction that should be mentioned. One of the first properties noticed about this construction was how it is different from a superficially similar-looking construction, that of the object control or object equi construction, illustrated in (7), which can be compared to the A+I construction in (8):

(7) Carol persuaded the doctor to examine Bobby.

(8) Carol expected the doctor to examine Bobby.

Rosenbaum (1967) observed that if the material following the main verb is passivized, the results for (7) and (8) are notably different:

(9) Carol persuaded Bobby to be examined by the doctor.

(10) Carol expected Bobby to be examined by the doctor.

While (8) and (10) are paraphrases of each other, (7) and (9) are not. In (7) Carol is persuading the doctor to do something while in (9) Carol is persuading Bobby to do something. In other words, the 'persuadee' differs in the two sentences. In (8) and (10), on the other hand, Carol has an expectation and in both it is about an examination that the doctor will perform on Bobby.

Thus, semantically, the main verb in (7) *persuade* takes three arguments: the persuader (*Carol*), the persuadee (*the doctor*), and the event (the doctor's examination of Bobby); however, the main verb in (8) *expect* takes only two arguments: the expecter (*Carol*) and the expectation (the doctor's examination of Bobby). Indeed, this underlies the main distinction between the two constructions; while the A+I construction's postverbal NP as in (8) superficially seems parallel to the postverbal NP in (9), there is one crucial difference: the NP in (8) is not semantically related to the main predicate, while the postverbal NP in (9) is.

The rest of the chapter is laid out as follows. Section 2 outlines the two major 'brands' of analysis that have been pursued to explain the properties of the A+I construction; this section also presents a roughly chronological discussion of the particular accounts that have been suggested. Section 3 presents the main types of evidence that supporters of each brand have offered. Section 4 briefly discusses the categorial status of the complement clause in the A+I construction. And section 5 mentions some general conclusions and suggestions for additional reading.

2 Two brands of analysis

2.1 Overview

2.1.1 Raising to object

One type of analysis given to the A+I construction is often called the raising to object analysis. On this analysis the reason *Marcia* in (1) has object-like properties is that it is an object of *believes* at the relevant level of representation. Its subject properties follow from the claim that it is also a subject at some other level of representation.

This analysis is the first one given to the A+I construction in the generative literature, being endorsed by Rosenbaum (1967), McCawley (1970), Kiparsky and Kiparsky (1970) and most notably Postal (1974) in the early transformational literature. Its basic claim can be found in non-transformational approaches such as Relational Grammar (Perlmutter and Postal 1983a), Lexical Functional Grammar (Bresnan 1982c) and Head-driven Phrase Structure Grammar (Pollard and Sag 1994). More recently an updated version of this proposal has been reintroduced into the transformational literature and can be found in Johnson (1991), Lasnik and Saito (1991), Koizumi (1993) and Runner (1995), among others. All of these analyses share the intuition that at the relevant level of representation *Marcia* in (1) is a direct object of *believes* and at some other level of representation it is a subject of *to be a genius*. What differs among these analyses is what the relevant levels of representation are and how they are related. Before discussing any of the details of the raising to object approach, the next section will outline the other main approach to the construction in (1), the exceptional case marking approach.

2.1.2 *Exceptional case-marking*

A second type of analysis given to the A+I construction is called the exceptional case-marking or ECM account. On this approach, the reason Marcia has subject properties is that it is in subject position at all levels of representation. The object-like properties follow from the claim that these properties do not target direct objects per se but rather target NPs that have a particular structural relationship to a nearby verb; it happens that this relationship holds of both a direct object (the verb's immediate sister) and of the embedded ECM subject, which is claimed to be 'closer' to the verb in the relevant sense than a normal embedded subject like we find in, e.g., (2). One special characteristic of this construction, according to the ECM approach, is that the verb 'exceptionally' assigns case to this NP which is not its thematic direct object.

The seeds to this approach are first planted by Chomsky (1973) and a version of it is developed by Bresnan (1972). Much of the transformational work of the 1980s assumes the ECM approach, following Chomsky (1981). Though the details vary somewhat, these analyses all agree on one crucial point that distinguishes them from the raising to object approach: the NP *Marcia* in (1) is not in direct object position at any level of representation.

The sections that follow discuss in more detail further properties of the A+I construction that analyses have attempted to explain; then they provide a roughly chronological presentation of versions of the two brands of analysis outlined above. The A+I construction has received so much attention in the literature that it will be impossible to discuss its each and every property or do justice to all of the different analyses proposed. This chapter will outline the main issues and evaluate the success of the different accounts available in the literature.

2.2 Particular analyses

2.2.1 Raising to object

The earliest transformational approach to the A+I construction was the raising to object analysis. In its essentials it has the following characteristics. At an initial stage of the derivation of the sentence the postverbal NP is in the subject position of the embedded clause, as in (11a). As part of the syntactic derivation a transformation moves that embedded subject up to the direct object position of the main clause as in (11b), hence the name 'raising to object'.

(11) a. Mike proved [[Sam the butcher] to be innocent]
b. Mike proved [Sam the butcher] [___ to be innocent]

At deep structure – the initial stage of the derivation – *Sam the butcher* is the subject of the predicate *to be innocent*. At surface structure it is in the main clause as a direct object of the verb *proved*.

How does this analysis handle the basic properties of the A+I construction outlined above? Since *Sam the butcher* is in subject position at deep structure, and deep structure was considered the level of representation where semantic role assignment takes place, the fact that *Sam the butcher* is semantically the subject of *to be innocent* is accounted for. Since *Sam the butcher* raises to the main clause to become the direct object of *proved*, any rules sensitive to direct objects will be able to apply to this NP. One of these rules is passivization. Passivization was thought to be a grammatical function-changing operation that rearranged the subject and direct object arguments of a transitive verb, making the direct object the subject and making the subject a kind of oblique. Since raising to object creates a transitive predicate by providing the main clause verb with a direct object, passivization can then successfully apply. Consider the derivation sketched in (12):

(12) a. Cindy believes [Marcia to be a genius]
b. Cindy believes Marcia [___ to be a genius]
c. Marcia is believed (by Cindy) [___ to be genius]

Marcia is the embedded subject initially, as in (a). Then it raises to the object position of the main clause, as in (b). Finally, passivization applies and *Marcia* winds up as the subject of the passivized verb.

The raising to object analysis also has a straightforward account of the case-marking facts. Since at surface structure, where case-marking is determined, the initially embedded subject is a direct object, it appears with accusative, not nominative, case:

(13) Cindy believes her/*she [___ to be a genius]

Further, the reflexive facts also follow from the raising to object account. Though the actual analysis provided at the time differed in detail, the generalization is still correct: a reflexive NP is licensed if it has a more prominent (c-commanding) clause-mate antecedent. Since raising to object takes an embedded argument and makes it a clause-mate to the subject of the main verb, the conditions for licensing a reflexive are met:

(14) Cindy$_i$ believes herself$_i$/her$_{*i}$ [___ to be a genius]

The Relational Grammar (RG; Perlmutter and Postal 1983a) approach to raising to object was in its essentials very similar to that just outlined. RG does not invoke transformations that rearrange pieces of phrase structure, but it does have rules that change the grammatical relations of the arguments of a clause. RG's view of raising to object is that the embedded subject at an earlier level (or stratum) ends up taking on the role of direct object in the main clause at a subsequent level. Once it is the direct object in the main clause it is available for rules targeting direct objects, as outlined above.

2.2.2 Exceptional case-marking

The seeds of the exceptional case-marking (ECM) approach are found in Chomsky (1973). This approach agrees with the raising to object account that the postverbal NP is an embedded subject initially. However, its claim is that at surface structure the postverbal NP is still in the embedded subject position. A sentence like (15) would have the bracketing indicated throughout the derivation.

(15) Cindy believes [Marcia to be a genius]

This approach, then, straightforwardly explains the subject properties of *Marcia* since it is a subject throughout the derivation. How does it account for the 'object-like' properties?

In the earliest versions of this approach Chomsky argued that the passivization transformation affected whatever NP was directly following the verb. Since both direct objects and the embedded subject in (15) are NPs directly following the verb, both are available for passivization. A similar approach was assumed for reflexivization. What blocked passivization and reflexivization in structures like (16)?

(16) Cindy believes [Marcia is a genius]

Chomsky notes that a crucial difference between (15) and (16) is the finiteness of the embedded clause. He proposes the Tensed-S condition, which blocks rules (like passivization and reflexivization) from relating elements within a tensed clause to elements outside of that clause.

Chomsky (1981) introduced the ECM approach to the A+I construction. It had in common with his earlier analysis that the embedded subject is a subject

throughout the derivation. Its account of the object-like properties of that postverbal NP differs. The intuition behind the ECM account is that a verb bears a particular structural relationship to certain sufficiently 'close' NPs. This relationship is called government. A verb governs its sister direct object; and it also governs the subject of its infinitival sister clause. It does not govern the embedded subject of its finite sister clause. The claim is that a finite clause node is a barrier to government. Additionally, the main verb in the A+I construction can assign accusative case to the embedded infinitival subject, which is exceptional, in that a verb usually only assigns accusative case to its own thematic object.

Then passivization, and the conditions on reflexives and case-assignment are also sensitive to the notion of government by the main verb. Since regular direct objects and the postverbal NP in the ECM construction are both governed by the main verb, they form a natural class and are treated as such by the syntax, reflected in their parallel behavior with respect to passive, reflexives, and case-marking. The fact that the main verb does not govern the subject of an embedded finite clause is part of the explanation for why that NP is not available for passivization, cannot be a reflexive bound in the main clause, or appear in the accusative case.

It is probably worth noting here that the above description of the ECM account is slightly simplified. Indeed, it was assumed that both finite and non-finite complement clauses were dominated by the same syntactic nodes, namely S and S' (what are now called IP or TP and CP). S' was considered a barrier to government, thus the main verb could not govern into either the embedded finite or non-finite clause without some special or exceptional device:

(17) a. Cindy believes [$_{S'}$ [$_{S}$ Marcia to be a genius]]
b. Cindy believes [$_{S'}$ [$_{S}$ Marcia is a genius]]

The special device was the rule of S'-deletion, which would delete the S' node in the A+I construction (17a), but not in (b), with finite complementation. Thus, at surface structure there is a difference between the two constructions:

(18) a. Cindy believes [$_{S}$ Marcia to be a genius]
b. Cindy believes [$_{S'}$ [$_{S}$ Marcia is a genius]]

S'-deletion was considered an exceptional rule limited in its application to a handful of verbs.

Section 4 will take up the question of the categorial nature of the sentential complement of verbs like *believe* in the A+I construction. This in itself is one of the important variables in analyses of the A+I construction.

2.2.3 Raising revisited

In 1991 Kyle Johnson published an article arguing that all direct object NPs in English move from their base-generated position, as sister of V, to a VP-peripheral position, Spec,VP. One of his concerns was that while argument PPs seem able

to intermingle with adverbial and other non-nominal VP-internal material, argument NPs always appear directly to the right of the main verb in English:

(19) a. Bobby talked (quietly) to Bill (quietly).
b. Bobby watched (*quietly) Bill (quietly).

He argued that the NP needed to move leftward to Spec,VP to have its case assigned. Since the main verb still precedes the direct object NP, Johnson provided several arguments that it too moved leftward; he claimed it landed in a VP-external functional head position:

(20) Bobby watched [$_{VP}$ Bill t_V t_{NP} quietly]

Johnson went on to argue that the same range of facts is relevant in the A+I construction. That is, the main verb and the postverbal NP are always adjacent. That and other facts led him to reintroduce a raising analysis for the A+I construction.

Johnson's analysis side-stepped one of the main road blocks that the raising to object analysis faced in the Government and Binding (GB) theory of the 1980s. Partly to constrain GB's main transformational rule, Move Alpha, and partly to rule out transformational analyses like raising to object, GB constraints were stated in such a way as to rule out a construction in which the sister of a lexical item is not that item's semantic/thematic argument. Since raising to object takes an NP thematically related to an embedded predicate and places it in the position of sister of V, this application of Move Alpha would violate these constraints. Since the raising in Johnson's analysis is to a specifier position and not to the sister of V position, this difficulty does not arise. Indeed, there is nothing in the theory to rule out Johnson's approach to the A+I construction.

Additionally, in the late 1980s (published as chapter 2 of Chomsky 1995c) Chomsky suggested that accusative Case was assigned to a direct object NP, not in its surface position, which is sister to V, but rather in a VP-external functional specifier position, Spec,AGRoP. Since it was assumed that the direct object was a sister to V in the surface representation, the claim was that the NP would raise at the abstract level of Logical Form (LF) to the Spec,AGRoP. The main motivation for this was conceptual. Subject NPs were thought to be generated in Spec,VP and raise to Spec,IP overtly to have their nominative case assigned. Chomsky wanted to unify nominative and accusative case-assignment.

Lasnik and Saito (1991) extended Chomsky's approach to the A+I construction. They tentatively suggest that the embedded subject NP moves overtly to the main clause Spec,AGRoP position in the A+I construction. The verb would also move to a higher VP-external functional head position. This much of the analysis paralleled Johnson's proposal. Oddly, they proposed this overt account only for the A+I construction, maintaining Chomsky's covert movement account for regular direct objects. Others have extended the overt movement analysis to direct objects, as well, making them fully parallel with the postverbal NP in the A+I construction (e.g., Koizumi 1993; Runner 1995, and others).

Both the ECM and the revised raising approaches potentially have the ingredients for an explanation of another property of the A+I construction: it is associated with verbal complementation alone. No adjectives or nouns allow for the A+I construction, as noted by Ross (1974a) and Kayne (1983). As only verbs, but not nouns and adjectives, are independently thought to be structural case-assigners, this favors an analysis that tries to relate the A+I construction to structural case-assignment.

2.2.4 The lexicalist approach

Another approach, which has its roots in the raising to object analysis, is found in the lexicalist frameworks, Lexical-Functional Grammar (LFG; see, e.g., Bresnan 1982c) and Head-driven Phrase Structure Grammar (HPSG; see, e.g., Pollard and Sag 1994). Like the raising approach, the lexicalist approach claims that in the surface syntactic structure the postverbal NP in the A+I construction is a direct object of the main verb. This allows a straightforward account of the object-like properties of that NP. What about the subject properties? Both LFG and HPSG recognize that the postverbal NP must have the semantic properties associated with the subject of the embedded predicate. Thus, both frameworks provide a means for associating the syntactic direct object with the semantic features of the embedded subject. At the level of syntactic analysis, the NP is a direct object; at the level of semantic analysis, it is a subject.

3 Evidence for the two brands

3.1 Evidence for raising to object

Many arguments have been offered in favor of the raising to object account of the A+I construction. Indeed, Postal (1974) alone, outlines 14 or so such arguments. Many of these arguments have roughly the following form: NPs certain to be direct objects behave in manner X; the postverbal NP in the A+I construction behaves in manner X; therefore, it is a direct object. Some of these arguments could be turned around and used to support in a similar way the ECM approach: NPs certain to be governed by the main verb behave in manner X; the postverbal NP in the A+I construction behaves in manner X; therefore, it is governed by the main verb. See Bach (1977b) and Bresnan (1976b) for critical reviews of Postal (1974).

The crucial difference between the two approaches hinges on the treatment of the postverbal NP with respect to the surface syntax. Thus, arguments that show the NP to indeed be part of the main clause in the surface syntax are arguments in favor of the raising to object account.

One simple argument of this type comes from adverb placement. If the postverbal NP were in the embedded clause one might expect a main clause adverb to be able to intervene between the main verb and the postverbal subject. This is not possible, as is well known:

(21) Alice believes (*strongly) Sam to be the best butcher in town.

But see section 3.2 for an argument against the raising to object approach based on a very similar example. Another more complicated argument is put forth in Postal (1974). It involves the interpretation of adverbs. Consider these examples:

(22) a. Mike expected Greg incorrectly to take out the trash.
b. #Mike expected Greg incorrectly would take out the trash.

In the A+I example in (22a) the adverb *incorrectly* can have a reading in which it modifies the main verb *expect*. Indeed, that is probably the favored reading. In the full finite clause in (22b) the adverb sounds awkward. If it is inverted with the modal *would* it can be interpreted as modifying the embedded predicate. If the interpretation of an adverb is determined by its surface position then this contrast can be taken as an argument for raising to object. For the adverb *incorrectly* to be interpreted as modifying *expected* it must be in the same clause as *expected*. If it is in the same clause as the verb, then the NP between the verb and the adverb must also be in that clause. Therefore, the postverbal NP is in the main clause.

Another, perhaps slightly more straightforward, piece of evidence in favor of the claim that the postverbal NP in the A+I construction is indeed part of the main verb comes from the 'particle construction'. Kayne (1985) points out examples like the following and Johnson (1991) argues that they show that the postverbal NP is within the surface string of the main clause:

(23) She made Jerry out to be famous.

On the assumption that *made* and *out* are both uncontroversially in the main clause, then since *Jerry* appears between them, it too must be part of the main clause.

A third kind of argument for the raising to object approach comes from testing how 'high' the postverbal NP in the A+I construction is compared to the subject of an embedded finite clause. Versions of these arguments are found in Postal (1974) and are re-introduced in Lasnik and Saito (1991). These may not actually tell us anything about where the postverbal NP is in the overt syntax since currently many frameworks do not assume these phenomena are sensitive to surface syntax, but rather to some more abstract representation (like Logical Form). Nonetheless, these arguments do seem to point toward a difference between the postverbal NP in the A+I construction and a subject NP in an embedded finite clause.

In each of the following the postverbal NP in the A+I construction behaves like it is higher in the structure than a clearly embedded subject at some level of representation. It can take wider scope than an embedded subject; it triggers a Binding Theory Condition C effect in the main clause; it can bind a reciprocal in the main clause; and it can license a Negative Polarity Item (NPI) in the main clause.

Scope:

(24) a. The FBI proved few students to be spies.
b. The FBI proved that few students were spies.

Condition C:

(25) a. ?*John believes him$_i$ to be a genius even more than Bob$_i$'s mother does.
b. John believes that he$_i$ is a genius even more than Bob$_i$'s mother does.

Reciprocals:

(26) a. ?The DA proved the defendants$_i$ to be guilty during each other$_i$'s trials.
b. ?*The DA proved [that the defendants$_i$ were guilty] during each other$_i$'s trials.

NPI:

(27) a. ?The DA proved none of the defendants to be guilty during any of the trials.
b. ?*The DA proved [that none of the defendants were guilty] during any of the trials.

3.2 Evidence for the ECM approach

Several arguments against the raising to object account have been proposed over the years. Chomsky (1973) argues that if the post-verbal NP is indeed syntactically a direct object, then what explains the following type of contrast?

(28) a. Which famous singer does Marcia always believe [gossip about ___]?
b. *Which famous singer does Marcia believe [gossip about ___] to have ruined his career?
c. *Which famous singer does Marcia believe that [gossip about ___] has ruined his career?

He suggests that examples like (27b, c) are simply examples of illicit extraction from subject position, while (27a), being extraction from object, is fine. Postal responded to this criticism by claiming that the condition which blocks extraction from subject is actually a condition on extraction from a phrase that has been a subject at some point in the derivation; even the raising to object analysis assumes that the postverbal NP is a subject underlyingly.

Another argument against the raising to object approach also comes from adverb placement. This time the ECM approach seems to make the right prediction:

(29) a. Alice believes Sam (*strongly) to be the best butcher in town.
b. Alice believes strongly that Sam is the best butcher in town.

If the postverbal NP is indeed part of the main clause, why is it not possible to place this main clause adverb after the supposed main clause direct object? Runner (1995) attempts to explain this by comparing (29a) to (30b):

(30) a. Alice strongly believes Sam's story.
b. *Alice believes Sam's story strongly.

The example in (30a) shows that *strongly* can modify *believe*, but (b) shows that it cannot appear postnominally. The adverbs that are often used to illustrate the contrast in (29) do not do well postnominally even when the postverbal NP is uncontroversially a direct object. And given that there are adverbs that do well in such a position, as illustrated in (22) above, the force of this argument is weakened.

Another type of argument that Chomsky (1973) makes against the raising to object approach involves *tough* movement. *Tough* movement is usually assumed to target various kinds of objects, but not subjects:

(31) a. Bobby is easy to please ___
b. *Bobby is easy to believe [___ saw Big Foot]
(cf. It is easy to believe Bobby saw Big Foot.)

However, the postverbal NP in the A+I construction cannot undergo *tough* movement. This is unexpected if it is a direct object, but is expected if it is a subject:

(32) *Bobby is easy to believe ___ to have seen Big Foot.
(cf. It is easy to believe Bobby to have seen Big Foot.)

Here the raising to object analysis has to explain why the derived object does not undergo certain phenomena usual direct objects undergo. The ECM analysis simply points out that these NPs are subjects, not objects, and hence the contrasts follow straightforwardly.

4 The categorial status of the complement clause

Somewhat independent of the choice of analysis, raising to object or ECM, is the question of the categorial status of the embedded clause. The original analyses usually claimed that it was a full sentence embedded within an S′ (or CP). However, other accounts are possible and have been proposed. One is that the full finite complement of a verb like *believe* is an S′ or CP, the infinitival complement found in the A+I construction is simply an S or IP (or TP). This approach would capture the intuition that there is less syntactic material between the main verb and the embedded subject NP in the A+I construction, without positing a rule of S′ deletion (see, e.g., Massam 1985 for an ECM-type analysis along these lines).

Kayne's (1981b) study of English and French complementation argued that the categorial status of the sentential complement mattered for a range of properties. There he showed that whereas French does not in general have the basic A+I construction outlined above (see (33a, b)), it does have a similar construction, what is now called a small clause (33c). This construction, which does not appear to involve a full infinitival complement clause, looks superficially like the English A+I construction. Interestingly, it is possible to extract the embedded subject of (33b) resulting in (33d).

(33) a. I believe Jean to have arrived.
b. *Je croyais Jean être arrivé.
I believe Jean to-be arrived
c. Je crois Jean intelligent.
I believe Jean intelligent
d. le garcon que je croyais être arrivé
the boy that I believe to-be arrived

Kayne (and see also Rizzi 1981) argues that (33b, d), involve S' (CP) complementation, whereas (33c) does not.

A paradigm pointed out in Postal (1974: 304–305) suggests that even within a single language the possibility of both the English-type and the French-type A+I construction must co-exist. English, too, has predicates that pattern similarly to the French examples in (33b, d):

(34) a. *He alleged Melvin to be a pimp.
b. Melvin, he alleged to be a pimp.
c. Who did they allege to be a pimp?
d. They alleged to be pimps – all of the Parisians who the CIA had hired in Nice.
e. Melvin was alleged to be a pimp.

On the other hand, such an account requires that a predicate be able to select particular categorial features of its complement (here, to be able to choose between S' and S); categorial- or c-selection itself has been controversial with a number of researchers aiming to reduce it to semantic- or s-selection (Grimshaw 1979; Pesetsky 1982). Given the fact that the A+I construction and its finite counterpart are roughly synonymous, it becomes difficult to see how to have the difference in the category of the complement clause follow from semantic characteristics alone (but see Pesetsky 1989 for such an attempt).

5 Conclusion

The A+I construction has had a long and illustrious history in generative syntax. Brand-loyalty ran very strong and it seems that complete subparts of theoretical

frameworks were developed simply to account for this construction. However, over the past five years or so it seems that most analysts have converged on some version of the raising to object approach. With the decoupling of underlying semantic/thematic positions and surface (or LF) functional case positions being explored in recent minimalist versions of transformational grammar, the need for the ECM approach has declined and indeed the full raising to object analysis is the only one consistent with new architecture of the theory. The static representational notion of 'government' no longer plays a role in the theory and its work has been taken over by a derivational feature-movement approach to local relations. Thus, modern transformational grammar joins current lexicalist approaches to grammar in endorsing the basic concepts embraced by the raising to object approach.

This chapter has provided an outline of some of the relevant issues to the analysis of the A+I construction in English. Those interested in reading more about it may want to consult some of the following additional sources and the sources cited therein: Kayne (1985), Massam (1985), Bošković (1997c) and Runner (1998). This list is a tiny fragment of what is available as is clear by doing a Google search on "'raising to object' OR 'exceptional case marking'," which receives over 600 hits.

  8.1 Lexical agreement of *-en* with objects
  8.2 External theta-role suppression (dethematicization)
  8.3 An additional consequence of the Head Accessibility Constraint
9 Conclusion: the unity of syntax and morphology

1 Introduction: what counts as a passive?

Perhaps the first task in any work on passives is to set down what this elusive term is meant to cover. Keenan's (1985a) broad but quite detailed overview insists that passives are operations on verb phrases rather than on sentences (p. 247) for which a characteristic morphological marking is central (p. 251). Åfarli (1992: 8) summarizes this research in the following concise statement:

> . . . every sentence one might reasonably want to call a passive may be minimally characterized as follows:
>
> (22) a. Relative to its active counterpart, the passive sentence is marked with special verb morphology.
> b. The subject of the active sentence never remains subject in the passive counterpart.

This characterization of passives lays stress on the role of the subject phrase and its relation to passive morphology. The general approach to characterizing passive in terms of 'dethematized' subjects (those whose expected theta-role is suppressed) stems from Roberts (1987).

1.1 Two types of passives

Åfarli goes on to cite Keenan (1985a: 251) who "distinguishes between two broad types of passive according to the verbal morphology involved: Periphrastic passives, which necessarily make use of a passive auxiliary verb, and strict morphological passives, which do not." Periphrastic passives are also sometimes called 'analytic' and strict morphological passives 'synthetic'.

In these traditional terms, an 'analytic passive' is constructed with an auxiliary verb and a non-finite form of the main verb. In the bracketed passive clauses below, the usual place of the subject (underlined) contains either a noun phrase with the semantic role of what would otherwise be the main verb's object (1a) or some dummy pronoun (a null or overt 'expletive'), as in (1b). The passive auxiliaries are italicized and the non-finite main verbs are in bold.

(1) a. The fact that [<u>the door</u> *was* {**repainted/taken** off} by the tenant] upset her.
It seems that [<u>John's requests</u> are *getting* {**satisfied/written** down}].
b. [<u>It</u> might *be* quickly **concluded** that Mary is ill].
[<u>Det</u> *vart* **sunge**]. 'It was sung.' (Norwegian, from Åfarli 1992: 85)

The non-finite passive form in English, the 'passive participle', combines a verbal stem with a past participle suffix, thus yielding complex analytic or periphrastic passives such as *be repaint-ed*, *be tak-en*, *get satisfi-ed*, *get writt-en*; this pattern is very common throughout Indo-European languages. This suffix is (often) referred to as past, not because of the passive, but because many languages also

combine this participle with different auxiliaries to form composed past tenses (the English perfect tenses *have taken*, the French *passé composé*, the Italian *passato prossimo*).[1] Because of the suffix's distinctive form in many irregular English verbs (*broken*, *done*, *eaten*, *flown*, *gone*, *taken*, *written*), it has usually been notated as *-en*, even when spelled *-ed*, since the earliest transformational work.

At least in the realm of what Baker (1988a: ch. 1) terms "grammatical function changing" rules, this analytic passive certainly reigns as 'king' of transformations. It is one of three singled out in Chomsky (1957) for extensive treatment and has maintained a center stage position in research ever since. This constant attention is in large part due to the fact that the correct analysis for any kind of passive remains uncertain; indeed much debate has turned on to what extent across languages and within one language the many variations on the 'passive' can even be considered a unitary phenomenon (Keenan 1985a; Postal 1986).

1.2 Two variants of 'analytic passives'

Contributing to the uncertainty about the limits on the passive is an interesting dichotomy, widely exemplified in Indo-European systems, between what are termed verbal and adjectival passives. The construction most familiar from transformational literature is in fact a 'verbal passive'. But a second type of passive, often homonymous with the first, is called 'adjectival'. Wasow (1977) draws several grammatical distinctions in English, which we will review as we proceed, between verbal passives as in (2a) and adjectival passives as in (2b):

(2) a. During my visit, that door was quickly *taken off* by the tenant.
John's requests are getting *satisfied*.
b. At my arrival, that door was already completely *taken off*.
John now seems very *(un)satisfied.*

A rough semantic characterization is that a verbal passive (2a) refers to an activity and an adjectival passive (2b) to an already attained state.

This study is devoted to sketching the history of treatments of adjectival passives in generative grammar and to selecting the elements among these treatments that seem to provide a satisfactory analysis for the construction. As the adjectival passive has much in common with periphrastic verbal passives and is often of the same form, we will necessarily be treating aspects of the latter construction.[2] However, we can exclude strict morphological (synthetic) passives from this study, relying on Åfarli's conclusions: "Among Germanic languages, the [strict morphological]-passive is unique to the Scandinavian languages" (1992: 13). "It is important to note that s-passives never have an adjectival reading" (1992: 12).

Between the periphrastic passives, the adjectival variant certainly arrived later on the generative scene (for reasons we will review), and has never become the focus of attention in the same way as the verbal passive. It has been instead confined to a relatively unexamined lexicon where its properties are supposedly

relevant only to the development of 'lexical semantics'.[3] Yet a review of literature and argumentation about the adjectival passive suggests rather that it is the more basic, minimal and diachronically constant representative of the two types.[4]

In the terms of syntactic theory, this review will finally conclude not only that verbal and adjectival periphrastic passives are formed from a single lexical item, the participial suffix, but also that *both involve transformational movement from object to subject for exactly the same reason*. That is, I will argue that both uses of the passive suffix relate similarly to 'NP movement' and that neither is connected to any lexical device which relates arguments of verbs to semantic or 'theta'-roles.

2 Verbal vs. adjectival passives: their differences

I first review the properties that differentiate the two types of passives, summarizing material that also appears in Emonds (2000: ch. 5). The differences in sections 2.2, 2.3, and 2.5 were brought under generative scrutiny in Wasow (1977). In this study of the generative history of adjectival passives, it is important to keep in mind that the specifically adjectival properties reviewed below were never taken as crucial considerations in formulating early versions of the passive transformation.

2.1 The interpretive difference: ongoing vs. completed activity

We began by examining a property that is taken in both traditional and generative grammar to distinguish passive participles with an activity sense (2a, 3a) from those indicating a resultant state (2b, 3b). The verbal passives in (2a, 3a) lack the sense of completed activity conveyed by the adjectival passives in (2b, 3b):

(3)	a.	The door {got/was} *closed* during the noon hour.	(door can be open at noon)
		The door is being *(*un)painted*.	(painting incomplete)
	b.	The door {remained/was} *closed* during the noon hour.	(door closed by noon)
		The door looked *(un)painted*.	(painting complete)

Certain verbs are incompatible with this 'completed sense' and hence do not appear in adjectival passives. Consequently, such V can be passivized only as *verbal* passives; they cannot appear as complements of most verbs subcategorized as +___AP:[5]

(4) *New York seems (very) {*approached/left*} in the tourist season.
*That good dinner felt {*accompanied/followed*} by too much drink.
Many polluted cities remain {(un)avoided/escaped*} during the summer.

*The clay looked (too) {*handed* around to students/*pressed* into a bowl}.
*The message appeared {*slipped* to the spy/*put* in the drawer}.
*Some basketballs sounded {*dribbled* across the floor/*thrown* against the wall}.

The sense of completed activity in (2b, 3b), i.e., of a property, seems nothing more than the characteristic Logical Form (LF) interpretation of the syntactic category A. Moreover, interpretation as a property seems to be exactly what verbal passives lack.[6] I thus propose the following at least descriptive relation between the morphology of the passive and its interpretation. Following the right hand head analysis for bound suffixes in Lieber (1980), the suffix *-en* is the head of the passive participle. Then, while *-en* is obviously present in Phonological Form (PF) in all passives:

(5) a. In adjectival passives, the head [$_A$ *-en*] is present in both LF and PF.
b. In verbal passives, [$_A$ *-en*] is absent in LF and present only in PF.[7]

Many empirical differences between adjectival and verbal passives correlate with and can be largely explained by (5). Of course, we also wish to develop a better theoretical perspective on (5).

We will see as we proceed that there is no need to invoke any further category distinction or change between the two types of passives as long as we maintain a contrast during some part of a derivation, whereby verbal but not adjectival passives lack the filled lexical head [$_A$-*en*] at LF.

2.2 *Selection by different classes of V*

In most of the paradigms from Wasow (1977), the distributions of adjectival passives and underived lexical adjectives are essentially identical. This general fact follows from the presence of adjectival *-en* at all levels of a derivation (5a). In contrast, he considers the lack of the category A in verbal passives to be a crucial indicator of their transformational genesis. That is, while adjectival passives instantiate a category change of the stem for Wasow (morphological 'derivation' from V to A), verbal passives do not and could not effect a category change, because transformations lack this capability. Thus, verbal passives must be of category V. Chomsky (1981: 50) takes a somewhat different tack, proposing a special 'neutralized category' status for verbal passives, presumably to keep them separate from the (undiscussed) adjectival passives (see section 5.1).

Empirically, both types of Germanic and Romance passive phrases are selected by verbs whose subcategorization frames include AP, but there is a difference between adjectival and verbal passives. Adjectival passives are selected by essentially *all* V that select AP complements (Wasow mentions English *act*, *appear*, *be*, *become*, *look*, *remain*, *seem*, *smell*, and *sound*), while only one or two such 'auxiliary' V in each language select verbal passives. Under either Wasow's or Chomsky's categorial proposals, (5a) certainly explains at least the first part of

this statement. Nonetheless, neither proposal clarifies why Indo-European verbal passives are compatible with only one or two 'passive auxiliaries' otherwise specified as +___AP (e.g., *be* and *get*).

2.3 *Degree words freely modify only (certain) adjectival passives*

There are not fully understood differences among adjectival passives as to which permit a full range of characteristic adjectival modifiers, so-called 'degree words', as in (6a).[8] In any case, verbal passives do not tolerate them. By using either a progressive or the verbs in (4) (*approached/avoided/handed*, etc.) to ensure that a passive is verbal rather than adjectival, we create ungrammatical combinations with adjectival modifiers (6b).

(6) a. The garden seemed too overplanted.
New York remains more affected by strikes than other cities.
That region doesn't seem very inhabited.
How spotted with food did those clothes look?
b. The garden is being (*too) overplanted.
*New York is more avoided by tourists than other cities.
*That prison doesn't seem very escaped these days.
*How handed around to students did the clay feel?

Though a full theory of grammatical modification remains to be worked out, the following seems to be a minimal requirement: Many, perhaps all, items that modify only lexical category X^0 (here A) require that this X^0 be lexicalized throughout a derivation. The structural contrast (5) then lays the basis for correlating free adjectival modification with the presence of a lexical entry under A. Since the *-en* suffix on a verbal passive is absent in LF (5b), these forms don't tolerate degree words.

The distinction between lexicalized passive adjectives and those resulting from productive syntactic derivation is studied in more detail in Emonds (2000: ch. 5), in relation to determining possible modifiers of adjectival passives. In that approach, fully lexicalized members of this class (*affected*, *inhabited*, *restricted*, *worried*) are suffixed in the lexicon and hence throughout a derivation, and so can be modified by degree words. Other adjectival passives (*destroyed*, *lost*, *painted*, *planted*) are formed in the syntax, i.e., they are not adjectives throughout a derivation, and hence do not tolerate degree words.[9]

2.4 *Passives with the adjectival prefix* **un-**

This test distinguishing verbal from adjectival passives dates from Siegel (1973). Passives prefixed with *un-* can appear as complements of verbs that take APs as in (7a), while verbal passives cannot. So prefixing *un-* to the verb stems in (4),

which are compatible with only verbal passives, creates the impossible italicized combinations (7b), no matter what the wider context:

(7) a. That work seemed {unknown/unpainted/unrewarded}.
Those books should remain {untouched/unfinished/unsold}.
b. *That work {was/seemed} {*unleft* in good hands/*unfollowed* by others}.
*Those books should {get/remain} {*unthrown/unhanded*} to any customers.

As in the previous subsection, it appears that if a prefix modifies only members of lexical category X^0, then X^0 should be lexicalized throughout a derivation.

Bresnan (1978: 6–9) claims that this pattern precludes using transformational movement in adjectival passives in, e.g., (7a). However, the assumptions of her argument seem to be that passive movement is restricted to V-headed clauses (begging the question) and that all operations contributing to a transformed passive surface structure occur simultaneously (which is currently not assumed).

2.5 *Only verbal passives have the full internal structure of surface VPs*

As observed by Wasow (1977: 341), verbal passives essentially recreate the full range of structures found in active VPs, except that the passive VP contains one gap *e* for the DP which is 'passivized': *Mary was (being) elected e President; Sue was sent e the letter.* They are thus unlike adjectival passives, which fail to appear in such contexts: *Mary felt {happy/*elected President}*; **Sue was unsent the letter.*

Åfarli (1992: chs. 3–4) shows that Norwegian passives with expletive subjects in fact exhibit a full range of active VP structures. Similarly, the 'gapless' Japanese passive VPs analyzed in Kubo (1992) contain one or two object DPs exactly like their active counterparts; and Japanese 'gapped' passive VPs also contain direct objects and other complements, except for the single 'passivized' DP.

In contrast, adjectival passives exhibit a significantly smaller range of syntactic patterns. In particular, they tolerate no overt bare complement DPs not in surface PPs: **Bill sounded offered a dinner.* Nor can their subjects correspond to derived rather than deep direct objects: **John sounds considered to be a scoundrel*; **There seems believed to be corruption in high places* (Wasow 1977: 344). We return in section 5.2 to an account of these limitations. I will suggest that the best currently available analysis depends in part on the morphological distinction in (5a, b) and in part on other independently justified aspects of grammatical theory.

2.6 *Only verbal passives have external arguments*

Many studies (to name some: Chomsky 1965: ch. 2; Wasow 1977, section 4.3; Jaeggli 1986a, section 6; Åfarli 1989, section 1.2.2.1; Schoorlemmer 1995, section III.1.1) have contributed to establishing a widely accepted claim that a verbal passive is always related to a syntactically present noun phrase that acts as its

logical subject, either a *by* phrase or a covert DP. Verbal passives (8) thus contrast with adjectival passives (9), which lack such arguments.

(8) a. The meeting was started on time (by Susan) (in order) to please the host.
b. The chairs were moved around on purpose (by the guests).
c. This corn has been grown voluntarily ({by peasants/to stave off famine}).
d. Our workers are better paid intentionally (by the new boss).
e. Art classes are being restored (by the Board) in order to qualify for funding.

(9) a. That series of meetings sounds completed (*by the committee).
b. Most of our furniture is still unmoved (*by the company).
c. We judge the corn fully grown ({*voluntarily/*to stave off famine}).
d. Our workers remain better paid (*intentionally).
e. Some art classes seem restored (*in order to qualify for funding).

The works just cited propose that an overt *by* phrase or corresponding covertly represented logical subject accounts for two widely recognized properties of verbal passives:

(10) This logical subject may (not necessarily must) control the optional PRO subject of a 'higher' infinitive of purpose, optionally introduced by *in order*, as in (8a, c, e).

(11) A syntactically present animate subject seems to be a necessary condition for adverbs of intentionality, as in (8b, c, d), and for that matter, for adjunct purpose clauses as well.

Given this 'special location' of the external argument in passives, we want to know why verbal passives *must*, but adjectival passives *must not*, have such a structurally represented overt or covert DP subject. (We are not yet accounting for the 'dethematicization' property, i.e., why these external arguments are located in a *by* phrase rather than in the surface position that potentially agrees with the verb; this will be discussed in section 8.2.)

We know that verbs generally require subjects in LF – this follows from the Extended Projection Principle ('EPP') of Chomsky (1981). (12) seems like a workable formulation of this idea:

(12) **Extended Projection Principle at LF (EPP).** A verb must have a structural subject phrase if and only if the verb is a *lexical head* of a constituent in LF.

This formulation exempts 'empty auxiliaries' such as passive and perfect auxiliaries from the EPP; on their own such verbs plausibly lack inherent content, and concomitantly they seem to impose no requirement of having their own

subject. Perhaps more to the point here, verbs in compounds and derivational morphology such as those in bold in ***meet**ing place*, *dish **wash**ing*, ***think** tank*, ***go** cart*, ***infest**ation*, ***bereave**ment*, etc. also lack syntactically specified subject phrases, overt or covert.

To see how (12) applies to passive structures, let us look again at the preliminary characterization (5) of the difference between adjectival and verbal passives.

(5) a. In adjectival passives, the head [$_A$ *-en*] is present in both LF and PF.
b. In verbal passives, [$_A$ *-en*] is absent in LF and present only in PF.

(5a) straightforwardly exempts adjectival passives from (12), because the V stem of an adjectival passive is *not the lexical head* of the construction at LF. The V stems in adjectival passives resemble rather the subjectless initial V in compounds and derivational morphology. In fact, this construction is traditionally treated as an example of the latter. That is, a V inside a passive adjective is simply not subject to the EPP, which accounts for the pattern (9).

On the other hand, according to (5b), the stem V is the only candidate for being the lexical head of a verbal passive phrase in LF, precisely because [$_A$ *-en*] is absent. This V then is subject to the EPP (12), which forces the presence of a subject. As mentioned above, we return in section 8.2 to why this subject is not realized in the usual 'nominative' position but must rather be covert or in a *by* phrase.[10]

2.7 *Idiomatic object nouns passivize freely only in verbal passives*

There remains a final contrast between adjectival and verbal passives concerning idiomatic V-NP combinations. That is, adjectival passives disallow any semantic relation other than 'pure argumenthood' between a subject DP and the participle's V stem, as seen in the contrasts in (13).

(13) Some advantage may finally {be/*feel} taken of our new wealth.
A great deal {was/*sounded} made of your visit.
No attention {is being paid/*seems paid} to minor officials.

Actually, this kind of contrast can be related to a difference between so-called 'inflectional' and 'derivational' morphology, although the confusion over the nature of this distinction limits the usefulness of this reduction. Thus, a verb formed with another fully productive inflection, the *-ing* of the gerund or present participle, allows idiomatic combinations like *maintain silence*, *pay attention*, *please DP no end* and *bore DP to tears* in (14).

(14) During the trial, all were impressed by John's maintaining silence.
His paying {bribes/attention} to minor officials was foolish.
This show is pleasing local kids no end.
They heard Mary boring us to tears.

But in derivational formations such as the nominals and adjectives in (15), idioms don't survive.

(15) *During the trial, all were impressed by John's maintenance of silence.
His payment of {bribes/*attention} to minor officials was foolish.
This show seems pleasing to local kids (*no end).
Mary sounded so boring (*to tears).

Consequently, the contrasts in passive paradigms with idioms as in (13) suggest that verbal passives are inflectional like gerunds, while adjectival passives are not.

The explanation seems to be that idiomatic combinations of heads and arguments tolerate no intervening heads in LF.[11] Once again in accord with the structure (5a), the intervening lexical item [$_A$ -*en*] at LF blocks idiomatic combinations of Vs and phrasal complements in adjectival passives, whereas the absence of [$_A$ -*en*] in the verbal passive LFs (5b) has no effect and hence allows them.[12]

We have now reviewed seven differences between adjectival and verbal passives, which have been discussed in various works on passives in English and other languages. We have been able to attribute six of these differences, at least in part, to the distinction between a structure for adjectival passives (5a), in which a lexicalized A is present in LF, and one for verbal passives (5b), whose adjectival head is *not* lexicalized at LF, but only at PF.

Nonetheless, the genesis of the distinctive properties of the two kinds of passives in the terms just developed remains somewhat mysterious. We have not elucidated what is perhaps syntactically the most important of these differences, that of section 2.5: only verbal passives have the full internal structure of surface VPs. Moreover, we would like to understand better the structural difference (5) that underlies several of the others. Finally, there remains the question of formally accounting for Åfarli's 'essential property of the passive': how does the special morphology of a passive guarantee that the subject of an active sentence never remains an (agreeing) subject in either kind of passive? In my view a satisfactory answer can be given (only) by treating verbal and adjectival passives together.

The next four sections follow the history of the treatments of adjectival passives, and will provide an account of why verbal passives have the internal structure of surface VPs rather than of APs. Then, the last two sections of the study will situate (5) in a theory of lexical insertion and propose an account of the passive's essential 'dethematicization' of an active verb's subject.

3 Adjectival properties of all passives

For two decades prior to Wasow (1977), transformational grammar was largely content to treat verbal passives as the only passives worthy of the name. In particular, Chomsky's early analyses of the passive (1957: ch. 5; 1965: ch. 2) laid

particular stress on properties just reviewed in sections 2.1 and 2.5: verbal passive clauses are transformationally derived because they are largely synonymous with corresponding actives, and the characteristic constituent sequences one finds in verbal passive clauses are systematically related to base configurations. Passive sequences are exactly those we expect if VPs have precisely one NP transformationally 'removed' from them.

However, certain theoretical developments in the early 1970s led to questioning this claim that the passive involves movement. Although the revisionist view seems in retrospect to have been a 'mistake' – moreover one quickly rectified via Wasow (1977) – correcting this mistake led to a second misconception concerning adjectival passives that persists today.[13]

An alternative analysis of the English verbal passive in Hasegawa (1968) had faulted Chomsky's earlier formulations as implausible amalgams of "too many elementary transformations," including movement leftward, movement rightward, auxiliary insertion, and optional deletion of an agent phrase. Under the influence of this critique, Chomsky (1970) reanalyzed the passive as two independent subrules, preposing of a deep object into a subject position (NP-preposing), and demotion of a deep subject into a postposed PP headed by the P *by* (agent-postposing). At the same time, these two operations were used in Emonds (1970, 1976) to illustrate the notion of 'structure-preservation', namely, categories generated in the base component were moved into positions where the phrase structure rules of the base could actually also generate these same categories.[14]

Now the motivations for postulating transformationally derived status, widely circulated at this time and later published in Lakoff and Ross (1976), were (i) possible simplifications in the base component, (ii) allowing simpler definitions of grammatical relations in terms of base structures, and (iii) permitting simplified statements of co-occurrence restrictions on lexical insertion. If transformational outputs of NP-preposing and agent postposing could be generated by independently needed base rules, there remained only two possible (nonetheless non-trivial) motivations for them, (ii) and (iii).

This led some analysts to hypothesize that the passive constructions derived by structure-preserving operations, and thus lacking the motivation (i) for transformations, might simply be base-generated constructions full stop. Freidin (1975: section 2) argued that certain aspects of Chomsky's two NP movement rules, especially the agent postposing rule, were problematic. He further claimed that certain passive properties were similar to, and should be subsumed under, those of base-generated adjective phrases. I now treat each of these four adjectival properties of verbal passives in separate subsections.

3.1 An AP pattern inside passive phrases?

The phrase structure of adjective phrases is generally taken to preclude the possibility of multiple NP sisters to the adjectival head. Freidin's (1975: 401) rule (47) expresses this:

(16) AP → A (NP) (PP) . . .

If a passive participle is analyzed as an A, many varied examples of passive constructions indeed conform to his rule. The brackets represent AP boundaries:

(17) The letter was [given to Ann].
The station was (being) [approached from two sides].
How much unfair advantage was [taken of Bill]?

(18) Ann was [given the letter].
Who got [taken such unfair advantage of]?
A lot of vacation was (being) [allowed the workers].
The workers were (being) [allowed a lot of vacation].
That letter was [sent all the candidates].
Peter was (being) [forgiven his sins].
Peter's sins were (being) [forgiven him].
He was (being) [charged a lot of money].

Wasow (1977: 341) however sharply criticizes (16), claiming: "There is no other construction in English that requires rule (47)," and supports his criticism with extensive argument (his long note 10). Note that most of the overt surface NPs in Freidin's putative APs in (18) are typically and crucially 'bare', i.e., they lack an overt P. Such a complement type is quite unusual with head As in English and many languages, and thus the lack of a structural PP for these complements seems unexplained.[15]

A descriptive generalization (19) that better covers the range of complements observed in (17–18) is unrelated to the range of structures lexically chosen by head As:

(19) English passive verbs take exactly the same range of complement combinations as active verbs, except that one noun phrase is missing in a passive structure.

Thus, the variation in passive verb complement types in (17–18) matches that of identical active verbs in (20), except for the presence in each example of (20) of an additional italicized noun phrase.

(20) give *the letter* to Ann, approach *the station* from two sides, take *such unfair advantage* of Bill, give *Ann* the letter, allow the workers *a lot of vacation*, send all the candidates *that letter*, forgive Peter *his sins*, charge *him* a lot of money.

It is of course the correlation in (19) that originally led Chomsky to propose a transformational treatment of the passive, although it is unclear how many construction types he had in mind. This same correlation led most syntacticians in

Chomsky's surround back to a movement analysis of verbal passives, despite the challenges in Freidin (1975) and Bresnan (1978, 1982d).

In the meantime, however, this challenge and Wasow's (1977) response succeeded in making the field aware of the adjectival properties of analytic passives, three more of which will now be discussed. As will be seen later in this study, only after quite a long period of ambivalence about the categorial status of participles have analyses of the passive emerged which use a synthesis of both transformational movement and a central role for the category A.

3.2 The choice of the passive auxiliary

Freidin (1975: 402) observes that the English 'passive auxiliary' *be* – the same can be said for its second passive auxiliary *get* – is in any case subcategorized for taking AP complements (cf. section 2.2 above). This lexical property follows from analyzing passives as base-generated adjectives. In contrast, if the passive auxiliary is generated separately in a base rule for an AUX constituent, it is subject to several ad hoc restrictions. Moreover, if it is transformationally inserted, its resemblance to other base-generated auxiliary structures seems strangely fortuitous.

More generally, *both* types of passives are selected by verbs that have the lexical frame +___AP. In fact, Wasow (1977) notes that adjectival passives appear as complements of almost all Vs whose subcategorization frames include +___AP or +___DP^(AP). For example, English intransitives such as *act*, *appear*, *be*, *become*, *feel*, *look*, *remain*, *seem*, *smell*, *sound*, *stay*, and *taste* all accept APs, including adjectival passives:

(21) She {felt/seemed/sounded/found him/considered Bill} {ill/betrayed/cared for}.

Although verbal passives are selected by only two linking verbs, Freidin correctly observes that these also have the frame +___AP.[16] Thus, analyzing all analytic passives as adjectives at least explains why both variants inevitably appear as complements of Vs that are +___AP or +___DP^(AP). But still, one wonders why so few verbs select verbal passive complements.

An account of this puzzle is presented in Emonds (2000: ch. 5). Passive auxiliaries, i.e., those V that select *verbal* passives, are invariably among the 'grammatical V' of a given language, that is, those V which lack purely semantic features and hence, in that framework, can be inserted late in a derivation. Now clearly, it is the passive participle morpheme [$_{A}$ *-en*] itself that creates an insertion context ___AP for passive auxiliaries, and the insertion of this purely grammatical element is itself part of PF. Consequently, a V can select a verbal passive only if it is (i) uninterpreted at LF (i.e., inserted in PF), and also (ii) has the frame +___AP. *Be* and *get* are the only such V. I know of no other principled account of why so few verbs can select verbal passive complements.[17]

3.3 The adjectival character of participial morphology

By taking the passive participle as simply an adjective, Freiden (1975) also explains certain aspects of the morphology of a range of Germanic, Romance, and Slavic analytic passives. First, as Lieber (1980) and Bresnan (1982d: 21–24) discuss in some detail, the irregular forms in verbal passives almost exactly mimic items of the same form that are clearly adjectival.[18]

(22) being written, seems written; being done, seems done; being stung, seems stung; etc.
Exceptional: being {burned/*burnt}; looks {?burned/burnt}

The full similarity leads them to endorse a rule of 'conversion', which adds the category A by brute force to verbal participles for the formation of passive adjectives, a procedure also endorsed in Levin and Rappaport (1986). That is, these authors argue that separate lexical formation rules would miss a generalization that the same morphological structure is involved.

Second, in whichever contexts an adjective agrees with a modified nominal in Romance and Germanic languages, both adjectival and verbal uses of the passive participle agree as well. For example, Romance adjectives typically agree in number and gender with modified nominals in both attributive and predicative positions. Therefore, both adjectival (23a) and verbal passives (23b) in French exhibit feminine (plural) agreements via the bold ***-e(s)*** in exactly the same positions.[19]

(23) a. A mon arrivée, ces *joli**es*** portes semblaient déjà {*repeint**es**/gris**es***}.
at my arrival, those pretty doors seemed already {repainted/gray}
'At my arrival, those pretty doors seemed already {repainted/gray}.'
b. Cette *joli**e*** porte était vite *repeint**e*** par le locataire pendant ma visite.
that pretty door was quickly repainted by the renter during my visit.
'That pretty door was quickly repainted by the renter during my visit.'

When only attributive adjectives agree, as in German, then both uses of the passive participle agree in and only in the same attributive contexts. Further, both German adjectives and passive participles agree in number, gender, *and case.* Within some Slavic systems, similar inflectional parallels between verbal and adjectival passive participles are also common. For Russian, they are outlined in Schoorlemmer (1995: section IV.1.1).

Uniformly analyzing all passive participles as adjectives thus explains the fact that adjectival and passive agreements share both their morphology and their syntax in several language systems. Note further that adjectival agreement is unlike verb agreement in the languages in question (verbs agree with subjects in person but *not* in gender), and so the argument goes beyond an appeal to undifferentiated 'agreement'.

In view of Lieber's (1980) right hand head analysis of bound morphology, the morpho-syntactic properties of participles reviewed in this section suggests a partial lexical entry (24) for all passive participles, both verbal and adjectival.

(24) Passive participles (partial lexical entry): *en*, A, + V___, . . .

The realizations of this entry at the PF and LF interfaces are those given above in (5):

(5) a. In adjectival passives, the head [$_A$ *-en*] is present in both LF and PF.
b. In verbal passives, [$_A$ *-en*] is absent in LF and present only in PF.

One means of expressing (24) and (5b) together is to postulate that a structure [$_A$ V – [$_A$ Ø]] can be generated syntactically and be lexically filled in either syntax (5a) or only at PF (5b).[20]

3.4 The AP distribution of passive participles

Phrases with heads of passive form and lexical adjective phrases appear to modify nouns and verbs as 'adjuncts' under basically the same conditions. Passive participles can be adjuncts of sentences (25a), of verb phrases (25b) and attributive modifiers of nouns (25c), all of which are characteristic positions of predicate adjectives:

(25) a. {*Desolate/Unwanted/Rejected*}, the child turned to crime.
b. The child spent its school years {*hungry/uncared for/bullied*}.
c. Church bells {*silent/rung*} at noon reflect the status of the clergy.
It's patients {*unable* to pay/*left* to wait/*examined* hastily} that leads to problems.

An additional distributional argument for the adjectival status of passive participles can be constructed around the usage of the particle *as* as a 'prepositional copula'. Like the copula *be*, non-comparative *as* takes a predicate attribute NP or AP; cf. Emonds (1985: ch. 6). The fact that passive participles can be complements to this prepositional copula then becomes another argument for their adjectival status.

(26) He {struck us/treated them} as {*intelligent/ill/experienced/undernourished*}.

We can thus conclude with Freidin that all passive clauses share in the morphology and the syntax of adjective phrases AP, especially as regards their interaction with material *external* to AP: agreement with a subject, selection by external heads, and distribution as adjuncts. The differences between verbal and adjectival passives reviewed in section 2 turn rather around the syntax *internal* to passive phrases: how they are interpreted, whether they can contain idioms, how their

heads can be modified, how they internally arrange phrases, and whether they contain interpreted subjects.

4 Lexical redundancy rules vs. Anderson's 'Theme Rule'

Given the several adjectival properties of *all* analytic passives, it is not surprising that Freidin proposed to assimilate both types passives to the category of base-generated adjective phrases. In fact, the arguments above in sections 3.2 through 3.4 retain some force. But then, as observed in Freidin (1975: 291), if ". . . the synonymy of active–passive pairs is not explicitly accounted for by a rule in the syntactic or semantic component, a grammar that captures the active–passive relation must include a rule that does so." As a consequence, he looked elsewhere to explain the second motivation for a transformational movement: why do main lexical verbs assign a semantic function (theta-role) to the surface subject of passives in the same way as they assign a role to an object NP in active sentences? Once this explanation was found, it supposedly would simultaneously explain any selectional and subcategorization co-occurrence restrictions on lexical insertion of passive forms, thus removing the third possible motivation (cf. p. 26) for movement in passives.

The device first favoured by this line of research was the 'lexical redundancy' condition or rule, based on extending certain ideas for complex lexical entries in Chomsky (1970). Freidin (1975: section 3) develops such a system, including a general condition for assigning synonymy to projections from similar lexical entries, a general specification of the form of multi-category entries, and a specific redundancy condition that stipulates positional relations between the semantic functions of an active verb and those of a passive verb.[21] Similarly, for adjectival passives only, Wasow (1977: section 4.2) endorses a type of lexical redundancy rule developed in Jackendoff (1976).

The field did not take long to react against a second type of formal device for assigning the same predicate–argument relations to differently situated arguments, however. On the one hand, Anderson's (1977) commentary on Wasow's essay (peer responses follow the papers in this ground-breaking volume) endorses a lexical treatment at least of adjectival passives, in line with grammatical thinking of the time: "The criteria Wasow proposes for distinguishing rules of the two types [lexical and transformational] are entirely natural and well-motivated ones within the general conception of grammar developed as the Extended Standard Theory . . . There is an obvious advantage to making the subclass of lexical redundancy rules as large as possible" (p. 364). On the other hand, however, his main aim is to "arrive at a narrower and more interesting conception of the lexical redundancy rules, [so] that some of the problems arising in Wasow's paper receive a satisfying account" (p. 366).

Anderson then proceeds to implement the following critique of lexical redundancy rules. "The association between grammatical and thematic relations, then,

ought not to be stated in each lexical entry, but ought rather to be stated once and for all as a general rule: part of the semantic component of a grammar of English, or (conceivably) part of a semantic meta theory" (p. 367). His main proposal then follows: the semantic roles of NPs in adjectival passive clauses are determined by what he terms the Theme Rule (and states only informally): "the Theme is quite generally to be found in Subject position if the verb is intransitive, and in Direct Object position if the verb is transitive" (p. 367). The task of the lexicon then reduces to separately listing intransitive forms such as, e.g., *break*, *broken*, *close* and *closed*, and (let me add) *taken*, *eaten*, *painted*, *(over)planted*, *(un)inhabited*, but not verbs such as *take*, *eat*, *paint*, *(over)plant*, or *inhabit*:

(27) a. The door may {break/seem broken/close/seem closed}.
b. This apartment may seem {taken/painted} during your visit.
The park will soon look {(over)planted/(un)inhabited}.
c. *This apartment may {take/paint} during your visit.
*The park will soon {(over)plant/inhabit}.

But Anderson's lexical entries would not have to say anything, via item-particular stipulations and/or lexical redundancy rules, about how subjects and objects receive thematic roles; that would be the province of the Theme Rule. And in fact, Williams (1981a) soon postulates a more formal version of the Theme Rule, positing a direct relation between bound morphemes such as *-en* and the syntactic position of thematic roles, i.e., with *-en*, the Theme must be the external argument.

Lest terminology confuse the issue, we should emphasize that for Anderson the italicized phrases in (28) are Themes, unlike many lexical semantic treatments that would assign them Locational type theta-roles.

(28) A vandal smeared *my house* with the paint. (p. 369)
The result annoyed *John*. (p. 372)
The garden swarmed with bees. (p. 369)
George Washington slept in *this bed*. (p. 373, with the passivizable sense of 'affecting' the bed)

Anderson's proposal and Williams's Theme Externalization are thus close to expressing a generalization (29) that will be important below:

(29) The subject of (always intransitive) adjectival passives relates semantically to the verb root like the direct object of corresponding transitive verbs.

We should keep in mind that various formulations of the Theme Rule don't explain, without having recourse to redundant stipulations, why passive adjectives are more easily formed than intransitive verbs. We return to this in section 6. Nonetheless, Anderson's proposal, to the extent it was appreciated, obviated the need for syntactic theory to countenance a type of lexical redundancy device which 'doubles' the grammatical function changing work of transformations.

Another response to the momentary focus on adjectival passives was more direct. In his seminal article on trace theory, Fiengo (1977) proposed deriving them by using Chomsky's object-preposing inside AP. While his brief formal treatment for interpreting these passives seems inadequate, he nonetheless finds a weak spot in the lexicalist opposition: contemporary argument against deriving adjectival passives via movement seemed to beg the question; it *assumed without argument* that NP movement doesn't apply in an AP domain.

In any case, works like Anderson (1977) led to transformationalists losing interest in lexical redundancy rules, though of course a framework that lost interest in transformations, namely Lexical Functional Grammar, continued to develop the notion of 'lexical relatedness' in terms of lexical 'functional structures' (Bresnan 1978) and 'predicate argument structures' (Bresnan 1982d).

5 The relation of passive participles to case assignment

Before continuing to review analyses specific to adjectival passives, let us investigate the relation of passives to abstract case, a factor which could have – but did not – figure in distinguishing the two types of passive. Traditional grammars of European inspiration have frequently related passive structures to the failure of accusative case assignment. In turn, this failure seems somehow related to the adjectival nature of all passive participles and the fact that adjectives do not in general assign accusative case. A role for case along these lines became a central aspect in government and binding analyses of the verbal passive in the eighties, and in my view, could have led to quicker progress had it been formulated with the properties of adjectival passives in mind.

5.1 Chomsky's Case-driven analysis

In his initial authoritative treatise on government and binding, Chomsky (1981: 48–50) observes that the fundamental property of (verbal) passives may be either one of two options:

(30) Something forces a passivized object NP to move away from its base position.

(31) Something deprives a passive subject position of its usual theta-role and thereby renders it a landing site for movement.

In terms of the then recent incorporation of abstract case into generative syntax, a plausible motivation for forcing movement could be lack of case on a passive verb's object NP, in turn due to the verb's adjectival morphology. Chomsky (1981) thus opts to develop (30) on the basis of a 'Case Filter', by virtue of which

overt noun phrases lacking case at the end of a derivation render a structure ill-formed.[22] The contemporary debates about the relation of passive participles to the category A most likely played a role in attributing forced movement in passives to the adjectival form of the V.

However, if one straightforwardly claimed that verbal passive participles *are* As, then essentially nothing would structurally differentiate verbal from the adjectival passives, which had been consigned to the distant lexicon; Wasow's defense of a transformational passive seemingly depended on *maintaining a difference* between verbal passive participles and the category A. Thus, verbal passive participles should 'act like' As and yet be not quite entirely As. The solution suggested by Chomsky (1981: 50) is to assign them to a special, "unspecified for ±N" neutralized category. In Case Theory, whose Case Assigning categories are V and P (in terms of features –N), the +N categories N and A fail to assign case (Stowell 1981). Chomsky's implied revision of Case Theory is that the categorial features of verbal passive participles, namely [+V, unspecified for N], do not assign case either, which then accounts for (30).

This proposal turns into an equivocation, however, because on the next page Chomsky (1981: 51) suggests that *of* in the context N___NP has the features [–V, unspecified for N] and *does* assign case. Hence, an ad hoc 'neutralized category' (unspecified for N) of highly defective distribution (with only two members, *-en* and *of*) leads not to a definition of a natural class of case assigners somehow related to [–N]), but rather to item-particular stipulations.

In spite of this shaky foundation, the voluminous literature of government and binding in the eighties maintains (and proclaims) this analysis with almost one voice: the mantra was 'lack of case forces movement in the passive'. This literature also uniformly presupposes Wasow's conclusion that only verbal passives involve movement; cf. again note 3. More than a decade later, Åfarli (1992: section 1.2.3.1) reviews the unchanged 'Orthodox Analysis', including the factor that the participle is a "neutralized [+V] category . . . and like adjectives, it is a bad Case assigner."

5.2 Rethinking the full internal VP structures

Government and binding analyses of the passive were slow to challenge Chomsky's choice of (30) over (31). Roberts (1987: ch. 2) reformulated the relation to case assignment in terms of a passive verb assigning 'all but one' of its cases, and began to focus more on properties of a passive's 'dethematized' subject. Cross-linguistic studies of passives, including Åfarli's, finally undermined the choice of (30) over (31).[23] They reason on the basis that verbal passive constructions in several languages can exhibit overt direct objects, even with morphological accusative case.

Some examples include Sobin (1985) on the impersonal passives of Ukrainian, Åfarli (1989, 1992) on the wider range of such constructions in Norwegian, and Kubo (1992) on the 'adversative' and dative passives of Japanese. Åfarli (1989: 23) rejects (30), arguing "on the basis of Norwegian data that passive verbs assign

Case just like their active counterparts do . . . [and] that this is also essentially correct for English . . ." He concludes (1989: 102) rather in favor of (31): "the essential property of the passive phenomenon is that the subject position of a passive clause is theta-free and thus becomes a possible landing site for NP movement."[24] In what follows, I will refer to this as 'the essential property of the passive'.

More prosaically, even very familiar facts of English cast doubt on whether a verbal passive in any way interferes with case assignment. The examples of (18), repeated here, contain a range of italicized objects to which prima facie, *a passive V assigns case*.[25]

(18) Ann was [given *the letter*].
Who got [taken *such unfair advantage of*]?
A lot of vacation was (being) [allowed *the workers*].
The workers were (being) [allowed *a lot of vacation*].
That letter was [sent *all the candidates*].
Peter was (being) [forgiven *his sins*].
Peter's sins were (being) [forgiven *him*].
He was (being) [charged *a lot of money*].

Put differently, since verbal passives have the full internal structure of VPs (the property noted in section 2.5), all these VPs with a single gap are well-formed.[26]

In interesting contrast to these verbal passives, the corresponding adjectival passives based on the 'double object constructions' in (32), as observed in Wasow (1977), are always ill-formed. Levin and Rappaport (1986: section 4) also note these effects for adjectival passives, but do not pursue the implications of the contrast with verbal passives.

(32) *Ann seemed given the letter.
*That letter sounded sent all the candidates.
*Who acted taken such unfair advantage of?
*Peter felt (un)forgiven his sins.
*Peter's sins stayed forgiven him.
*Those workers appeared allowed a lot of vacation.
*He felt (un)charged too much money.

Had syntacticians retained an interest in adjectival passives, they could have concluded that the Case Filter accounts naturally for this regular ungrammatical pattern, because an A can assign case neither to an NP that moves nor to one that stays in its base position. The fact the Case Filter successfully excludes these examples suggests that a proper movement analysis, counter to the government and binding consensus, might be capable of explaining the other systematic syntactic restrictions on adjectival passives: that they are incompatible with derived, non-deep direct objects (section 2.5) and idiomatic objects (section 2.7).

Summarizing, like other adjectives, the participles in (32) with right hand word-internal A heads simply fail to assign case to any VP-internal DPs not targeted by NP movement. Consequently, adjectival passive phrases can't contain such DPs. In contrast, nothing stops a verbal passive from assigning case to these 'second DPs'. This contrast in case-assigning capability is actually another property that follows from the earlier partial structural characterizations of the two passive types:

(5) a. In adjectival passives, the head [$_A$ *-en*] is present in both LF and PF.
b. In verbal passives, [$_A$ *-en*] is absent in LF and present only in PF.

That is, in (5a) the A head prevents case assignment, but in (5b) the V head assigns case normally. What causes movement in passives is thus not lack of case.

As in note 7, there are different ways to realize this LF distinction in passives (5): (i) Derivation – a participial suffix could be entirely absent in verbal passives in the syntax, with [$_A$ *-en*] added to a V in PF. (ii) LF Feature Checking – the suffix [$_A$ *-en*] is present in both passives in the syntax, but is checked off (i.e., deleted) in LF only in verbal passives. (iii) Late Insertion – the suffixal A node is present in both passives; it is already lexicalized in syntax as *-en* in adjectival passives, but in verbal passives it is empty in the syntax and lexicalized only in PF.

For understanding the history of passive analyses, the choice among (i–iii) need not concern us. The Derivation alternative (i) reflects an early generative impulse, but seems unlikely because it does not explain why verbal passives are selected by auxiliaries with a feature +___AP and generally appear in syntactic AP positions (sections 3.2 and 3.4).[27] Alternatives (ii) and (iii) are currently more plausible accounts of (5). The next section briefly examines empirical grounds for favoring Late Insertion (iii), but this is not crucial for our overall review of adjectival passives.

5.3 Passive participle contrasts in Dutch verb raising

The difference between a feature checking approach to *-en* (ii) and its late insertion (iii), i.e., inserting the verbal passive *-en* under a suffixal A in PF, can be tested empirically in the syntax. Under late insertion, verbal passive participles are expected to show some transformational behaviour of V not shared by As, whereas under LF feature checking of *-en*, a verbal passive participle should have the same syntax as an A, because verbal and adjectival passives then come to differ only in LF.

In Dutch sequences of final verbs (where all but the underlyingly highest must be non-finite), verbal and adjectival passive participles behave differently. Verbal participles can move from their base position, italicized in (33a), over higher final verbs as in (33b), but adjectival participles must remain in their italicized base position in (34a). H. Van Riemsdijk has provided these examples:

(33) a. . . . dat de brief *verzonden* moest worden.
. . . that the letter sent must get
'. . . that the letter must be sent.'
b. . . . dat de brief moest worden *verzonden.*

(34) a. . . . dat de brief *onverzonden* moest blijven.
. . . that the letter unsent must remain
'. . . that the letter must remain unsent.'
b. *. . . dat de brief moest blijven *onverzonden.*

Under the verb-raising analysis advocated in Haegeman and Van Riemsdijk (1986), one may say that verbal passive participles undergo reanalysis and subsequent verb raising, while adjectival ones cannot. Furthermore, verb raising, which most likely applies at PF, is optional for a verbal passive participle (33). In contrast, Dutch verb raising to final position is obligatory for an infinitive, as italicized in (35).

(35) a. *. . . dat Henk de brief *zenden* zal moeten.
*. . . dat Henk de brief zal *zenden* moeten.
b. . . . dat Henk de brief zal moeten *zenden.*
. . . that Henk the letter will must send
'. . . that Henk will have to send the letter.'

These observations suggest that verb raising and/or movement is obligatory (in some contexts and dialects) for an item analyzed as a V, but impossible for an item analyzed as an A. That is, at the point in the derivation at which this operation applies, (a) an infinitive is unambiguously a V, (b) a verbal passive participle is analyzable as either a V or an A, and (c) an adjectival passive participle is unambiguously an A. Now according to the late insertion alternative of *-en* (iii), the verbal passive in a syntactic derivation (and early in PF) is precisely a V stem with an empty suffixal head A. Hence an operation such as verb raising/movement can see ('analyze') the verbal passive as either a V or as an A, correctly yielding both variants in (33). By contrast, an adjectival passive is unambiguously an A, with a syntactically invisible V stem inside it throughout a derivation; it must then remain in situ as in (34). Finally, an infinitive is a V and nothing else, so it must undergo verb raising/movement as in (35).

Under the feature-checking approach, the two types of passive are the same in the syntax and shouldn't differ in behavior at all. We thus see that the explanatory contrasting LF structures in (5) are more likely due to the possibility of inserting grammatical morphemes at different derivational levels than to any differences in LF feature checking of a V that moves in syntax or PF.[28]

6 Evidence for Move in adjectival passives

6.1 Levin and Rappaport: relating deep direct objects to adjectival passives

Despite their many surface differences, we can nonetheless descriptively characterize adjectival and verbal passive phrases in very similar terms. To appreciate the empirical import of this, let's first briefly examine a class of 'active' adjectives derived from verbs where we *cannot* descriptively characterize the two classes in similar terms. Consider a large class of lexical adjectives in *-ive* that attach to V stems, i.e., *attractive*, *attentive*, *corrosive*, *decisive*, *defensive*, *derisive*, *dismissive*, *evasive*, *exhaustive*, *invasive*, *obtrusive*, *offensive*, *perceptive*, *(re)active*, *receptive*, *repulsive*, *seductive*, *selective*, etc. In just about every case, the types of permitted arguments with the verb and the corresponding adjective differ.

First, *decide*, *defend*, *dismiss*, *evade*, and *perceive* are transitive, but their adjectival counterparts are preferably intransitive, with *of*-phrase complements being marginal at best, e.g. **John is {decisive/defensive} of his own actions.* Second, selection restrictions on corresponding arguments differ unpredictably: *Magnets {attract/ *are attractive {to/of}} metals*; *America {often invades/*is often invasive of} the Caribbean*; *Those weapons were offensive ≠ Those weapons offended; Mary {repels/is repulsive to} John* vs. *Mary {repels/*is repulsive to} John's advances*; *We are selective about cheeses* vs. *We select (*about) cheeses*, etc., etc.

The variation between adjectival passives and corresponding active verbs is nothing on this scale. In fact, the possible subjects of adjectival passives seem to be precisely those deep direct objects of verbs *whose obligatory subcategorizations are otherwise respected in the passive phrases*. Levin and Rappaport (1986: sections 2–3) explicitly demonstrate that any individual theta-roles, whether or not Theme is understood as in Anderson (1977), are irrelevant for determining well-formed passive adjectives. They use the following type of data to establish this generalization.

(36)
	verb:	They stuffed the feathers *(into the pillow).
	adjective:	The feathers remained stuffed *(in the pillow).
	verb:	They crammed the freezer (with food).
		We crammed food *(into the freezer).
	adjective:	The freezer remained crammed (with food).
		The food remained crammed *(into the freezer).
	verb:	We are placing our company records *(where they belong).
	adjective:	Our company records are placed *(where they belong) by now.
	verb:	The trees are being stripped {of/*with} bark.
		The bark is being stripped {from/*on} those trees.
	adjective:	The trees look stripped {of/*with} bark.
		The bark remains unstripped {from/*on} those trees.

In essence, Levin and Rappaport's results establish a syntactic passive relation between a direct object and a subject. The import of their findings is straightforward: *the theta-role of the subject of an adjectival passive is always that of the corresponding verb's deep direct object.* However, they avoid reference to syntactic structure in describing these findings, as they are convinced that theta-role specifications should replace subcategorization in lexical representations.[29] They therefore paraphrase references to the fact that passive adjectives preserve verbal subcategorization, speaking for example of a "basic insight: the properties of an AP headed by an adjectival passive participle are determined by the complement structure of the base verb" (p. 637). And they summarize "the theta-role assigned to the direct argument internal to the VP headed by the verb is assigned external to the AP headed by the related adjectival passive participle . . ." (p. 643).

A little reflection shows that the syntactic generalization for adjectival passives, above in italics, is exactly what holds for verbal passives, except that 'direct argument' (= deep direct object) for adjectival passives is replaced for verbal passives with 'direct object at Spell Out'. In my view, this relation is best captured, as it has been throughout the history of generative grammar, by using object to subject NP movement in adjectival passives, as suggested in Fiengo (1977). The subsequent inability to even conceive of this option is the unfortunate legacy of Wasow (1977) mentioned in introducing section 3.

Deriving adjectival passives from transformational movement immediately explains the problem faced by Anderson (1977) exemplified in (27): why adjectival passives are easier to form than middle verbs. The latter apparently require lexical specification, which comes with a cost-per-item not assessed for transformational passivization.

Let us see in more detail how Move can derive adjectival passives and account for their differences with verbal passives.

6.2 *Reformulating Levin and Rappaport's 'Sole Complement Generalization'*

We have seen that in the perspective of Anderson (1977), the generalization (29) of section 4 should be expressed by principles of grammar, not in individual lexical items.

(29) The subject of (always intransitive) adjectival passives relates semantically to the verb root like the direct object of corresponding transitive verbs.

Small changes in (29) can lead to a central descriptive generalization about adjectival passives that encompasses the other systematic syntactic restrictions on adjectival passives: their compatibility with only deep direct objects (section 2.5) and their incompatibility with idiomatic objects (section 2.7).

First, it is the presence *in the syntax* of the participial stem [$_{A}$ *-en*] that somehow forces an adjectival passive's subject to relate to a *deep* object rather than a derived object. Second, as argued in Levin and Rappaport (1986: section 4.5),

theta-roles are plausibly interpretations provided only to argument phrases, so that parts of idioms generally lack theta-roles.[30] These two considerations lead us to restate (29) as (37):

(37) **Passive Adjective Condition (PAC).** The subject of adjectival passives receives the theta-role that its verb root assigns to a deep direct object in an active VP. In other respects adjectival passives respect the subcategorization of the verb root.[31]

The conclusion (37) is almost the same as Levin and Rappaport's (1986: 631) summary of their empirical findings for adjectival passives:

(38) **Sole Complement Generalization (SCG).** An argument that may stand as sole NP complement to a verb can be externalized [become the subject] by Adjectival Passive Formation (APF).

The SCG as formulated is inaccurate, however. As discussed in note 5, certain sole NP complements cannot become subjects of adjectival passives. Moreover, NP subjects of adjectival passives can only relate to direct objects; they cannot correspond to predicate nominals or measure phrases (e.g., *We seemed to remain almost three weeks/*Almost three weeks seemed remained*). Therefore, having a sole NP complement is not a sufficient condition for APF.

Nor is the SCG a necessary condition for APF. For example, (38) fails to predict the existence of the adjectival passives in (39a), because their subjects are not potential sole complements to verbs. These APF verbs require *two* complements, as the active counterparts (39b) show.

(39) a. Roses looked strewn everywhere.
Their balconies stayed bedecked with flags for a week.
That application seems worded with exceptional care.
b. The children have strewn roses *(everywhere).
Fans were bedecking their balconies *(with flags).
Mary worded that application *(with exceptional care).

The SCG (38) is not a necessary condition for APF because adjectival passive phrases, like verbal passive phrases, must respect the subcategorization of the head verb. The descriptively adequate reformulation of the SCG is therefore the PAC (37). And if the term 'theta-role' is replaced by the more general term 'interpretation', then the PAC is nothing other than a description of deriving adjectival passives by movement of a deep direct object.

6.3 A non-problem for Move with adjectival passives

Even though Levin and Rappaport show that individual theta-roles are irrelevant for characterizing adjectival passives, there remains another legacy of lexicalist treatments that could prevent acceptance of using Move for this construction.

A number of researchers feel that the idiomatic lexicalized meanings of many passive adjectives, as evidenced in (40), somehow undermine any account of them in terms of transfomational movement of the object DP.

(40) deeply {moved/*shoved} so lost in {thought/*fear}
how {overplanted/*planted} unheard *(of) outrage

But this conclusion is a non sequitur. Chomsky's (1970) long accepted analysis of derived nominals, which also exhibit a notorious range of idiomatic and lexicalized meanings, uses – indeed is the source of using – the NP-preposing transformation for objects. The lexicalized meanings of many passive adjectives are thus no barrier to deriving adjectival passives by 'NP movement'.

7 Lexical notation for dual level or polyfunctional morphology

Throughout this chapter, I have claimed that the LF difference in (5a, b) between phonologically identical adjectival and verbal passives underlies several of their surface differences. If Move can be used in deriving both passive types, the distinction in (5) should somehow correlate with how Move interacts differently with object NPs in the two constructions.

In both passives, the participial head *-en* can be said to agree with a moved passive subject, as this agreement is morphologically overt in many languages (section 3.3). This agreeing surface subject has its source in different pre-movement positions, however:

(41) In adjectival passives, the head [$_A$ *-en*] agrees with the *deep* direct object of the verb, by virtue of the PAC (37). This morpheme is present at LF (5a).

(42) In verbal passives, the head [$_A$ *-en*] agrees with a noun phrase that is a *derived* object of the verb, i. e., the object in the predicate phrase subsequent to transformational computation. This morpheme is absent at LF (5b).

Aside from this difference both uses of the English and other passive participle morphemes can be expressed in a single lexical entry (43). As is standard, phi-features refer to NUMBER, GENDER, and PERSON features on nominal projections:

(43) **Passive participle:** *-en*, A, +V___, phi-features of an (empty) nominal projection sister[32]

The second sentences in (41) and (42) are just (5a, b) rephrased. I assume that these LF differences are simply inherited from the corresponding syntactic representations, so that 'present/absent at LF' is equivalent to 'present/absent in

syntax' and 'absent in syntax/LF' means 'present only in PF'. I thus rephrase (41) and (42) as follows:

(44) Adjectival Passives. An item [$_A$ *-en*] in the context V___ in the syntax agrees with V's *deep* direct object.

(45) Verbal Passives. An item [$_A$ *-en*] in the context V___ only in PF agrees with V's *surface* object.

The links between 'deep' and 'present in syntax' in (44), and 'surface' and 'present only in PF' in (45) now seem suggestive. We want to correlate these two properties of participial *-en*, and thus reduce all the differences between adjectival and verbal passives to one.[33] The sort of dual behavior of grammatical morphemes expressed in (44) and (45) has in recent years been the focus of increasing theoretical interest, for example in Borer (1991, 1993), Emonds (1991a, 2000), Grimshaw (1990), and Schoorlemmer (1995).

For example, Schoorlemmer's thorough study of the Russian participles examines what she terms the 'polyfunctionality' of several grammatical morphemes in Slavic systems. Among them one prominent example is the Russian adjectival passive ending and the homonymous 'PPP' (past passive participle in verbal passives), which is basically the counterpart of the polyfunctionality in (44) and (45). Most of the differences she discusses between Russian adjectival and verbal passives are similar to or even identical with the differences for English: (i) Certain Russian adjectival passives undergo degree word modification and show 'semantic drift', i.e., they are part of the permanent lexicon. These aspects of English adjectival passives are discussed in slightly different terms in section 2.3 above. (ii) Adjectival passives have no external argument (implicit or explicit); cf. section 2.6. (iii) A Russian counterpart to *un-* prefixation, namely *ne-* prefixation, occurs with adjectival but not verbal passives; cf. section 2.4. (iv) The verbal passive reports an event (with a possible durative adverb), while the adjectival passive reports a state; cf. section 2.1. (v) Adjectival passives can be complements of *stat'* 'become, get' whereas verbal passives cannot be; cf. section 2.2.[34]

She summarizes these results as follows: "The PPP is adjectival only with respect to its inflection, everything else is verbal, as shown by its behaviour in the diagnostics for adjectival passives" (1995: 217–222). In an earlier passage, Schoorlemmer characterizes this type of grammatical behavior as follows:

> there seem to be two kinds of morphological processes: those that can be argued to be presyntactic [e.g., in passive adjectives] and those that can be argued to be non-presyntactic [e.g., in verbal passives] . . . the morphological output of both rules is almost entirely uniform. (Schoorlemmer 1995: 163–164)

The formulations (44) and (45) reflect the same dichotomy between 'presyntactic' and 'non-presyntactic'.

In order to provide a theoretically satisfactory basis for expressing the polyfunctionality of the Russian PPP (i.e. *-en*), Schoorlemmer uses an approach developed by H. Borer:

> for a unitary morphological module that runs parallel to syntax and also precedes and follows it, an approach to morphology named Parallel Morphology in Borer (1993) . . . Morphology . . . is a set of rules that can apply anywhere. It derives Lieber type head-adjoined structures (Lieber 1980, 1992) . . . The product of these morphological rules may be inserted at both D- and S-structure. Borer argues that the difference between two kinds of nominals (like Hebrew and English process and result nominals) is one of the levels at which the product of the morphological rules enters syntax. (1995: 171–173)[35]

This relatively new approach to morphology, though doubtlessly still in need of refinement, seems capable of capturing the dual functionality of the passive participle morpheme [$_A$ *-en*] expressed above as (44) and (45). We want to derive it from the single lexical entry (43).

Adjectival passives require the Lieber type head-adjoined structure [$_A$ V – [$_A$ *-en*]] that results from (43) to enter a derivation *presyntactically*, at the beginning of a computational 'phase'. Presyntactic insertion naturally implies that the item *-en* satisfies its lexical specification *at that level*, i.e., it must agree with a nominal projection that is its *pretransformational* sister. This can only be a deep direct object, so (44) follows. Moreover, since the head of the predicate phrase is a lexicalized adjective *-en*, no case can be assigned to any DP sister of the head. The same *-en* blocks any idiomatic V-Complement readings by virtue of O'Grady's (1998) Continuity Constraint; cf. note 11.

Verbal passives instantiate this same structure and lexical specification, but applied in PF. Consequently, they enter the derivation 'nonpresyntactically'. We can improve on this rather vague term by specifying Spell Out as the appropriate input for the insertion operation. The output of the insertion is then part of PF. Satisfying its lexical requirement at Spell Out implies that *-en* agrees with any nominal phrase that is its sister *after* the (visible) transformational computation. From this follows (45).[36] Moreover, since the A head is not lexicalized *at* Spell Out (but only *after* insertion in PF), V is the visible head of the construction and both case assignment and idiom interpretation can proceed normally. The different types of agreements of *-en* are thus derived from its two levels of insertion (44) and (45) into the computation.

The only thing that remains to stipulate for *-en* is the dual level insertion itself. Apropos, Schoorlemmer (1995: section 3.3.3) rightly observes: "A related question is why there are so few morphological processes with dual properties" (p. 180). This empirical observation suggests that polyfunctionality is a marked lexical option, perhaps partly motivated diachronically; cf. note 4. What the lexical entry for *-en* then needs to indicate is that A can optionally, in the marked case, remain *uninterpreted in LF* – the property (5b) of verbal passives so frequently called on earlier to explain differences in the two passive types.

In a study attempting to develop some appropriate notations for the special lexicon of grammatical formatives, Emonds (2002) argues that while syntactic categories are never optional (every morpheme in a tree has a category), they may *optionally be ignored at the LF interface*. The marked option of not interpreting a category at LF can then be simply notated by parenthesizing it. If further an element so parenthesized has no other interpretable features (and *-en* does not, since agreement features are not interpreted), then the item optionally plays no role at LF. But items without interpretations should be inserted into the derivation only in PF, which is precisely what is needed in order to derive the results of this study. Revising (43) in this way, we derive a final and parsimonious lexical entry for the polyfunctional passive participle morpheme:

(46) **Revised Passive participle:** *-en*, (A), +V___, phi-features of an empty sister

In the reading without parentheses, A is a normal LF-interpreted syntactic category, as needed in the adjectival passive. As expected, A is interpreted as a property of the subject DP that it modifies. In the marked reading with parentheses, the category A (i.e., a 'state' or 'property') is ignored at LF; therefore *-en* is inserted in PF, and the verbal passive results.[37]

Certain languages such as Ukrainian (Sobin 1985) and Norwegian (Åfarli 1989, 1992) have 'transitive impersonal passives' in which the participle has phi-features of an *overt* noun phrase sister. In these languages, 'empty' in (46) is an option rather than a necessity as in English. Various formal analyses of such distinctions are given by these authors and in Baker, Johnson, and Roberts (1989), Lappin and Shlonsky (1993), and Emonds (2000: ch. 5).

Two last details: since phi-features can originate only with nominal projections, (46) does not mention the latter. Moreover, the fact that sisterhood is the favored source for agreement is plausibly also to be derived from Universal Grammar and need not be stipulated in a lexical entry.

We thus seem to have successfully accounted for all differences between adjectival and verbal periphrastic passives with a single polyfunctional lexical entry (46) that specifies an inflection, exactly in accord with the rather bold research program for language particular properties proposed in Borer (1984a: 29).

8 Consequences of adjectival agreement in passives

There still remains the issue of how to best characterize what passive structures have in common: the verbal stem of a passive participle cannot assign an external theta-role to the participle's grammatical subject, even when the verb's objects remain in situ (as in Norwegian and Ukrainian). The key to these 'dethematicized' subjects lies, I believe, in understanding the crucial role of adjectival agreement. While this agreement is not universal, it is typical of the Indo-European family whose periphrastic passives we are trying to understand. Moreover, it has certain systematically recurring characteristics (phi-features of gender and number,

interaction with case marking, absence in adverbial APs) that suggest some common cross-linguistic basis.[38]

8.1 Lexical agreement of **-en** *with objects*

The lexical entry (46) stipulates that a certain verbal suffix, the passive participle, agrees with that verb's object. That is, the phi-features on the inserted item *-en* must be the same as those of any nominal projection sister at the moment of insertion, which can be pre-transformational (44) or exactly at Spell Out (45). Notice that (46) is indifferent between (i) insuring that the phi-features of A's sister are *those independently assigned to A*, due to the general agreement of adjectives with their subjects, and (ii) assigning the phi-features of A's sister to *a featureless empty A* (which then appear on *-en* in PF).

Some puzzling related but non-passive paradigms in several Romance and Slavic systems strongly suggest that the reference to object agreement in (46) is on the right track. As mentioned in section 1.1, many of these languages additionally use their passive participle morpheme to form an active periphrastic past tense (e.g., the French *passé composé* and Italian *passato prossimo*), in which *the participle does not agree with the subject*. With some language-particular restrictions, the participial morpheme *-en* in this active tense nonetheless agrees in phi-features with a deep object, i.e., a DP sister, just as stated in (46).

Exact determination of the variable conditions on this non-passive object agreement is orthogonal to our concerns here. At one extreme, Modern Spanish active perfective participles, also based on the passive form, never agree with an object. In other systems only empty objects trigger agreement, e.g., in Standard French they must be bound by a clitic or a fronted constituent such as a clefted or questioned direct object. Agreement of *-en* in adult Standard Italian generally requires empty DPs in deep object position, under conditions that are similar though not identical to Standard French. We see the relevant contrast in French in (47), where bold indicates feminine plural suffixes; t_i is a trace of the moved direct object.

(47) a. Cette femme a $[_{AP}$ vite repein-$[_A$ t-**{Ø/*es}**$]$ $[_{DP}$ ces bell**es** port**es**$]]$.
that woman has quickly repaint-ed those beautiful doors
'That woman has quickly repaint-ed those beautiful doors.'

b. C'est $[_{DP}$ ces bell**es** port**es**$]_i$ que cette femme a $[_{AP}$ vite
it's $[_{DP}$ those beautiful doors] that that woman has quickly
repein-$[_A$ t-**{*Ø/es}**$]$ $[_{DP}$ $t_i]]$.
repaint-ed $[_{DP}$ $t_i]$.
'It's those beautiful doors that that woman has quickly repaint-ed.'

In yet other systems, *-en* agrees even with overt objects. Perhaps the most striking contrast is within Italian. Antinucci and Miller (1976) and Volterra (1976) report that at a certain stage of child Italian, the agreement of participial *-en* with all direct objects in the *passato prossimo* is uniform.[39] Borer and Wexler (1992: 153)

describe this as follows: "Presumably, the learner initially tries a 'simple' rule, like 'agree with the D-structure object'."[40]

The active participle ending *-en* thus seems exceptional only in being an adjective that does not agree with subjects, as seen in (47a).[41] Otherwise though, its lexical entry must be an extension of (46), since it shares every other characteristic of the passive participle: its category (A), its host (V), and its phonological form. In addition, the object agreement of *-en* in active tenses that has led several authors to conclude that *its central property in all its uses* is potential agreement with a verb's object, precisely as specified in (46), albeit at different levels and under different conditions. Among the passive constructions, this apparent object agreement is obviated just in those cases where the language allows expletive subjects (without phi-features), which in, e.g., Norwegian and Ukrainian include even VPs that contain overt object noun phrases.

We find in the literature at least four mechanisms for effecting the phi-feature agreement mandated in (46) between deep object noun phrases and participial *-en*. In each case the mechanism extends beyond passive constructions; all extend agreement with null objects to other uses of *-en*. While I am a partisan of this general approach, the exact conditions determining these limitations on agreement clearly lead outside the domain where adjectival passives have a special role, so my summary of these four mechanisms is cursory.

A first proposal in McA'Nulty (1990) limits itself to generalizing in French over object traces in passives and A-bar bound traces, as suggested by the paradigms just mentioned. Second, Lefebvre (1988) develops a more general system in terms of 'Move Case', thus making precise government and binding's often vague concept of 'case absorption' by *-en.* She summarizes, "agreement morphology on the past participle spells out the features of the trace of the NP governed by the past participle."

A third proposal is the widely adopted hypothesis that all phi-feature agreements are defined on Specifier–Head configurations. Since the non-passive uses of *-en* agreement involve deep objects (e.g., the French and Italian paradigms cited above), Kayne (1989a) proposes that it takes place after the agreeing object nominals move to relatively low Specifier positions within extended verbal projections. Borer and Wexler also follow this approach (1992).[42]

Finally, Emonds (2000: ch. 4) argues that morphological inflections instantiate a widespread phenomenon called 'Alternative Realization'. Under this view, grammatical features are *interpretable only in certain base positions* (e.g., phi-features are interpreted only on D). However, they can also occur in non-base positions on lexically stipulated closed class elements (usually on an adjacent head) if they thereby contribute to Economy of Derivation. Accordingly, the entry for *-en* stipulates (only) that it 'alternatively realizes' phi-features of objects, with differences among the passive systems of English, German, and Norwegian attributed to slightly different lexical specifications. A general restriction to local contexts in the definition of (unmarked) Alternative Realization renders unnecessary any mention of 'empty sister' in (46).

We need not decide among these four alternatives. However this agreement of *-en* with an object is finally formalized, the analytic passive sub-case of (46),

robustly overt in several grammatical systems, fully unifies adjectival and verbal passives. All their differences are due to the levels of insertion of *-en*, as explicated in section 7. And somewhat surprisingly, we will see in the next section that (46) also leads directly to explaining Åfarli's 'essential property of (all) passives', the suppression of external theta-roles in SPEC(IP).

Needless to say, object agreement in participles still leaves unanswered questions: (i) Why and under what conditions do expletive subjects cancel the need for it? (ii) Why do only certain grammars exhibit it in active composed pasts with overt object noun phrases? (iii) How is this *-en* agreement (46) related to expressing what is familiarly called 'object to subject movement', i.e., is 'subject–object agreement' possibly a *prerequisite* for the latter? (Cf. Emonds 2000: ch. 5.) But since these intriguing questions lead well outside the realm of specifically adjectival passives, this study leaves them for future research.

8.2 External theta-role suppression (dethematicization)

If adjectival passives are derived by movement, they show that the common property of passives has nothing to do with some subject position 'losing' an ability to express a theta-role, since the works cited in section 2.6 show that no such underlying position or theta-role is ever part of a derivation of adjectival passives. Rather, what makes the subject of *any* (verbal or adjectival) passive clause 'theta-free' (and hence, when expletives are unavailable, forces movement of some DP to this position) is the fact that agreement with a subject simply makes the latter *inaccessible* for being interpreted within any phrase headed by a passive participle. That is, nothing outside a phrase whose head V *has adjectival morphology* can serve as an argument of that V. If we can explain why – why the feature specification of the A head of the passive participle should block theta-role assignment to SPEC(IP) – we thereby account for Åfarli's 'essential property of the passive'.

We want to do this with no stipulation about passive structures, using only generally justifiable statements of grammatical theory. The key distinction, overtly morphological in several Romance languages, lies in the adjectival agreements of *-en*. The following French examples from section 3.3 show a typical situation: *all passive participles overtly agree with the surface subject* as shown in bold brackets in (48a, b) while *active participles do not* (48c).

(48) a. A mon arrivée, ces joli**es** portes semblaient [$_{AP}$ déjà
at my arrival, those pretty doors seemed already
repein-[$_{A}$ **t-es**]].
repainted
'At my arrival, those pretty doors seemed already repainted.'

b. Ces joli**es** portes étaient [$_{AP}$ vite repein-[$_{A}$ **t-es**] par le
Those pretty doors were quickly repainted by the
locataire] pendant ma visite.
renter during my visit
'Those pretty doors were quickly repainted by the renter during my visit.'

c. Ces femmes ont [$_{AP}$ tout de même pein-[$_{A}$ **t-{Ø/*es}**] seulement
those women have all the same painted only
par nécessité].
by necessity
'Those women have all the same painted only by necessity.'

Using the representations for adjectival agreement just developed, we can account for this contrast with what is actually a generalization of the Head Movement Constraint (Travis 1984). The HAC (49) is motivated by the same paradigms as the HMC but is also more general than the HMC.

(49) **Head Accessibility Constraint (HAC).** In a structure . . . X^j . . . [$_{YP}$ . . . Z^0 . . .], X^j can be related only with the least embedded Z^0 specified for inherent features within YP.[43]

There are two cases, j = 0 and j = 1. The case that j = 0 is Travis's HMC, with the slight and welcome modification that a completely featureless intervening head doesn't trigger the HMC; a computational step can relate two heads X^0 and Z^0 over an intermediate head Y^0 only if Y^0 completely lacks features. In particular, a lexical stem V of a participial AP can relate to a higher head in LF, e.g., a tense or modal in I, only if both the head [$_{A}$ Ø] of AP *and* any auxiliary V have no features. This occurs in derivations where the lexical entry (46) assigns phi-features to A only in PF, i.e., in active perfects and certain reflexive clauses.[44] In contrast, participles in all analytic passive clauses agree in phi-features with their subject DPs *in the syntax*, so that the role of (46) is to verify that phi-features *already on [$_{A}$ Ø]* are compatible with those of an object.

What accounts for dethematicization in passives is the case where j = 1 in the HAC, e.g., where X^j is a subject DP position.[45] As desired, (49) says that a subject in SPEC(IP) is inaccessible to V^0 (= Z^0) in the syntax whenever the head of the participle (= Y^0) is specified for features, as in fact the A^0 head is in the syntax of both types of periphrastic passives. Consequently, *ces jolies portes* in SPEC(IP) in (48a, b) simply cannot relate to the verb stem *repein-*, as external argument or in any other way. This prediction of the HAC then finally expresses the 'essential property of the passive' that we have been hoping to derive throughout this study.

On the other hand, the DP *ces jolies portes* in (48a, b) does indeed receive an LF iterpretation: it has the property expressed by the adjectival head *-en* that modifies it. The agreeing phi-features of *-en* transmit to the subject the property of playing the role of the phrase Y it agrees with, namely the object noun phrase in the proposition expressed entirely within the AP: 'X repaints Y, where Y = the direct object'.

In contrast to passives, the right hand morphological head [$_{A}$ *-t*] of the French active participle in (47a, b) and (48c) is an exceptional non-agreeing adjective, like those in the idioms *avoir chaud* 'feel hot', *tenir bon* 'hold on', *peser lourd* 'weigh a lot', etc., it is lexically specified to not agree with a subject DP. This participle can

thus acquire phi-features only in PF, due to the object agreement induced by (46). Hence the HAC (53) allows the stem V *(re)pein-* to relate to the DPs in a higher SPEC(IP) outside the AP in these examples, because the PF features on *-t* are not part of the syntax or LF. The only factor which could inhibit such a relation would be an intervening head V *specified for features*. But the intervening auxiliary head *avoir* 'have' with an active participle is precisely a V that is also empty except in PF. Therefore, the DPs *cette femme/ces femmes* in (47a, b) and (48c) relate to the Vs *(re)pein-* as their subject, even though these Vs are contained in both a higher VP headed by *a/ont* 'have' and an AP headed by *-t* '-en'.[46]

In this section, we have been able to account for Åfarli's 'essential property of the passive' (31) by generalizing Travis's Head Movement Constraint to the 'Head Accessibility Constraint' (49). The crucial 'dethematicization' of the external argument position in passive phrases is crucially due to the fact that both types of passives are *inflected adjectives*, i.e., they have feature specifications in syntax that make impossible any relation between their subject and the V stem to which they are attached. The HAC thus prevents any of a verb's theta-roles from being realized outside the passive AP. Nothing in this explanation of dethematicization requires reference to any special passive properties, once we understand both the syntactic nature of adjectival agreement and the far-reaching syntactic effects of the passive morpheme's unified lexical entry (46).[47]

8.3 An additional consequence of the Head Accessibility Constraint

We can examine a different adjectival construction to see how the HAC fares when confronted with possibly disconfirming data. Let us again consider the class of lexical adjectives formed by attaching *-ive* to V stems, i.e., *attractive*, *corrosive*, *decisive*, *defensive*, etc. French cognate counterparts of many of these, like other French adjectives, agree with their subjects: masculine *défensif(s)* and feminine *défensive(s)*. For many adjectives in this class, it seems like the subject of the adjective is also the subject of the verb stem: one who is decisive also decides, something that is offensive also offends, etc.

According to the HAC (49), however, the subjects of these APs cannot directly relate to these V as subjects, because the agreeing suffixes [$_{A}$ *-if/-ive*] block accessibility between V and these subject phrases. And the fact that the restrictions on the subjects of corresponding Vs and As are so different suggests that this is correct. As reviewed in section 6.1, one who receives visitors or gifts is not receptive, one who repels attacks is not repulsive, the goal phrases for *attractive* must be animate, etc.

There is a regularity, however: the adjective seems appropriate for a *subset* of cases where the verb stem can be used as a bare predicate. Thus in most cases, if 'X is V-ive', then typically 'X V-s . . .' in a subset of contexts in which 'X-V-s . . .' is appropriate. Plausibly, the lexical entry of a V in this formation associates the suffixation frame ___ *+ive* with both these limitations and also a subject variable X, possibly sometimes giving the latter a ±ANIMATE value. (Only people seem

perceptive and selective, although animals can perceive and climactic conditions can select.) In this way, *the adjectival ending serves to transmit to its own subject the external theta-role* of the V stem. The subject of the adjective then has the property of one who fulfills that role X in the associated proposition (e.g., 'X repels people' but not 'X repels attacks').[48] But in all this, the V itself does not need to directly relate to the subject DP in, e.g., SPEC(IP). So it seems that the HAC is not undermined by typical adjectival modification, which does not involve passive 'dethematicization'.

9 Conclusion: the unity of syntax and morphology

We have reviewed the history of treatments of the adjectival passives, concluding that Fiengo's (1977) basic idea was correct: this construction should be derived by NP movement, just like verbal passives. The many differences between adjectival and verbal periphrastic passives, which reproduce themselves cross-linguistically, are due not to their genesis in different grammatical components but rather to their morphological structure entering a syntactic derivation at different levels. Adjectival passive *-en* is inserted essentially at the outset of transformational computation (causing it to be mistaken for a base construction). Verbal passive *-en* is inserted only at Spell Out, with the result that it has been mistaken for a VP when it is in fact an AP of a special sort, one whose head A is not interpreted in LF.

We have found that almost every well-known property of either type of periphrastic passive is intimately connected to its participial morphology. Its category A and the insertion level of its morphemic realization *-en* determine (i) the suppression of the external theta-role, (ii) the missing external argument and unavailability of case in (only) adjectival passives, (iii) the type of verb which selects each passive type, (iv) the types of modifiers which each type tolerates, and (v) their general syntactic distribution. To the extent these conclusions are warranted, we must conclude that studying the passive independent of its morphology is as fruitless as studying its morphology in isolation. The unity of morphology and syntax is not only an a priori desideratum based on parsimony but apparently a methodological necessity.

A somewhat more exotic conclusion of this study has been that the verbal passive, considered in early generative grammar to be the 'true passive' and straightforwardly taken as the basis of the adjectival passive in several studies (e.g., Bresnan 1982d; Levin and Rappaport 1986), is rather the lexically marked and diachronically later variant of the construction, as proposed in Schoorlemmer (1995: 180–183). This conclusion is expressed formally by the use of parentheses in (46). That is, parenthesizing a grammatical element's syntactic category opens the way for its use as a semantically empty 'inflection' (if a bound morpheme) or 'function word' (if a free morpheme).

This conclusion brings us back around to the chapter's subtitle, from Dumas's *Man in the Iron Mask*. The verbal passive, king of transformations in the domain of syntax, has for decades shaped the beliefs and practices of the loyal subjects, to say nothing of the cabinet's. Examples: movements give rise to co-indexed chains rather than vice versa; syntax can be fruitfully pursued with at most lip service to 'autonomous' morphology. But the king has a double, and this double carries the same traits as the king: it is adjectival, it is a verbal suffix, and it agrees with object nominals. Moreover, it is adjectival in meaning, not just in exterior form. So the double doesn't look like the king but rather the king looks like the double, and derives its kingship precisely from being a look-alike. Strangely, the double has been locked in an impregnable fortress, the lexicon, where few transformationalists have cared to venture; and the kingdom's beliefs and practices have developed during this imprisonment. When we now bring the double out of this fortress, the king will have two faces and the loyal subjects may lose their bearings. The beliefs and practices established during the kingship, perhaps even those of the cabinet, may have to change.

NOTES

1 Moreover, this participial suffix and the finite past tense are the same in Standard English for all but a closed set of irregular verbs. In many spoken dialects, the past participle and the finite past tense have the same form even *with* these verbs: *they('ve) took it*, *they('ve) done it*, *they('ve) wrote it*, *they('ve) broke it*, *they('ve) sung it*, *they('ve) hid it.*

2 Fassi-Fehri (1993) reserves the term verbal passive for an Arabic construction more akin to the Latin synthetic passive. He refers to the Arabic construction corresponding to an English verbal passive as an adjectival passive because it is "internally verbal but externally adjectival." This study will focus on the adjectival properties of Germanic and Romance periphrastic verbal passives and try to integrate them in the final analysis.

It is only an accident of academic history that we do not use Fassi-Fehri's terms, i.e., what we call here throughout the verbal passive could be called the 'syntactic adjectival passive' and what we call the adjectival passive could be called the 'lexical adjectival passive'.

3 For example, Jaeggli's (1986a) landmark Government and Binding article "Passive" mentions adjectival passives only on the last page, essentially as an afterthought. Baker, Johnson, and Roberts' (1989) treatise on the passive refers to them with scare quotes in the last footnote and does not cite literature on the topic.

4 Ackema (1995) proposes that dual or second usages of suffixes such as English passive *-en* may arise "because they serve to fill in the gaps in the morphological system in diachronic change" (cited in Schoorlemmer 1995: 181). For example, when the suffixes of the Latin synthetic passives were lost (Romance languages typically show no reflexes of them), Latin analytic perfect passives formed from the copula plus an adjectival passive participle were extended to a second use in Romance, that of a verbal passive, thereby filling the morphological gaps. Thus, Romance adjectival passives seem historically the prior type.

5 Levin and Rappaport's (1986) study of adjectival passives might attribute some of the examples in (4), e.g., with verbs like *hand* and *slip*, to their 'Sole Complement Generalization' (SCG):

(i) Sole Complement Generalization. An argument that may stand as sole NP complement to a verb can be externalized by Adjectival Passive Formation.

However, the SCG can't be the *only* restriction on forming adjectival passives, since in view of the examples in (ii), those in (4) *all* counter-exemplify (i).

(ii) They {approached/left} New York. Drinks {accompanied/followed} dinner. During the summer, we try to {avoid/escape} cities. They practiced {dribbling/throwing} the ball.

So some other characteristic of verb classes must be incompatible with adjectival passives.

6 The fact that adjectival passives describe a property is mentioned in Bresnan's (1982d) lexical rule of conversion, which adds this interpretation as well as the category A to verbal participles. It seems obvious that 'property' or 'state' is simply the unmarked interpretation of A.

7 The formulation (5) is neutral as to how syntax derives this LF alternation. It could be that *-en* is present in both types of syntactic derivation, with its uninterpretable A feature checked off prior to LF in verbal passives (in the terminology of Chomsky 1995c), or that the *-en* of verbal passives is inserted under A only in PF (as in Emonds 2000: ch. 5). Sections 3.3, 5.2, and 7 return to these alternatives.

8 In general, adjectival passives can themselves be divided into lexicalized adjectives, which like most other adjectives are compatible with a full range of degree words, and those that seem 'created anew' at each use. The latter often sound unacceptable with adjectival modifiers and in this sense resemble verbal passives.

9 Similarly, Emonds (1991a) claims that a range of quantifiers and determiners which modify only nouns cannot modify English gerunds headed by V + [$_{N}$ *ing*] because this N is empty in LF.

10 Authors who agree that verbal passives contain covert agent phrases (which is all that is necessary for the analysis here) disagree as to its nature. Chomsky (1986b) and Roberts (1987) argue that it cannot be the same as the PRO subject of infinitives. Emonds (2000: ch. 10) claims that Chomsky's examples are inconclusive because they are based on properties of 'obligatory PRO', while a covert agent phrase has discourse-bound properties of so-called 'optional' PRO.

11 This restriction on idiom formation is a slight strengthening of O'Grady's (1998: 284) well researched 'Continuity Constraint' on idioms (i), where he defines 'chain' as in (ii):

(i) The Continuity Constraint. An idiom's component parts must form a chain.
(ii) The string x . . . y . . . z . . . (order irrelevant) forms a chain iff x licenses y and z, or if x licenses y and y licenses z.

12 In other words, the italicized phrasal complements XP of adjectival passives in (i), like those of morphologically derived nominals in (ii), must be non-idiomatic:

(i) The dinner seemed made *from leftovers*.
They sounded fully informed *of your intentions*.

(ii) The maintenance *of these roads* is costly.
His payment *of huge sums* didn't result in any entertainment *of poor children*.

13 Calling a step in the history of generative analyses a 'mistake' refers only to how it has been ultimately evaluated by most Chomskyan practitioners. Adherents of other frameworks may consider such a step as a crucial breakthrough.

14 The structure-preserving constraint (SPC) of Emonds (1976) is more than an observation that operations such as the passive movements reproduce base structures; it also specifies the exact conditions for when landing sites do *not* require base structures. In mimimalist terms, part of structure preservation (in the original stronger sense of category preservation) means that the possible non-vacuous outputs of Merge and Move are structurally identical at given points in a derivation. In one sense, feature checking may predict this: if in any given position *Move and Merge necessarily check the same features*, this part of the SPC may follow.

But the SPC further specifies conditions under which structure preservation does not occur, i.e., the conditions under which Move and Merge do *not* have the same effects. In other words, certain Moves at the root of a tree prevent further Merges. The promissory note on structure preservation in Chomsky (1995c: section 7.2) seems to shed no light on how feature checking addresses this issue.

15 The exceptional English A-NP combination in *very near the station* may be a hybrid of an AP *very near to the station* and a PP *right near the station.*

16 In particular, 'passive auxiliaries' are those V with the frame ___AP that are *least semantically specific*: *be* and *get.* Most of the Germanic and Romance languages with similar analytic passives use translations of one or both of these.

17 While it is obvious that *be* does not contribute to LF, it might seem that *get* does. Emonds (2000: ch. 5) argues that while the *distribution* of *get* seems restricted by a following verb's 'change of state' feature (*?get owned*, *?get hated*, *?get known*), no difference in *interpretation* is observed in pairs such as *{get/be} examined by, {get/be} built by, {get/be} scared by,* etc.

18 Archaic and sometimes semantically irregular options such as *burnt*, *proven*, and *supposéd* are sort of 'exceptions that prove the rule'.

19 In contrast, the composed past of a verb in French does *not* agree with a subject when the auxiliary is *avoir* 'have':

(i) Cette femme a tout de même *peint(*e)* seulement par nécessité.
that woman (FEM) has all the same painted (*FEM) only by necessity
'That woman has all the same painted only by necessity.'

These kinds of patterns are commonplace in traditional grammars of languages such as French, German, and Spanish, and so will not be exemplified in detail here.

20 An alternative to such insertion would be for a separate morphological operation to 'add on' an A-headed structure in PF to a simple syntactic V. But this ad hoc solution for the morphology explains neither the selection of verbal participles by *be* and *get*, nor their more general syntactic distribution reviewed in the next subsection. In addition, derivationally changing a V to $[_A$ V – $[_A$ *en*]] would contravene Chomsky's (1995c) programmatic Inclusiveness Condition (transformational operations can't introduce new material) more violently than late insertion into an independently justified syntactic slot. Consequently, the optimal *syntactic* target for the verbal passive participle seems to be $[_A$ V – $[_A$ Ø]].

21 Freidin claims (1975: 395) that passive rather than active verbs are listed in the lexicon and (p. 396) that his formalism "must be stated in terms of semantic functions rather than syntactic categories." A consequence is that verbs with two passives (*give*, *take advantage of*, *allow*, etc.) each require two lexical passive verbs in the lexicon.

22 Van Riemsdijk (1983a) provides an important bridge linking a generative perspective on abstract case to the traditional understanding that accusative case is unavailable in the absence of V.

He further questions the standard version of the Case Filter, based on the availability of apparent 'default morphological cases' in many constructions in many languages, e.g., German. Rephrasing his concern, why are some noun phrases lacking categories which assign them case ill-formed, while default case allows other such noun phrases to be well-formed? This study retains a Case Filter of the original sort, assuming that any default cases are limited to noun phrases in Specifiers not linked by movement to argument (A-) positions. This formulation partly answers Van Riemsdijk's objections, but detailed justification is not straightforward and would lead us too far afield.

23 Baker, Johnson, and Roberts (1989: section 4) discuss and try to circumvent, almost desperately it seems to me, the mounting evidence against attributing case a central role in accounting for the passive; cf. especially their note 10. In the twilight of government and binding, they "are forced to conclude, following Sobin (1985), that the absorption of accusative Case is a cross-linguistically more variable property of passive than the absorption of a θ-role" (p. 236).

24 Minimalism itself, to the extent it is based on empirical paradigms, can be traced to abandoning a case-based 'forced government' account (30) and embracing an 'attract' account of passives (31), under the at least tacit influence of the cited studies. Passive movement in minimalism is universally motivated by the 'EPP property' of the landing site, satisfied by Movement in a situation where it cannot be satisfied by Merge. But a deeper examination of these issues would lead squarely into the territory of the verbal passive, and away from the particular focus of this study.

25 These paradigms and arguments are from Emonds (2000: chapter 5). Government binding treatments mention this type of example from time to time, often suggesting that some kind of ad hoc inherent case can be assigned to the italicized noun phrases. This line of thought sheds no light on the problem, however. Since noun phrase complements of lexical adjectives typically can have 'inherent case' cross-linguistically, one remains at a loss to explain why the adjectival counterparts (32) of (18) are nonetheless uniformly out (i.e., why inherent case is unavailable just where we most expect it).

26 One can still maintain that noun phrases moved in passives don't receive case, if one holds that structural cases are always assigned *optionally*. Emonds (1985: ch. 1) develops this perspective on case assignment; if a DP doesn't receive case from V (whether or not the V *may* assign case), this DP may move to get case, e.g., into the surface position of SPEC(IP).

27 A variant on (i) relates adjectival and verbal passive participles via unaffixed 'conversion', as in Bresnan (1982d) and Levin and Rappaport (1986: section 4.3). That is, the two constructions would share a common stem but be syntactically distinct like a noun-verb pair *smoke*/*smoke*; one would derive from the other by zero affixation. There are reasons to reject this approach, however. First, conversion only rarely affects morphologically derived forms: while the noun *commission* doubles as a verb, the more typical *transmission*, *contraction*, *communion* and *contrition* do not. Second,

conversion typically relates two phonologically identical and semantically close forms that do *not* share syntax. But as seen in section 3, adjectival and verbal passives share a *lot* of syntax. Third, Schoorlemmer (section III.2.3.2) provides extensive arguments against using conversion to express the morphological relatedness of Russian adjectival passives and passive perfective (verbal) participles, drawing on special properties of its tense and aspect systems. The participial syntax of Germanic and Slavic languages is similar enough to expect that conversion cannot be completely wrong for the Slavic systems and yet right for Germanic.

28 In any case, feature checking in LF of a V that itself doesn't move in LF seems essentially incoherent.

One can of course both reject late insertion and insist that the feature-checking in both kinds of passives is the same, but then one has no account of any differences between them, i.e., such a theory ends up with nothing to say about any of the contrasting passive paradigms. Recent studies often insist on theoretical simplicity of this and that sort, at the cost of accounting for few if any paradigms.

29 Thus, Levin and Rappaport begin their section 4.1: "In accordance with the program initiated in Chomsky (1981), we eschew the explicit use of subcategorization frames in lexical entries as a representation of the complement structure of verbs." Consequently, after establishing their empirical conclusion, the second half of their essay reformulates their result in terms of theta-grids (taking issue with various competing semantic formulations). In my view, their choice of a semantics-based lexical framework makes it impossible to express their main result in a natural way, namely, that adjectival passive phrases lack exactly that overt DP that is licensed by the lexical frame +___DP.

30 Levin and Rappaport's vague term 'argument' should perhaps be replaced by a more testable concept such as 'potentially referring phrase'. NPs in some idioms may exceptionally potentially refer, consequently receiving a theta-role and appearing in adjectival passives. Thus ?*Sam will spill the beans before anyone else spills them* sounds at least marginally acceptable, so *the beans* may be a theme. This would license the idiom in adjectival passives: *?The beans now seem spilled.*

31 'Object' in (37) can also refer to objects of stranded P. I have not made an analysis here of stranded prepositions in passives found in English in both verbal (i) and adjectival (ii) variants:

(i)	This problem is being attended to.	That couch got sat on soon afterwards.
(ii)	It is a long unattended to problem.	That couch looks more sat on than I thought.

The stranded P in the first example in (ii) is puzzling because English pre-nominal adjective phrases typically terminate in a head A, i.e., such an A must be adjacent to the N-projection it modifies. Perhaps the required adjacency forbids only intervening phrases. (Along similar lines, postverbal particles do not interfere with the adjacency usually required between English verbs and their object.)

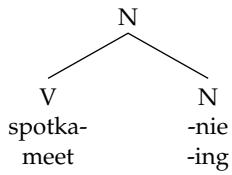
In any case, the approach here removes a problem posed by 'P-stranding' for a case account of passive movement, since stranded Ps generally assign case. Since movement here is not caused by lack of case, the fact of movement with stranded Ps becomes unremarkable.

32 Pseudo-passives fall under this formulation if they are derived by 'detaching' a governing P from its object (or otherwise rendering it invisible) in the context V___.

33 Recall that a lexicalized A blocks all case-assignment in adjectival passives (44), while the V in verbal passives (45) can assign case to objects, including double objects. Moreover, non-referential object phrases in idioms are compatible with (45) but not (44). These independent factors reviewed earlier should be consequences of imposing the agreements in (44) and (45) at different levels.

34 I omit three further distinctions analyzed by Schoorlemmer, which represent specifically Russian reflexes of polyfunctionality and are interesting in their own right. They would require preliminary discussion of Russian morphology (the genitive of negation), stylistics (the long form of adjectives), and aspect (her 'perfectivity restriction', to which she devotes most of her chapter 4), and thus take us too far afield.

35 Borer (1991) is an earlier, more accessible reference on Parallel Morphology. In her (43), Schoorlemmer exemplifies a Lieber type head adjoined structure with a Polish result nominal:



A similar theory of morphological analysis, but one that denies the need to distinguish a separate morphological component, is presented in Emonds (2000: chs. 3–5). Under this view, 'morphology' is simply the name of what results phonologically when lexical items composed entirely of grammatical features are additionally specified as 'bound', i.e., requiring a sister within an X^0 domain.

36 My version of dual level lexical insertion (cf. Emonds 2000: ch. 4) tries to respect the spirit of Chomsky's (1995c) Inclusiveness Condition: new structure should not be added during a derivation. Therefore, even though the morpheme *-en* is itself absent from verbal passive participles during the first part of a derivation, its category A should be present and empty; cf. sections 2 and especially 3.3 above.

37 Borer and Wexler (1987) propose a government and binding analysis of passives whereby verbal passives contain traces (A-chains) and adjectival passives do not. They attribute the later acquisition of verbal passives to a difficulty with acquiring A-chains. In the analysis of passives based directly on the lexical formulation (46), the later acquisition of verbal passives is due to the marked nature of 'cancelling' syntactic categories at the LF interface by means of the parenthesis notation.

38 Emonds (2000: ch. 5) argues that much of the grammar of APs derives from their being subject to the Case Filter, as in Stowell (1981). Non-agreeing adjectives, including perfective *-en*, are in general those endowed with an inherent case feature that obviates subject agreement. Other realizations of case are adverbial *-ly* and agreement itself. This particular mode of explanation is not at issue here.

39 Borer and Wexler (1992) cite the following summary of Antinucci and Miller (1976): "Up to a certain age, variable from child to child and ranging roughly from 2;0 to 2;5, the rule of agreement between transitive past participles and their grammatical object is never violated."

40 Borer and Wexler's simple rule is precisely (46), which I claim is at the centre of passive phenomena as well. They reject verbal agreement with objects, however, since

they wish to subsume this agreement under SPEC–HEAD agreement, along the lines of Kayne (1989a); see below in the text.

As they observe, a partisan of (46) has to explain why the adult rule is restricted to only empty objects. In the framework in Emonds (2000: ch. 4), agreement patterns 'alternatively realize' features away from their canonical LF positions; sometimes these features are also spelled out in the canonical positions and sometimes they are not. Unmarked Alternative Realization in fully developed adult grammars is used mainly to achieve economy; that is, for avoiding 'doubling.' Thus the child Italian rule, whereby *-en* doubles overt objects, would be a marked option for adults and so is superseded by a more restricted variant.

41 Several instances of exceptional non-agreeing adjectives in French are discussed in Emonds (2000: ch. 5): *avoir chaud* 'be hot', *peser lourd* 'weigh heavy', *tenir bon* 'hold on', etc.

42 The material in this study seems orthogonal to the question of whether traditional VPs should all be analyzed as functional category projections (so-called 'small vPs' of some sort) with object noun phrases located in some Specifier, as Kayne's proposal requires.

43 Contextual features on Z^0, for example whatever differentiates *be* and *have*, are irrelevant.

44 French and Italian have active participles whose auxiliary, like the passive auxiliary *être/essere*, 'be' agrees with their surface subject in, for example, reflexive sentences. Such agreements might seem to counterexemplify the HAC, since in these sentences the verb's agent theta-role is assigned to this subject, as in French *Cette femme s'est peinte* 'That woman has painted herself.'

But in this construction, *-en* acquires agreement features only *after être* is inserted in PF as a result of the reflexive clitic. (Spanish reflexives which don't trigger a change in auxiliary exhibit no agreement.) Since these reflexive-induced agreement features on *-en* don't appear in the derivation of LF, they are irrelevant (invisible) for a principle blocking a theta-role relation between a subject and a V (respectively X^j and Z^0 in the HAC).

45 If VP and NP have more than one functional projection in their maximal 'extended projections' (IP and DP respectively), then (53) should perhaps include all but the topmost extended projections of YP, since I and SPEC(IP) need access to V, and D and SPEC(DP) to N.

We might also decide to include *all* extended projections of VP and NP under the term YP in (53). This would permit directly relating C to V (as in analyses countenancing 'long head movement' of V to C) and also V to the N heads of direct objects, as in Baker's (1988a) noun incorporation. Moreover, it would allow selection restrictions to pair V with object Ns, skipping D. All these seem like acceptable, even welcome consequences.

46 I will not try here to recast everything in terms of some kind of 'XP-internal subject hypothesis', where XP includes any type of phrase. The VP-internal subject hypothesis of Zagona (1982) has indeed played an important role in improved analyses of causative and restructuring complements. However, the analyses of these constructions in Emonds (2000: ch. 6) indicates the inadequacy of a commitment to uniform phrase internal subjects.

47 The reason this explanation has been a long time coming is the agreed 'division of labor' between 'syntactic theorists' and 'morphological specialists', as advocated for example in Aronoff (1994: 134): "But within a lexeme-based framework in which

morphology and syntax are autonomous, what Passive consists of syntactically is not directly relevant to its morphological realization . . . For my purposes, the question is just not interesting. Conversely, its morphology has no bearing on its syntax and should not be used as evidence for one syntactic analysis or another."

This study has shown that satisfactory descriptions of all the main grammatical components of Indo-European periphrastic passives require a tight integration of morphology and syntax. Along similar lines, Kubo (1992) shows that the much wider range of passivizable NP positions in Japanese is directly linked to the V category of its passive morphology, which contrasts with the adjectival nature of the Indo-European periphrastic passives.

48 On similar lines, the lexical entry for the adjectival suffix *-able*, which is often said to also form passive adjectives, transmits to its subject not an external theta-role but that of a direct object.

  6.3 Adjunction vs. specifiers and serialization of adjectives
7 Challenges for the derivational analysis and semantics-based approach
8 Conclusion

1 Introduction

Not unlike adverbs (see chapter 4), the study of adjectives and adjective ordering is a difficult and complex one. Aside from interpretation considerations of the various adjective types, two different problems have been the object of much research in the field: the ordering of adjectival strings per se, and the relative ordering of adjectives and the noun they modify in various languages (see also chapter 2).

These two main areas of research have been developed substantially over the last few years in large part due to our improved understanding of the structure of Determiner Phrases (DP) and their various components. This has enabled researchers to tackle the adjective ordering problem in a systematic and principled way.

Here, we first look at some of the earlier work with respect to adjective ordering, then move on to discuss some of the more influential proposals concerning the aforementioned problems.

2 Predication and attribution

Variation in terminology and classification notwithstanding, adjectives are usually divided into two categories: predicative and non-predicative (for detailed discussions of adjective types, see Bolinger 1967; Kamp 1975; Siegel 1980; Higginbotham 1985; Keenan and Faltz 1985; Giorgi and Longobardi 1991). Generally, predicative adjectives describe a property that is predicated of the set of individuals denoted by the noun, while non-predicative adjectives do not. This distinction usually correlates with the adjective's capacity to appear with a copula (null or not) or with a verb in a reduced relative construction; predicative adjectives do, while non-predicative adjectives establish a relation with a noun without an intermediate copula (see Bolinger 1967; Cinque 1994).[1]

This differentiates, for instance, *round* from *alleged* in (1):

(1) a. The round table. (round = property of the set of tables)
b. The table is round.
c. The alleged communist. (alleged ≠ property of the set of communists)
d. *The communist is alleged.

Predicative adjectives can be further divided into intersective and non-intersective adjectives. The adjective *round* in (1) is intersective because it denotes the sets of objects that are both round and tables. This is not the case for *careful* in (2).

(2) A careful cook.

Here the adjective may either restrict the reference denoted by the set of cooks to only those who are careful (internal scale) or determines the set of cooks being characterized (denoting cooks that are careful as individuals, not just as cooks – external scale – see Bouchard 1998, from whom the above discussion is taken, for a more detailed discussion, and how these distinctions sometimes correlate with the pre- or postnominal position of adjectives in French).

3 Ordering

One major concern in the study of adjectives is ordering. Hetzron (1978) observes that, for a good number of natural languages, adjectives seem to be ordered according to semantic criteria.[2] The major rule calls for the more objective and undisputable qualifications to be closer to the noun, and the more subjective, opinion-like ones to be farther away. At one extremity of the continuum we find subjective and individual denoting adjectives, at the other objective and collective denoting adjectives. In between, there is a whole spectrum of semantic features.[3]

According to Hetzron, the general cross-linguistic tendency is that adjectives that usually appear closest to the noun are those denoting *purpose* or *destination*.

In prenominal position, for instance, these are preceded by adjectives denoting *composition*, *origin*, *color*, *physical defect*, *shape*, and finally, *age*.

This ordering of adjectives seems to apply independently of the position of adjectives with respect to the noun they modify, i.e., it is somewhat general. Indeed, in languages with A(djective)-N(oun) word order the ordering is exactly the mirror image of what is found in consistent NA word order. There are also 'mixed' languages, e.g., French, in which adjectives may appear either in pre- or postnominal position (this particular case is examined in detail in the sections below). The paradigm in (3) illustrates the distribution of a subclass of adjectives in each language type.

(3)

AN languages	*Evaluating*	*Size*	*Color*	*N*
English	beautiful	big	red	ball
German	schöner	großer	roter	Ball
Hungarian	szép	nagy	piros	labda
NA languages	*N*	*Color*	*Size*	*Evaluating*
Indonesian	bola	merah	besar	tjantik
Persian	tupe	qermeze	bozorge	qasangi
	ball	red	big	beautiful
ANA languages	*Evaluating*	*Size*	*N*	*Color*
French	joli	gros	ballon	rouge
Italian	bella	grossa	palla	rossa
	beautiful	big	ball	red

When two adjectives of the same class co-occur, it seems that the order is interchangeable across languages. Thus, both (4a, b) (which involve two adjectives of the *human propensity* class in Dixon's classification) are acceptable in English:

(4) a. a clever brave man
b. a brave clever man

There are exceptions to the general pattern. For one, it seems that in some of the languages Hetzron examined certain adjectival categories are either interchangeable or take ordering precedence over others. For instance, some languages allow *color* and *evaluation* adjectives to interchange. One example is Polish. According to Hetzron's informants both (5a) and (5b) are acceptable "with relative ease:"

(5) a. pięknа duża piłka
beautiful big ball
b. duża piękna piłka

In other languages, certain types of adjectives must occur first in the line of adjectives. This is the case for *size* adjectives (arguably because size qualifications

are obligatorily treated as emphatic in these languages) in Japanese (also Amharic) and Romanian (as well as Spanish). As a comparison between these two language types shows, this ordering precedence is at play whether adjectives precede or follow the noun:

(6) a. Japanese: ōki kirei na akay bōru
big pretty red ball
b. Romanian: o minge mare roșă (și) frumoasă
a ball big red (and) pretty

Finally, some languages are rather free with respect to adjective ordering, which in this case depends on external factors such as context, relative emphasis, euphony, etc. Two examples are Somali (which has relatively few basic adjectives) and Kurdish, which allow all six permutations of the strings in (7a, b):

(7) a. Somali: gabadh fiican dheer madow
girl good tall dark-skinned
gabadh fiican oo madow oo dheer
gabadh dheer oo madow oo fiican
etc.
b. Kurdish: top-a jwan-a gawr-a sur-a-ka
ball beautiful big red
top-a sur-a gawr-a jwan-a-ka
etc.

Having said this, Hetzron points out that the languages that exhibit the more general ordering (i.e. (3)) have the most elaborate systems, and he goes on to suggest that "it is the properties of adjective ordering in these languages, such as English and Hungarian, that need thorough investigation in view of establishing a general theory, while the other language types will be described as a simplification of the more complicated system, or . . . a statement has to be made to the effect that they are EXEMPT from the generalizations established for the first group" (1978: 175).

Sproat and Shi (1988) also look at adjective ordering in some detail. Their analysis aims at providing some justification for a cognitive-based account of adjective ordering. Looking at English and Mandarin Chinese, they distinguish between *apparent* and *non-apparent* adjectives. More apparent adjectives are those that denote an intrinsic property of a noun, while less apparent adjectives denote a property in relation to other objects. For instance, the adjective *red* describes an intrinsic property of an object since being red does not require comparing the object with other non-red objects in order to determine its color. On the other hand, *large* is less apparent in the sense that for an object to be considered large it needs to be compared with non-large objects: a butterfly may be large compared to other butterflies but is still smaller in real size than a large (or even a small) car. Hence, adjectives that require less comparison are more apparent, while those that require more comparison are less apparent.

With prenominal adjectives, Sproat and Shi's proposal is that the less apparent the adjective is, the further to the left in the adjective string it appears. This is exemplified by the following pairings of adjectives in English:

(8) The large red car. *Size* (less apparent) to the left of *color* (more apparent)

(9) A nice small dog. *Quality* to the left of *size*

(10) A nice green table. *Quality* to the left of *color*

Aside from the ordering problem, which they also touch upon, recent studies on adjectives have sought to give a principled analysis of the relative position of adjectives with respect to the noun in various languages. As we saw above, in some languages adjectives appear before the noun, in others they appear after the noun, yet in others they may appear in either position. The problem can be looked at either from a derivational or a representational point of view. We begin in the next section with an approach that has spawned much research in recent years: the derivational analysis.

4 Adjective placement as an argument for N-movement (Cinque 1990a, 1992; Valois 1991a, 1991b, 1996)

In early work in generative grammar, adjectives were generally considered to be adjoined to the intermediate N′ projection of the noun, with no real attempt at accounting in a principled way for cross-linguistic variation with respect to the relative order of adjectives and the noun they modify. Recent work has looked at this very problem. Much progress made in this area is in large part due to other important developments in syntactic theory, such as recent research on the structure of Determiner Phrases, and head-movement within the DP. These studies on adjectives are thus inseparable from these developments, and will be presented in that context here, as we provide a general overview of some of the more detailed and influential research on adjective placement.

Research in generative grammar on the structure of DP and its similarities with the structure of clauses (an idea originally put forth by Szabolcsi 1987, 1994; see also Abney 1987) has provided in the late 1980s and the 1990s a new way of looking at the distribution of adjective phrases (AP) within the DP. One important development is the proposal by Cinque (1990a) that the distribution of APs provide an argument in favor of N-movement within the DP.

It has been argued that the relative position of adverbs in English and French is a consequence of the different ways that inflectional morphology attaches to the verb in the two languages: via verb movement to an inflectional node located higher than the adverb in French, but through affix-hopping of the morphological features onto the verb in English (Emonds 1976; Pollock 1989; Chomsky 1995c) (see chapter 75). Typical examples are given below:

(11) a. Marc often eats apples.
b. Marc mange$_i$ souvent t$_i$ des pommes.

Looking at thematic (external argument) adjectives in event (deverbal or derived) nominals (see chapter 19), Cinque (1990a, 1992) points out that their relative position with respect to the noun differs in Romance and Germanic languages in a way that is reminiscent of what can be observed with verbs and adverbs. The proposed analysis is thus similar to that for adverbs: The noun moves over the thematic adjective in Italian (or French), but not in English. This is illustrated in (12), where the thematic adjective occupies the basic position of the external argument (SpecNP) in both languages:

(12) a. *L'[$_{NP}$ italiana invasione dell'Albania]
the Italian invasion of Albania
b. L'invasione [$_{NP}$ italiana __] dell'Albania
c. L'invasion italienne de l'Albanie
the invasion Italian of Albania
d. *The invasion [$_{NP}$ Italian __ of Albania]

Crucially, (13) below shows that APs (with normal intonation; see the discussion concerning (35) below) cannot be rightward-moved, as they cannot appear on the right of the noun and its complement, meaning that the string in (13) cannot be the result of adjunction of the adjective to the right of the head noun (from prenominal position):

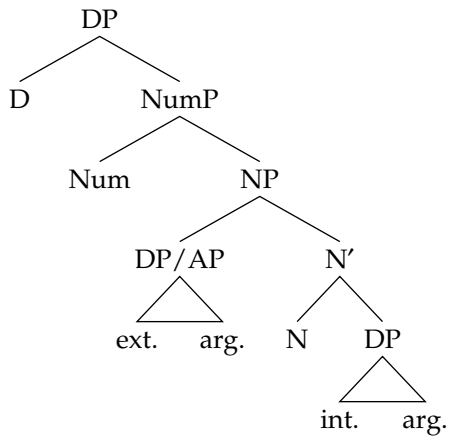
(13) *L'invasione dell'Albania italiana

Motivation for N-movement, just like V-movement, is morphological: it takes place in Romance (to a functional Num(ber) category – more details below) in order for the noun to attach to its number features. It is worth noting that, aside from accounting for the contrasts in (12), the proposal that the noun may undergo head-movement has been the source of substantial research in recent years, and has been shown to have a wide range of consequences concerning the syntax of DP. For instance, with respect to Romance and Germanic languages, Valois (1991a, 1991b, 1996) outlined certain differences between the two language types that can be ascribed to a parameterization of N-movement. Among these are (i) the relative distribution of DP-internal arguments; and (ii) the relative distribution of adjectives in event nominals. Concerning the former, French and English differ with respect to the relative position of the noun and its external argument. In English, the external argument precedes the noun (14a), whereas it follows it in French (14b).

(14) a. Rembrandt's (agent) portrait of Aristotle (theme)
b. Le portrait de Rembrandt (agent) d'Aristote (theme)

Both English and French having basic S-N-O (and S-V-O) word order, N-movement past the external argument in French derives (14b) while the absence of movement in English derives (14a). In Valois (1991a, 1991b, 1996), movement is to an intermediate Num(ber) Phrase (see Ritter 1991 for arguments in favor of NumP). The (partial) structure of DP is thus as in (15):[4]

(15)



The second difference between the two language types has to do more directly with the topic at hand, i.e., adjectives, more precisely adjectives in event nominals. This is the topic of the next section.

5 DP and clausal structures: adjectives in event nominals

The study of the distribution of adjectives in French and English event nominals Valois 1991a, 1991b, 1996) was conducted in the spirit of drawing parallels between the syntax of clauses and the syntax of DP. Indeed, event (deverbal) nominals form a class of nouns that is very closely connected to verbs. One obvious parallel between clauses and event nominals is the semantic connection between some of their modifiers, e.g., adverbs and adjectives.

For his purpose Valois adopted Travis's (1988) and Rochette's (1990b) position that the first four classes of adverbs discussed by Jackendoff (1972) are reducible to three classes indicating the level of adjunction of the adverb within IP. This is shown in the classification below (labeling is Valois'):

Adverb classification (by level of adjunction)

Adverbs of the *probably* class: Jackendoff's Class III	Highest
Adverbs of the *frequently* class: Jackendoff's Classes I and II	Higher
Adverbs of the *completely* class: Jackendoff's Classes I and II	Lower

The underlying assumption here is that the positional distribution of adverbs in English is predictable on the basis of their meaning. For instance, manner adverbs (those belonging to the *completely* class), which modify the VP, are adjoined lower than sentential adverbs (those belonging to the *frequently* class and those belonging to the *probably* class). Setting other independent factors (such as transportability) aside, and provided that only one adverb may adjoin to a given projection (Jackendoff 1972), co-occurrences of adverbs generally follow the structural hierarchy imposed by their meaning; that is, adverbs of the *probably* class, which modify propositions (mapped onto CP according to Rochette 1990b), precede those of the *frequently* class, which modify events (mapped onto IP or VP), which in turn precede those of the *completely* class, which modify actions (mapped onto VP). This can be seen in the pairings in (16–18):

(16) a. They [$_{IP}$ probably [$_{VP}$ completely invaded China]].
b. *They completely probably invaded China.

(17) a. They [$_{IP}$ frequently [$_{VP}$ completely invaded China]].
b. *They completely frequently invaded China.

(18) a. They [$_{IP}$ probably [$_{VP}$ frequently invaded China]].
b. *They frequently probably invaded China.

Turning now to adjectives, the assumption is that the classification assumed for adverbs also applies to the corresponding adjectives, as given in the classification below:

Classification of adjectives in event nominals (by level of adjunction)

probable class: probable, unfortunate, etc.	Highest
frequent class: clever, clumsy, careful, careless, frequent, etc.	Higher
complete class: complete, easy, total, bad, mortal, brutal, etc.	Lower

According to the stand concerning the parallel syntax of DP and CP, the expectation is for the distribution of the adjectives in the above list to parallel that of the corresponding adverbs; that is, pairings of adjectives belonging to different classes should yield word orders in which adjectives belonging to, say, the *complete* class follow adjectives of the *frequent* class, or in which adjectives of the *frequent* class follow members of the *probable* class. Looking at English first, we see that this prediction is borne out:

(19) a. The probable complete invasion of China
b. *The complete probable invasion of China

(20) a. The frequent complete invasion of China
b. *The complete frequent invasion of China

(21) a. The probable frequent invasion of China
b. *The frequent probable invasion of China

This follows if, like adverbs, adjectives are adjoined hierarchically according to the class to which they belong, as shown in (22) (see Crisma 1989 on Italian).

(22) [$_{DP}$ *probable* class [*frequent* class [*complete* class [$_{NP}$ invasion of China]]]]

In French, when preceding the head noun, the same distributional constraints operating for adverb ordering can be observed for adjectives, as shown in (23–25).

(23) a. La probable complète invasion de la Chine
the probable complete invasion of China
b. *La complète probable invasion de la Chine
the complete probable invasion of China

(24) a. La fréquente complète invasion de la Chine
the frequent complete invasion of China
b. *La complète fréquente invasion de la Chine
the complete frequent invasion of China

(25) a. Les probables fréquentes invasions de la Chine
the probable frequent invasions of China
b. *Les fréquentes probables invasions de la Chine
the frequent probable invasions of China

However, as in Italian, French adjectives may also appear in postnominal position (thematic adjectives being one case, cf. (12c)), as can be seen in the event nominal constructions in (26):[5]

(26) a. L'invasion probable de la Chine
the invasion probable of China
b. L'invasion fréquènte de la Chine
the invasion frequent of China
c. L'invasion complète de la Chine
the invasion complete of China

This is the unmarked case if, as concluded with respect to (12c), the noun moves past the adjective in French. This in turn begs the question as to the formal mechanisms responsible for the presence of adjectives in prenominal position.

Valois' answer (which differs from Cinque's 1994 approach, as we discuss in section 6) is that prenominal adjectives are derived via the application of an additional rule that adjoins the adjective to the left (by head-movement), as (27) illustrates:[6]

(27) a. L'invasion probable de la Chine
b. La [probable$_i$ [invasion]] t$_i$ de la Chine

In (23–25), the presence of two prenominal adjectives indicate that two instances of left-adjunction have taken place.[7]

This process is reminiscent of cases of syntactic incorporation (Baker 1988a). One indication that this view might be on the right track is that liaison is (slightly) more acceptable when the adjective is in prenominal position than when it is in postnominal position, presumably because incorporation involves the formation of a 'tighter' morphophonological complex (see also Bernstein 1993, who claims that liaison is obligatory with prenominal adjectives but optional in postnominal position, an observation disputed by Bouchard 1998):

(28) a. Les improbables [z] invasions de la Chine
the improbable invasions of China
b. Les invasions (?[z]) improbables de la Chine

The alternate pre- and postnominal position, as well as co-occurrence restrictions of adjectives, is given a substantially different analysis by Cinque (1994). The next section presents Cinque's approach on this and other aspects of the syntax of adjectives.

6 Serialization and partial N-movement (Cinque 1994)

6.1 Attributive APs

Cinque (1994) proposes an analysis that differs from Valois' proposal in two important ways. He proposes that (i) Adjective Phrases (APs) are generated in specifier positions of functional categories; (ii) nouns can undergo *partial* N-movement, a mechanism responsible for the possibility for an attributive adjective to appear in pre- or postverbal position.

Before moving on to the analysis proper, it should be noted that Cinque revises his initial stand that thematic adjectives are generated in SpecNP. This is motivated by the observed prohibition on the co-occurrence of both manner and thematic adjectives in prenominal position, as in (29a), combined with the fact that the noun moves past a manner adjective, as in (29b):

(29) a. *?L'aggressione brutale (manner) italiana (thematic) ___ all'Albania
the agression brutal Italian against Albania
b. L'aggressione brutale (manner) all'Albania

If thematic adjectives were generated in SpecNP and the noun could move past a manner adjective, as (29b) shows, (29a) ought to be possible. Cinque's conclusion concerning the ungrammaticality of (29a) is that both manner and thematic adjectives compete for the same position outside NP.

We saw in the previous section that in French some adjectives may appear either pre- or postnominally. This is the case in Italian as well. Compare (29b) with (30):

(30) La brutale aggressione all'Albania
The brutal aggression of Albania

Cinque's account of the pair of examples differs markedly from Valois'. Rather that assuming incorporation to account for the prenominal position of the adjective in (30), he proposes to base-generate *brutale* in two different positions in the DP. The motivation behind this is based on Cinque's observation that, although the difference is subtle, (29b) and (30) yield slightly different interpretations: While the adjective in (29b) has a 'pure' manner interpretation, it has a subject-oriented interpretation in (30), a result that can clearly not be attributed to the sole application of N-movement. In other words, *brutale* in (29b) and (30) are two different homophonous adjectives, one (the subject-oriented adjective) being base-generated higher than the position to which the noun moves.

The relationship between the position and interpretation of *brutale* can be seen by the fact that, in constructions that force the manner interpretation of the AP, the subject-oriented interpretation is unavailable, as shown in (31):

(31) a. Le aggressioni brutali (*manner*) vanno severamente condannate.
the aggressions brutal are strongly condemned
b. *Le brutali (*subject-oriented*) aggressioni vanno severamente condannate.

Subject-oriented APs followed by manner or thematic APs are impossible between N and its complements, suggesting that N does not move past a subject-oriented AP:

(32) *?L'aggressione stupida (*subject-oriented*) brutale (*manner/thematic*) all'Albania
the aggression stupid brutal/Italian of Albania

Since subject-oriented adjectives may be preceded by speaker-oriented APs, as in (33), Cinque arrives at the partial structure in (34) (the ___ symbol indicating possible landing sites for N):

(33) ?La probabile (*speaker-oriented*) stupida (*subject-oriented*) aggressione dell'Albania
the probable stupid aggression against Albania

(34) [$_{XP}$ speaker-oriented ___ [$_{YP}$ subject-oriented ___ [$_{ZP}$ manner/thematic [$_{NP}$ N . . .]]]]

6.2 Predicative APs

While the word order N-complement-AP is generally not possible (see (13) above), it becomes possible under certain specific conditions. In (35), the sentence is grammatical if there is a sharp intonational break between the complement and the AP:

(35) La loro aggressione all'Albania BRUTALE
the their aggression of Albania brutal

According to Cinque, the adjective in (35) is a predicative AP, i.e., an AP that is predicated of a maximal projection (here NP; see also Bernstein 1993b; Sleeman 1996). Such APs generally appear after the noun and its complements.

A good test to support the assumption that predication is at play when adjectives follow a noun complement would be to try to insert to the right periphery of the DP an adjective that is not suitable for predication. This is the case for thematic adjectives, which cannot be predicative, as the ungrammaticality of (36a) shows. Indeed the result is not felicitous when the AP appears after the noun complement (36b):

(36) a. *L'invasion de Jupiter fut martienne.
the invasion of Jupiter was Martian
b. *L'invasion brutale de Jupiter MARTIENNE
the invasion brutal of Jupiter Martian

That post-complement APs are predicative is further supported by the fact that APs that cannot be used predicatively, as evidenced by (37a), cannot appear after N and its complements (37b), although they can appear pre- or postnominally (37c, d):

(37) a. *Questo motivo è principale.
this reason is main
b. *Questo è il motivo della sua partenza, PRINCIPALE.
this is the reason of his departure, main
c. Questo è il principale motivo della sua partenza, PRINCIPALE.
this is the main reason of his departure, main
d. Questo è il motivo principale della sua partenza.

Note in passing that the fact that when two adjectives appear in postnominal position the second one is predicative might explain the restriction in Romance on the number of (intonation-free) postnominal adjectives, which seem to be limited to two (this is not discussed in Cinque's article):

(38) a. Une émission chargée intéressante
a program contentful interesting

b. Une émission tardive intéressante
a program late interesting

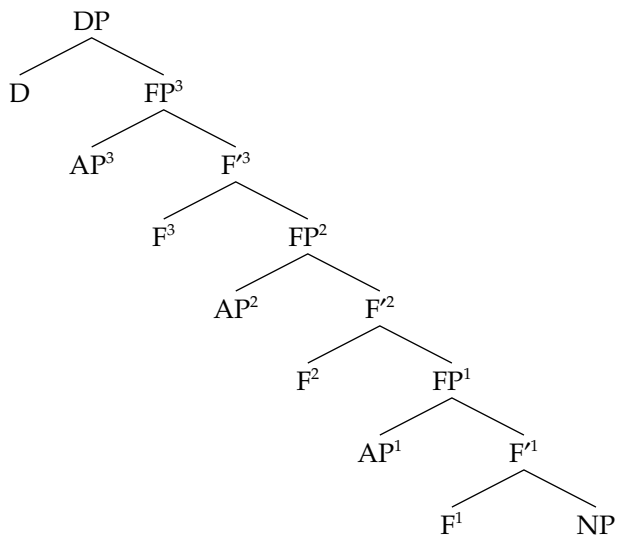
c. Une émission tardive chargée
d. *Une émission tardive chargée intéressante

The ungrammaticality of (38d) would follow if adjectival predication, as is the case for the subject-verbal predicate relation, were a 'one-time' process.

6.3 Adjunction vs. specifiers and serialization of adjectives

While Valois (1991a, 1991b, 1996) proposes that APs are adjoined to X^{max} projections within DP, Cinque argues that they should rather appear in specifiers of some DP-internal functional projection, as illustrated in (39) (omitting other potential functional categories, such as NumP):

(39)



According to Cinque, there are both conceptual and empirical reasons to prefer this approach to the adjunction analysis. On the conceptual side:

(i) There is an unmarked *serialization* of the different classes of APs:

poss > cardinal > ordinal > speaker-oriented > subject-oriented > manner/thematic

Example (partial):
Le *sue due altre probabili goffe* reazioni *immediate* alla tua lettera
his two other probable awkward reactions immediate to your letter

poss > cardinal > ordinal > quality > size > shape > color > nationality

Example (partial):
(I) *suoi due altri bei grandi quadri tondi grigi*
his two other beautiful big pictures round gray

Adjunction being generally free, Cinque contends that the strict ordering is better rendered if encoded into the tree structure.[8]

(ii) There is a clear limit on the number of uncoordinated attributive APs, a fact that is better rendered by imposing a limit on the number of functional projections available in DP rather than limiting the number of adjunctions (although Cinque does not present an analysis of this).

(iii) The specifier analysis does not need to stipulate that APs are base-generated to the left of N, since this follows from the fact that specifiers are always on the left in Romance and Germanic.

Two empirical arguments for this approach are presented: First, APs with complements cannot appear on the left of N (a fact that was attributed to Heavy-AP Shift by Valois (1991a)), as is generally the case for XPs on a left branch:

(40) a. Il suoi fedeli (*alla causa) sostenitori.
the their faithful (to the cause) supporters
b. Il suoi sostenitori fedeli alla causa.

Second, as we saw in section 2, there is a cross-linguistic regularity in adjective ordering, whether adjectives precede or follow the noun. Again, this would follow from encoding serialization into the tree structure.

7 Challenges for the derivational analysis and semantics-based approach

There are outstanding issues that the derivational approaches must address. Bouchard (1998) points out a few in relation to the distribution and the scope of right-adjoined adjectives, as well as to interpretation differences between prenominal and postnominal adjectives in French. The main points are discussed below.

Possibly the most important issue that the derivational approaches raise is the mirror image distribution of adjectives one finds when comparing two languages like French and English. Indeed, when looking at classes of adjectives other than those found in event nominals, English adjectives are on the surface ordered in a way that mirrors the ordering found in French: whereas French postnominal adjectives exhibit the order N-ADJ1-ADJ2, English has ADJ2-ADJ1-N. If N-movement were the only factor responsible for the relative distribution of N and ADJ in these two languages, this is unexpected (French, for instance, should be $N\text{-}ADJ_2\text{-}ADJ_1$). In this connection, Lamarche (1991; see also Bouchard 1998) provides the following contrasts:

(41) a. A huge orange fruit
b. Un fruit orange énorme

(42) a. A delicious cold chicken
b. Un poulet froid délicieux

Lamarche's objection is that, if adjectives were generated prenominally in the same fashion in both French and English, with N-movement in French accounting for word order differences between the two languages, we should obtain: **Un fruit énorme orange* instead of (41b). On the basis of such examples, his conclusion is that free adjunction to the right of N in French is a more appropriate analysis than the derivational account (but recall Cinque's objections to free adjunction). If correct, this constitutes a serious problem for the derivational analysis. However, Cinque objects that (41b) is nonetheless compatible with the derivational analysis if the second AP (*énorme*) is interpreted predicatively, and as such is adjoined to the right periphery of NP. In fact, in their attributive interpretation, the same two French adjectives are ordered exactly as in English (partial N-movement being responsible for the ADJ_2-N-ADJ_1 order):

(43) Un énorme fruit orange

Bouchard (1998) objects to Cinque's analysis on the basis of two types of examples. Consider first (44):

(44) a. Le ministre de la défense *français*
the Minister of defense French
'The French Minister of Defense'
b. Le ministre de la défense est *français*.

In this example Bouchard claims that the postnominal (post-complement) adjective appears to receive an interpretation that seems to differ from the one it receives in the predicative construction (44b) (44b refers to the person's nationality more specifically).

The second type of example concerns the relative scope of adjectives. Bouchard's analysis (see below) predicts that, in French, when two adjectives appear postnominally, the rightmost adjective has scope over the other one. This is the case in (41b, 42b) for instance.

In the derivational approach, this is attained by allowing adjectives to be adjoined to the right periphery of the DP and be interpreted predicatively (Cinque 1994; Bernstein 1993b; Sleeman 1996).

Bouchard's objection to this option is based on the following examples:

(45) a. La distribution de pétrole américaine
b. *La distribution fut américaine.

While in (45a) the adjective can appear on the right periphery of the DP, (45b) shows that it cannot receive a predicative reading.

Although this issue may require further investigation, there seems to be a way to look at the two sets of examples that is till compatible with the derivational approach. The idea is that in both (44a) and (45a), the noun and its complement can be interpreted as a compound.[9] If this is correct, both examples simply represent cases of N-movement past an attributive adjective.

That the noun and its complement form a compound is probably more evident given the absence of a determiner before the noun *pétrole* in (45a). In fact, addition of a determiner results in ungrammaticality:

(46) *La distribution du (= de le) pétrole américaine

Returning to the mirror image issue, one last remark is in order. There have been additional claims that the mirror image in (41–42) is only apparent. For instance, in Laenzlinger's (2000) analysis of adjective ordering in French, (41b) could be derived from (43) through XP-movement of the string *fruit orange* to the left of the adjective *énorme* (much like Cinque's 1999 account of adverb ordering VP-fronting).[10]

Turning to Bouchard's (1998) account in more detail, which will lead us to discuss one last apparent challenge to the derivational analysis, his goal is to propose an analysis of the differences between French and English illustrated in the previous sections without recourse to N-movement. His approach is representational and relies on semantic rather than syntactic factors. The analysis is couched in Chomsky's (1995c) Minimalist Program. Here we briefly outline Bouchard's proposal and look at and discuss some of the empirical arguments behind it.

The main aspects of Bouchard's analysis are the following (it should be noted these premises play a role in other syntactic differences between French and English):

- in French, number is in D and has scope over all ADJ;
- in English, number is a morphological morpheme on N and has scope over elements on its left;
- *Number Scope Condition*: the element that codes Number in a nominal expression must have scope over the elements that determine the extensity of the expression (complementless adjectives are such elements).

Since number in D governs everything to the right within DP in French, adjectives may be adjoined higher than N, allowing them to be right adjoined to NP in postnominal position. In English however, adjectives are forced to appear in prenominal position attached to N since Number is on N and governs to the left.

Adjectives in French may also appear in prenominal position, some may even appear in either pre- or postnominal position. According to Bouchard, the relative position of the noun and the adjective is semantically based: prenominal

adjectives have a non-intersective reading while postnominal adjectives are intersective. The following example illustrates this:

(47) a. Une ancienne église
an old church
b. Une église ancienne
a church old

In (47a), the denotation is that of a former church while in (47b) it is that of an old church. In other words, the adjective may only be non-restrictive in (47a), while it may only be restrictive in (47b). Bouchard (1998) accounts for this difference in meaning by positing two different base-generated adjunction sites for adjectives (a consequence of his Internal Merging condition): prenominal adjectives are adjoined to N, while postnominal adjectives are adjoined to NP. As such, prenominal adjectives modify components internal to N, while postnominal adjectives modify all components. In other words, in (47b) a property is assigned to the set of individuals determined by the noun, while in (47a) it is not.

According to Bouchard, the contrast in (47) constitutes another challenge to the derivational analysis given the impossibility for N-movement by itself to account for the difference in meaning between the (a) and (b) examples. In fact, there clearly is no plausible reason why N-movement should have an impact on the meaning of the adjective in (47). Bernstein's (1993b) response to cases such as (47) is to posit two homophonous adjectives that are base-generated in different positions within the DP. In (47a) *ancienne* is an attributive adjective past which the head-noun has moved, while in (47b) the homophonous adjective is base-generated in a position that is higher than the target of N-movement.

It is worth observing that adjectives in event nominals, the analysis of which constitutes one of the main arguments for N-movement, do not exhibit the same meaning differences based on their surface position. Consider (48):

(48) a. L'invasion brutale de l'Albanie
b. La brutale invasion de l'Albanie

Although Cinque (1994) observed that the interpretation of the adjective in (48a) is that of a manner adjective while (48b) is that of a subject-oriented adjective, to us the difference in interpretation is minimal and certainly not nearly as sharp or along the lines of (47a, b), i.e., that of a non-restrictive vs. a restrictive interpretation.

Bouchard's analysis is presented in reaction to other objections of a conceptual nature to Cinque's (and the general derivational) analysis. Among others, Bouchard questions the nature of the functional categories whose specifiers contain the AP, as well as the mechanisms regulating partial N-movement, i.e., how far can the noun move, and how does it 'know' when to stop so that the correct word order is derived? We refer the reader to Bouchard's article for a more detailed discussion of the relative merits of the derivational and the representational analyses.

8 Conclusion

After discussing briefly the two main adjective types, i.e., predicative and attributive adjectives, the former further splitting into the intersective and non-intersective type, we looked at some early accounts of the ordering of adjectives problem. We then examined in detail two areas of research that have been developed recently concerning the syntax of adjectives: the ordering of adjectival strings per se, and the relative order of the adjective and the noun it modifies. Attempts at providing a principled account of adjective ordering have taken two different approaches: a derivational account, and a representational account. The derivational analysis derives the various positions of the noun and the adjective via N-movement (partial in the case of Cinque 1994), while the representational analysis is based on semantic features. There is a longer discussion than that presented here of the relative merits of the two analyses in Bouchard's (1998) paper. For instance, Bouchard's objections concerning the nature of the functional categories in Cinque's analysis, as well as the nature and constraints of partial movement, are valid points that must be addressed in further research. But we think that it is important to point this out: It seems that the debate might involve two independent considerations, i.e., (i) the assumptions behind the analyses of adjective distribution per se, and (ii) the arguments for N-movement. To reframe the problem, we might formulate the following questions: (i) Is the derivational account sufficient to account for *all* aspects of the syntactic distribution of adjectives? (ii) Are the arguments for N-movement (especially those based on the distribution of adjectives in event nominals, which extends to the distribution on DP-internal arguments) still valid?

NOTES

Thanks to two anonymous reviewers for useful suggestions.

1 According to Kamp (1975), predicativeness is described (informally) by the following syllogism:

(i) All Xs are Ys.
Z is a member of X.
Therefore Z is a member of Y.

Regarding adjectives, those for which the conclusion of (i) is true are predicative, others are not (they are attributive). According to this assumption, *white* in (ii) is predicative, but *large* is not:

(ii) All mice are mammals.
Freddy is a white mouse.
Therefore Freddy is a white mammal (true).
All mice are mammals.

Freddy is a large mouse.
Therefore Freddy is a large mammal (false).

2 This, of course, refers to stringed adjectives, that is, it exludes adjectives linked together by coordinate (e.g., and) or logical (e.g., but) conjunctions, adjectives enumerated with comma intonation, or adjectives that appear in sequences where one of them carries contrastive stress. It also only refers to 'morphological adjectives', as some languages, e.g., French, in some cases use different devices to qualify an object (e.g., *a wooden chair, une chaise [$_{PP}$ en bois]*).

3 Previous surveys had already established some semantics-based ordering of adjectives. Crystal (1971) reports that the order *size-age-color-nationality-material* is the norm in English, as exemplified in (i):

(i) Those large new red English wooden chairs.

However, he observes some cases where adjectives are interchangeable, as in (ii):

(ii) a. the cheap comfortable chairs
b. the comfortable cheap chairs

Seiler (1976) has a slightly different view: He claims that anaphoric adjectives precede all others and are followed by *affective-evaluating-color-material* adjectives. This is illustrated in (iii):

(iii) The aforementioned marvelous beautiful red wooden statue.

Other studies mentioned by Hetzron include Quirk and Greenbaum (1973), Sussex (1974), and Dixon (1977). However, Hetzron points out that these are either not systematic or limited to English.

4 The structure is actually more elaborate than (15). For instance, on top of the theme and agent arguments French DPs also allow the presence of a possessor argument (see Valois 1991a, 1991b, 1996 for details). In addition, Valois (1991a, b) advocates a 'layered' structure similar to that proposed by Sportiche (1990) which was shown to have some consequences with respect to the syntax of French sentence negation, *wh*-pied-piping (Moritz and Valois 1994) (see chapter 50), and extraction out of DP.

5 There seems to be a limitation on the number of postnominal adjectives. We return to this in section 6.2.

6 Bernstein (1993b) argues on the other hand that the pre- and postnominal position of an adjective results from the capacity of some adjectives to adjoin to different DP-internal position.

7 The right order of prenominal adjectives (e.g., *la probable complète invasion de Jupiter* versus **la complète probable invasion de Jupiter*) is achieved in Valois (1996) through a more elaborate structure of DP (as proposed in Sportiche 1990). For instance, *invasion* here is an event nominal which may select both an internal (here Jupiter) and an external (not realized) argument. Each requires its own maximal projection layer, as in (i):

(i) $[_{DP}\ [_{NumP}\ [_{NP^*}\ [_{NP}$ invasion de Jupiter]]]]

The adjectives *complète* and *probable* are adjoined to NP and NP* respectively.

(ii) $[_{DP}\ [_{NumP}\ [_{NP^*}$ probable $[_{NP^*}\ [_{NP}$ complète $[_{NP}$ invasion de Jupiter]]]]]]

On its way to Num, the noun first moves to the head on NP*, N*. *Complète* adjoins to the left of the noun at this point, forming the complex *[complète-invasion]*. This newly formed complex then moves to Num, followed by adjunction of *probable* to its left, yielding the right order of prenominal adjectives: *[probable [complète-invasion]]*.

One residual problem with the analysis is mentioned by Valois but no solution is offered at that point: The N-movement analysis he presents predicts that two or more postnominal adjectives should be possible, whereas they are not:

(iii) *L'invasion probable complète de Jupiter

Cinque's (1994) analysis (presented in section 6) offers a solution to this problem.

8 Although one might object that adjunction could be regulated by some (semantic) principles which would generate the right ordering, for example in a Montague-style grammar.

9 Thanks to an anonymous reviewer for the suggestion.

  5.1 *Wh*-movement
  5.2 Other kinds of movement
  5.3 Adverb placement as a diagnostic for movement
6 Adverbs and adjunction
7 Adverbs and the syntax/semantics mapping

1 Introduction

Adverbs are one of the familiar categories of traditional grammar. Traditional terminology suggests that adverbs are modifiers of the verb (Lat. *adverbium*, Gr. *epírrhema*). The traditional view has to be improved in at least two respects. First, adverbs modify not only verbs, but also predicates belonging to other syntactic categories (adjectives, as in *very smart*, other adverbs, as in *very soon*, etc.). Second, and even more importantly, not all adverbs can be interpreted as predicate operators (see section 3 for a discussion of this point). Sentence adverbs (for instance, 'modal' adverbs such as *probably*) are better conceived of as sentence operators, whereas subject-oriented adverbs such as *rudely* roughly correspond to two-place relations between individuals and events.[1] Temporal adverbs of frequency (such as *often*, *always*) have been interpreted as unselective operators (starting from Lewis 1975's seminal work) or even as generalized quantifiers (cf. De Swart 1993). The inescapable conclusion is therefore that different adverbs are projected into different semantic objects: the interpretive notion of 'predicate modifier' does not provide us with a criterion of classification sufficient to understand what all adverbs have in common.

Morphologically, matters are certainly not less intricate. Descriptively, adverbs can be classified into lexical and derived adverbs. Lexical adverbs can be morphologically related to adjectives (as witnessed by English *hard*, *fast*, etc.), to nouns (*yesterday, tomorrow,* etc.), to prepositions (*downstairs*, *before*, etc.) and arguably even to determiners (*now, there*, etc.).[2] Derived adverbs (*-ly* adverbs in English, adverbs formed by means of the Latin suffix *-mente* in Romance) are all adjectivally related adverbs, but they belong semantically to distinct classes (*probably* is a sentence operator, whereas *rudely,* at least in one of its possible readings, is a predicate operator). Therefore, it is difficult to see how morphological criteria could be helpful in our attempt to find a unitary characterization for adverbs.

Adverbial syntax, on the other hand, is notoriously a fairly complex domain. Traditionally, the parallelism with adjectival modification in the nominal domain and the possibility for adverbs to occur 'stacked' (*John repeatedly viciously attacked Mary*), as adjectives do (see chapter 3), has been held to imply that adverbs give rise to adjunction stuctures.[3] The view that (adjectival and adverbial) modification essentially involves adjunction is still widely shared, as we will see in the following sections. However, at least two problems should be immediately mentioned in this connection. First, many adverbs are clearly selected/subcategorized by the verb (as in *The job pays us handsomely, John worded the letter carefully*), and this fact has often been assigned a central theoretical relevance.[4] Second, it is far from obvious that the complex facts characterizing adverbial syntax can be derived by means of principled constraints on adjunction.[5] A careful examination of the literature shows in fact that the issue of adverbial modification fairly exceeds the domain of base-generated adjunction and significantly overlaps with issues concerning the status of implicit and optional arguments and the parallelism with optional oblique arguments such as benefactives, instrumentals, locatives, and so on.

These first considerations about the syntax of adverbs acquire a particular importance if viewed in the light of their ambiguous categorial status (which will be discussed in detail in section 2). It has been observed in the literature (cf. especially Larson 1985a) that the distribution of adverbs can be hardly made dependent on some common set of syntactic features, corresponding to a well-defined syntactic category, as is arguably the case with the other lexical categories (N, V, A, and presumably P). Adverbs may be characterized as a collection of phrasal categories exhibiting similar distribution (and being hopefully assigned some common semantic function, such as that of 'modifier'). However, it is far from obvious that CPs (as in *because I am sleepy*), PPs (as in *at 4 o'clock*), APs (as in *hard*) and NPs (as in *that way*) constitute a natural class under any generally accepted set of syntactic features. This makes it hard to understand why they tend to be distributionally equivalent when occurring as adverbials, under common assumptions concerning the relation between semantic and categorial selection.

These considerations might lead to interesting general conclusions along the following lines. Adverbs (and more generally 'adverbials', that is, phrasal categories

of different sorts roughly performing the same function as lexical adverbs) constitute a still largely unsolved puzzle concerning the form of mapping between syntactic and semantic categories. The problems are more serious than those that arise with other lexical categories (the fact, for instance, that the very same syntactic category may be mapped into two or more distinct semantic categories, or the related fact that different syntactic categories may be mapped into the very same semantic object). The additional problem concerns here the difficulty to understand which set of syntactic features is involved in the mapping (as we have seen, the distributional evidence does not provide us with the desired answer), and the lack of agreement among scholars as to the precise definition of the co-domain of the mapping function (are adverbials to be uniformly regarded as predicate modifiers, or are they to be assigned to a large variety of semantic objects, ranging from individuals to sets to sets of sets, just abstracting away from 'intensional' complications?). Given this state of affairs, it is really not surprising that the syntax of adverbs (and, more generally, the syntax of modification) still represents one of the most controversial domains of research, posing essential challenges to core modules of syntax such as the theory of categorial constituency, so that ". . . we still have no good phrase structure theory for such simple matters as attributive adjectives . . . and adjuncts of many different types" (cf. Chomsky 1995c: 382, n. 22).

Nevertheless, we hope that the following sections will show to the reader that research in formal linguistics has greatly contributed, over the past 30 years, to our understanding of important properties of adverbs and adverbial phrases.[6] Our discussion will be fairly interdisciplinary, partly reflecting the different perspectives from which the issue of adverbial modification has been approached along the years. In section 2, the categorial status of adverbials will be discussed, in the attempt to clarify whether the presence of adverbs in the lexicon of a given language requires the enrichment of the commonly assumed set of syntactic categories and/or the commonly accepted set of categorial features. Section 3 deals with the main attempts to classify adverbials into several distinct classes, mainly based on interpretive criteria and revolving around the mapping from syntactic representations to 'logical' forms which provide a suitable 'compositional' input for interpretation. In section 4 it will be shown that the issue of syntactic placement of adverbials is largely underdetermined by their partition (on semantic grounds) into different classes. Section 5 will face the issue of movement (how it relates to adverbial syntax): we will discuss the peculiar properties of *wh*-movement when applied to adverbs/adjuncts of several types and the status of the argument/adjunct asymmetry (see chapter 64), the possibility that adverbs undergo other sorts of movement and the use of adverb placement as a diagnostic for the application of different sorts of syntactic processes, with special reference to head-movement processes. In section 6 the issue of adjunction and some related theoretical issues will be handled. Finally, in section 7, an attempt will be made to illustrate the range of semantic ambiguity of adverbials by means of a detailed examination of the behavior of different sorts of temporal adverbs.

2 The categorial status of adverbs

As emphasized in the introduction, this is one of the long-debated issues in adverbial syntax. It is easy to observe that handbook-level classifications of syntactic categories generally tend to overlook the presence/role of adverbs, under the (often) implicit assumption that lexical adverbs are relatively easily amenable to the most common syntactic categories (A, N, and P). A necessarily condensed survey of the relevant literature reveals that this attempt has been pursued in two main directions.

On the one hand, adverbs occurring in sentence-final position (as in *John ran downstairs*) are easy to interpret as 'intransitive' (that is, objectless) prepositions, as confirmed by the fact that many of them can behave as normal prepositions (*down the stairs*) and/or are morphologically related to prepositions (Klima 1965; Jackendoff 1972). This strategy is at first sight corroborated by the parallel treatment of postverbal particles (as in *John carried up the trunk*) as transitive prepositions also admitting an intransitive use, in terms of 'directional' adverbs with virtually the same meaning as when they have an object (Emonds 1985: 252ff.; see also chapter 76). However, it is hard to see how adjectival adverbs such as *long* or *fast* might be inserted in this category (Jackendoff 1972: 63). Similarly, the issue arises of *-ly* adverbs occurring sentence-finally as selected by the verb (as in *John dresses elegantly*): are they to be added to the inventory of (intransitive) prepositions or are they transformationally related to the sentence-internal position (see section 3) where they are normally generated if not selected by the verb (as in *John elegantly solved the problem*)? Either solution does not appear particularly natural, even though the transformational analysis is more readily discarded on strictly theoretical grounds (it would unnecessarily increase the complexity of subcategorization rules, Jackendoff 1972). The variety of interpretations and the complex distribution of *-ly* adverbs has constituted in fact the main source of evidence against the attempts to reduce adverbs to more primitive syntactic categories, as we will see in a moment.

The case of adjectivally related adverbs such as *fast* and *hard* has led some scholars to the hypothesis that even non-selected adverbs are uniformly categorized as A(djectives), say with a defective distribution (Emonds 1985). In other words, *-ly* is considered a suffix inflectional on A (tentatively accounting, under the assumption that English admits only one inflection per word, for the fact that comparative/superlative affixes cannot be added to *-ly* adverbs: **elegantlier*), the crucial evidence being provided by the cases where the adverb is morphologically indistinguishable from the related adjective. As for the case of underived adverbs (such as *seldom*, *often*, etc.) which do not occur in noun-modifying position, it has been argued that they may be As as well, on the grounds of the observation that they exhibit the same specifier system as adjectives, as can be seen in *very seldom*, *how often*, etc. The position that unselected adverbs are uniformly As from a categorial perspective is somehow reminiscent of the hypothesis (dating back to at least Katz 1964) that alternations such as *good/well*

constitute suppletive pairs of the abstract underlying form (A, EVALUATIVE), the different surface realization being the result of case-assignment to the adjectival member of the pair (the comparative/superlative forms *better* and *best* are actually indistinguishable). A natural development of this basic insight would be to assume that APs and adverbial APs differ in that the former, but not the latter, are case-marked. It has been observed that there are cases where adjectival and adverbial realization appear to be in free alternation (Emonds 1985: 58, n. 30).[7] Pursuing this line of research would obviously require versions of theta *and* case theory which are able to correctly derive the fact that caseless APs are interpretable only in some well-defined positions (the adverbial use being strictly confined to these positions). Alternatively, one might simply consider some extension of the case filter to true APs, with adverbs belonging to a syntactic category other than A. This possibility leads us to examine the radical alternative to the 'reductionist' approaches considered so far, based on the assumption that adverbs constitute a primitive syntactic category.

This alternative is explicitly developed in Jackendoff (1972), where adverbs are assumed to be lexical categories performing, within the verbal domain, the same function performed by adjectives within the nominal domain. The parallelism between adverbs and adjectives is particularly striking on distributional grounds: adverbs surface between subject and main verb (in the so-called 'auxiliary position', identified with the underlying position for *-ly* adverbs, as in *John easily won the race*), exactly as adjectives surface between the determiner and the noun (*the easy solution*). Derived nominals and gerunds provide the most suitable context for the parallelism to be detected (*John's rapid reading of the letter* vs. *John's rapidly reading the letter*) (see chapter 30). The leading hypothesis is that there are two distinct base rule schemas for adjectives and adverbs, roughly assigned the following form (Jackendoff 1972: 60):[8]

(1) N′ (Adj) – N – Complement

(2) V′ (Adv) – V – Complement

The rule admits a more abstract formulation, in which the categorial labels N/V are replaced by the common symbol X (referring to the sets of syntactic features shared by N and V), and Adj/Adv are replaced by the common symbol Y (referring to the set of features shared by adverbs and adjectives): in this way it is possible to capture the distributional similarity emphasized above by simply expressing the generalization that whenever the feature +V is assigned to X the feature +Adv will be assigned to Y (yielding the base rule schema in (2)). It is worth noticing that these distributional facts (whose theoretical relevance is confirmed by the observation that adjectives that only occur prenominally are paralleled by adverbs exclusively occurring in auxiliary position, as in *the mere truth* vs. *John merely said the truth*) could not be easily given formal expression in a grammar where adverbs are derivative categories transformationally related to adjectival sources (as was the case, in the 1960s, for the approaches inspired by

the Katz-Postal hypothesis, according to which all semantic information is encoded in underlying structure). The fact that a sentence such as *John easily won the race* can be assigned an underlying structure roughly equivalent to *It was easy for John to win the race* does not offer any clue as to why adjectives and adverbs should exhibit the distributional symmetry tentatively captured in (1–2). Criticism of the idea that adverbs and adjectives are transformationally related is also based on the observation that adverbs of certain classes (such as *merely, readily, actually*, etc.) cannot be derived from adjectival sources (*Albert is merely being a fool / *it is mere that Albert is a fool*) and on the hopeless variety of the adjectival sources arguably involved (to be reviewed in section 3 while discussing the variety of interpretations assigned to different classes of adverbs). It seems reasonable to conclude that adverbial syntax constitutes one of the domains of research in which the complex and idiosyncratic rules resorted to in generative semantics (typically involving deletion of the superordinate clause and insertion of lexical material in the lower clause) proved not only difficult to handle but also severely inadequate empirically. A case in point (beyond the general difficulty of attaining a real simplification of the lexicon due to the unavailability of adequate adjectival sources for many adverbs) is provided by the analysis of adverbials such as instrumental PPs. The attempt to link sentences such as *John sliced the salami with a knife* to sources involving *use* in the deleted higher clause (*John used a knife to slice the salami*) has been argued at least as early as in Bresnan (1969) to be problematic in view of cases such as *John used a knife to slice the salami with*.

It might be argued that *derived* adverbs and a subset of *lexical* adverbs are adjectival, with other adverbs distributing over various syntactic categories, as is the case for prepositional adverbs occurring in sentence-final position (see above) and for bare NP adverbs, like the *now/then* and *here/there* pairs discussed in Emonds (1985) and the temporal, locative, directional, and manner bare NP adverbs discussed in Larson (1985a) (*sometime*, *someplace*, *that direction*, *that way*). However, this analysis would still be in need of explaining the central fact of adverbial syntax, that is, the distributional symmetry observed among 'adverbial' constituents belonging to several syntactic categories. Bare NP adverbs, for instance, certainly exhibit distributional peculiarities, in that they can occur in specifier positions which are restricted to NPs (as in *yesterday's refusal*, Larson 1985a: 598). They also exhibit, however, a distributional behavior quite similar to that of other 'adverbial categories': they occur in subcategorized position (as in *Peter worded the letter that way/tactlessly/in a thoughtful manner*), co-occur with the intensifier *right*, as adverbial PPs and adverbial clauses do (*I saw John right then/near the door/after you did*), and can be easily coordinated with adverbial categories of a different syntactic category (*They will be arriving Thursday and/or subsequently*). The obvious expectation is that constituents sharing, to a significant extent, the same distributional behavior, will also be endowed with the same categorial feature(s). On the other hand, as already emphasized, CPs, APs (or AdvPs), PPs, and NPs hardly constitute a natural class under any generally accepted set of syntactic features. As observed by Larson, the temptation might

be strong to postulate 'hidden' categorial structure for which it is difficult to find independent evidence, as in Bresnan and Grimshaw's (1978) account of English free relatives (see chapter 27), where bare NP adverbs are analyzed as PPs headed by an empty head. A better solution consists in the assumption that distribution is not an exclusive function of category membership, as was the case in structural linguistics and in earlier phases of generative linguistics. Distribution is rather the product of the interaction of different modules of syntax (essentially, theta theory and case theory). This approach is particularly natural if it is assumed that predicates may assign 'adverbial theta-roles' to arbitrary categories and that distributional constraints affecting certain adverbial categories (like bare NP adverbs) essentially depend on case considerations.[9] Potential problems for this approach concern the feasibility of the notion of 'adverbial theta-role' (based on the analogy with the theta-roles assigned to other optionally selected constituents such as benefactives), especially in view of the fact that adverbial categories are arguably mapped into a relatively large variety of semantic objects (section 7), and that the nature of the mapping is largely independent of their categorial specification.

Summarizing, there seems to be agreement that the notion 'adverb' is largely dependent on thematic and case-theoretic considerations and cannot be simply reduced to a categorial primitive. Phrases belonging to different syntactic categories (NPs, PPs, CPs) are easily assigned the same semantic function and the same syntactic distribution as 'lexical' adverbs. As for the latter, there seems to be some consensus that the 'reductionist' approach (all adverbs are Ps, As, or Ns) cannot be pursued up to its extreme consequences, and that mention of the category 'Adverb' might well be unavoidable. Interestingly, reductionist approaches tend to discharge the burden of explanation on specific versions of theta and case theory.

3 Adverb classes

Descriptively, adverbs of different sorts are distinguished on intuitive meaning grounds. In the literature, reference to adverbs often makes use of such primitive labels as manner adverbials, locative adverbials, temporal adverbials (further distinguished into punctual, durative, frequency adverbs, etc.), means and degree adverbs, reason adverbials and so on. At a more abstract level, the classification task is intended to provide generalizations which might be relevant for a satisfactory formal characterization of adverbs, on syntactic and/or semantic grounds. Adopting a semantic or a syntactic perspective may lead indeed to quite different results. Here, we will consider the two perspectives separately, comparing them only at a later phase.

Semantically, adverbs have been traditionally partitioned into predicate operators and sentence operators (roughly corresponding to the familiar distinction into VP-adverbs and S-adverbs). S-adverbs are assumed to take scope over the whole sentence, as is clearly the case with modal adverbs such as *probably*,

certainly, presumably, etc., whose semantic structure roughly coincides with a copula clause containing *Adj* (that is, the adjectival counterpart of the modal adverb) and taking as its unique argument the sentence resulting from removing the adverb (*Frank is certainly avoiding us / It is certain that Frank is avoiding us*) (Jackendoff 1972: 69). However, the interpretation of S-adverbs as uniformly belonging to the syntactic category t/t (categories combining with sentences to yield sentences) is clearly deemed to fail, since many other sorts of S-adverbs, such as evaluative adverbs (*fortunately, happily*, etc.), domain adverbs (*politically, botanically*, etc.), and pragmatic adverbs (*frankly, honestly*, etc.) seem to resist this straightforward semantic treatment.[10] Jackendoff's Type I adverbs ('speaker-oriented adverbs') are actually interpreted as involving (at least in some cases) a two-place adjectival predicate, whose first argument is the sentence resulting from removing the adverb and whose second argument is an NP referring to the speaker: ADJ (SPEAKER, f(NP^1, . . . , NP^n)), where ADJ is the adjectival counterpart of the adverb and f(NP^1, . . . , NP^n)) expresses the relation between the verb and its strictly subcategorized arguments. As a consequence, the appropriate paraphrase for a sentence such as *Happily, Frank is avoiding us* (containing an evaluative adverb) will involve a two-place adjective, as in *I am happy that Frank is avoiding us*. Matters are even more complex in the case of speech-act modifying or pragmatic adverbials, which seem to modify an implicit speech-act predicate: the appropriate paraphrase for *Botanically, a tomato is a fruit* will presumably be something equivalent to *In making the following assertion, I speak botanically: A tomato is a fruit*. What seems to be at stake here is that "we do not use the proposition expressed by the modified sentence as input to our adverb: rather, the adverb helps determine what proposition that sentence expresses. And this then makes it impossible to treat sentence adverbs of this kind as semantic functions whose arguments are propositions expressed by the modified sentences" (McConnell-Ginet 1982: 176). In other words, it seems reasonable to conclude that Jackendoff's class of 'speaker-oriented adverbs' is sufficient to show that the interpretation of S-adverbs in terms of sentence operators is severely inadequate. As for the nature of the mapping between sentences containing adverbs and the adjectival structures purported to express their interpretation, it is important to emphasize that Jackendoff interprets it in terms of 'projection rules' belonging to the interpretive component (against the view of generative semanticians, contending that adverbial sentences and their adjectival counterparts are transformationally related).[11] The role of syntax consists in constraining the application of these rules, since each of them applies to a well-defined set of structural descriptions: for instance, the projection rule mapping speaker-oriented adverbs into two-place adjectives will not apply to syntactic configurations where the adverb is generated too low in the structure, as in **George will be happily finishing his carrots*. Of course, interesting issues arise concerning the compositional nature of the interpretation procedure, issues to which we will return below.

Let us consider now the case of VP-adverbs (that is, adverbs allegedly interpreted as predicate operators). The traditional view in formal semantics (established in Montague's classical contribution and defended in largely influential

successive work, cf. especially Thomason and Stalnaker 1973) is that VP-adverbs, typically instantiated by manner adverbials such as *slowly*, correspond to predicate functors, that is, categories of type <<e,t>, <e,t>>, which apply to predicates to yield predicates (see Heny 1973 for a discussion of this approach). A well-known shortcoming of this approach is that it fails to derive arguably valid logical entailments such as *John walks slowly / John walks* as a matter of logical form, requiring the introduction of specific meaning postulates (that is, the validity of this kind of logical entailment has to be independently established, in principle, for each single predicate). It is worth noticing that the set-theoretic treatment of VP-adverbs as predicate functors appears to constitute a suitable formalization of Jackendoff's semantic structure for manner, degree, and time adverbs (Type III adverbs, Jackendoff 1972: 70–71). The semantic structure associated to manner adverbs by projection rules is roughly represented as [f + ADV] (NP^1, . . . , NP^n), expressing the fact that the adverb can be interpreted as adding a lexically determined set of 'semantic markers' interacting with the set of semantic markers corresponding to the lexical meaning of the verb, without altering its 'functional structure', that is, its selection properties.[12] Both approaches (Montague's and Jackendoff's) fail to characterize adverbial modification as essentially involving that the extension of the modified predicate is (properly) included in the extension of the original one – "that the set of those who talk quickly is a (probably proper) subset of the talkers" (McConnell-Ginet 1982: 162). That 'davidsonian' inferences of this sort actually hold has been repeatedly challenged in the literature: *He filled the tank halfway / He filled the tank* can hardly be viewed as a logically valid entailment, even though *halfway* qualifies as a VP-adverb according to the diagnostics proposed in Thomason and Stalnaker (1973), contrary to adverbials such as *allegedly* and *in a dream*, which have also been used in order to reject the davidsonian inference pattern (Parsons 1970; Montague 1974). However, it is widely aknowledged that inference patterns such as *John walks slowly, therefore he walks* fit quite well our pre-theoretical intuitions about adverbial modification. That the analysis of VP-adverbs as predicate functors can hardly be assumed to adequately formalize our pretheoretical intuitions about 'modification' is more clearly confirmed by the fact that this analysis cannot be satisfactorily developed in purely extensional terms. In a model where 'those who talk' accidentally coincide with 'those who walk', we do not want to conclude that those who talk quickly necessarily coincide with those who walk quickly (McConnell-Ginet 1982: 162). The solution traditionally consists in assuming that the adverb takes the intension rather than the extension of the predicate as its argument (this way, alternative situations are considered (possible worlds) where the extension of the properties of walking and talking are differently defined, making it possible to differentiate the result of the application of the function 'quickly' to these properties). However, the intensional machinery does not really reflect the way we think about *why* quick talkers and quick walkers may well correspond to two distinct sets in situations where talkers and walkers coincide. Intuitively, what we would like to have is a semantics according to which ". . . a single situation can distinguish those walking quickly

from those talking quickly, even if walkers are all talkers and vice versa" (McConnell-Ginet 1982: 163). There is a clear sense in which 'intensions' are beyond the point here, but intensions are all we have to achieve the correct empirical result if VP-adverbs are to be treated as predicate functors.

As is well known, the davidsonian approach (Davidson 1967) is often understood as a research program intended to circumvent these counterintuitive intensional complications, by means of a non-standard formalization of first-order logic. Events are entities and predicates contain an additional argument position for events. Sentences such as *Sebastian strolled through the streets of Bologna at 2 am* and *Sebastian strolled through the streets of Bologna* are assigned the logical forms in (3) and (4), respectively, easily reducing logical entailment between the first and the second sentence to a matter of form (Davidson 1980: 166):

(3) ∃e(Strolled(Sebastian, e) and Through(e, the streets of Bologna) and at(e, 2am))

(4) ∃e(Strolled(Sebastian, e) and Through(e, the streets of Bologna))

The real issue, however, is that interpreting VP-adverbs as predicate functors (as in Montague grammar) or as predicates of events (as in Davidson's proposal) does not provide any viable approach for the analysis of slightly more sophisticated uses of VP-adverbs, as with the 'subject-oriented' reading of manner adverbs like *rudely, carefully*, etc. According to this reading, the adverb does not express the manner in which the action occurred, but rather expresses some judgment about the import of its occurrence (the latter reading is also qualified as 'stative', cf. Higginbotham 1989). Jackendoff (1972) assigns this reading the following semantic structure: ADJ(NP^i, $f(NP^1, \ldots NP^n)$), corresponding to a two-place adjective which takes as its first argument the sentence obtained by removing the adverb and as its second argument one of the elements selected by the verbal predicate. The canonical example *Louisa rudely departed* will therefore be assigned, in its subject-oriented reading, a paraphrase roughly corresponding to *It was rude of Louisa to depart* (McConnell-Ginet 1982; Higginbotham 1989).[13] Notice that a delicate compositionality issue arises here, since Jackendoff's paraphrase contains two instances of the subject NP (as a semantic constituent in its own right and as a sub-constituent of the sentential argument), whereas sentences such as *Louisa rudely departed* cannot be assumed to contain multiple occurrences of the subject NP (abstracting away, of course, from analyses which identify the deep structure of the sentences under scrutiny with their logical form, as in Lakoff 1965). McConnell-Ginet proposes a solution according to which Jackendoff's paraphrase should be modified by replacing the sub-constituent of the sentential argument which also occurs as first argument of ADJ with a variable. This can be made semantically straightforward by assuming that in the subject-oriented reading of *Louisa rudely departed*, the adverb is a daughter of the sentential node and applies to VP (interpreted as a predicate, that is, λxPx). Since predicates and open sentences of the form Px are both interpretable as propositional functions,

the semantics of *Louisa rudely departed* can be partially made parallel to that of its adjectival paraphrase *It was rude of Louisa to depart* (where the semantic variable is presumably provided by the subject PRO of the infinitival clause), without any need of unorthodox stipulations concerning the syntactic structure of *Louisa rudely departed*.[14] However, application of the predicate functor *rudely* to either V (yielding (6)) or to the whole VP (yielding (5)) will still be insufficient to differentiate the manner reading from the subject-oriented one, since the predicates to which the adverb applies in the two cases differ only structurally, but not semantically, and will therefore yield undistinguishable interpretations (McConnell-Ginet 1982: 161):

(5) (Louisa) (rudely (λx (x departed)))

(6) (Louisa) (rudely (departed))

Again, the predicate-operator approach needs to resort to meaning postulates in order to arrive at the correct empirical result: in this case, it seems necessary to assume two distinct predicate operators 'rudely$_1$' and 'rudely$_2$', one designating manner and the other attitude.

This is the reason why a number of scholars have rejected the predicate-operator approach, essentially by adopting non-standard assumptions about the argument structure of (verbal) predicates. According to one of these hypotheses, manner adverbs (presumably on a par with other 'circumstantial' adverbs such as locatives, instrumentals, etc.) are to be interpreted as 'optional' arguments of the verb. The main piece of evidence is provided by the fact, discussed in section 2, that adverbs, on a par with other 'optional' arguments such as 'benefactives', are sometimes obligatorily selected by the verb, as in *Joan behaved *(badly)* and *Most of the people treated Jill *(rudely)*.[15] Jackendoff's failure to satisfactorily connect the homonymous 'manner' and 'sentence-complement' (i.e., subject-oriented) adverbs is allegedly repaired by assuming that adverbs that are semantically equivalent to predicates with a sentential complement are actually connected (by means of some lexical rule) with genuine 'higher' predicates, modified by the adverb and regularly taking sentential complements. In this way, the subject-oriented interpretation of *Louisa rudely departed* will be traced back to structures of the form *Louisa acted rudely to depart* (McConnell-Ginet 1982: 173). Notice that this kind of approach is essentially based on assuming fairly complex lexical representations, with a high degree of lexical ambiguity: the manner reading depends on the possibility of adding an extra argument position in the theta-grid of *depart*, whilst the subject-oriented reading is based on the possibility that the adverb can be interpreted as the modifier of an implicit higher predicate. Conceptually, they seem to be motivated by the desire to replace the mechanical meaning postulates which would anyway be necessary within the predicate-operator approach with explicit assumptions about the nature of the lexical operations involved, in the hope that these assumptions will eventually lose their stipulative flavor. In the same vein, but more in the spirit of Davidson's

approach, Higginbotham (1989) proposes that the issue of adverbial modification reduces to how open positions in the lexical structure of lexical items are 'saturated' by means of the mechanism of thematic discharge (involving the operations of theta-binding, theta-identification, and autonymous theta-marking) developed in Higginbotham (1985), and originally applied to adjectival modification. The basic insight is that there are cases of adverbial modification, as in *Mary fatally slipped*, which exactly parallel the canonical adjectival modification in *a white ball*. Under the assumption that adverbs express relations about an event *e* and an individual *x*, and that the open positions in the lexical structure of the adverb can be 'discharged' by identifying them with those in the lexical structure of the verb, it is possible to arrive at the correct semantic paraphrase (*Mary slipped and it (the slip) was fatal to her*). Needless to say, the manner and subject-oriented readings of adverbs such as *rudely* require that the adverb under scrutiny be assigned more complex (and distinct!) lexical structures: as for the manner reading, rudely is interpreted as expressing a relation between situations and 'attributes' (the latter corresponding to the 'intensional' equivalents of predicates), in order to arrive at paraphrases like '*e* is a departure by Louisa and it is rude (for a departure by Louisa)'; as for the subject-oriented reading, the adverb is assigned the lexical structure of a three-place predicate (expressing a relation among situations, individuals, and attributes), in order to yield paraphrases such as 'the departure of Louisa was rude of Louisa, as classified by the very attribute of being a departure by Louisa'.[16] It is worth noticing that Higginbotham's analysis of adverbial modification can be interpreted as an attempt to provide the semantics for adjunction structures: adverbs, within the large variety of their interpretations, are consistently analyzed in terms of n-place relations crucially involving the event variable assigned to action predicates by Davidson.[17] This position has to be carefully kept apart from the view taken in McConnell-Ginet (1982) or Larson (1985a), where 'circumstantial' adverbs are interpreted, as emphasized above, as (optional) arguments of the verb. In section 7, we will see that the latter view is apparently supported by important facts concerning (a subset of) temporal adverbs. For the time being, we will limit ourselves to pointing out some intriguing facts concerning adverb-incorporation in Modern Greek, which also seem to militate in favor of the relevance of the argument status of adverbials (Rivero 1992). Rivero discusses the fact that manner and directional adverbs apparently incorporate into the verb in Modern Greek.[18] Incorporation is not limited to strictly selected adverbials (as in *Mary behaves badly toward her sister*) but significantly extends to normal cases of adverbial modification like *Mary turned it upside down*. The class of incorporators arguably includes 'aktionsart' adverbials such as *again* (intuitively referring to the internal properties of the event, much in the spirit of Verkuyl 1993's 'theory of aspectuality' and as such qualifying as VP-internal), but crucially excludes 'aspect' adverbials like *still* (apparently sensitive to the perfective/imperfective distinction) and 'tense' adverbials like *yesterday* and *often* (which are assumed to be adjoined to different functional layers such as AspP and TP). Under the assumption that these phenomena fall under the range of Baker's (1988a) analysis of incorporation in terms

of head-movement into a higher selecting head, Rivero uses them as a diagnostic for a distinction between adverbials which qualify as arguments of the verbal predicate (manner, directional, and aktionsart adverbs) and those that are adjuncts related to different functional projections (primarily aspect and tense adverbs). The results produced by the application of this diagnostic are sometimes highly intriguing. The classification cuts across the class of circumstantial adverbs: manner and locative adverbials are kept apart from temporal adverbials, suggesting that the latter are never interpreted as arguments, a result difficult to justify both on empirical and theoretical grounds (see section 7).

As emphasized at the outset, identifying different adverb classes is strictly dependent on the nature of the criteria which are applied. On essentially distributional grounds, the number of relevant classes can be easily shown to exceed the semantically motivated partition into VP- and S-adverbs, and the related quadripartition proposed in Jackendoff (1972).[19] There is a large amount of literature, concerning a relatively large typological domain, about the rigid relative ordering of different sorts of adverbs.[20] Cinque (forthcoming) proposes a universal hierarchy of adverbs (hopefully correlating with a fixed universal hierarchy of functional projections, see section 6) which distinguishes among (at least) an ordered sequence of 'higher' sentence adverbs, an ordered sequence of 'lower' VP-adverbs and an unordered sequence of VP-internal 'circumstantial' adverbs:

(7) higher sentence AdvPs > lower AdvPs > (DP^{subj}) (V) complements > > place, time, manner, etc. adverbials[21]

The theoretical relevance of the partition obtained by applying distributional criteria is assumed to depend on the feasibility of the correlation between (classes of) adverbs and independently motivated functional projections, and on the existence of a one-to-one correlation between syntactic positions and semantic structures. At the same time, it is worth emphasizing that these results are unlikely to improve our understanding of the compositionality issue. The relation between the syntactic position occupied by an adverb and the semantic role fulfilled by the latter remains essentially non-compositional (as was the case in Jackendoff's analysis).[22] We might say, by adopting Jackendoff's terminology, that the arbitrariness of the projection rules involved is hopefully compensated for by the presence of a distinct structural description for each projection rule. The role of syntax seems to consist in producing an unambiguous input for the application of non-compositional interpretive strategies. This would entail that the relation between the manner and the subject-oriented readings of adverbs such as *carefully* or *rudely* does not go far beyond accidental homonymy.

Summarizing, we have seen that the familiar distinction between VP-adverbs and S-adverbs is hardly supported by a semantic partition between adverbs that are predicate operators and adverbs that are sentence operators. Rather, a large variety of interpretations has emerged (for instance, Jackendoff's speaker-oriented and subject-oriented readings of S-adverbs and VP-adverbs, respectively).

Two major streams of research have been discussed. The one tries to cope with the challenge that adverbial syntax poses to compositionality. The other accepts the arbitrariness of the projection rules and tries to provide the most adequate characterization of the set of structural descriptions involved (representing the input for the interpretive component). We turn now to the consequences of the proposed analyses for the issue of adverb placement.

4 Issues of adverb placement

As remarked at the end of the previous section, investigations on the syntactic position occupied by adverbs are likely to play an essential role if syntax is assumed to provide an unambiguous input for the application of the interpretive procedure ('projection rules') which associates adequate semantic structures to sentences containing adverbs. In the ideal situation, configurations where an adverb is assigned more than one interpretation should be ambiguous between two distinct configurations in which the adverb fills a different position, and, conversely, there should be no case of an adverb receiving the same interpretation in more than one syntactic position (abstracting away, for the time being, from the 'reconstruction' properties of certain kinds of adverb movement, which will be discussed in sections 5.1 and 5.2). Jackendoff (1972) tried to reduce the notion 'ambiguity of syntactic position' to the notion 'ambiguity of syntactic attachment'. The canonical cases of ambiguity taken into consideration concern relative ordering of adverbs and auxiliaries, as in the following examples:

(8) a. John cleverly has read the book.
b. John has cleverly read the book.
c. John has read the book cleverly.

As is well known, (8a) is only possible with the subject-oriented reading of the adverb, and (8c) with the manner reading of the adverb. As for (8b), it is assumed to be ambiguous between the subject-oriented and the manner reading. These facts easily follow if the adverb is attached to S in (8a) and to VP in (8c), whereas it is ambiguous between VP-attachment and S-attachment in (8b), under the assumption that the projection rule providing the subject-oriented and the manner reading only applies to adverbs attached to S and to VP, respectively. The ambiguity of attachment holding for (8b) is derived from the hypothesis that the auxiliary system is split into two parts, with Modal and Tense realized as a daughter of S and (*have -en*)/(*be -ing*) realized under VP (Klima 1966; Emonds 1970). Since obligatory raising of *have*/*be* to Tense is assumed to take place, this system entails that an adverb which follows a single auxiliary, as in (8b), can be attached either to S or to VP, reducing interpretive ambiguity to structural ambiguity, as desirable on theoretical grounds. One of the predictions is that adverbs following more than one auxiliary are only compatible with the manner reading (crucially excluding S-attachment), since the second auxiliary, that does not

undergo movement to Tense, is obligatorily VP-internal, forcing VP-attachment of the adverb. The prediction is borne out, as shown in (9) (Jackendoff 1972: 76):

(9) George will have (*probably/completely) read the book.

A more complex class of facts involves the marginality of the manner reading in configurations where the adverb surfaces between two auxiliaries, as in *John will (probably/?*completely) have read the book*. Within the system outlined above, the question is how to exclude VP-attachment of the adverb. The solution consists in assuming that the position of VP-adverbs within VP is rigidly determined to follow *have/be* and is therefore incompatible with the relative ordering observed in the sentence under scrutiny (entailing VP-fronting of the adverb). The position of the adverb is however somewhat less rigid in the cases involving S-attachment: the system has to account for (at least) the possibilities exemplified below, with the adverb preceding the subject, filling an intermediate position between the subject and the auxiliary, following the auxiliary, and occurring in dislocated sentence-final position (Jackendoff 1972: 72ff.):

(10) a. Evidently John has eaten the beans.
b. John evidently has eaten the beans.
c. John has evidently eaten the beans.
d. John has eaten the beans, evidently.

As emphasized above, the very same structural position should be involved here, since the interpretation is essentially the same in all cases. The proposed solution consists in assuming that all the adverb positions detected in (10) crucially involve S-attachment: the relative ordering with respect to other constituents may vary, provided the sisterhood relation to these constituents is maintained. This proposal is technically implemented by resorting to the 'Transportability Convention' introduced in Keyser (1968), according to which constituents marked as [+transportable] can be freely moved, giving rise to a (possibly) large variety of linear orders, under the condition that the fundamental *structural* relations that they entertain with the other constituents be preserved. The stipulative flavor of this solution is essentially maintained under more recent approaches to the problem raised by (10). Belletti (1990), where a more constrained version of X-bar theory is adopted (essentially, that defined in Chomsky 1986a), ruling out uniform base-generation of subject, auxiliary, and adverb as daughters of IP (= S), proposes for (10c) an analysis which involves recursion of the Agr(eement)-node.[23] The proposal is that S-adverbs such as *evidently* are uniformly generated as adjoined to the sentential AgrP node. Whenever an auxiliary is present, Agr-recursion is assumed to take place, with obligatory movement of Aux to the higher Agr-node (cf. Belletti 1990: 53ff.). Under these assumptions, the word orders in (10a) and (10c) depend on whether the adverb has been adjoined to the lower or to the higher AgrP-node. In other words, the adverb is granted a certain amount of freedom with respect to syntactic placement, provided certain

fundamental *structural* relations are preserved (here, adjunction to a sentential node), much in the spirit of the 'Transportability Convention'. There are cases, however, where global improvement in the theoretical format of the theory might correspond to a real advancement in our understanding of some of the issues involved by the paradigm in (10). As far as the pair in (10a) and (10b) are concerned, for instance, Belletti proposes that the latter is transformationally related to the former by means of left-dislocation of the subject. Evidence for this hypothesis is provided by the observation that the word order in (10b) is unavailable in Italian in cases where left-dislocation of the subject NP is independently excluded, as with indefinite quantifiers.[24] As for 'lower' VP-adverbs such as *spesso* 'often', Belletti argues that the configurations where they occur sentence-initially (as in *Spesso Gianni incontra Maria in vacanza* 'Often Gianni meets Mary on vacation') are derived by the application of '*wh*-movement' (topicalization) to the adverb, as shown by the ungrammaticality of structures in which a second constituent has undergone topicalization (**MARIA spesso Gianni incontra in vacanza*), under the independently well-motivated assumption that topicalization cannot affect more than one constituent per sentence (Belletti 1990: 62; see chapter 26). The examples just discussed conveniently illustrate the general remark made at the beginning of this section: one of the main streams of research on the syntax of adverbs has implicitely adopted Jackendoff's assumption that principles of adverb interpretation are tied to a well-defined set of structural descriptions, further constraining it in the sense of an ideal one-to-one correlation between syntactic positions and adverb readings. Cases where two or more positions are apparently associated with a single interpretation are tentatively analyzed as involving movement of syntactic constituents other than the adverb, or as involving *wh*-movement of the adverb itself (under the well-established assumption that the meaning associated with the position of the trace is retained, for example via 'reconstruction'; see chapter 54).[25] In this perspective, the only viable alternative consists in the possibility that the interpretations involved turn out to be different under a deeper examination. This has been argued to be the case with the manner reading associated with adverbs realized preverbally or postverbally (in a non-dislocated position). A case in point is the following minimal pair (Cinque 1999):

(11) a. John has cleverly answered the question.
b. John has answered the question cleverly.

That the two positions of the adverb in (11) cannot be tied to the same interpretation is shown by the fact that the position in (11a) does not satisfy the selection properties of the verb (**John has carefully worded the letter*), differently from what happens when movement is involved (cf. the grammatical *How carefully did John word the letter?*). The hypothesis that the readings involved are actually different is corroborated by Thomason and Stalnaker's (1973) observation that the two adverb positions in (11) are associated to unambiguous scope construals, yielding in some cases different truth-conditions, as shown by the example in (12):

(12) a. He slowly tested some bulbs.
b. He tested some bulbs slowly.

As Thomason and Stalnaker put it "sentence (12a) would be true if he took a long coffee break between each testing, even though he tested each single bulb quickly." Other cases where the interpretation of an adverb occurring in (at least) two distinct positions is only apparently the same involve frequency adverbs such as *often*, as exemplified by the minimal pair in (13) below (to be further discussed in section 7):

(13) a. John knocked on the door often.
b. John often knocked on the door.

It has been observed that (13b) corresponds to a 'relational' statement comparing two classes of events (roughly paraphrasable as 'many of the events in which John knocked on something are events in which John knocked on the door'), whereas (13a) corresponds to the 'absolute' statement that the knocking events (by John) were many.[26] The relation between the postverbal and preverbal position in which some adverbs may occur can give rise to intriguing (and still poorly understood) scope patterns, such as that exemplified in (14) and (15):

(14) a. John knocked on the door intentionally twice.
b. John knocked on the door twice intentionally.

(15) a. ?John twice intentionally knocked on the door.
b. ??John intentionally twice knocked on the door.

It has been noticed that the scope construal associated to (14) corresponds to some sort of 'inverse-linking' effect (see chapter 36): the reading according to which John intended to knock twice is expressed by either (15b), the adverb on the left takes wide scope, as expected, or (14b), here it is the adverb on the right that takes wide scope (see Andrews 1983; Cinque 1999 for a detailed discussion of this issue).

As a result of these observations, we can conclude that the possibility for the same adverbial to occur, with distinct interpretations, in different syntactic positions (as we have shown to be the case for manner adverbials and frequency adverbs) raises a number of delicate questions revolving around the relation between these interpretations and largely bearing on still poorly understood issues concerning the syntax of 'modification' and the syntactic encoding of quantification over events and/or times. A better understanding of these matters will hopefully lead to a satisfactory answer to the questions whether and how these adverb positions are related by movement and to a better assessment of the relevance of adverbial syntax for the compositionality issue in natural language (much in the spirit of McConnell-Ginet's stimulating observations).

5 Adverbs and movement

5.1 Wh-*movement*

The observation that adverbs can naturally undergo *wh*-movement is quite uncontroversial. As is well known, it has motivated the argument-adjunct asymmetry in extraction facts (Huang 1982a and much subsequent literature). Roughly, adverbs turn out to be sensitive to both strong and weak islands (see chapter 64), whereas arguments are only sensitive to strong islands. The asymmetry does not reduce to the fact that elements which are not selected (that is theta-marked) by the verb are less easily extractable. Selected adverbials, as the French manner adverbial in the following example, are worse than optional comitative arguments when extracted from *wh*-islands, falsifying the hypothesis that semantic selection is the relevant factor for the admissibility of long movement (Rizzi 1990b: 77ff.):

(16) a. ?Avec qui ne sais-tu pas [comment [PRO te comporter t t]]
with whom don't you know how to behave
b. *Comment ne sais-tu pas [avec qui [PRO te comporter t t]]
how don't you know with whom to behave

It seems that the possibility for an element to enter binding relations (hence to give rise to long-movement dependencies) is connected with the fact that it bears a 'referential' theta-role (expressing a 'participant' in the event referred to by the predicate) and is therefore endowed with a 'referential' index:[27] the manner adverb in (16) does not refer to any 'participant' in the relevant event, in spite of the fact that it is obligatorily selected by the verb. An alternative approach ascribes the sensitivity of adverbs for weak islands to the fact that adverbs refer to 'partially-ordered' objects (that is, objects that cannot be collected into unordered sets, but only into sets whose members exhibit inclusion and/or overlap relations), under the assumption that weak islands provide semantic environments which do not preserve partial ordering (Szabolcsi 1992: 410ff.; cf. also Szabolcsi and Zwarts 1993). One of the merits of the latter approach is that adverbs cease to represent a uniform semantic class, as was the case with the 'referential-role' approach: there might well be adverbs referring to 'individuals' (elements which can be collected into unordered sets), as is arguably the case with punctual temporal adverbials such as *at 5 o'clock*, which significantly perform quite better than manner adverbs when extracted from weak islands (Giorgi and Pianesi 1997; cf. section 6) (see chapter 72).

Independently of the correct characterization of the constraints governing *wh*-movement of adverbials, notice that the question how adverbs move should be naturally preceded by the question why adverbs can be moved. Under a conjunctive formulation of the E(mpty)C(ategory)P(rinciple), the obvious assumption is

that adverb traces (on a par with the other empty categories) have to be formally licensed by a higher head of the appropriate type. In Rizzi (1990b), manner adverbials are assumed to be VP-adjoined and to be formally licensed by the higher functional head T(ense) (Rizzi 1990b: 46). An interesting issue arises with sentence adverbs such as 'reason' adverbials (the domain of interrogative *why*): as S-adverbs, they are expected to be attached to a higher position than manner adverbials, arguably TP or AgrP: in both cases, proper government by T is obviously excluded, raising the issue of why *wh*-movement is perfectly admissible in these cases. Rizzi's solution consists of the assumption that adverbs of the reason type are base-generated in spec-CP. Evidence is provided by the fact that reason adverbials cannot occur *in situ* in French, contrary to what happens with other VP-adverbials (*Il a parlé comment* vs. ?**Il a parlé pourquoi*) and by the observation that French stylistic inversion cannot be triggered by sentential adverbials such as pourquoi (*Comment a parlé Jean* vs. ?**Pourquoi a parlé Jean*) (Rizzi 1990b: 47–48).[28]

A semantically-based approach to the issue of adverb movement is proposed in Chierchia (1985), where a trace is assumed to be properly governed if and only if it constitutes the argument of some propositional function (Chierchia 1985: 433). The basic insight is that variable-binding of adverbs is generally excluded, since adverbs are 'functors' (that is, predicate operators, cf. section 3) and the type-hierarchy in natural language is arguably limited to three semantic 'layers' (individuals, propositional functions, and functors). This hypothesis nicely accounts for the fact that a large variety of adverbs cannot be *wh*-moved (including *too*, *again*, *also*, *even*, *almost*, etc.). As for the adverbs that undergo *wh*-movement (typically, manner adverbs in *-ly*), the solution consists of the assumption that these adverbs are semantically related to predicative counterparts (that is, to 'propositional functions') by means of a mapping function *-ly*, with morphemes such as *-ly* playing the role of 'exceptional' proper governors. This approach raises a number of intriguing issues concerning the cases where *-ly* adverbs cannot be *wh*-moved, as when they are assigned a subject-oriented interpretation (How elegantly do you think he was dressed? vs. *How luckily has he won?; Cinque 1999), and the cases where other sorts of adverbs (with no lexically distinct predicative counterpart) are *wh*-moved, as with punctual temporal adverbs (At which time do you think he went out?).

Before closing this section, let us note that *wh*-movement easily allows the "regular" relative order between two adverbs to be subverted, as has been emphasized in Cinque (1999), who provides the following paradigm for Italian:

(17) a. Tratta già male il suo assistente.
he is treating already badly his assistant
b. *Tratta male già il suo assistente.
c. Quanto male tratta già il suo assistente?
how badly is he already treating his assistant

5.2 Other kinds of movement

As noted in section 4, the issue of whether the different syntactic positions filled by a given adverb are related by movement is arguably one of most poorly understood topics in adverbial syntax. However, Cinque (1999) discusses a number of cases in which varieties of displacement other than *wh*-movement appear to be involved. As observed in Kayne (1975), French exhibits structures where an adverb surfacing in the main clause is thematically related to the predicate of the embedded clause, as in *Il ne faut plus que tu parles* 'it is necessary that you do not speak.' Interestingly, the fixed relative order cannot be subverted in these cases, as shown by the ill-formedness of examples such as **Il a mal dû toujours raccrocher* 'he must have badly always hung up', contrary to what happens with *wh*-movement (section 5.1). The same seems to hold for the cases where an adverb is topicalized, in Germanic SOV langages, to comply with the verb-second requirements. As observed in Koster (1978c), adverb topicalization is not admitted to alter the fixed relative order between two adverbials, as shown by the Dutch paradigm in (18–19), suggesting that these verb-second phenomena have to be kept apart from standard *wh*-movement:

(18) a. Het is zo dat hij *helaas waarschijnlijk* ziek is.
it is the case that he unfortunately probably sick is
b. *Het is zo dat hij *waarschijnlijk helaas* ziek is.

(19) a. Helaas is hij *waarschijnlijk* ziek.
b. **Waarschijnlijk* is hij *helaas* ziek.

A different class of phenomena, attested in Italian, is discussed in Cinque (1990c), where it is noted that certain instances of 'adverb-preposing' exclusively apply to sentence-initial adverbials. The evidence for this hypothesis originates from the observation that the preposed adverb does not preserve the scope properties which are linked to the VP-adjoined (or sentence-final) position, a phenomenon that is naturally accounted for under the assumption that adverbs undergoing this sort of movement are necessarily IP-initial (see chapters 53 and 54). A relevant example is provided in (20a), where the preposed adverb cannot be interpreted in the scope of the universal quantifier in subject position, contrasting with the ordinary case of *wh*-movement in (20b), where narrow scope of the adverb is readily admitted (Cinque 1990c: 91–92):

(20) a. In una città del sud, ognuno di loro è nato.
In a southern city everyone of them was born
b. In quale città del sud ognuno di loro è nato?
In which southern city was everyone of them born

Additional evidence is provided by the absence of crossover violations in contexts involving adverbial clause preposing (originally discussed in Longobardi

1983), exemplified in (21a), and clearly contrasting with the strong crossover violation detected in (21b), suggesting the presence of an IP-internal trace in (21b), but not in the case of adjunct-preposing (21a):

(21) a. Dopo aver presentato Maria a che ragazzo, lui vi si è dimostrato riconoscente?
after presenting Maria to which boy, he was grateful to you
b. *[Di parlare a [che ragazzo]$_i$]$_k$ [pro$_i$ vi ha chiesto t$_k$]
to speak to which boy did he ask you

These observations have motivated highly intriguing hypotheses, according to which 'adverb-preposing' corresponds to an instance of non-standard *wh*-movement and 'circumstantial' adverbs (as the locative in (20)) can be directly generated in IP-initial position, contrary to the familiar assumption that they are VP-internal (Cinque 1990c: 94; on the issue of adverbial PP preposing, see also Rizzi 1990b, appendix 1). Again, adverbial syntax seems to lead to quite puzzling questions concerning the interplay between issues of placement (cf. section 4) and issues of movement.

5.3 Adverb placement as a diagnostic for movement

Issues of adverb placement have traditionally been related to the syntactic analysis of processes of inflectional morphology (Emonds 1978, 1985; Pollock 1989). In Emonds' analysis, the process of finite verb formation corresponds to a language-particular transformation (as such not belonging to the operation Move) which allows a grammatical formative realized in the third-level projection of V to be realized as an inflection bound to V (Emonds 1985: 200ff.). As a matter of fact, inflectional processes are crucially assumed to require adjacency configurations: the fact that finite verb formation is not blocked by the presence of adverbs (such as *scarcely* or *never*) is accounted for by assuming that adverbs are generated within the first level of V, with adjacency defined in such a way that the head X of a phrase is considered adjacent to the boundary of the phrase X'. Elements which block head-attachment (such as the negation *not* in English) are assumed to be generated outside V", destroying the required adjacency configuration (Emonds 1985: 207ff.). In Pollock's analysis, head-movement operations belong to the core of the syntactic system (much in the line of Baker's 1988a analysis of a large variety of incorporation processes in terms of head-movement). The parametric difference between English and French in configurations where the verb selects a direct object, illustrated by the minimal pair in (22), is assumed to depend on the fact that V moves to the functional projection(s) realizing the inflectional features in French, but not in English (see Pollock 1989 and much subsequent literature for a more detailed assessment of the empirical issues involved):

(22) a. Mon ami prépare *toujours/souvent* du poisson.
b. *My friend prepares *always/often* fish.

However, the conclusion that verbs do not move in English has been challenged in view of the observation that the position of the adverb seems to depend on the application of the adjacency requirement between verb and nominal objects proposed in Stowell (1981): adverbs easily occur to the right of the verb (as in French) whenever prepositional or clausal complements are involved, as shown by the minimal pair in (23) (Chomsky 1995c: 329ff.):

(23) a. *John reads often books.
b. John reads often to his children.

This state of affairs is in principle compatible both with the hypothesis that verb movement is not generally barred in English, possibly depending on case considerations (see Pesetsky 1989; Johnson 1991), and with the hypothesis that structures such as (23b) do not involve verb movement, but rather the adverb occurring sentence-finally with extraposition of the prepositional complement (Pollock 1997).[29] Chomsky (1995c) formulates the more radical hypothesis that the relevant paradigm of adverb distribution might be entirely independent from the issue of verb raising: adverbials such as *every day* or *last night* exhibit the behavior shown in (23) for *often* (**John reads every day books* vs. *John reads every day to the children*), but they are not allowed in the preverbal position available to *often* (*John often reads to his children* vs. **John every day reads to his children*). Chomsky's proposal for English, according to which covert movement of the nominal object in (23a) to the functional position relevant for case-checking is blocked by the occurrence of two closer intervening elements (the subject and the adverb itself) filling specifiers of a Larsonian VP-shell (as a violation of 'shortest movement'), raises the issue of how to account for the grammaticality of the French counterpart of (23a).

As a result of this brief survey, let us emphasize that the use of facts of adverb placement as a diagnostic for syntactic operations affecting constituents other than adverbs (which is a typical characteristic of a significant part of the literature on Germanic scrambling and Scandinavian object-shift) is arguably more problematic than it is generally assumed. However, some skepticism seems at least partly justified in these empirical domains as well (see especially Neeleman 1994a for the view that a given adverb can fill a variety of syntactic positions in Germanic SOV languages, giving rise to 'base-generated' scrambling).

6 Adverbs and adjunction

In recent times, the hypothesis that XP-adjunction does not belong to the core of the 'computational system' (or syntax proper) has gained considerable credit. Adjunction sites strictly resemble traditional specifier positions in Kayne's (1994) version of X' theory, where a principled constraint on multiple adjunction is introduced. Chomsky (1995c) develops a model in which syntactic operations are triggered by Last Resort and feature-checking, under the restrictive assumption

that the checking domain of a category is limited to positions included (rather than contained) in Max(α) and that XP-adjunction is severely constrained to semantically vacuous targets (Chomsky 1995c: 324–326; cf. also pp. 329ff.).

This research program is apparently supported, empirically, by a large number of facts arguing against the idea that adverbials are freely generated in adjunction positions, to be briefly reviewed below.

A first class of data concerns the constraints on right-adjunction (cf. Cinque 1999; Costa 1997; and others). Under the familiar approach to adjunction according to which both right- and left-adjunction are possible, a sentence like *John has spoken to his mother cleverly* should be interpretable as involving right-adjunction of the adverb *cleverly* to the same (functional) category to which *cleverly* is left-adjoined in cases such as *John cleverly has spoken to his mother*, as shown by the structures in (24):

(24) a. John [$_{XP}$cleverly [$_{XP}$has spoken to his mother]]
b. John [[has spoken to his mother$_{XP}$] cleverly$_{XP}$]

However, it is well known that *cleverly* is exclusively assigned the subject-oriented reading in (24a), and can only receive the manner reading in (24b) (see section 4). This difference in meaning is clearly unexpected under the assumption that all hierarchical relations relevant for meaning are essentially preserved in the shift from (24a) to (24b). Similarly, the ungrammaticality arising from 'stacking' adverbs in sentence-final position, as in **John has answered their questions stupidly cleverly* is actually unpredicted if this sentence can be assigned a structural analysis (as is quite naturally the case under the adjunction hypothesis) which has the adverb right-adjoined to the same projection to which the adverb is left-adjoined in its grammatical counterpart *John cleverly has answered their questions stupidly.*

A second kind of argument against adjunction is provided by the observation that adverbs tend to pose severe 'selectional' constraints on the 'adjoinee', giving rise to a relatively fixed linear order among their different classes. There is a large literature to be considered here, including at least Zubizarreta (1982a), Sportiche (1988), Travis (1988), Rochette (1990c), Bowers (1993), Lonzi (1991), and Cinque (1999). On the grounds of a fine-grained assessment of the empirical evidence from Italian, Cinque proposes for instance the following relative order for S-level adverbs (see section 3 for the variety of readings actually assigned to this class of adverbs):

(25)	francamente	< purtroppo	< evidentemente	< probabilmente
	frankly	< unfortunately	< evidently	< probably
	< ora	< forse	< stupidamente	
	< now	< perhaps	< stupidly	

Deriving patterns of relative order as that in (24) under the free adjunction hypothesis is arguably quite problematic, unless it can be shown that the order constraints follow from the application of independent semantic conditions at the

interface with the interpretive system. However, we have already emphasized (see sections 3 and 4) that the interpretation of 'higher' adverbs as those in (25) is largely non-compositional, as it involves a fairly arbitrary set of mapping operations between the syntactic structures exhibiting the order constraints under discussion and the logical forms which correspond to a compositional codification of their meaning. Cinque's implicit assumption is that adverb ordering is in fact *not* semantically motivated, but rather encoded in syntax in the form of a one-to-one correlation between (distributionally motivated) adverb classes and functional positions (whose hierarchy is in principle independent of interpretive considerations, for instance the logically motivated exclusion of certain scope construals). This correlation arguably permits an elegant treatment of the complex interplay between adverbs and various sorts of verbal heads, whose analysis is highly problematic under the free adjunction hypothesis, which must resort to arbitrary 'filters' to reduce overgeneration.[30]

A third class of facts that apparently militate against adjunction concerns the behavior of 'circumstantial' adverbs of time, place, and manner. These adverbs easily enter coordination and binding relations which are problematic under the free adjunction hypothesis. As discussed in Larson (1988b), temporal adverbials can be coordinated with a complement of the verb, and anaphors contained in them can be bound by antecedents corresponding to a complement of the verb, as shown in (26a) and (26b), respectively:

(26) a. Sue gave books [to these people on Friday] and [to those people on Saturday]
b. Sue gave books *to these people on each other's birthday.*

Under relatively well-motivated assumptions concerning coordination and binding (essentially establishing that coordination exclusively involves constituents and that binding requires c-command), these facts have been taken to show that circumstantial adverbials of various sorts must be sisters to a projection of V, motivating the adoption of VP-shell structures, with 'alleged' adjuncts filling a position lower than verbal arguments in compliance with a thematic-relational hierarchy of some sort (Larson 1988b; Pesetsky 1995: 163ff., and the references cited there). Pesetsky interprets the availability of coordination configurations such as *Sue gave books to [these people on Friday] and [those people on Saturday]* as evidence that shell-structures (characterized by the abandonment of the requirement that the verb's lexical properties be satisfied at D-structure) might not suffice to achieve empirical adequacy and as an argument for the adoption of *cascade*-structures in syntax.[31] All these facts conspire to the conclusion that circumstantial adverbs are syntactically represented VP-internally, by filling a fixed (lower) position with respect to the arguments of the verb. There is in fact some evidence that these adverbs correspond to the presence of a spatio-temporal argument (Kratzer 1995) in the theta-grid of verbs: temporal adverbs such as *on Friday* or *at 4 o'clock* exhibit for example an argument-like behavior in extraction contexts, in not being sensitive to weak islands (Giorgi and Pianesi 1997) and

giving rise to rigid-denotation effects in certain contexts (see section 7).[32] The well-known fact that other 'circumstantials' such as manner adverbials *are* indeed sensitive to weak islands need not represent a problem for the hypothesis that *all* VP-internal adverbials are arguments: the contrast between punctual temporal adverbs and manner adverbials easily follows, for instance, from the approach to weak islands developed in Szabolcsi and Zwarts (1993), under the quite reasonable assumption that (certain) temporal arguments refer to 'individuals' (times), whilst manner adverbials necessarily refer to 'partially-ordered' objects (see section 5.1).

Before closing this section, it is worth noticing that the negative conclusions about the relevance of base-generated adjunction for issues of adverb placement is corroborated, at a more general level, by the conceptual and empirical success of proposals aimed at severely constraining the role of adjunction in movement processes. Cases in point are Rizzi's (1997) attempt to reduce alleged instances of adjunction such as topicalization and focus movement to instances of substitution movement and Beghelli's (1995) decomposition of quantifier raising into a class of 'checking' operations involving a well-defined set of functional projections. Finally, issues concerning the role of intermediate adjunction sites have been addressed, within the same negative program, in Sportiche (1993a; see also Chomsky 1995c).

7 Adverbs and the syntax/semantics mapping

In the preceding sections, we have repeatedly emphasized that one of the major problems arising with adverbials is constituted by their ambiguous role in the mapping from syntax to semantics. This ambiguity is conveniently illustrated by the interaction between adverbial phrases and specific modules of syntax, such as theta-theory. In the literature, claims are found both that adverbials are arguments of the verb receiving a specific theta-role (McConnell-Ginet 1982; Larson 1985a) and that adverbials are elements assigning some theta-role to predicates, heads, or other adjuncts (Chomsky 1995c: 45). In this final section, we want to provide further exemplification of the kind of complexities arising at the syntax–semantics interface. Given our space limitations, we will only present some interpretative ambiguities involving different classes of temporal adverbs. The choice of temporal adverbs is not accidental. As we have seen, one of the most promising lines of research for the treatment of adverb semantics involves assuming more complex lexical structures for verbal predicates, with a consequent increase in the degree of complexity of the related syntactic representations.[33] The adoption of syntactic representations permitting quantification over events and/or times seems to provide adequate heuristic tools for a satisfactory assessment of the factors involved in the contribution of temporal adverbials to meaning.

A first class of facts concerns temporal adverbials of the *punctual* or *durative* sort (such as *at 5 o'clock*, *for three hours*, etc.). These adverbials have been shown to be ambiguous between a "p(osition)-definite" interpretation, according to which

they unambiguously fix the position of a time span on the time axis, and a non-p-definite interpretation, according to which they express a time span whose position on the time axis is vague (Klein 1992). Significantly, this interpretive ambiguity seems to correlate with the syntactic position (sentence-final or sentence-initial) occupied by the temporal adverbial, as exemplified by the minimal pair in (27). (Hitzeman 1995):

(27) a. Mary lived in Amsterdam for three years (once).
b. For three years, Mary lived in Amsterdam (#once).

Sentence (27a) is ambiguous between a reading in which "there is some three-year interval in the past during which Mary lived in Amsterdam, and a reading in which Mary lives in Amsterdam at the speech time and has done so for the three years preceding speech time" (Hitzeman 1995: 2), whereas only the latter reading is preserved in (27b), as shown by the awkwardness of *once* (which presumably forces the event time to be non-p-definite) when occurring in this structure. Interestingly, this sort of ambiguity can be expressed by saying that *for three years* can be interpreted as a 'predicate' in (27a) (it corresponds to the restriction of a time variable which is existentially quantified), but necessarily counts as an argument in (27b) (it behaves as a rigidly-denoting referential expression, unambiguously fixing a certain position on the time axis). The name-like behavior of temporal adverbials corroborates the hypothesis that they may count as arguments of the verbal predicate, in accordance with the argument-like behavior they exhibit in extraction contexts, as already observed in sections 3 and 6. This conclusion easily extends to *punctual* adverbials, as shown by the fact that the sentences in (28) exhibit the same kind of ambiguity detected in (27):

(28) a. Mary will be in her office at 8 o'clock.
b. At 8 o'clock, Mary will be in her office.

At this point, we may wonder which factors (beyond the syntactic position of the adverbial) are involved in these kinds of meaning ambiguities. Delfitto and Bertinetto (1995) observe that Aspect arguably plays a crucial role, since the ambiguity detected in (27) and (28) does not arise with 'habitual' sentences. However, the position of the temporal adverbial affects truth-conditions even in habitual sentences. This is shown, for Italian, by means of the 'imperfective' sentences in (29), where the realization of the punctual adverbial either in VP-internal or in dislocated position clearly affects meaning, as expressed by the logical paraphrases in (30):

(29) a. Gianni beveva un caffè alle 8.
Gianni drank-IMP a coffee at 8 o'clock
b. Alle 8 Gianni beveva un caffè.
At 8 o'clock Gianni drank-IMP a coffee

(30) a. Gn t (∃e: D(e) and at(e,t)) (at 8(t))
b. Gn t (at 8 (t)) (∃e: D(e) and at(e,t))

The ambiguity detected in (28) can be explained by saying that *at 8 o'clock* is uniformly interpreted as a 'predicate' expressing a property of time, with the syntactic position of the adverb determining whether this property applies to the temporal variable in the scope (30a) or to the temporal variable in the restrictive clause (30b). Accordingly, (29a) will be roughly assigned the paraphrase 'every time Gianni used to drink a coffee it was 8 o'clock' and (29b) the paraphrase 'every time it was 8 o'clock Gianni used to drink a coffee', intuitively expressing different truth-conditions.

A second class of facts concerns the ambiguity of 'frequency' adverbs such as *often* and *always*, which can be interpreted, on a par with determiners, as generalized quantifiers (De Swart 1993). For instance, the interpretation of *always* in (31a) as a generalized quantifier expressing a relation between two sets of events/times is represented in (31b) ('the set of events in which John writes with something are included in the set of events in which John writes with a red pencil'):[34]

(31) a. John always writes with a red pencil.
b. λe [∃y (John writes with y) (e)] ⊆ λe [(John writes with a red pencil) (e)]

However, Q-adverbs may also be assigned, when occurring in (non-dislocated) sentence-final position, an 'adjectival' reading according to which they express a cardinal predicate of the plurality of events referred to by the verbal predicate: (32) seems to correspond to the 'absolute' statement that 'the situations in which John writes with a red pencil are many', paralleling the 'adjectival' usage of weak determiners in cases such as *These students are many* (Higginbotham 1987):

(32) John writes with a red pencil (quite) often

Again, the syntactic position of the adverb appears to be crucial in order to discriminate between the 'relational' and the 'cardinal' interpretation of Q-adverbs.

Summarizing, we have seen that temporal adverbials exhibit a broad range of semantic ambiguity, in that they can be mapped into individual-referring expressions, predicative expressions and quantificational expressions (referring to different types of logical objects). The factors involved in these kinds of ambiguity include at least syntactic placement, the presence of an event/time argument in the lexical structure of verbal predicates, and morphologically encoded aspectual distinctions. Needless to say, any theoretical advancement in these domains is likely to improve our understanding of the role of adverbs in the mapping from syntax to semantics.[35]

NOTES

1 See in particular Jackendoff (1972) and McConnell-Ginet (1982).

2 See Emonds (1985), where the *now/then* and *here/there* pairs are analyzed as 'suppletive' NPs, in view of the fact that they exhibit the same distant/proximate dichotomy as *this/that* and that they can be the object of prepositions (Emonds 1985: 161).

3 According to the by now standard version of X-bar theory originally proposed in May (1985) and adopted in Chomsky (1986a), adjunction structures involve categories composed of two or more *segments*. These theories are thus based on the distinction between segments and categories, and on the related distinction between inclusion and containment. See also section 6.

4 The issue concerning the syntactic relation between the sentence-final position in which selected adverbials occur and and other adverb positions will be addressed in section 4. As emphasized in the text, the presence of 'selected' adverbials has been important for syntactic theorizing, mainly in order to decide whether the argument/adjunct asymmetry can be reduced to the role of theta-marking or must receive a more sophisticated conceptual foundation (on this issue, see the literature on the proper definition of the Empty Category principle (ECP) and especially Rizzi 1990b).

5 See sections 3 and 4 for a critical discussion of some basic facts in the syntax of adverbs, and section 6 for a critical assessment of the explanatory role played by adjunction.

6 Besides the contributions explicitly referred to or discussed in the text and in the notes, see also the following works for a presentation of other important aspects of the syntax and semantics of adverbs: Åfarli (1995), Andrews (1982), Baker (1981, 1989), Bartsch (1976), Cresswell (1985), Dik et al. (1990), Dowty (1982b), Emonds (1976), Ernst (1984), Geis (1986), Huang (1975), Kuroda (1968b), Ladusaw (1978), Laenzingler (1993), Lakoff (1968, 1974a), Larson (1984), Moltmann (1991), Pecoraro and Pisacane (1984), Ramat and Ricca (1994), Rizzi (1997), Rooth (1995), Schreiber (1971), Stroik (1992b), and Vinet (1995).

7 According to Emonds, one possibility is that case-marking of APs is syntactically optional, providing adjectival APs when it applies and adverbial APs when it does not apply. There seem to be syntactic positions in which both case-marked (adjectival) and case-less (adverbial) APs can be realized and interpreted:

(i) Bill [walked into the room] [fearful]
(ii) Bill [walked into the room] [fearfully]

8 The base rule schemas in (1) and (2) in the text, intended to capture the prenominal and preverbal occurrence of adjectives and adverbs, respectively, can be easily restated in a more updated X-bar theoretic framework by assuming that adjectives and adverbs fill the specifier position of intermediate functional projections, on the grounds of the by now standard parallelism between nominal and clausal structures (see especially Szabolcsi 1987; and Abney 1987). See also sections 3 and 6.

9 The claim that the distribution of bare NP adverbs crucially involves case considerations, as in Larson (1985a), is obviously reminiscent, at an abstract theoretical level, of Emonds' treatment of adverbial APs as non-case-marked. For the claim that predicates may assign 'adverbial theta-roles' to arbitrary categories, see McConnell-Ginet (1982), Roeper (1983), Larson (1985a), and others.

10 For a discussion of the peculiar properties of the classes of adverbs mentioned in the text, see Mittwoch (1977), Bellert (1977), McConnell-Ginet (1982), and others.

11 The reader is referred to Lakoff (1965); for an early detailed criticism of Lakoff's positions, see Bowers (1969).

12 This is intended to capture meaning equivalences such as that existing between *break violently* and *smash*, the semantic markers added by *violently* being incorporated in the lexical entry of *smash* (Jackendoff 1972: 71).

13 See Stowell (1991) (and the references cited there) for the syntactic analysis of this particular kind of adjectival construction, involving 'mental predicates' and arguably expressing stage-level relations between individuals and events.

14 McConnell-Ginet's proposal, according to which VPs correspond to predicates (hence to semantic objects interpreted as propositional functions) obtained by lambda-abstracting over the subject position, arguably finds a rather solid 'compositional' foundation under some version of the VP-internal subject hypothesis (cf. Koopman and Sportiche 1991a), and the assumption that the VP-internal subject trace is interpreted as a variable undergoing lambda-abstraction (see especially Chierchia 1995b).

15 See McConnell-Ginet (1982) and Larson (1985a), where some of the arguments against the treatment of oblique terms as arguments are critically evaluated and tentatively rejected.

16 The cases of adverbial modification which exclusively involve theta-identification (as in *Mary fatally slipped*), paralleling adjectival modification in *white ball*, are assigned the structure indicated in (i), where coindexing indicates theta-identification:

(i) $[_{V'}$ [fatally, $<1^i, 2^j>$] $[_{V'}$ slipped, $<1^j, E^i>$]]

The manner interpretation of *Louisa rudely departed* is obviously assigned a more complex representation, involving theta-identification together with autonomous theta-marking of the V'. The subject-oriented (or, according to equivalent terminology, 'stative') reading of the same sentence involves an interpretation of 'rudely' as a three-place predicate with the thematic grid <1, 2, 3>, interpreted as expressing that situation 1 is rude of actor 2 with respect to 'attribute' 3 (that is, with respect to the property of being a departure of Louisa) (see Higginbotham 1989: 476–479).

17 Scholars are divided into those who assume that only some classes of predicates contain an open position for the event variable, crucially excluding statives and/or individual-level predicates (Kratzer 1995; Diesing 1992b) and those who assume that the event argument is selected by virtually every sort of predicate (Parsons 1990; Higginbotham 1985) (see chapter 8). However, it should be noticed that there have also been attempts to distinguish between Davidson's event argument and Kratzer's spatio-temporal argument (see Ramchand 1996).

18 Some of the examples of adverb incorporation provided by Rivero are reproduced below in (i) and (ii) (involving manner and directional adverbials, respectively):

(i) a. I María férete KAKÁ stin adelfí tis.
the Mary behaves badly to+the sister hers
b. I María KAKOférete stin adelfí tis.
the Mary badly+behaves to+the sister hers

(ii) a. I María tha to girísi ANÁPODA.
the Mary FUT it turn upside down

b. I María tha to ANAPODOgirísi.
the Mary FUT it turn upside down

19 We have already introduced three of the four classes of adverbs discussed by Jackendoff: class I includes modal adverbs (sentence operators) and speaker-oriented adverbs; class II includes subject-oriented adverbs; class III is typically instantiated by manner adverbs. As for class IV, it is assumed to include adverbs such as *merely, truly,* etc., for which Jackendoff is unable to provide a suitable semantic structure. Adjectives belonging to this class have been important for the empirical evaluation of the hypothesis that adverbs are transformationally related to adjectival sources, since they do not seem to admit adequate semantic paraphrases with adjectival predicates. However, it should be noticed that these adverbs exhibit a striking distributional symmetry with the corresponding adjectives (*mere*, etc.): the prohibition against the adverb occurring sentence-initially or sentence-finally is paralleled by the prohibition that the corresponding adjectives occur in predicative position (for a more detailed discussion of the distributional constraints holding for this class of adjectives, see especially Bernstein 1993b).

20 See especially Ruwet (1968), Bellert (1977), Travis (1988), Belletti (1990), Lonzi (1991), Bowers (1993), and the references cited in Cinque (1999). The hypothesis put forward by Cinque, essentially based on a principled correlation between adverbs and designated functional projections, presents important analogies with the analysis independently developed in Alexiadou (1994).

21 As for the class of 'higher' adverbs, Cinque proposes, for Italian and French, something along the lines of the following ordered sequence of adverbs (each adverb in the hierarchy is assumed to stand for a set of adverbs belonging to the same (distributional) class):

(i) francamente/fortunatamente/probabilmente/ora/forse/intelligentemente
frankly/fortunately/probably/now/perhaps/intelligently

For the class of 'lower' adverbs, the proposed hierarchy is as follows:

(ii) solitamente/mica/già/più/sempre/completamente/tutto/bene
usually/not/already/any longer/always/completely/everything/well

Cinque shows that violations of the relative ordering constraints give rise to ungrammaticality, as exemplified in the paradigm below, concerning the class of 'lower' adverbs:

(iii) a. Da allora, non accetta mica più sempre i nostri inviti.
since then, he doesn't any longer always accept our invitation
b. *Da allora non accetta mica sempre più i nostri inviti.
c. *Da allora, non accetta sempre mica più i nostri inviti.
d. *Da allora, non accetta più mica sempre i nostri inviti.
e. *Da allora, non accetta più sempre mica i nostri inviti.

22 Cinque's proposal entails that a 'modal' adverb such as *probably* and a 'subject-oriented' adverb such as *cleverly* occupy the specifier position of different functional layers. This is not enough to provide us with syntactic structures which allow the

former adverb to be 'compositionally' interpreted as a sentence operator and the latter to be interpreted as a two-place predicate expressing a relation between individuals and events. Another clear instance of the compositionality issue arises with frequency adverbs such as *always*, which can be interpreted as generalized quantifiers expressing relations between two classes of events (see section 7). It is explicitly assumed that the two 'arguments' of *always* are not syntactically represented and are in fact derived by applying relatively complex interpretive procedures (see Rooth 1985; De Swart 1993; Delfitto and Bertinetto 1995 for a 'compositional' alternative). The issue has important implications for the 'Universality of theta-assignment hypothesis' (UTAH), which proposes a rigid mapping between thematic notions and structural configurations and has revealed itself an important heuristic tool for the investigation of several syntactic domains. There is nowadays large agreement, for instance, on the fact that 'unaccusative' adjectives such as *likely* in *This result is likely* are related to source structures of the form *[e] is likely this result*, in spite of the ungrammaticality of **It/there is likely (of) this result*, and that pairs like *John was clever to leave* and *Leaving was clever of John* admit a common structural source (since they are assigned the same thematic interpretation). In the same vein, we would like to explain the fact that members of pairs like *John will probably call* vs. *It is probable that John will call* or *John rudely departed* vs. *John was rude to depart* are basically assigned the same meaning, by relating them to a common structural source (unless we want to restore compositionality by assuming hidden higher predicates for subject-oriented adverbs, as in McConnell-Ginet 1982). Since there seems to be no obvious way to relate adjectival and adverbial constructions syntactically (that is, by resorting to widely accepted modules of syntax, much in the spirit of Jackendoff's criticism), we are forced to depart from the strongest version of UTAH. It seems fair to conclude, however, that this issue is still poorly understood (see also section 4).

23 The Agr(eement) node corresponds to one of the functional projections in which the Aux(iliary) node has been split under the set of assumptions developed in Pollock (1989), Moro (1988).

24 A suitable example is *Nessuno probabilmente telefonerá alle 5* 'Nobody probably will call at 5', where only the topicalized reading of the negative subject is admitted (Belletti 1990: 43). Under the assumption that the left-dislocated subject can be 'reconstructed' into its original position, we can arguably derive the correct semantic result, according to which the modal adverb takes scope over the whole sentence. However, notice that the same facts obtain for sentences involving subject-oriented adverbs, as in *Nessuno intelligentemente telefonerá alle 5* 'Nobody cleverly will call at 5', where the negative subject is obligatorily topicalized. In this case, it is not clear that reconstruction of the subject in the scope of the adverb would produce the correct semantic result, since the subject is one of the arguments of the 'relational' adverb. Additional (interpretive) assumptions are needed, suggesting that (independently motivated) movement of constituents other than the adverb is not sufficient to assign a 'compositional' meaning to the latter (on the compositionality issue, see also section 3).

25 There are also approaches where a certain adverbial reading is admitted to apply to a set (crucially not a singleton) of structural descriptions, as in Neeleman's (1994a) analysis of the variety of adverbial positions characterizing West-Germanic scrambling.

26 See De Swart (1993), Delfitto and Bertinetto (1995), Cinque (1999).

27 See Cinque (1990c) for an empirically motivated refinement of the notion 'referential index' in terms of the notion 'D-linking' (Pesetsky 1987a). According to Cinque's

proposal elements bearing a referential index must refer to discourse-prominent entities in addition to referring to a participant in the event expressed by the predicate.

28 The hypothesis that adverbs can be generated in spec-CP is also apparently corroborated by the analysis of 'affective adverbials' (that is, adverbs mitigating the '*that*-trace' effect) as base-generated in spec-CP and as triggering, in such a position, CP-recursion, arguably as a consequence of the requirements on clause-type identification (Browning 1996). A convenient example is provided by the following minimal pair:

(i) *Robin met the man Leslie said that was the mayor of the city.
(ii) Robin met the man that Leslie said that for all intents and purposes was the mayor of the city.

Browning claims that the circumvention of the *that*-trace effect is achieved via coindexation of the *wh*-operator with the trace of the displaced C, and presents interesting evidence to the effect that embedded topicalization of arguments is essentially different from embedded topicalization of adverbials.

29 Costa (1996) provides interesting empirical arguments against Pollock's analysis, arguing that extraction is possible in English from the allegedly extraposed prepositional complements.

30 Under the hypothesis that adverbs belonging to a given class fill the specifier position of a designated functional projection, it is expected that one and only one head position is available between two arbitrary adverbs (corresponding to the head of the designated functional projection). Data concerning the distribution of past participle heads in Romance arguably provide support for this hypothesis.

See section 3 for a critical assessment of the conceptual foundations of the proposed correlation between adverbs and functional heads.

It should be emphasized that this idea has been advocated, in various ways, by different authors (Travis 1988; Bowers 1993; and others), claiming that adverbs belonging to a given class are licensed by the features realized on a single designated head, which may be functional or lexical. Travis (1988) assumes, for example, that adverbs licensed by V can be generated either as complements of V (within V'), as in *John learned French perfectly*, or as adjoined to V' (or VP), as in *John learned French quickly*, where the adverb is allowed to occur preverbally, contrary to what happens in the former example (**John perfectly learned French*). The form of head licensing developed in Bowers (1993) is far more restrictive, since adverbs are uniformly analyzed as X'-adjuncts and a one-to-one correlation is assumed to exist between adverb classes and designated heads. Bowers assumes that adverbs which exclusively occur postverbally, such as *perfectly* in the example above, are in fact those which are licensed by V, explaining the prohibition on their preverbal occurrence in terms of obligatory verb movement to the functional category Pred, encoding predication in syntax (see Bowers 1993 for the derivation of verb movement within the 'minimal functional complex' from the particular version of theta-theory assumed there, which presents clear analogies with the Larsonian VP-shell theory). Since direct objects are assumed to be generated in spec-VP, and VP-adverbs are adjoined either to V' or to Pred', the prohibition against adverbs occurring between the verb and the direct object is straightforwardly derived, without any need to resort to the adjacency condition on case assignment originally proposed in Stowell (1981). As a matter of fact, Bowers claims that V-adverbs are prohibited from appearing between the verb and the direct object even in French, as shown by the ungrammaticality of **Jean parle*

parfaitement l'Anglais (predicted by the hypothesis that the postverbal position of V-adverbs is a consequence of obligatory movement of V to Pred). The assumption that adverbs like *perfectly* and *intimately* are V-adjoined, together with obligatory V-raising to Pred and the assumption that direct objects are in spec-VP and PP-complements within V', provide a direct structural explanation for the fact that V-adverbs do not resist placement between verb and PP-complements, as revealed by the following contrast (see Bowers 1993: 609 and section 5 for further discussion of these facts):

(i) John spoke French intimately to Mary.
(ii) *John spoke intimately French to Mary

An important aspect of Bowers' analysis is that head licensing of adverbs is assumed to be essentially nondirectional (with right and left adjunction equally permitted), explaining why Pred-adverbs can optionally occur postverbally (as in *John learned French (very) quickly*). See, however, section 6 for important arguments against right-adjunction and the nondirectionality of adverb licensing.

31 Cascade-structures are characterized by a modification of the usual selection requirements according to which a head H is allowed to select positions corresponding to the specifier of the sister of H.

32 As examples of the insensitivity of temporal adverbials to weak islands, Giorgi and Pianesi (1997) discuss minimal pairs as the following in Italian, instantiating a clear contrast between manner and temporal adverbials:

(i) A che ora ti dispiace che Mario sia partito?
'At which time do you regret that Mario has left?'

(ii) *Come ti dispiace che mario sia partito?
'How do you regret that Mario has left?'

33 Instances of analyses of the argument structure of verbal predicates which depart from usual assumptions are Higginbotham's (1985) event argument, Kratzer's (1995) spatio-temporal argument, and Stowell's (1996) temporal argument.

34 See Rooth (1985) for technical discussion of the way in which the two arguments of the frequency adverb are derived. The view adopted there is that these arguments are not syntactically expressed, and must be derived by applying relatively complex interpretive devices, based on the so-called association with focus procedure. For the view that the two arguments can be derived compositionally by means of a relatively straightforward mapping between syntax and semantics, see Delfitto and Bertinetto (1995).

35 There is an extensive literature on the interplay between temporal morphemes and adverbials (see the references cited in Ogihara 1996). The interplay between temporal/aspectual adverbials and aspectual morphemes is a somewhat less studied phenomenon (see the references mentioned in Delfitto and Bertinetto 1995).

5 Affectedness

MONA ANDERSON

1 Introduction
2 Other formulations of affectedness
3 Extending affectedness to verbs
4 Affectedness in middles
5 Affectedness in dative constructions
6 Other forms constrained by affectedness
7 Experimental work

1 Introduction

The notion of affectedness was used in Anderson (1977a, 1979) to describe the relation between a preposable object and its head in noun phrases. In (1a) the logical object of the noun can appear as the possessive but in (1b) it cannot. The mechanism by which this generalization is captured is that only nouns which affect their complements can take bare NP complements. The structure of a noun phrase like (1a) would have *the city* as the direct complement of destruction. The surface structure would be derived by NP preposing. The structure of a noun phrase like (1b) would have *history* as the object of a true preposition *of* and (1b) could not be derived by NP preposing because a preposition would be stranded. There is no legitimate source for (1b) because the noun *knowledge* cannot take a bare complement but only a prepositional phrase complement. Only those nouns which affect their complements can take bare complements. A necessary assumption is that a stranded preposition within the NP marks it as ungrammatical. Only nouns which affect their complements can allow those complements as possessives. In essence the notion of affectedness determines the categories of complements that nouns can select. Those which affect their complements can select bare NPs but those which do not affect their complements must select prepositional phrases. The notion of affectedness is extended to nouns of creation such as *the production of the play.*

(1) a. the city's destruction
b. *history's knowledge
c. the destruction of the city by the barbarians

Since that claim, others have used this notion for other constructions or modified it or tried to derive it from other principles. Others used the notion in describing language acquisition or patterns of verb usage in adults. The modifications of how the constraint operates are of several types.

For Fiengo (1980) there is a sort of filter on noun phrases which requires arguments within noun phrases to be either agents or affected objects if they are structurally possessive but semantically not subjects or structurally in a prepositional phrase and semantically subjects. This information is expressed as features on these nouns. Jaeggli's (1986a) version of the constraint applies to both nouns and verbs and he makes an attempt at an explanation. He claims that the relation between a noun or verb and an unaffected complement is not as clear as when the complement is affected and so the external theta-role must be expressed when the complement is unaffected. This indirectly constrains the kinds of objects that can occur with a certain class of nouns and verbs by constraining the external theta-role position rather than the object position. Grimshaw (1990) has another set of mechanisms to deal with the data. She argues that passive nominals like (1a) are fundamentally different from their active counterparts (1c). In (1c) the noun *destruction* takes arguments, has event structure, and assigns a theta-role through the preposition *of*, but in (1a) the noun *destruction* neither takes an argument, has event structure, nor assigns theta-roles. The relation between the noun *destruction* and *city* is expressed not at the syntactic level but at the lexical semantic level. (1b) is ungrammatical because it is stipulated that complements cannot be unaffected at the lexical semantic level.

Rozwadowska (1988) and Amritivalli (1980) present data from English and Polish, a new theta-role, and several language specific constraints to account for affectedness but it appears that their data are better described in terms of lexical gaps rather than by this extra machinery.

Giorgi and Longobardi (1991) extend Anderson's (1977a, 1979) analysis to Italian nouns which allow preposed pronominal objects even though these objects are not affected. They follow Jaeggli in assuming that nouns of this class must have the external theta-role expressed and they assume that Italian nouns have a position which allows the pronominal object to prepose, a position not available in English. Rizzi (1986a) uses affectedness as a constraint on possible theta-grids to predict the availability of null objects in Italian.

Tenny (1992, 1994) revises the semantic description of affectedness to include verbs of creation, concealment, and exposure which seemed not to fit into the original formulation. She claims the correct description is that the object delimits the event of the noun or verb. She uses data from middles in English and the *ba* construction in Mandarin to illustrate her point. Egerland (1998) discusses this version in terms of middles in English and claims that the event is delimited if it must take place over a fixed period of time.

Ackema and Schoorlemmer (1994) try to derive the affectedness constraint from other principles using data from middles in Dutch and English. They claim that some middles are formed in which the object is not affected and that these and other middles are predicted by the presence of an action tier for the verb or noun and a suppressed arbitrary actor and a thematic hierarchy. However, their Dutch examples fall under Tenny's revision of affectedness, a more economical way of accounting for them.

It appears that affectedness may play a part in some dative constructions. Janda (1988) claims that the dative of possession in Czech implies the possessor is affected and that it can be used pragmatically to create a feeling of intimacy. Landau (1999) argues that the possessive dative construction in Hebrew, French, and Spanish is not constrained by affectedness but rather by independent constraints on movement. Collins (1995) argues that interpretation of datives in English is not constrained by affectedness. Sadakani and Koizumi (1995) however, argue that children learn the distinction between the case marker *ni* and the postposition *ni* in Japanese on the basis of affectedness. They relate this to a hierarchy proposed by Koizumi in which more affected arguments are attached closest to the verb. Koizumi uses depictive predicates and secondary resultative predicates in Japanese to provide evidence for this claim. Miyagawa (1988) uses floating numeral quantifiers in Japanese to make a similar point.

This connection between the semantic notion of affectedness and the closeness of the connection between the complement and the head seems to be the most salient feature of the work on affectedness. In Anderson (1977a, 1979) this is expressed as a constraint on the syntactic frames that nouns affecting their objects can appear in. This constraint seems to extend to verbs as well. It seems reasonable to suggest that this semantic notion has an effect on syntactic structure at the level of subcategorization. The use of affectedness in experimental and acquisition studies seems to support the idea that this is some kind of semantic primitive that constrains syntactic frames.

In an experimental study Gropen et al. (1991) found that when asked to use novel verbs children more often made the goal in the illustrated activity the direct object of the verb when the goal was affected. The moving entity was more often made the direct object when the goal was unaffected. Lebeaux (1988a) claims that children use affectedness in acquiring passives with affected objects being more readily passivized. Gordon and Chafetz (1990), however, claim that the difference in comprehension by children is due to the fact that they hear the passives with non-affected objects less often. The data on affectedness in acquisition provides some support for the notion being a semantic primitive.

2 Other formulations of affectedness

Fiengo (1980) uses a feature system involving the notion affected to describe the same data but claims the features allow him to include the generalization that

the objects of *by* must be affectors. He combines the generalization in Anderson (1977a, 1979) with another generalization. In his system the possessives in (1a) and (1b) must be interpreted as affected because there is a rule forcing arguments within nominals to be marked as [+affect] whenever the case and the semantic notion of subject match in value. The example in (1b) is ungrammatical because it cannot be interpreted as affected contrary to the rule (2).

(2) $\theta \longrightarrow$ + affect / _____
α Oblique
α Subject

Nouns are semantically classed as requiring affected objects and/or affector subjects. Fiengo claims that the possessive case is [–oblique] and the case of the object of the preposition is [+oblique]. In the semantics of the NPs in (1) both *the city* and *history* are [–subject] and the NPs in the *by* phrases if they were present would be [+subject]. The feature [+affect] belongs to both the affected NP and the affecting NP. The possessives in (3a) and (3b) are both [–subject] in a semantic sense and [–oblique] in a case sense. They match, being both [–] and therefore must be interpreted as affected. However *expresssion* is in the class of nouns which does not affect its objects and so there is a clash between the syntactic feature and the necessary interpretation.

(3) a. Carthage's destruction by Rome
b. *great relief's expression by John
c. *the definition of a term by a dictionary

(3c) is out because *the dictionary* is [+oblique] being the object of a preposition, and [+subject] being the semantic subject, so it must be [+affect] but it is not capable of being an affector.

It is not entirely clear why a dictionary cannot affect something. Fiengo is relating the notion of affector to the notion agent.

Technically, the notions of affected patient and affecting agent are brought together in this analysis but the system as a whole does not seem to be an improvement over the original formulation in Anderson (1977a, 1979).

Jaeggli (1986a) suggests another way of expressing affectedness in an attempt to unify it with constraints on passive in general. His Affectedness Constraint specifies that if a complement of a category is unaffected, it is impossible to eliminate the external theta-role of that category.

In an example like (3b) *expression* does not affect its complement and therefore the external theta-role cannot be absorbed and expressed in the prepositional phrase because of the Affectedness Constraint. An example like (1b) is out because the external theta-role is not expressed. An example like (4) is allowed because there is a PRO expressing the external theta-role of *expression*.

(4) the expression of great relief

Jaeggli has an explanation of sorts for this generalization. He claims that when the complement is affected the thematic relation between the predicate and the complement is well defined. When the complement is unaffected the relation is not clear and depends on the external theta-role for clarification. The external role cannot be eliminated because then the relation will not be clear. Jaeggli sees this as a possible way to derive the Affectedness Constraint from more general principles. As it stands it seems to be a constraint on the theta-roles occurring in a class of nouns. Nouns which do not affect their complements have an obligatory external theta-role. This is more indirect than the formulation in Anderson (1977a, 1979) in that the lack of preposing is attributed to the unavailability of the specifier position in these nouns but the unavailability is directly linked to the ability of the noun to affect its object. Both rely on the semantic characterization of these nouns constraining the frames they can appear in.

Grimshaw (1990) has another version of the way the constraint operates. Grimshaw argues that nouns do not assign theta-roles unless they have prepositions mediating between the noun and the complement. This means that a system like Anderson (1977a, 1979) will not work because there the noun assigns the theta-role to the bare NP complement before it moves. For Grimshaw the affectedness constraint works at the level of lexical semantic representation. At this level, the objects of nouns are complements but not grammatical arguments. Complex event nominals such as *destruction* have a representation like verbs in that they take arguments and assign theta-roles. They must have prepositions to actually assign the roles. However, for her the example in (1a) has no event structure and does not have arguments or assign roles. Result nominals such as *knowledge* have no arguments and do not assign theta-roles. The relation to their complements as in *knowledge of history* is represented at the lexical semantic level and not at the syntactic level. There is no movement in nominals and the ungrammaticality of nominals like (1b) results from the stipulation that at the lexical semantic representation complements cannot be unaffected. In other words "unaffected [lexical conceptual structure] arguments are not subject to complement interpretation" (Grimshaw 1990: 94). The effects of the affectedness constraint are achieved by restricting arguments to those nouns which are process nouns and by a stipulation at the semantic level that unaffected DPs cannot be complements. In a phrase like *knowledge of history* presumably the phrase *history* is interpreted as a complement so there must be a more specific constraint. Nominal passives are not parallel to verbal passives in syntax but only at the lexical semantic level. The possessive in a passive nominal like *the city's destruction by the enemy* is interpreted as the patient because it is an argument at the lexical semantic level. The *by* phrase should not be interpreted as agent because there is no syntactic argument structure so Grimshaw must deny that *the enemy* is interpreted as an agent. Within her analysis passive nominals cannot be interpreted as processes with event structure though their counterparts such as *the enemy's destruction of the city* have event structure and theta-roles. This discrepancy between the interpretation of nominals which appear to be similar in meaning is a weakness of this analysis.

Rozwadowska (1988) claims that the affectedness constraint should be replaced by a new grammatical relation, Neutral, and the constraint that Neutral can not be in the specifier of an NP. The examples which provide evidence for this are in (5).

(5) a. the public's delight in the book
b. *the book's delight of the public
c. The book delights the public.
d. The public delights in the book.

The assumption seems to be that because (5c) is a good sentence the nominal *delight* should result in the NP in (5b). However there is another sentence (5d) which could have the verb which is related to the nominal in (5a). In Anderson's (1977a, 1979) analysis the affectedness constraint limits the nouns which take bare NP objects. If one assumes that the noun *delight* corresponds to only one of the possible categorical frames of the verb *delight* the prediction is straightforward. The noun *delight* never appears with an *of* preposition so there is no reason to believe that it takes a bare NP and the lexical preposition *in* in both the NP form (5a) and the verb form (5d) indicates that there is no bare NP involved here. Chomsky (1970) in his original proposal of the lexicalist hypothesis cautioned that not all verbs will have related nominals and there seems to be no good evidence that the verb in (5c) has a related nominal. Rozwadowska goes on to use the notion affected to define a new thematic relation, Neutral, in which the entity holding that relation to a predicate is not affected by the predicate and does not have control over the predicate. She formulates a principle that Neutral can never appear in a specifier position of a nominal. This principle and the new relation will rule out the example in (5b) which in Anderson would be accounted for by the lexical gap, no nominal *delight* corresponding to the verb in (5c).

Rozwadowska (1988) goes on to bring in data from Polish to show that only affected arguments can be expressed as genitive complements of Polish nominals. She accounts for these with an additional principle applying to Polish nominals.

(6) a. Jan podziwia Marię. (Polish)
John-nom admires Mary-acc
'John admires Mary.'
b. Podziw Jana dla Marii
admiration-nom John-gen for Mary-gen
'John's admiration for Mary'
c. *Podziw Marii przez Jana
admiration-nom Mary-gen by John-gen
*'Mary's admiration by John'

Amritivalli (1980) presents a class of noun/verb pairs which Rozwadowska claims cause a problem for the affectedness constraint.

(7) a. Gamma rays excited the protons.
b. the excitation of the protons by gamma rays
c. The news excited Mary.
d. *the excitation of Mary by the news
e. *the excitement of Mary by the news
f. Mary was excited at the news.
g. Mary's excitement at the news
h. *Mary's excitation by the news

The question raised is if *excitation* is a nominal that allows preposing as in (8a) why does the animate noun not appear in the genitive in (8b)?

(8) a. the proton's excitation by gamma rays
b. *Mary's excitation by gamma rays

The answer seems clear when you look at the whole range of examples. The noun *excitement* is related to the adjective/past participle in (7f) not to the verb in (7b). This is shown by the fact that (7e) is ungrammatical. (7d) is bad because *the news* cannot cause the kind of physical event that is meant by the noun *excitation*. For the same reason (7h) is out. (7b) is actually grammatical if the physical sense of *excitation* is used. Other nouns which show this same pattern are *depression* and *agitation.* Although they do not have two different forms of the nominal they have the two senses. The crucial factor is the difference in the two senses of the nominals, not in whether the object is animate or not. This set of data can be more easily explained by a lexical gap rather than by a new thematic role and several independent principles.

Giorgi and Longobardi (1991) look at affectedness in Italian and English but suggest that the generalizations probably hold for Germanic and Romance languages in general. They accept Anderson's (1977a, 1979) analysis in which those nouns which do not affect their objects take true prepositions which prevent preposing because of preposition stranding. However they point out some nouns in Italian which allow preposed objects which are not affected.

(9) la sua conoscenza (Italian)
the its knowledge
'its knowledge'

They claim that examples like this are possible in Italian because there is a pronominal empty category which serves as the external theta-role. English and other Germanic languages do not have this empty pronominal as a possibility. They claim that this class of nouns requires an external theta-role. Others in the class are derived from verbs translated as *know*, *see*, *recollect*, *perceive*, *observe*. In English, because there is no empty pronominal to take the external theta-role, preposing the object fills the external theta-role position and this violates the

condition that these nouns must have an external theta-role. Their version of the affectedness condition says that if the complement of a noun is unaffected the external theta position cannot be de-thematized. This would distinguish between the two phrases in (10) because the technical definition of dethematized applies to the *by* phrase in (10b) but not to the *by* phrase in (10a).

(10) a. the knowledge of algebra by the students
b. *algebra's knowledge by the students

In order to make this analysis work they include the condition from Anderson (1977a, 1979) that only nouns that affect their objects can take bare NPs and a condition which says that certain nouns must have an external theta-role and that the theta position cannot be dethematized if the complement is unaffected. This extra condition is needed to account for the Italian examples like (9a) which appear to violate the condition from Anderson (1977a, 1979). They are allowed because Italian allows for an extra position where the pronoun *sua* can be before the noun but not in the thematic subject position.

They provide additional evidence to support the class of nouns which require an external theta-role. They show that these nouns do not allow backward control by a non c-commanding controller. In (11a) *lui* and *Mario* cannot be coreferent.

(11) a. Una migliore conoszensa di lui e della natura del problema
a better knowledge of him and of the nature of the problem
avrebbe giovato alle decisioni di Mario.
would have helped the decisions of Mario
b. Quella fotografia di lui in divisa ha giovato molto alla
that picture of him in uniform has helped much the
carriera di Gianni.
career of Gianni

Nouns like *fotografia* in (11b) do allow control because they are not in that class. In (11b) *lui* and *Gianni* can be coreferent. Nouns like *fotografia* have an agent as the external argument.

3 Extending affectedness to verbs

Rizzi (1986a) also uses nouns like *fotografia* to support a generalization based on the affectedness distinction from Anderson (1979). He suggests that affectedness operates on theta grids. Some verbs take unaffected objects. He claims that theta-roles other than theme, such as experiencer, benefactive, source, goal, are always affected but that there are two kinds of theme: theme 1, which is affected and theme 2, which is unaffected. He argues that an empty pronominal cannot be interpreted as arbitrary if it is unaffected and this predicts that verbs which take

theme 2 will not allow null objects whereas those which take theme 1 will. The contrast is shown in (12):

(12) a. *Gianni incontra/trova/vede/sente/ arrabiati (Italian)
Gianni meets/finds/sees/hears angry
b. Gianni fotografa/ritrae/visita nudi
Gianni photographs/portrays/visits nude

In (12a) the null object is not allowed because these verbs take unaffected objects. In (12b) the null object is allowed because these verbs take affected objects. Rizzi agrees with Anderson (1977a, 1979) in claiming that reproduction of an object as in *fotografia* counts as affected.

Rizzi notes that the same kind of distinction shows up in middles as described by Fiengo (1980) and Keyser and Roeper (1984).

(13) a. John portrays easily.
b. *John sees easily.

Rizzi notes that the affectedness effect becomes less clear-cut if the context indicates the object is affected even when the verb is one that takes an unaffected object.

(14) In questo paese, talvolta la polizia trova ___ nudi
In this country, sometimes the police find ___ nude
sulla spiaggia. (Italian)
at the beach

In (14) the null object should not be allowed because the verb *trova* does not affect its object but the context indicates that those found nude by the police will be affected. Rizzi also notes that "the affected–unaffected distinction appears to be of higher syntactic relevance than most distinctions offered by θ theory" (1986a: 540). These attempts to use affectedness to cover other languages essentially accept the definition of affectedness in Anderson (1977a, 1979) though they modify the mechanism, but Tenny (1992) modifies the description itself.

Tenny (1992, 1994) argues that the affected argument of a verb is better described as "an argument which measures out and delimits the event described by the verb" (1992: 8). This quality of delimiting the event is supported by the fact that these verbs take temporal adverbs:

(15) a. The missionaries converted the natives in a day/*for a day.
b. John avoided Bill *in a day/for a day.

In (15a) *the natives* delimits the act of conversion and does not allow the temporal adverb with *for* which modifies an event taking place over a period of time. In (15b) *Bill* does not delimit the act of avoiding and allows the adverbial with *for* but not the adverbial with *in* which applies to events with an end point. Tenny

claims that this brings together the other nominals allowing preposing, those of creation, concealment, or exposure. Anderson (1977a, 1979) had to extend the notion of affected to include these nominals. Tenny claims that describing this class of predicates in terms of aspect allows a more unified description of the whole class. She claims they have a measure aspectual role which gives a temporal limit associated with the event being measured out. She seems to mean by delimited that the endpoint is indicated.

4 Affectedness in middles

Tenny (1992, 1994) extends this analysis to middles and here again argues that the notion affected is not as accurate as the notion of delimited. In (16) neither *cross* nor *wander* affects the object, *desert*, but *the desert* delimits crossing and not wandering. Thus (16a) is predicted to be grammatical and (16b) is not.

(16) a. This desert crosses easily.
b. *This desert wanders easily.

Tenny agrees with Anderson (1977a, 1979) that the affected object is a direct internal object of the verb or noun when the object is affected or in Tenny's terms, when the object delimits the event of the verb or noun.

In support of the measure aspect Tenny gives examples from the *ba* construction in Mandarin. In this construction the object preceded by a preposition can move to a position before the verb only if it is affected:

(17) a. Ta ba Zhangsan sha-le. (Mandarin)
he BA Zhangsan kill-ASP
'He killed Zhangsan.'
b. *Lisi ba Xiaoming kanjian-le.
Lisi BA Xiaoming help-ASP
'Lisi saw Xiaoming.'

The object can appear with *ba* before the verb if the object is affected as in (17a) but not otherwise as in (17b). Tenny cites Cheng and Ritter (1987) for these examples and claims that verbs with change of state or resultatives also allow this construction. She claims that all of these involve a measure aspectual role.

It is not clear how the aspectual role actually limits the operation of these movement rules. Tenny claims that some syntactic processes such as passivization are sensitive to the measure aspect but others such as *wh*-movement are not. However, it appears that taking the affected object as delimiting the event unifies the kinds of predicates that are involved in affectedness for both nouns and verbs.

Going back to the noun preposing examples, one could claim that those nouns which are delimited by their objects take those objects as bare NPs and when the

event is not delimited the complement is a prepositional phrase. A prohibition against preposition stranding then prevents preposing such objects.

Egerland (1998) follows Tenny in assuming that the affectedeness constraint is better described in terms of the object delimiting the event. For Egerland an event is delimited if it must take place over a fixed period of time. Egerland uses middles to illustrate his point:

(18) a. John read the book.
b. The book reads easily.

In (18a) *the book* delimits the act of reading even though it is not affected by the event. As predicted, *read* is good as a middle and middles are assumed to work only with affected objects.

Ackema and Schoorlemmer (1994) suggest that the affectedness constraint can be derived from other conditions. They claim that there are middles in Dutch and English in which the subject is not affected:

(19) a. De Matterhorn beklimt gemakkelijker dan de Mt. Everest. (Dutch)
the Matterhorn climbs more easily than the Mt. Everest
b. Greek translates easily.

In their analysis these are predicted because they claim that middles are formed in the lexicon whenever there is an action tier and a suppressed arbitrary actor. When this occurs the affected patient can be projected as the external argument. Both the Dutch and English examples have action tiers but no patients and so the only remaining arguments become the external arguments. They claim that these kinds of examples are rare because usually verbs with action tiers have patients. This means that middles tend to have affected objects but not always. Additional evidence comes from Dutch impersonal middles. The subject is not affected so the affectedness constraint fails to predict the grammaticality of (20):

(20) Het loopt lekker op deze schoenen. (Dutch)
it walks comfortably on these shoes

This is grammatical because there is an action tier and a suppressed arbitrary actor so the impersonal pronoun is projected in the external argument position. (21) is predicted to be bad because there is no action tier or actor for a state verb:

(21) *Het lijdt even makkelijk met veel geld. (Dutch)
it suffers as easily with much money

The authors suggest that a similar explanation may underlie the claim that the affectedness constraint controls passive nominals and null objects. They suggest that the logical subject argument is suppressed and the external argument chosen

by the thematic hierarchy and that such a derivation will be possible only with nouns that have an action tier.

For Ackema and Schoorlemmer the work of the affectedness constraint is done by the thematic hierarchy which dictates that the affected patient will be the external argument, if there is one, instead of the arguments lower on the hierarchy. Examples like those in (22) show that this analysis does not cover all of the data because both *avoid* and *avoidance* surely have action tiers and suppressed actors but they do not allow a middle (22) or preposing (22a):

(22) a. *the avoidance of the hole by John
b. *That hole avoids easily.

It appears that Tenny's version of the affectedness constraint covers their examples. In (19) the *climbing* and the *translating* are both delimited by the syntactic subjects. The impersonal middles are not obviously predicted by Tenny's version of affectedness. It is not clear what mechanism prevents middles from forming with verbs which don't affect or delimit their objects but there seems to be agreement that some constraint operates here.

5 Affectedness in dative constructions

Janda (1988) relates affectedness to the dative of possession in Czech. The dative of possession as contrasted to the regular possessive implies that the possessor is affected. So for example in (23b) the possessor is considered to be affected, but not necessarily in (23a):

(23) a. Jeho matha zemřela. (Czech)
his -possessive mother-nom died
'His mother died.'
b. Zemřela mu matha.
died him-DAT mother-NOM
'His mother died.'

Further, the regular genitive (24a) cannot be used for inalienably possessed body parts but the dative of possession (24b) can be:

(24) a. *Litost sevřela hrdlo Petra. (Czech)
regret-NOM tightened throat-ACC Peter-GEN
'Regret tightened Peter's throat.'
b. Litost sevřela Petrovi hrdlo.
regret-NOM tightened Peter-DAT throat-ACC
'Regret tightened Peter's throat.'

Both the dative of possession and the regular possessive can be used together. As in (25):

(25) Když sevrátit viděl že mu shořel
When refl-ACC returned saw that him-DAT burned down
jeho dům. (Czech)
his-POSS house-NOM
'When he returned he saw that his house had burned down (and he was affected).'

Janda claims that this dative can then be used to pragmatically create intimacy, solidarity, and authority because it can create the feeling that the speaker or the listener is affected by the action when it is not obvious that this is so. For example in (26), the mother includes herself as affected by the teething pain of the child and creates a feeling of solidarity:

(26) Rostou nám zoubky
grow us-DAT teeth-Nom

Janda relates this pragmatic use to Lakoff's cognitive grammar (Lakoff 1987).

Landau (1999) argues that in Hebrew, French, and Spanish the possessive dative construction is limited by independently motivated constraints on movement and that affectedness does not make the correct predictions. The contrast in (27a) and (27b), he claims, does not support the importance of affectedness because even though the affected dative in (27a) is good and the unaffected dative in (27b) is out there are other examples in both Hebrew and French in which the dative is unaffected, as in (28a) and (28b):

(27) a. Je lui ai arraché la dent. (French)
I him have pulled the tooth
'I pulled his tooth.'
b. *Je lui ai admiré le bras
I him have admired the arm
'I admired his arm.'

(28) a. Gil xipes le-Rina et ha-taba'at. (Hebrew)
Gil searched to-Rina ACC the-ring
'Gil searched for Rina's ring.'
b. Je lui ai photographié les pieds. (French)
I to- her have photographed the feet
'I photographed her feet.'

Landau claims that the dative of possession in these languages originates in the specifier of the DP which is possessed, *les pieds* in (28b), and raises from there to the specifier of the VP. His analysis predicts that you will not get dative of possession when there is no specifier of the VP and he claims this is true when the verb is a subject experiencer verb. In these verbs the experiencer is an internal argument so there is no position to which the possessive can raise. He argues that verbs with agents require a higher verb shell and the possessive can raise to the

specifier of that shell. In experiencer verbs like those in (27) the experiencer, *je*, occupies the specifier of VP position and the dative cannot raise. His analysis also predicts that the dative of possession will not be possible if the possessed DP is not present as in (29):

(29) Gil axal le-Rina *(et ha sendvich). (Hebrew)
Gil ate to-Rina Acc the sandwich
'Gil ate Rina's sandwich.'

These data from French and Hebrew cast doubt on the claim that dative of possession in general allows only affected objects. However there does seem to be a connection between the closeness of the object to the verb in datives and the notion of affectedness. Shopen (1986) claims that "in any construction the position immediately following the verb draws more attention to affectedness than a position farther removed from the verb" (1986: 153). Thus in *threw John out* there is more interest in the effect on *John* than there is in *threw out John*.

Collins (1995) argues on the basis of alternations extracted from the Australian Corpus Project that affectedness is not the only factor in the interpretation of datives. He claims that whether the NPs are definite, accessible, pronouns, or at the end of the VP are all factors. He claims that in examples like (30) the (30a) version occurs more often when *the flowers* is new information and (30b) more often when the identity of the recipient is new information. These are not distinguished by affectedness.

(30) a. Tom gave his aunt the flowers.
b. Tom gave the flowers to his aunt.

Another claim about the relevance of affectedness to datives is made in Sadakani and Koizumi (1995). They claim that children distinguish between the dative case marker *ni* and the postposition *ni* on the basis of the affectedness of the NP. The case marker *ni* is attached to more affected objects and the postposition is attached to less affected objects.

(31) a. Emi-wa Mika-ni bara-no hanataba-O ageta.
Emi-Top Mika-ni rose-Gen bouquet-Acc gave
'Emi gave Mika a bouquet of roses.'
b. Kanta-wa yuuenti-de uma-ni notta.
Kanta-Top amusement park-at horse-NI rode
'Kanta rode a horse at the amusement park.'
c. Mika-wa Tanaka sensee-ni inu-o.
Mika-Top Tanaka prof.-NI dog-Acc
'Mika was affected by Professor Tanaka's complimenting her dog.'
d. Kanta-no ronbun-wa GB riron-ni.
Kanta-Gen paper-Top GB theory-NI
'Kanta's paper is based on GB theory.'

In (31a) and (31b), where *Mika* and *the horse* are more affected, the case marker is used and in (31c) and (31d), where *Professor Tanaka* and *GB theory* are not affected, the postposition is used. This difference in affectedness is implicated in the process by which children learn the distinction between the postposition and the case marker. Children give a case marker structure to NPs which are more affected and a postposition to those which are less affected. The dative case marker is acquired first by children. This corresponds to a hierarchy suggested by Koizumi (1994) in which more affected arguments are attached closest to the verb.

6 Other forms constrained by affectedness

Koizumi (1994) argues that depictive predicates in Japanese are not grammatical when the antecedent of the depictive is a non-affected theme. The contrast is shown in (32).

(32) a. Taroo-ga aizin-o hadaka-de korosita. (Japanese)
Taroo-Nom lover-Acc naked killed
'Taro killed his lover naked.'
b. Sinko-ga manekin-o hadaka-de korosita.
Shinko-Nom mannekin-Acc naked displayed
'Shinko displayed the mannequins naked.'
c. *Taroo-ga Ziroo-o hadaka-de hometa.
Taroo-Nom Ziroo-Acc naked praised
'Taro praised Jiro naked.'
d. *Taroo-ga Ziroo-o hadaka-de oikaketa.
Taroo-Nom Ziroo-Acc naked chased
'Taro chased Jiro naked.'

In (32a) and (32b) the antecedents of the depictive *naked*, *his lover*, and *the mannekin*, are affected by the verbs, *killed* and *displayed*. In (32c) and (32d) the antecedent, *Jiro*, is not affected by the verbs *praised* and *chased*. Koizumi claims that the affected theme illustrated in (32a) and (32b) is a sister to the lowest verb and thus available to the depictive predicate whereas the unaffected theme illustrated in (32c) and (32d) is a sister to the higher verb phrase and thus not available to the predicate. Koizumi's principle of predication requires that the predicate be c-governed by the antecedent and c-governed by an x zero category. C-government is defined in terms of c-command with the requirement that there be no barrier between the two elements.

(33) a. $[_{VP}$ NP-o ODP $[_{V'}$ v]]
b. $[_{VP}$ NP-o $[_{V'}$ ODP v]]

In (33a) the object depictive phrase (ODP) is not c-governed by the verb, the only available zero level category, and in (33b) the V' is a barrier to c-government by

the unaffected object theme. In (32c) and (32d) the non-affected theme *Jiro* will not c-command a depictive predicate that is c-commanded by the zero level verb. Only the affected theme which is sister of the zero level verb will do so. These non-affected themes can however be antecedents of depictives if they undergo passive:

(34) a. *Taroo-ga Ziroo-o hadaka-de nagutta. (Japanese)
Taro-Nom Jiro-Acc naked hit
'Taro hit Jiro naked.'
b. ?Ziroo-ga hadaka-de Taroo-ni nagurareta.
Jiro-Nom naked Taro-by was hit
'Jiro was hit by Taro naked.'

Koizumi says this is because the subject position allows the depictive because the depictive can be a sister of Infl and be c-governed then by both an x zero category and the antecedent in subject position.

Koizumi points out that the thematic roles assigned in (34) are the same and thus it is not directly the thematic role which restricts the interpretation. Rather it is the base structure associated with the semantic role. The affected theme is a sister of the lowest verb and the non-affected theme is not.

Koizumi claims that secondary resultative predicates are also sensitive to the affected/non-affected distinction as illustrated in (35):

(35) a. Taroo-ga garasu-o 3-tu-ni kitta. (Japanese)
Taro-Nom glass-Acc 3-CL-into cut
'Taro cut the glass into three pieces.'
b. *Taroo-ga garasu-o 3-tu-ni tataita.
Taro-Nom glass-Acc 3-CL-into hit
'Taro hit the glass into three pieces.'

He concludes that secondary resultative predicates like *into three pieces* are generated as sisters of the lowest verb, v, and thus can be predicated of affected themes which are also sisters of v as in (35a) but they cannot be predicated of non-affected themes like *the glass* in (35b) because such themes are sisters of the higher verb complex. In other words, these themes are attached higher in the structure. Locative phrases are claimed to behave in the same way:

(36) a. Taroo-ga Ziroo-o betto-no ue-de korosita.
Taro-Nom Jiro-Acc bed-Gen on killed
'Taro killed Jiro on the bed.'
b. Taroo-ga Ziroo-o betto-no ue-de hometa.
Taro-Nom Jiro-Acc bed-Gen on praised
*'Taro praised Jiro on the bed.'

Koizumi claims that (36b) is ungrammatical if just *Jiro* is on the bed but that (36a) is grammatical if just *Jiro* is on the bed. In the reading where both people are on the bed it is assumed that the locative is higher in the structure. If locatives are considered to be secondary predicates they fit the pattern of Koizumi's principle of predication.

The notion of affected versus non-affected theme is different for Koizumi than for Anderson. In example (35b) the verb *hit* seems to carry the connotation of affecting the object yet these examples are classified by Koizumi as non-affected themes. Koizumi claims that affected themes are selected by verbs which "cannot repeatedly act upon the same object while a non-affected theme transitive can" (1994: 74). Thus one can kill someone only once but one can hit or praise them a number of times. This seems compatible with Tenny's revision of affectedness, that the affected theme delimits the action of the verb.

Koizumi claims that a similar analysis of secondary predicates works in English and that in English secondary predicates cannot be predicated of non-affected themes as shown in (37):

(37) a. ?*John hit Tom naked.
b. ?*Mary praised the professor drunk.

He claims that the objects of the verbs as non-affected themes are generated in the spec of VP and the adjectives *drink* and *naked* are generated as sisters of v. The judgments here are not very clear. *John killed Tom naked* seems no better than (37a) or *chased Tom naked*. Further, (38) seems perfect though *see* does not affect its object:

(38) Mary saw the professor drunk

Miyagawa (1988) makes a similar point about floating numeral quantifiers in Japanese. He claims that only affected themes allow numeral quantifiers to float. In (39) the floated quantifier is grammatical with *okutta*, 'sent', but ungrammatical with *matte*, 'wait for'.

(39) a. futa-tsu John-ga kozutsumi-o t okutta (koto) (Japanese)
2-CL John-Nom package-Acc t sent fact
'(the fact that) John sent two packages'
b. *futa-ri Mary-ga gakusei-o t matte iru (koto)
2-CL Mary-Nom students-Acc t wait fact
'(the fact that) Mary is waiting for two students'

This he claims is because the type of verb he calls a theme transitive directly governs the numeral quantifier, a predicate in his terms. He further stipulates that a predicate leaves a trace only if it is in a virtual A position. He claims that affected themes can involve exchange, creation, conversion, destruction, or consumption. As a test he uses the intransitivizing resultative, *-te aru*:

(40) a. ringo-ga katte aru. (Japanese)
apples-Nom buy-Gerund exist
'Apples are bought = Apples have been bought.'
b. *Hanako-ga aishite aru.
Hanako-Nom love-Gerund exist
'Hanako is loved.'

(40a) is grammatical but (40b) is not. Using this test verbs translated as *open*, *write*, *collect*, *break* are theme transitives and *wait*, *praise*, *like*, *shout at*, and *hit* are non-theme transitives. He claims that *hit* does not affect its object or take an affected theme role and that the same is true in English as shown by the impossibility of the predicate *flat* in (41b):

(41) a. John smashed the can flat.
b. *John hit the can flat.

Numeral quantifiers cannot move out of the positions in which they modify non-themes as in (27b) because they cannot leave traces. The assumption here is that if they cannot leave traces they cannot move.

Miyagawa claims that the distinction between affected and unaffected themes is similar to the distinction between resultative and depictive predicates in English.

(42) a. How clean did the dog pick the bone?
b. *How raw did you eat the meat?

In (42a) *clean* is the state that results from the event. In (42b) *raw* depicts the state of *the meat* not the result of the event. Miyagawa argues that a result can only occur when an entity is affected. This connects the resultative predicates to affected themes. He claims that the resultative predicate, like the numeral quantifier, is governed directly by the verb because of the relation to the affected theme. The distinction he makes seems similar to Tenny's distinction between accomplishment vs. ongoing action.

7 Experimental work

Gropen et al. (1991) show that affectedness may be a semantic primitive that enters into the assignment of argument structure to verbs. The authors' experimental data provide evidence that children use a rich semantic structure with linking rules rather than a fixed list of thematic roles.

The linking rule they discuss is one that links the direct object of a verb to the entity affected by the verb. Children aged 3 to 9 and adults were introduced to novel verbs by showing them the action described by the verb. Entities, such as a piece of cotton, were moved to a goal which was either affected by that movement or not affected. For example, a piece of wet cotton soaked the goal which

changed color, or a piece of dry cotton had no effect on the goal. When the goal was not affected the motion was in a particular manner, such as zig-zagging. Sentences using the novel verbs were elicited and it was found that when the goal was affected the children more often made the goal the direct object rather than making the moving entity the direct object. They would more often use a structure like 'keated the paper with the cotton' than 'keated the cotton on the paper'. This was taken to show that the children were using a rich semantic structure including the notion of affected and that they linked affected entities to the direct object position. If children had a set list of thematic roles and assigned the moving object to one of these roles and the goal to another, one would not expect there to be a difference in syntactic structure when the goal was affected.

The authors also found that the ground or goal was made the direct object only when it was completely filled or covered. In 'keated the board with the ball' the board would be covered by the ball. However the figure, the moving entity, could usually be the object whether the ground was completely covered or filled or not. In 'keated the ball on the board' the board could be completely covered or not. In terms of affectedness this may mean that a ground will not be considered affected unless it is substantially covered or filled. Having a few apples does not affect a cart. However, a figure is affected just by changing position.

The authors assert that those verbs which alternate between figure and ground are those in which both the figure and the ground could be construed as affected. Verbs like *brush* and *dab* have force applied simultaneously to figure and ground and alternate between 'brush the board with paint' and 'brush paint on the board'.

Lebeaux (1988a) claims that children use the semantics of affectedness when acquiring passives. Children learn non-action passives like 'was liked' later than action passives like 'was hit' and Lebeaux claims this is because they have a constraint that affected entities are objects. When the child hears passives like 'John was hit' the child assumes that *John* is affected and so must have been the object and posits a trace after *hit*. The child does not make the same assumption for sentences like 'John was liked' and so can't process them. Later the child notices that there is a productive passive morphology and so extends passive to verbs like *like* on the basis of the morphology not the semantics. For noun phrases like 'the city's destruction' the child assumes that there is a trace and that *the city* is the object, but because there is no passive morphology for passives in noun phrases the child does not extend this structure to other nouns. Passive is assumed only for those which fit the thematic generalization that affected nouns must be internal arguments. In the adult grammar the NPs with nouns like *destruction* will have a trace but they will not be real passives because it is not a productive process and the nominal passive ends up being thematically restricted.

Gordon and Chafetz (1990) claim that at least in the acquisition of passives children are not influenced by whether or not the object is affected by the action of the verb. Children do not seem to comprehend non-action passives as early as action passives but Gordon and Chafetz claim this is because they hear fewer

non-action passives. In their studies the verbs with affected objects were no more likely to be understood in passive than those which had non-affected objects.

Affectedness seems to be a factor in a number of different constructions, NP preposing, middles, datives, depictive predicates. The effects are found in English, French, Dutch, Hebrew, Polish, Japanese. The most straightforward mechanism for describing the effect is that it is a semantic primitive which constrains the subcategorization frames of verbs and nouns. The actual way in which this mechanism operates is not worked out for most of the constructions described here. Experimental work adds weight to the idea that affectedness is a semantic primitive.

3 Conclusion

1 Introduction

The sentence in (1a) describes an event that occurred in the past of John repairing the car. In (1b), this sentence is embedded under a causative verb, *make*. The new sentence expresses the fact that the event of John repairing the car was brought about or caused by Mary.

(1) a. John repaired the car.
b. Mary made John repair the car.

Sentences such as those in (1b) are called causative sentences. The term *causative* derives from the semantics of these constructions. It is meant to express the fact that the event reported in (1a) is caused by someone. *Mary* in (1b) is called the *causer*, the person that brought about the event described by its verbal complement (*repair the car*), and *John* is called the *causee*. Other constructions that are like (1b) are given in (2):

(2) a. Mary let John repair the car.
b. Mary had John repair the car.

We call causatives of the types found in English analytical causatives, since the causative verb *make* (or *let*, *have*) and the verb in the complement are two independent words. Analytical causatives are also found in Romance languages, as the Catalan, French, Italian, Portuguese, and Spanish examples in (3) show:

(3) a. Marie fit reparer la voiture à Jean. (French)
b. Maria fece riparare la macchina a Gianni. (Italian)
c. Maria hizo arreglar el coche a Juan. (Spanish)
d. A Maria fez arranjar a máquina à João. (European Portuguese)
e. La Maria va fer arreglar el cotxe al Joan. (Catalan)
Mary made repair the car to John
'Mary made John repair the car.'

Although morphologically English and Romance causatives are similar (in both cases we have two verbs), syntactically the causative and the infinitive verbs (e.g., *fit reparer* in (3a)) in French and more generally in Romance languages behave as a single complex verb. This behavior is apparent in the distribution of

the infinitive arguments and in the properties of these arguments with respect to certain syntactic processes, as we will see in the following sections. Here we will mainly concentrate on Romance causatives.

Since Kayne's (1975) seminal work on French causatives, many studies have looked at the causatives in various Romance languages (see Rouveret and Vergnaud 1980; Manzini 1983b; Burzio 1986; Zubizarreta 1986; Bordelois 1988; Gonçalves 1999; Treviño 1990; Guasti 1993). For expository purposes, this review of analytical causatives will take Italian as a representative language of the Romance family and will explicitly point out the divergences among Romance languages.

2 The syntax of Romance causatives

Various properties single out Romance causatives. The most prominent ones are the distribution of the thematic subject of the infinitive verb embedded under the causative, and the behavior of its arguments with respect to certain syntactic processes like cliticization and passivization.

2.1 Distributional properties of the infinitive's subject

We have seen that in English the infinitive's subject surfaces between the causative verb and the infinitive, as in (1b). In Romance languages, the same order is generally prohibited, as seen in (4):

(4) a. *Maria ha fatto Gianni riparare la macchina.
Maria has made Gianni repair the car
'Maria made Gianni repair the car.'
b. *Paolo ha fatto la classe ridere.
Paolo has made the class laugh
'Paolo made the class laugh.'

The subject must occur in a position at the very end of the sentence, as in (3) above. In causatives based on transitive verbs, the subject of the infinitive, *Gianni*, appears after the direct object *la macchina* (the car) and is preceded by the preposition *a* (to), as in (3b) and (5a). Alternatively, it is introduced by the preposition *da* (by), as in (5b). These are not just two ways of expressing the causee. In fact, (5a) and (5b) are two different constructions that have some properties in common, but differ with respect to a number of other properties, as we will extensively discuss in section 2.3. Since Kayne's 1975 work, these two constructions have been named *faire-infinitif* (FI), (5a), and *faire-par* (FP), (5b):

(5) a. Maria ha fatto riparare la macchina a Gianni. *(faire-infinitif)*
Maria has made repair the car to Gianni
'Maria made Gianni repair the car.'

b. Maria ha fatto riparare la macchina da Gianni. *(faire-par)*
Maria has made repair the car by Gianni
'Maria had the car repaired by Gianni.'

In causatives of intransitive unergative verbs, as in (6), the subject of the infinitive surfaces after the infinitive verb, but is not and cannot be preceded by any preposition. This causative construction is also considered an instance of the *faire-infinitif* construction.

(6) Paolo ha fatto ridere la classe. *(faire-infinitif)*
Paolo has made laugh the class
'Paolo made the class laugh.'

The English order SV(O) displayed in (1b) is unacceptable in Romance causatives. Exceptions are some dialects of Spanish, according to Moore (1991) and European Portuguese (EP). For example, in EP, beyond the order in (3) found in the other Romance languages, one finds a causative construction displaying the English order, as shown in (7):

(7) Os pais mandaram os meniños comprar(em) os livros.
the parents made the children buy(-3PL) the books
'The parents made the children buy the books.'

Interestingly, in this EP construction, the infinitive verb can be inflected, that is, it can display overt subject agreement. In contrast, in the other causative construction, in (3d), typically found in the other Romance languages, inflected infinitives are prohibited. Notice also that the order SV(O) is perfectly acceptable in all Romance languages when the causative verb is replaced by a verb of perception as illustrated in (8). Compare (8) with the minimal pairs in (4):

(8) a. Maria ha visto Gianni riparare la macchina.
Maria has seen Gianni repair the car
'Maria saw Gianni repair the car.'
b. Paolo ha visto tutta la classe ridere.
Paolo has seen whole the class laugh
'Paolo saw the whole class laugh.'

The contrast between the ungrammatical sentences in (4) and the grammatical ones in (8) suggests that the Romance causative construction has properties that single it out from other infinitival constructions. With the exception of the EP construction in (7), all the sentences examined show that adjacency between the causative and the infinitive verbs cannot be interrupted by the subject of the infinitive. This fact may suggest that the causative and the infinitive verbs count as a single unit, an interpretation that is supported by other pieces of data.

2.2 Syntactic processes in causative constructions

In this section, we are going to examine the syntactic behavior of arguments of the infinitive verb with respect to two processes, cliticization and NP-movement, as it occurs in passive constructions. With respect to these two processes the two causative constructions, *faire-infinitif* and *faire-par* are essentially alike. Therefore, only examples of *faire-infinitif* will be offered.

2.2.1 Causatives based on transitive verbs

2.2.1.1 Clitic placement

Consider the sentence in (5a), repeated below for convenience:

(5) a. Maria ha fatto riparare la macchina a Gianni.
Maria has made repair the car to Gianni
'Maria made Gianni repair the car.'

The direct object of *riparare* can be expressed as an accusative clitic that appears in a position preceding the causative verb, as in (9a). Placement of this clitic after the infinitive is generally unacceptable, although some speakers (see Burzio 1986) accept it marginally (see (9b)):

(9) a. Maria la fa riparare a Gianni.
Maria it-FEM-SG-ACC makes repair to Gianni
'Maria made Gianni repair it.'
b. ??/*Maria fa ripararla a Gianni.
Maria makes repair+it-FEM-SG-ACC to Gianni
'Maria made Gianni repair it.'

Now compare the placement of the clitic in (9) with the placement of the clitic in other non-causative constructions, e.g., the control structures in (10). The direct object in (10a), *il libro* (the book), can be cliticized and placed after the infinitive verb, as in (10b). Placement of it in a position preceding the main verb, *promettere* (promise), yields a severe ungrammatical result, as illustrated in (10c):

(10) a. Gianni promise di leggere il libro.
Gianni promised to read the book
b. Gianni promise di leggerlo
Gianni promised to read+it-MASC-SG-ACC
'Gianni promised to read it.'
c. *Gianni lo promise di leggere.
Gianni it-MASC-SG-ACC promised to read
'Gianni promised to read it.'

Facts similar to those just discussed can be observed with *ne*-cliticization, that is, when we cliticize the head of an internal argument. Consider the causative sentence in (11a). The head of the NP, *libri* (books) in (11a), can be expressed by the clitic *ne* (of + them). In causatives, this clitic must surface on the causative verb, not on the infinitive verb, that is, (11b) is the only grammatical possibility of placing the clitic *ne*.

(11) a. La maestra fa leggere molti libri a Paolo.
the teacher makes read many books to Paolo
'The teacher makes Paolo read many books.'
b. La maestra ne fa leggere molti a Paolo.
the teacher of+them makes read many to Paolo
'The teacher makes Paolo read many of them.'

On the contrary, in non causative constructions, e.g., a control structure in (12a), the clitic *ne* standing in for the head of the internal argument of the infinitive surfaces after the infinitive, as in (12b). Placement of this clitic before the main verb *promise* leads to an ungrammatical result, (12c):

(12) a. Gianni promise di leggere molti libri.
Gianni promised to read many books
b. Gianni promise di leggerne molti
Gianni promised to read+of+them many
c. *Gianni ne promise di leggere.
Gianni of+them promised to read
'Gianni promised to read many of them.'

The set of data in (10) and (12) displays the normal distribution of clitics in infinitival constructions. What is exceptional is the placement of clitics in causative constructions. Not only is the placement of clitics on the causative verb possible, but it is the standard solution, appearance of the clitic on the infinitive leading to ungrammatical or rather marginally acceptable results.

In causatives, clitics standing in for the internal argument of the infinitive must cliticize on the main verb. The process by which this occurs is referred to as clitic climbing in the literature (see Kayne 1989b, 1991).

The subject of the infinitive introduced by the preposition *a* (to) can also be expressed by a dative clitic placed before the causative verb, as in (13b). No clitic exists for the subject of the infinitive when it is introduced by the preposition *da* (by).

(13) Maria gli fa riparare la macchina.
Maria to+him makes repair the car
'Maria makes him repair the car.'

Appearance of the dative clitic after the infinitive is unanimously considered unacceptable, as (14) illustrates:

(14) *Maria fa riparargli la macchina.
Maria makes repair+to+him the car
'Maria makes him repair the car.'

Generally, a clitic is placed close to the verb that determines its thematic role, its case, and its grammatical function. This is illustrated in (10) and (12). For example, in (10) the argument of the verb *leggere* (read) can be expressed by a clitic following the infinitive verb, which is the verb that determines its thematic role, its case, and its grammatical function. In causatives, instead, clitics expressing arguments of the infinitive surface on the causative verb. In a way, these arguments seem to act as arguments of the causative verbs as well, a fact that is in need of explanation.

2.2.1.2 Passivization and NP movement

When the causative verb is in the passive, the internal argument of the infinitive behaves as a direct object of the causative verb as well: it undergoes NP-movement to the subject position of the causative verb:

(15) a. La macchina è stata fatta riparare a Gianni da Maria.
the car is been made-FEM-SG repair to Gianni by Maria
'The car was made to be repaired to Gianni by Maria.'
b. La macchina è stata fatta riparare da Gianni (*da Maria).
the car is been made-FEM-SG repair by Gianni (*by Maria).
'The car was made to be repaired by Gianni by Maria.'

In passive sentences, the passive morpheme on the verb absorbs structural accusative case. As a consequence, the D-structure object is forced to move to a position where it receives nominative case. Since in (15) it is the D-structure object of the infinitive that undergoes movement, we must conclude first that the infinitive by itself has no case to assign; second that movement to the structural subject position of the causative verb ensures that the internal argument of the infinitive, *la macchina* (the car), gets a case, precisely nominative case. Since case is not assigned by the infinitive, one can conjecture that it is assigned by the causative and the infinitive taken as a complex verb. When the causative verb is passivized, the complex verb as a whole looses its ability to assign accusative case and forces movement of the D-structure object to the subject position. As in all passive sentences the subject, or in this case, the causer, Maria in (5), can be optionally expressed with the *by* phrase. Passivization is possible with the causative construction FP as well as seen in (15b), obtained by (5b). In this case, however, the presence of a *by* phrase standing in for the causer yields a very marginal result.

Passivization of the causative verb and NP-movement are perfectly natural in Italian and in EP, as seen in (16a) (see Gonçalves 1999). In other Romance languages, there is variation and restrictions apply. Variation exists among the speakers of Spanish concerning the status of passivization in causatives (see

Moore 1991). Zubizarretta (1986) reports that the equivalent of (15) is ungrammatical in Spanish. Guasti (1993) and Treviño (1990) give examples perfectly acceptable for Spanish speakers (see (16b)).

(16) a. O carro foi mandado arranjar à João.
the car was made repair to João
'The car was made to be repaired by João.'
b. La catedral fue hecha costruir por el Papa.
the cathedral was made-FEM-SG build by the Pope
'The cathedral was made to be built by the Pope.'

Passivization in French is generally reported to yield ungrammatical results, as shown in (17) (see Kayne 1975; Zubizarreta 1986):

(17) *La voiture a été fait reparer par Jean.
the car has been made repair by Jean
'The car was made to be repaired by Jean.'

In summary, we have seen that the arguments of an infinitive after a causative verb display a peculiar behavior: while being arguments of the infinitive, they behave as if they were arguments of the causative verb, as well. The direct object of the infinitive can be expressed by an accusative clitic surfacing before the causative verb and undergoes NP-movement when this verb is in the passive. The subject of the infinitive can be expressed by a dative clitic.

2.2.2 Causatives based on intransitive unergative verbs

2.2.2.1 Cliticization

In causatives based on intransitive unergative verbs, the subject of the infinitive must appear at the end of the sentence, as we saw in (6). It can be expressed by an accusative clitic, as direct objects can (see (18a)):

(18) Paolo l' ha fatta ridere.
Paolo her has made-FEM laugh
'Paolo made her laugh.'

Appearance of the clitic on the infinitive leads to severe ungrammaticality, as in (19):

(19) *Paolo fa riderla.
Paolo makes laugh+her
'Paolo makes her laugh.'

Since an unergative verb does not assign accusative case, this case must be supplied by the causative verb.

Let us now consider the process of *ne*-cliticization. Take the sentence in (20a). The head of the NP subject *molti bambini* (many children) can be cliticized by the clitic *ne* (of + them) and this must appear on the causative verb, as in (20b):

(20) a. Ciò ha fatto piangere molti bambini.
this has made cry many children
'This has made many children cry.'
b. Ciò ne ha fatti piangere molti.
this of+them has made-MASC-PL cry many
'This has made many of them cry.'

2.2.2.2 Passivization and NP movement

The subject of the intransitive verb embedded under a causative verb may undergo NP-movement, like a direct object, and becomes the subject of the causative sentence when *fare* is passivized. An optional *by* phrase, *dal dottore* (by the doctor), can express the underlying subject of the causative verb:

(21) Molti bambini sono stati fatti piangere per nulla
many children are been made-MASC-PL cry for nothing
dal dottore.
by+the doctor
'Many children have been made to cry for nothing by the doctor.'

Molti bambini (many children) is the subject of *piangere* (cry) and thus receives a thematic role from it. As we saw earlier in section 2.2.1, the arguments of the infinitives behave somehow as arguments of the causative verbs. Here we have seen that the subject of the infinitive behaves as an object: it can be expressed by an accusative clitic and undergoes NP-movement to the subject position of the causative verb when this is passivized.

2.2.3 Causatives based on unaccusative verbs

In declarative sentences the internal argument of an unaccusative verb can surface both before or after the verb (at least in Catalan, Italian, and Spanish), as shown in (22):

(22) a. Molti studenti arrivarono in ritardo.
'Many students arrived late.'
b. Arrivarono in ritardo molti studenti.
arrived late many students
'Many students arrived late.'

In causatives based on unaccusative verbs, the internal argument of the infinitive must stay in the postverbal position, as illustrated in (23):

(23) Lo sciopero ha fatto arrivare molti studenti in ritardo.
the strike has made arrive many students late
'The strike made many students arrive late.'

2.2.3.1 Cliticization, passivization, and NP movement

The NP-internal argument of the infinitive can be expressed by an accusative clitic surfacing on the causative verb, as in (24a), and its head can be expressed by the clitic *ne*, as in (24b):

(24) a. Lo sciopero li ha fatti arrivare in ritardo.
the strike them has made-MASC-PL arrive late
'The strike made them arrive late.'
b. Lo sciopero ne ha fatti arrivare molti in ritardo.
the strike of+them has made-MASC-PL arrive many late
'The strike made many of them arrive late.'

Finally, it may undergo NP-movement to the subject position of the causative verb when this is passivized. In this case, as in all passive sentences, an optional *by* phrase expressing the causer can be used (see 25b):

(25) a. Molti studenti sono stati fatti arrivare in ritardo.
many students were been made arrive late
'Many students have been made to arrive late.'
b. Molti bambini sono stati fatti nascere da giovani ostetriche.
many children were been made born by young midwives
'Many babies were made to be born by young midwives.'

Since unaccusative verbs do not assign accusative case, this case in (24a) must come from elsewhere. We must then conclude that the causative verb is playing a role in the process of case assignment. Again, these data show that the internal argument of the infinitive acts as an argument of the causative verb, as well. Notice that causatives based on unaccusatives behave as causatives based on unergatives as far as cliticization and NP-movement are concerned.

2.2.4 Summary

In Romance causatives based on transitive verbs, the direct object of the infinitive behaves as a direct object of the causative verb, and the subject of the infinitive as an indirect object. In causatives based on intransitive unergative verbs, the subject of the infinitive behaves as a direct object of the causative verb and, finally, in causatives based on unaccusative verbs, the internal argument of the infinitive acts as a direct object of the causative verb. One way to interpret these facts is by assuming that although Romance causative sentences include two morphologically distinct verbs, for syntactic purposes these two verbs behave as a single complex verb, an idea that we will develop in section 2.4. So far, we have examined some properties that are common to the *faire-infinitif* and to the *faire-par* construction. It is now time to see how these two constructions differ.

2.3 *The* faire-infinitif *and the* faire-par *constructions*

Since Kayne's 1975 work on French causatives, two types of constructions are distinguished in Romance languages: *faire-infinitif* (FI) illustrated in (5a) earlier and repeated in (26a) and *faire-par* (FP) illustrated in (5b) and repeated in (26b). In both constructions, the infinitive subject appears at the end of the sentence. However, while in the former case the causee is introduced by the preposition *à* (to), in the latter it is introduced by the preposition *par* (by) (Italian *a* and *da* respectively in (26a, b)). Causative sentences lacking the causee as in (26c) are also instances of the FP construction, as we will prove in 2.3.3.

(26) a. Maria ha fatto riparare la machina a Gianni.
Maria has made repair the car to Gianni
'Maria made Gianni repair the car.'
b. Maria ha fatto riparare la macchina da Gianni.
Maria has made repair the car by Gianni
'Maria had the car repaired by Gianni.'
c. Maria ha fatto riparare la macchina.
Maria has made repair the car
'Maria had the car repaired.'

2.3.1 *Status of the causee in the two causative constructions*

A major difference between the two causative structures is that the causee in the FI construction is an argument, whereas it is an adjunct in the FP construction, as shown by Burzio (1986). Binding of an anaphor is a standard test for argumenthood. In (27a) and (27b), instances of the FI construction, the causee binds the anaphor *proprio* ('own') and *se stesso* ('himself'), while it does not in the FP construction in (27c) and (27d), since it is an adjunct.

(27) a. Faremo curare i propri$_i$ interessi ai nostri clienti$_i$.
(we) will make take care of the own interests to our customers
'We will make our customers take care of their own interests.'
b. La polizia fece accusare se stesso$_i$ a Gianni$_i$.
the police made accuse himself to Gianni
'The police made Gianni accuse himself.'
c. *Faremo curare i propri$_i$ interessi dai nostri clienti$_i$.
(we) will make take care of the own interests to our customers
'We will make their own interests taken care of by our customers.'
d. *La polizia fece accusare se stesso$_i$ da Gianni$_i$.
the police made accuse himself by Gianni
'The police had himself accused by Gianni.'

In causatives based on intransitive verbs, the causee is an argument and not an adjunct. It cannot be omitted, as in (28a) and it can bind an anaphor, as in (28b). Thus, causatives based on intransitive verbs are also instances of the FI construction.

(28) a. *Paolo ha fatto dormire.
Paolo has made sleep
'Paolo had (someone) sleep.'
b. Faremo parlare ogni autore$_i$ del suo$_i$ libro.
(we) will make speak every author of his (own) book
'We will make every author talk about his book.'

In summary, causatives may take two forms referred to as *faire-infinitif* and *faire-par*. In the former, the causee is an argument, while in the latter it is an (optional) adjunct.

2.3.2 *Similarities between the passive and the FP construction*

Kayne (1975) and Burzio (1986) pointed out that the FP construction resembles the passive construction. The most evident similarity is that the causee is expressed in the same way the D-structure subject is expressed in passive sentences, that is, by a PP headed by the preposition *da* (by), a *by* phrase. (29) is an example of passive sentence with the *by* phrase:

(29) L' Italia fu battuta dal Belgio.
the Italy was beaten by the Belgium
'The Italian team was beaten by the Belgian team.'

Other less evident properties include the following. Idiomatic expressions, like *fare il furbo* ('be the smart one') that cannot be passivized cannot appear in the FP construction. This is illustrated in (30):

(30) a. *Il furbo è fatto da Gianni.
the smart one is done by Gianni
'The smart one is made by Gianni.'
b. *Ciò ha fatto fare il furbo da Gianni.
this has made make the smart one by Gianni
'This had (it) tried to be smart by Gianni.'

Expressions of inalienable possession cannot be used in passive sentences, neither can they appear in the FP construction. The sentences in (31) are ungrammatical under an inalienable possession reading of *la mano* ('the hand').

(31) a. *La mano è stata alzata da Gianni.
the hand is been raised-FEM-SG by Gianni
'The hand was raised by Gianni.'
b. *Ciò ha fatto alzare la mano da Gianni.
this has made raise the hand by Gianni
'This had Gianni raise his hand.'

Thus, the FP construction shares a number of properties with the passive construction. First, the subject of the infinitive verb is optional and when it is

expressed it is an adjunct as in the passive construction. Second, a number of verbs and idioms that cannot be passivized cannot appear in the FP construction as well. Third, expressions of inalienable possession can neither be passivized nor appear in the FP construction. Now that we know the properties of the FP construction, we can prove that the causative construction in which the causee is not expressed is also an instance of the FP construction.

2.3.3 Causative lacking the causee as instances of the FP construction

The *by* phrase is an adjunct and as such it can be omitted (see (26c) above). Thus, this kind of causative sentence is also an instance of the FP construction. As a matter of fact, the *by* phrase is optional in the FP construction, as it is in passive sentences. This claim is supported by the operativity of the same restrictions holding in causatives when the causee is expressed as *da* NP and also by some interpretative facts.

In section 2.3.2 above, we discussed evidence showing that a number of restrictions hold in the FP construction (and in the passive construction), but not in the FI construction. Interestingly, the same restrictions are still operative in causative sentences lacking the causee (see (30–31) above):

(32) a. *Ciò ha fatto fare il furbo.
this has made make the smart one
'This had (someone) be the smart one.'
b. *Ciò ha fatto alzare la mano.
this has made raise the hand
'This had (someone) raise his hand.'

Interpretative facts discussed in Pearce (1990) also suggest that causatives lacking an overt expression of the causee are instances of the FP construction. The ambiguous expression *prendere la medicina* ('take the medicine') can either mean ingest the medicine or take hold of the medicine. When this phrase is embedded under causatives the ambiguity disappears: in FI only the first meaning is conserved, as in (33a), whereas in the FP construction only the second meaning is preserved, as in (33b):

(33) a. La maestra ha fatto prendere la medicina al bambino.
the teacher has made take the medicine to+the child
'The teacher made the child take the medicine.'
b. La maestra ha fatto prendere la medicina dal bambino.
the teacher has made take the medicine by+the child
'The teacher had the child take hold of the medicine.'

Causatives lacking the causee, as in (34), retain only the second meaning, the one expressed in the FP construction in (33b). This fact can be explained only if we

say that causative sentences without an overt causee are also instances of the FP construction.

(34) La maestra ha fatto prendere la medicina.
the teacher has made take the medicine
'The teacher had (someone) take hold of the medicine.'

In summary, in the FP construction, the causee can either be expressed by an adjunct introduced by the preposition *da* ('by') or it can be omitted. By saying that it is omitted, we want to suggest that it is not simply lexically nonovert, but that there is no empty category standing in for the causee. We have seen above that the phrase *da* NP cannot bind an anaphoric expression, like *propri* or *se stesso* (see (27c, d)). The same holds true in causative sentences lacking the causee. The sentences in (35) are ungrammatical since the anaphors are not bound:

(35) a. *Faremo curare i propri interessi.
(we) will make take care of the own interests
'We will have (someone) take care of their own interests.'
b. *La polizia fece accusare se stesso.
the police made accuse himself
'The police had (someone) accuse himself.'

Failure to bind the anaphoric expressions in (35) suggests that the causee is syntactically absent. In fact, empty categories may serve as binders. This is illustrated in (36) where PRO binds the anaphoric expression *propri* in its governing category:

(36) I ragazzi hanno promesso di PRO portare i propri libri.
the boys have promised to PRO bring the own books
'The boys promised to take their own books.'

If the causee in (35) were structurally represented by an empty category it should be able to bind anaphoric expressions, as does PRO in (36). Since it does not, we conclude that the causee is syntactically absent in the causative construction lacking an overt expression for it. It thus seems reasonable to conclude that causative constructions lacking the causee are also instances of the FP construction.

2.3.4 Differences between the FP and the passive construction

Although the FP construction and the passive constructions share a number of properties, they differ in a number of respects, as pointed out in Guasti (1993). First, we observe implicit argument effects in a passive sentence. The logical subject (or external argument) of a passive sentence, the so-called implicit argument, is syntactically active: it can control PRO, as shown in (37a), and be the antecedent of anaphors, as in (37b). Notice that in (37) the *by* phrase cannot

control PRO or bind the anaphor, since it is an adjunct. Moreover, the sentences in (37) remain well-formed even if the *by* phrase is absent, proving that there is indeed an implicit argument in the structure.

(37) a. Questo edificio fu costruito (da Gaudì) per PRO ottenere un premio.
this building was built (by Gaudì) to PRO obtain a prize
b. Certi privilegi furono riservati ai propri amici (da Gianni).
some privileges were kept for own friends (by Gianni)
'Some privileges were kept for their own friends.'

Jaeggli (1986a) and Baker (1988a) suggest that the external argument role is assigned to the passive morpheme. Being syntactically present, this argument can act as a binder in (37b) and controls PRO in (37a).

In the FP construction, binding of an anaphor and control of PRO do not obtain. As for binding, this was already discussed in 2.3.1 above. For control, this is illustrated in (38) below. The controller of PRO here can neither be the *by* phrase (because it is an adjunct) nor a potential implicit argument (which is not present). To the extent that the sentence is grammatical, only the matrix subject, *il comandante* ('the officer') can control PRO.

(38) Il comandante ha fatto attaccare i nemici dal generale
the officer has made attack the enemies by+the general
senza PRO avvisare il governo.
without PRO informing the government
'The officer made the enemies be attacked by the general without informing the government.'

Notice that lack of control by the logical subject of the infinitive cannot be attributed to the prominence of the matrix subject, as proven by the ungrammaticality of (39), where control by the matrix subject is inhibited and no controller for PRO is available:

(39) *E' la ragion di stato che ha fatto sequestrare i beni
(it) is the reason of state that has made confiscated the properties
dall' avvocato senza PRO avvisare nessuno.
by+the lawyer without PRO informing nobody
'It is reason of state that had the property be confiscated by the lawyer without informing anybody.'

The contrast between the passive sentences in (37) and the FP construction in (27) and (38) is best understood if we assume that in passive sentences the external argument which is assigned to the passive morpheme can bind and control, while the external argument is not assigned to any morpheme in the FP construction and thus cannot act as a binder or a controller. In the FP construction, the external argument can only optionally be expressed by an adjunct, the *by* phrase.

A second difference between the passive and the FP construction is that there are verbs that can be passivized, but cannot appear in the FP construction (see Marcantonio 1981). These are *psych* verbs (*temere*, 'fear'), epistemic verbs (*pensare*, 'think'), some verbs of perception (*vedere*, 'see'; *sentire*, 'hear'), verbs like *perdere* ('lose'), *vincere* ('win'). In (40) we have examples of passive sentences with this set of verbs. In (41) we see that these verbs cannot be embedded in the FP construction:

(40) a. La grandine è temuta dai contadini.
the hail is feared by+the farmers
'The hail is feared by the farmers.'
b. Un canguro è stato visto da Gianni.
a kangoroo is been seen by Gianni
'A kangoroo was seen by Gianni.'
c. La causa è stata persa da Gianni.
the suit is been lost by Gianni
'The suit was lost by Gianni.'

(41) a. *La grandine ha fatto temere un disastro dai contadini.
the hail has made fear a disaster by+the farmers
'The hail had the farmers fear a disaster.'
b. *Maria ha fatto vedere un libro da Gianni.
Maria has made see a book by Gianni
'Maria had Gianni see a book.'
c. *L' avvocato ha fatto perdere la causa da Gianni.
the lawyer has made loose the suit by Gianni
'The lawyer had Gianni loose the suit.'

Thus, there are two properties that distinguish the FP construction from passives: First, there is no implicit argument in the FP construction or equivalently the logical subject is syntactically suppressed and thus is not syntactically active, as binding and control data above indicates. Second, verbs that can be passivized cannot enter the FP construction, which entails that suppression of the logical subject of the infinitive is not possible with all verbs.

2.3.5 Differences between FI and FP

We observed in the section above that there are a number of restrictions holding in the FP construction. It is interesting to observe that all the restrictions holding in the FP construction do not hold in the FI construction. First, some verbal expressions that cannot be passivized cannot be found in the FP construction (section 2.3.2). However, these verbal expressions yield perfectly grammatical results in the FI construction, as observed in Burzio (1986). In fact, if the causee is expressed by a PP headed by the preposition *a*, rather than by the *by* phrase, the sentences in (30b) and (31b) become grammatical. Compare (30b) and (31b) with (42a) and (42b), respectively:

(42) a. Ciò ha fatto fare il furbo a Gianni.
this has made make the smart one to Gianni
'This made Gianni be the smart one.'
b. Ciò ha fatto alzare la mano a Gianni.
this has made raise the hand to Gianni
'This made Gianni raise his hand.'

(42) shows that there is no intrinsic incompatibility between idiomatic expressions, expressions of inalienable possession, and causatives.

Second, we observed that some verbs cannot be found in the FP construction (section 2.3.4). Interestingly, all those verbs can be embedded in the FI construction. In contrast to the ungrammatical sentences in (41) we have the grammatical sentences in (43):

(43) a. La grandine ha fatto temere un disastro ai contadini.
the hail has made fear a disaster to+the farmers
'The hail made the farmers fear a disaster.'
b. Maria ha fatto vedere un libro a Gianni.
Maria has made see a book to Gianni
'Maria made Gianni see a book.'
c. L' avvocato ha fatto perdere la causa a Gianni.
the lawyer has made lose the suit to Gianni
'The lawyer made Gianni lose the suit.'

Third, Hyman and Zimmer (1976) observe that the FP and the FI constructions have different interpretations. Consider the two sentences in (44):

(44) a. I soldati fecero pulire le toilette al generale.
the soldiers made clean the toilets to+the general
'The soldiers made the general clean the toilets.'
b. I soldati fecero pulire le toilette dal generale.
the soldiers made clean the toilets by+the general
'The soldiers made the general clean the toilets.'

When the causee is expressed by an *a* NP, as in (44a), the interpretation is that the soldiers want the toilets to be cleaned and they want the general to do it and not someone else. The soldiers cause an event to take place and this causation is directed toward the general or the general is affected by the event caused. By contrast, when the causee is expressed by an adjunct *da* NP, the interpretation is that the soldiers caused an event, that of the toilets being cleaned. The general happened to do it, but this is incidental (see also Lepschy 1978).

2.3.6 Summary

The major differences between the two causative constructions, FI and FP, found in Romance are the following. First, the logical subject of the infinitive is syntactically

suppressed in the FP construction and is optionally expressed as an adjunct (the *by* phrase). By contrast, it is projected in an argumental position in the FI construction. Second, suppression of the logical subject of the infinitive in the FP construction is subject to restrictions: some verbs cannot be found in the FP construction, but they can appear in the FI construction. Third, certain verbal expressions (of inalienable possession, verbs of measure) cannot be embedded in the FP construction, but can be found in the FI construction. Fourth, the meaning of the two kinds of sentences is not the same. In the FI construction an event is caused and this causation is directed toward the causee; in the FP construction, just the event is caused.

2.4 *Theoretical accounts of causatives*

We have seen that Romance causatives are special in that the causative verb and the verb embedded under it behave as a single verb as far as syntax is concerned. Moreover, we have also seen that there are two causative constructions: FI and FP that differs in several respects. Having surveyed the major properties of causative constructions, we can now move on and examine how these can be handled.

2.4.1 *Causative complements as bare lexical structures*

Clauses are the projections of a verb augmented with a number of functional projections (Pollock 1989; Cinque 1999, among others). Within such a framework, differences between infinitival complements after causative verbs and other ordinary infinitival complements with respect to various syntactic processes, like cliticization, can be understood by assuming that these complements do not include the full array of functional categories found in other finite and infinitival clauses. The table in (45) below summarizes the functional projections of the clausal domain and the overt evidence for these projections:

(45)

Projection	*CP*	*AgrSP*	*NegP*	*TP*	*AgrOP*
Evidence	*Wh*-movement	Agreement SVO	Negation	Aspectual auxiliary	Accusative case

First, there is no *wh*-movement inside causative complements, suggesting that CP is not present. Second, AgrSP is usually associated with the presence of overt agreement and of overt preverbal subjects. As we have seen, a preverbal subject is disallowed in Romance causative complements, suggesting that a position for it is not available. Further support for this claim comes from European Portuguese. As we saw in sections 1 and 2, there are two (or three) kinds of causative complements in this language, one similar to that found in the other Romance languages (see (3) above) and displaying the order VOS and one similar to that found in English and displaying the order SVO (see (7) above). As we said earlier, when the order is SV(O), there are two possibilities: the infinitive in the causative complement can either be inflected, in which case

subject agreement is attested, or not. When the order is VOS, an inflected infinitive is not possible. One natural way to interpret this contrast is that the causative complements displaying the order VOS, the one that is typically found in all Romance languages, does not include AgrSP, while the other complement displaying the order SV(O) includes AgrSP. Interestingly, when AgrSP is overtly present, the causee receives nominative case, as proven by the fact that it can be expressed by a nominative pronoun: *O professor mandou eles sairem* ('The professor made they leave-Agr') (from Gonçalves 1999). When AgrSP is not overtly present, the causee gets accusative case as in E(xceptional) C(ase) M(arking) structures. Let us continue with the examination of the other projections. Third, negation *non* ('not') cannot be present in causative complements. Since *non* is assumed to be the head of NegP (see Zanuttini 1996), its absence from causative complements suggests that NegP is unavailable in such complements:

(46) *Gianni ha fatto non bere più Paolo.
Gianni has made not drink anymore Paolo
'Gianni made Paolo not drink anymore.'

Similarly, (aspectual) auxiliaries cannot be present in causative complements, as shown in (47).

(47) Marco farà aver letto i libro a Gianni per domani.
Marco will make have read the book to Gianni by tomorrow
'Marco will make Gianni have read the book by tomorrow.'

This restriction can be explained as follows. Because of their interpretive properties, aspectual auxiliaries are either located in tense or need to be licensed by tense. The unavailability of aspectual auxiliaries may be taken as evidence that TP is absent from causative complements. Finally, AgrOP is the position where structural accusative case is checked. As shown by the distribution of clitics, (see, e.g., (9)), structural case cannot be checked inside causative complements, a fact that may be interpreted as evidence that AgrOP is not present in such complements.

The data examined so far are best interpreted by assuming that causative complements do not include any functional projection, in contrast to other infinitival complements (that do not display the restriction examined in the previous sections). Under the assumption that the thematic information associated with a verb is expressed within a *v*P (Larson 1988b; Hale and Keyser 1993b; Chomsky 2000), it is plausible to assume that causative complements are bare lexical structures that at most project up to *v*Ps. The lower VP includes the verbal head and the complement; the higher *v*P includes a *v*-head to which the infinitive verb moves and the position for the external argument. In the following sections, we will refine this conjecture in view of the different properties of the two causative constructions, FI and FP.

2.4.2 The structure of infinitival complements in the FI construction

We have established that the causee is an argument in the FI construction, precisely it is the thematic subject of the infinitive. It has been proposed that the position of the subject is submitted to parametric variation, that is, it can be located either to the left or to the right of the verbal head. For Romance, the subject position seems to be to the right (cf. Bonet 1990; Giorgi and Longobardi 1991; Koopman and Sportiche 1991b; Friedemann 1997). Based on this hypothesis, the proposal is that in causative complements the subject surfaces in the base-generated position to the right of the verbal head. For concreteness, we assume that the subject position is Spec *v*P, and that this Spec position is to the right. Causative complements in the FI construction have the structure in (48):

(48) $[_{VP}$ fare $[_{vP}\ _{v'}\ [_{v}]\ [_{VP}\ [_{V}$ riparare] $[_{DP}$ la macchina]] a Gianni]]
$[_{VP}$ make $[_{vP}\ _{v'}\ [_{v}]\ [_{VP}\ [_{V}$ repair] $[_{DP}$ the car]] to Gianni]]

The subject or the external argument of a transitive or an intransitive verb stays in its base position that in Romance is located to the right of the *v*P head. The internal argument of a transitive verb occupies the V sister position of the lower VP. This hypothesis grants in the same structural status to the external argument of a transitive or an intransitive ergative verb: in both cases they remain the external argument of the selected verb. As for why the case properties of these two arguments vary, the reader can refer to 2.4.5.2.

2.4.3 The structure of infinitival complements in the FP construction

In the FP construction, the logical subject of the infinitive or the external argument is syntactically suppressed, as an argument (see section 2.3.4). When it is expressed, it surfaces in an adjunct phrase, the *by* phrase. These facts can be best accounted for by assuming that the complement of the causative verb in the FP construction is a bare VP lacking the higher *v*P and thus a position for the external argument (an idea that was already in Burzio 1986), as in (49). The internal argument occupies the V sister position and the adjunct causee is adjoined to the VP, when present.

(49) $[_{VP}$ fare $[_{VP}\ [_{V}$ riparare] $[_{DP}$ la macchina]]]
$[_{VP}$ make $[_{VP}\ [_{V}$ repair] $[_{DP}$ the car]]]

Unaccusative verbs also lack the thematic subject and only have internal arguments, as complements of causative in the FP construction. The natural assumption is that in causatives based on unaccusative verb, the complement is a VP lacking the *v*P and thus the position for the external argument; therefore, the structure of causative complements based on transitive verbs in the FP construction and on unaccusative verbs is the same, a VP without the projection of the external

argument (as in Burzio 1986). This captures the fact that in both cases the complement selected by the causative verb does not include an external argument.

In the 1980s it was generally assumed that causative complements were like full clauses, that is, they projected at least up to IP (or AgrSP in the Pollockian framework) (Burzio 1986; Zubizarreta 1986) or even to CP (Baker 1988a). Essentially, this assumption was forced by the fact that subjects were assumed to be generated in SpecIP (or SpecAgrSP). Therefore, IP was necessary to accommodate the subject of causative complements. The hypothesis that subjects are generated in a *v*P (a lexical structure that includes all thematic information associated to the verb) made the abandonment of such an analysis possible in favor of one that more accurately takes account of restrictions and distributional properties of expressions in causative complements.

In summary, the causative verb can either select a *v*P including a position for the external argument or a VP from which the higher *v*P is missing and thus a position for the external argument is lacking. In this case, the logical subject or the external argument is suppressed and is optionally expressed by an adjunct. We return later to the different selectional properties of the causative verbs.

2.4.4 *Romance causatives and the process of complex predicate formation*

The causative complement is a *v*P headed by the infinitive verb. In section 2.2 we have shown that the causative verb and the infinitive behave as a syntactic unit with respect to a number of processes, such as cliticization and NP-movement under passives. Various notions have been advocated in the literature to express this fact: reanalysis (Rouveret and Vergnaud 1980; Manzini 1983b), verb raising (Aissen 1974), merger (Marantz 1984; Rosen 1989), clause union (Gibson 1980). The common idea behind these various notions is that of transforming a biclausal structure or a structure with two distinct clauses (one for the causative and one for the infinitive verb) into one single clause. For example, reanalysis is the process by which two independent verbs are reanalyzed as a single verb. Reanalysis can be expressed through indexation, as in (50):

(50) Maria fa^{i} riparare^{i} la macchina a Gianni.
Maria makes repair the car to Gianni
'Maria makes Gianni repair the car.'

Although these notions capture the relevant data, they remain ad hoc devices with a limited explanatory power. Detailed work on morphological causatives (Baker 1988a) has prompted an analysis of causatives through the notion of incorporation, itself an instantiation of movement of one head to another head. Unlike other notions mentioned above, head movement is not construction specific and its application is quite widespread. One familiar case is movement of the verbal head to inflectional heads. In causatives, it is the infinitive that moves to the higher verbal head, the causative verb, and forms with it a complex verb *fare + riparare*.

2.4.5 Head-movement in Romance causatives

At D-structure, the infinitive and the causative verbs head two verbal projections. By S-structure, the infinitive moves to *v* (if present) and then higher up to incorporate into the causative verb, thus forming a complex verb with it, as in (51):

(51) $[_{VP}$ fare riparare$_i$ $[_{vP}$ $[_{v'}$ $[_{v}$ $t_i]$ $[_{VP}$ $[_{V}$ $t_i]$ $[_{DP}$ la macchina]]] a Gianni]]
$[_{VP}$ make repair$_i$ $[_{vP}$ $[_{v'}$ $[_{v}$ $t_i]$ $[_{VP}$ $[_{V}$ $t_i]$ $[_{DP}$ the car]]] to Gianni]]

The claim that in causative sentences the infinitive does not stay in its base position, but moves higher up, is supported by word-order facts. Consider the example in (52) (see Guasti 1993; Den Dikken 1995c):

(52) I professori$_j$ facevano commentare tutti$_j$ il libro a Ugo.
the professors made comment all the book to Ugo
'The professors all made Ugo comment on the book.'

Sportiche (1988) proposed that Floating Quantifiers (FQs) occur in positions which the subject has moved through on its way from its base position (inside *v*P) to the specifier of the higher projection, AgrSP. In (52), the matrix subject, *i professori* ('the professors'), has stranded the FQ *tutti* ('all') in a position close to the matrix *v*P. From the order in (52), causative-infinitive-FQ, we must conclude that the infinitive has moved from the causative complement to a position inside the matrix sentence, as displayed in (53). Thus, the infinitive must move and form a complex head with the causative verb overtly.

(53) $[_{IP}$ I professori$_j$ [facevano commentare$_i]_k$ $[_{vP}$ tutti$_j$ t_k $[_{VP}$ t_i quel libro a Ugo]]]

Thus, there is no special rule of causative formation: causative sentences are derived by a primitive process operating in various constructions, head-movement.

2.4.5.1 Potential problems and further refinements

One potential problem for this approach is that the causative and the infinitive verb can be separated by adverbial elements as shown in (54).

(54) I professori$_j$ fanno spesso commentare tutti$_j$ il libro a Ugo.
the professors make often comment all the book to Ugo
'The professors all make Ugo often comment on the book.'

Moreover, in French interrogative sentences, it is only the causative verb that precedes the clitic subject, as (55) shows (see Kayne 1975):

(55) Fera-t-il reparer la voiture a Jean?
make-he repair the car to Jean?
'Does he make Jean repair the car?'

If the causative and the infinitive formed a single complex head, they should not be separable, contrary to facts. Thus, on the one hand, there is evidence that head-to-head movement occurs in Romance causatives to form a complex verbal head. On the other, the causative verb and the infinitive may be separated. To accommodate all these facts, one can appeal to the notion of excorporation, another instance of head-movement. Romance causatives allow excorporation of the causative head from the complex verb previously formed by incorporation. The causative verb excorporates and moves alone to T and AgrS. In other words, Romance causatives are the result of two processes: incorporation and excorporation (for the technical execution of this proposal, see Roberts 1991a; Guasti 1993).

2.4.5.2 Consequences of incorporation

Causative constructions are an instance of verb incorporation, or head-to-head movement. This is the primitive property responsible for all the other properties manifested by Romance causatives and illustrated in section 2.2. As shown by Baker (1988a), verb incorporation disrupts the usual government relationships and creates new government relationships. It also alters the usual grammatical functions. The incorporation host (the causative verb) and the incorporee (the infinitive verb) become a single complex verb that inherits properties from its components and governs every argument governed by its constituent parts, as established by the Government Transparency Corollary (GTC), which states that:

GTC: A lexical category, which has an item incorporated into it governs everything which the incorporated item governed in its original structural position. (Baker 1988a: 64)

As a consequence of the formation of a complex verb, a single thematic grid is formed that includes arguments from each single verb. Therefore, the arguments of the infinitive become arguments of the complex verb. Under the assumption that case is assigned under government, the GTC also accounts for the case pattern found in causatives. In a language a complex verb cannot have more case assignment possibilities than a simplex verb. A simple verb in Romance assigns a single structural accusative case as shown in (56):

(56) Ho dato un libro a Maria.
(I) have given a book to Maria

Here the direct object is assigned accusative case, while the indirect object is marked with the dative case expressed by the preposition *a* ('to') in front of the noun. A complex verb behaves in the same way as far as case assignment is concerned. Formation of a complex verb and case assignment abilities of this verb account for the process of grammatical function change that we observe in causatives. The external argument of the infinitive becomes the direct or indirect object of the complex verb depending on the transitivity of the verb and the

direct object of the infinitive becomes the direct object of the complex verb. This change of grammatical functions is overtly shown by the processes of cliticization and NP-movement under passive that we discussed in section 2.2. We will illustrate this by means of the example in (6), repeated here:

(6) Paolo ha fatto ridere la classe.
Paolo has made laugh the class
'Paolo made the class laugh.'

In (6), *la classe* ('the class') is the logical subject of the infinitive. However, due to the incorporation process it is now governed by, and becomes the direct object of, the newly created complex verb *fa-ridere*. The complex verb assigns accusative case to the DP *la classe* ('the class'). When realized as a clitic, it cliticizes in front of the complex verb, as in (18), repeated below:

(18) Paolo l' ha fatta ridere.
Paolo her has made-FEM laugh
'Paolo made her laugh.'

When the causative verb is passivized, the complex verb of which it is part is unable to assign accusative case and *la classe*, originally an argument of the infinitive, becomes the subject of the passivized complex verb *fatto-ridere*.

2.4.5.3 Summary

In summary, the primitive property that is responsible for the behavior of Romance causatives is incorporation, or the process of head-to-head movement that creates a complex verb formed by the causative and the infinitive verb. As a side-effect of incorporation, the grammatical functions, the government relationships, and the properties of case assignment of the causative and of the infinitive verb are altered. This explains the exceptional behavior of the arguments of the infinitives, as far as case, cliticization, and passivization are concerned. Incorporation occurs in the syntax and is accompanied by a process of excorporation, 'another instance of head movement' that takes place to allow the causative verb to check its tense and agreement feature.

2.4.6 Selectional properties of the causative verb

It was proposed above that the causative verb can take a *v*P complement including the external argument of the infinitive or a VP lacking a position for this. Moreover, we saw that the two causative constructions FI and FP have different meanings. We can capture these observations by assuming that the causative verb can be associated to either of the thematic grids in (57):

(57) *Fare*	*thematic grid*	
	<<causer/agent, event> benefactive>	FI
	<causer/agent, event>	FP

The causative verb selects a causer and an event in the FP construction. The event is syntactically realized as a VP lacking the position for an external argument or subject. This hypothesis captures the idea that in this case, the causer wants some event to happen or some action to be carried out. In the FI construction, instead, the causation of the event is direct or is to the benefit of someone, hence the additional selection of a benefactive role (if positively affected, or a 'victim' if negatively affected). This role is assigned under government to the causee in the FI construction, which in this way receives two thematic roles, one from the causative verb and one from the infinitive. This proposal is compatible with versions of the Theta Criterion in (58) (Chomsky 1986b) according to which a single DP is allowed to receive more than one theta-role provided these are assigned to the same position:

(58) Theta Criterion: Each argument α appears in a chain containing a unique visible theta position P, and each theta position P is visible in a chain containing a unique argument α.

(Chomsky 1986b: 97)

Alternatively, one may also say that the two roles are fused together after the formation of a complex predicate and the ensuing creation of a single thematic grid (see also Alsina 1992).

2.4.7 An account of some differences between the FI and the FP constructions

Verb incorporation accounts for the major similarities between the FI and the FP constructions with respect to cliticization and NP-movement. However, the two constructions display a number of different properties. One is that the causee is an argument in the former case, while it is an adjunct in the latter (see section 2.3.1). The assumptions adopted in the 2.4.2 and 2.4.3 account for the different status of the causee in the two constructions as follows. Since the causee is projected into an argument position in the former case, it can act as a binder and can control PRO. By contrast, control and binding by the causee or by an implicit argument do not obtain in the FP construction because there is no implicit argument (sections 2.3.3, 2.3.4) and because when expressed the causee is an adjunct. Under the plausible assumption that expressions of inalienable possession are anaphoric to the possessor (see Kayne 1975), the ill-formedness of (32b) can be explained by appealing to the lack of an appropriate binder. As for idiomatic expressions like *fare il furbo* ('be the smart one') that cannot occur in the FP construction (as shown in (30b)), Burzio (1986) proposes that some sort of anaphoric relation exists between the subject and the idiomatic object, an idea that is suggested by the fact that the subject and the object agree, as exemplified by *Maria fa la furba* (lit. Maria-FEM makes the smart-FEM) where *Maria* and *la furba* are both in the feminine gender. If this view is correct, the ungrammaticality of (34b) is again a case of binding failure.[1]

We observed in section 2.3.2 that the FP construction resembles the passive construction. This similarity can be understood as follows. As observed by Burzio (1986), under the Principles and Parameters model there is no construction specific rule, that is, there is no rule of passivization. Instead, there are various operations and phenomena that can cluster or can occur in isolation. Passive sentences are characterized by (i) the introduction of the passive morphology; (ii) the movement of the object into subject position; (iii) the presence of an implicit argument or, optionally, of a *by* phrase. These three phenomena cluster in passive sentences because the introduction of the passive morphology absorbs accusative case. Thus, the object is forced to move to the subject position to receive case. The passive morpheme receives the role of the external argument and transmits this role to a doubling *by* phrase (Baker 1988a). In the FP construction, there is no passive morphology, no absorption of accusative case, and no movement of the object. The logical subject of the infinitive is suppressed in the lexicon. Optionally, it can be expressed with a *by* phrase that is licensed by the argument structure associated with the infinitive, precisely by the position that is lexically suppressed, as in Grimshaw (1990). One question that still needs an answer is what regulates the suppression of the external argument of the infinitive in the FP construction, an issue that we examine in the next section.

2.4.8 The FP construction and the affectedness constraint

In section 2.3.5 we saw that certain verbs cannot enter in the FP construction. These are *psych* verbs (*temere*, 'fear'), epistemic verbs (*pensare*, 'think'), some verbs of perception (*vedere*, 'see'; *sentire*, 'hear'), verbs like *perdere* ('lose'), *vincere* ('win'). According to Guasti (1993, 1996a), this restriction can be expressed by the Affectedness Constraint. She notes that the restrictions operating in FP also operate in passive nominals (see Anderson 1977a; Jaeggli 1986a; Roberts 1987). The object of a noun, such as *city* in (59a) undergoes NP-movement in passive nominals, as in (59b):

(59) a. Attila's destruction of the city
b. The city's destruction (by Attila)

Passivization is forbidden with certain types of nouns, as the following contrasts witness:

(60) a. John's loss of the job
b. *The job's loss (by John)
c. Mary's fear of storms
d. *Storms' fear (by Mary)

Jaeggli (1986a) proposes that in passive nominals the external argument is not syntactically projected because it is suppressed in the lexicon. Therefore, the prenominal position remains empty and is available for the object to move there, as in (59b). However, suppression of the external argument is possible only when

the object of the noun is affected by the process described by the noun. In (59a), the object of the noun *destruction* is affected and thus the external argument of this noun can be suppressed. Then, NP-movement of the object to the pronominal position is possible. By contrast, the external argument of *loss* or *fear* cannot be suppressed. The prenominal position must be filled with it and thus movement of the object of these nouns to the preverbal position cannot occur. Extending this line of thinking, Guasti (1993, 1996a) claims that suppression of the external argument of the infinitive embedded under a causative verb can only occur when the object of the infinitive is affected by the process described by the infinitive, as happens with verbs like *riparare* ('repair'). By contrast, with psych verbs, epistemic verbs, some verbs of perception, *lose* and *win*, the object is unaffected and the external argument cannot be suppressed but must be syntactically projected. Thus, the FP construction cannot be formed with such verbs. One might wonder why the Affectedness Constraint applies in Romance causatives as it does in passive nominals. In (verbal) passives, we observe a change of grammatical functions (GF) and the presence of overt morphology, the passive morpheme signaling this change. Usually a GF changing process is sanctioned by morphology. However, there are cases where this does not happen. Passive nominals are a case in point. The noun does not have different morphology in (60a), an active nominal and in (60b), a passive nominal. A second case is causative constructions. In the FI and in the FP constructions we observe a GF changing process not sanctioned by a morphological marker. It is possible that when GF changing processes are not morphologically marked, their power should be somewhat restricted or equivalently it can be limited to a set of verbs with special characteristics (see Pesetsky 1990 on this issue). Under this view the Affectedness Constraint that operates in the FP construction may be viewed as a condition limiting the power of grammatical changing processes and thus ensuring recoverability of the lexically suppressed argument.

2.4.9 Summary

Romance has two causative structures, both derived by syntactic incorporation. These structures are semantically different and this is expressed by assuming that the causative verb is associated to two thematic grids, one including a causer/agent and an event, the other also including a benefactive role. The event is structurally realized as a VP in the FP construction or a *v*P in the FI construction. While the external argument is present in the latter case, it is not in the former (since there is no position for it). Lack of the external argument and thus formation of the FP construction is possible only if the internal argument of the infinitive is affected by the process described by the infinitive itself.

3 Conclusion

Romance causatives include two verbs that syntactically behave as a single verb that takes as arguments the arguments of the two single verbs. This behavior has

been explained by appealing to the notion of verb incorporation of head-to-head movement. The syntactic properties manifested by the arguments of the infinitive after a causative verb follow from this process. Romance has two causative constructions that convey different meanings and display different lexico-semantic restrictions. These differences have been captured first by assuming that the causative verb is associated to two thematic grids and second by appealing to the Affectedness Constraint.

There is variation among causative constructions that are not accounted for by the proposals discussed in the previous section. One is the failure to form passive causative sentences in French and for some speakers in Spanish too; another is that in French/Spanish reflexive verbs, like *se laver/lavarse* ('to wash -self') can be embedded under the causative verb, while their Italian counterpart, *lavarsi*, cannot, as the contrast in (61) shows:

(61) a. Juan hizo lavarse las manos a Maria.
b. Jean faisait se laver les mains à Marie.
c. *Gianni faceva lavarsi le mani a Maria.
John made wash-self the hands to Maria
'John made Mary wash her hands.'

In Italian, the reflexive clitic must be omitted as displayed in (62), although the sentence maintains the same meaning as the Spanish and French sentences in (61a) and (61b):

(62) Gianni ha fatto lavare le mani a Maria.
John has made wash-self the hands to Maria
'John made Mary wash her hands.'

Interestingly, in EP the reflexive clitic cannot be present in a construction comparable to the one in (62) with the causee at the end of the clause, as the contrast between (63a) and (63b) shows.[2]

(63) a. *O João mandou barbear-se o Pedro.
the João made shave-self the Pedro
'João made shave himself Pedro.'
b. O João mandou barbear o Pedro.
the João made shave the Pedro
'João made shave Pedro.'

The reflexive clitic can be present in EP causatives when the order of the arguments of the complement is SV(O), as in (64):

(64) O João mandou o Pedro barbear-se.
the João made the Pedro shave-self
'João made shave himself Pedro.'

These facts support the idea advanced in section 2.4.1 that causative complements displaying the order SV(O) are not bare *v*P, but include functional projection (e.g., AgrSP). Under the assumption that reflexive clitics are located in AgrSP or in some other functional projection, the contrast between (63a) and (64) can be explained by saying that AgrSP is present in the latter case, but not in the former, that is, causative complements displaying the order VOS are bare lexical structures, while causative complements displaying the order SV(O) include functional projections (see Guasti 1993, 1996a for a development of these ideas; see Zubizarreta 1986 for an alternative proposal about the distribution of reflexive clitics in causatives).

NOTES

1 Although in passives there is an implicit argument, as shown in (37) in the text, this argument has special properties and is not compatible with all kind of anaphoric expressions.
2 Gonçalves notes that the EP sentences in (63b) does not have a reflexive interpretation, but an arbitrary interpretation. By contrast, the Italian sentence in (62) has a reflexive interpretation (Guasti 1993). This fact may depend on the availability in EP, but not in Italian, of the ECM construction in (64) to express the reflexive interpretation.

9 Conclusion: closing remarks

1 Introduction

An A-not-A question is a type of question with a function similar to that of a yes/no question, the surface form of which involves two copies of a predicate with one copy negated. A-not-A questions have been investigated most thoroughly in Mandarin Chinese, with (1) and (2) below being characteristic examples. One noteworthy aspect of (1) is that it has reduplicated only the first syllable of the verb; *xi* here is not a word on its own, it is simply the first syllable of *xihuan*.

(1) ta xi-bu-xihuan zheben shu? (A-not-A)
he li-not-like this book
'Does he like or not like this book?'

(2) ta xihuan-bu-xihuan zheben shu? (A-not-A)
he like-not-like this book
'Does he like or not like this book?'

The A-not-A questions above represent one of several ways that one can inquire about the truth of a proposition in Mandarin, and much of the recent literature on the topic has been concerned with distinguishing such questions from one another.

A-not-A questions like (1) and (2) are not really yes/no questions of the familiar sort; yes/no questions are usually formed using the sentence-final question particle *ma* in Mandarin, as in (3). Apart from the distributional differences to be discussed at length below, perhaps the clearest difference between A-not-A questions and yes/no questions is that only yes/no questions can be naturally answered with *shi* 'yes', *dui* 'correct', or *bu* 'no'; the questions in (1) and (2) are answered by repeating either the questioned predicate *xihuan* 'like' or its negation *bu xihuan* 'not like':

(3) ta xihuan zheben shu ma? (Y/NQ)
he like this book Q?
'Does he like this book?'

With respect to how they are answered, A-not-A questions are similar to alternative questions, such as (4) below. Although it is tempting to assume that (4) is simply a more explicit version of (2), the distribution of questions containing the word *haishi* 'or' differs from that of questions lacking *haishi*.

(4) ta xihuan zheben shu haishi ta bu xihuan zheben shu? (AltQ)
he like this book or he not like this book
'Does he like this book or doesn't he like this book?'

In addition to the three classes of questions described so far, there are several other ways in which this question can be asked, each of which has been claimed at some time or another in the literature to have a distinct structure.

In the following set of examples, (5–7), the negative morpheme comes after the VP; what differentiates the forms is how much of the second copy is repeated. In the VP-not-VP type in (5) the whole VP is repeated, in the VP-not-V type in (6) only the verb is repeated, and in the negative particle question (NPQ) in (7), the negation appears alone at the end of the question.

(5) ta xihuan zheben shu bu xihuan zheben shu? (VP-not-VP)
he like this book not like this book
'Does he like this book or doesn't [he] like this book?'

(6) ta xihuan zheben shu bu xihuan? (VP-not-V)
he like this book not like
'Does he like this book or doesn't [he] like [it]?'

(7) ta xihuan zheben shu bu? (NPQ)
he like this book not
'Does he like this book or not?'

The next set of examples illustrates A-not-A-type questions formed with an auxiliary, a modal, and the focus morpheme *shi*. Example (8) is an M-not-M question in which a modal is reduplicated, and (9) is a B-not-B question in which the focus morpheme/copula *shi* is reduplicated:

(8) ta hui-bu-hui tiaowu? (M-not-M)
He can-not-can dance
'Can he dance?'

(9) ta shi-bu-shi xihuan zheben shu? (B-not-B)
he be-not-be like this book
'Is it the case or not that he like this book?'

Given that Mandarin allows omission fairly freely, the null hypothesis should be, and traditionally was, that (1–2) and (5–7) are simply versions of (4) that have undergone varying degrees of ellipsis, and that (8) and (9) are simply extensions of the A-not-A pattern of (1–2).

By far the most influential work on A-not-A questions was that of Huang (1982b, 1991), who challenged the traditional assumption by showing, among other things, that A-not-A questions, yes/no questions, and alternative questions have different distributions. Probably the most well-known observation that Huang made about A-not-A questions like (1–2) is that they, unlike alternative questions like (4), resist appearing in movement islands. On the basis of this, Huang hypothesized that the A-not-A surface sequence reflects an abstract question morpheme that must undergo movement to a scope position in CP, and drew a parallel between this A-not-A morpheme and adjunct *wh*-words like *weishenme* 'why'.

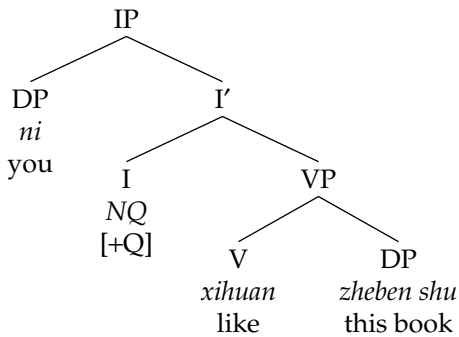
In the remainder of this chapter, we will review the distributional characteristics of A-not-A questions and the rest of the family of questions introduced in this section. The main goal here is not so much to exhaustively present and compare the different theoretical analyses as it is to try to present the types of data that have been crucial in formulating the analyses. The first few sections will concentrate on the A-not-A question 'proper', like (1–2), after which we will move on to consider similarities and differences between A-not-A questions and the other forms, such as VP-not-V questions, NPQs, and VP-not-VP questions. A relatively brief review of some related cross-linguistic data will close the discussion.

2 A-not-A as a reduplicative inflectional morpheme

2.1 The NQ morpheme

Huang (1991) proposed that the A-not-A sequence in A-not-A questions is the morphological exponent of a reduplicative interrogative morpheme located in the inflectional system, an 'interrogative INFL'.

(10)



In light of subsequent developments in syntactic theory, particularly the widely assumed need to separate IP into several separate projections (following Pollock 1989), the structure in (10) requires elaboration – but it illustrates the basic idea: the A-not-A sequence is essentially a word formed morphologically by an abstract question morpheme and a following predicate. For expediency, we will refer to this morpheme as NQ (intended to reflect both its negative and interrogative character).

A simple argument in favor of a structure like (10) can be made from the fact that NQ must appear on the modal or auxiliary when one is present in the sentence. Thus, while (11) is an acceptable question, (12), with NQ on the main verb, is impossible (Li and Thompson 1979):

(11) ta hui-bu-hui tiaowu?
He can-not-can dance
'Can he dance?'

(12) *ta hui tiaowu-bu-tiaowu?
He can dance-not-dance
('Can he dance?')

It is also worth noting that NQ is not limited to attaching to verbs. An A-not-A question can also be formed, for example, with an adjective (13), a preposition (14), an adverb (15), or a modal/auxiliary as above (11):

(13) zheben shu hao-bu-hao?
this book good-not-good
'Is this book good?'

(14) ta cong-mei-cong Beijing lai?
he from-not-from Beijing come
'Did he come from Beijing?'

(15) ta chang-bu-chang lai?
he often-not-often come
'Does he come often?'

If NQ is indeed something like a VP-proclitic, these facts follow; it simply reduplicates the word (or syllable) that it attaches to, with a negative morpheme between the copies.

Huang (1991) also provides a cross-linguistic argument for this analysis, pointing out that Taiwanese has a question particle *kam* that appears in the same contexts in which NQ is hypothesized to be in Mandarin. Huang cites an extensive cross-dialectal survey by Zhu (1985) that concludes that *kam*-type questions and A-not-A type questions are essentially in complementary distribution across dialects: a language either has *kam*-type questions or A-not-A questions but not both. Huang interprets this as evidence that NQ and *kam* are different morphological exponents of the same underlying morpheme. Other *kam*-type questions are found in Shanghai and Early Mandarin. Huang's examples are given in (16–18).

(16) li kam beh lai? (Taiwanese)
you Q want come
'Do you want to come?'

(17) nong a le va? (Shanghai)
you Q come prt
'Will you come?'

(18) ni ke you kong? (Early Mandarin)
you Q have time
'Do you have time?'

2.2 The role of negation

The fact that the A-not-A question in (1) involves a syllable that does not carry any meaning of its own (it is simply the first syllable of the questioned predicate) suggests that the surface form arises from a morphological process, and not from ellipsis or any purely syntactic process, since neither syntax nor ellipsis can generally target just part of a word.

As discussed above, Huang (1991) proposed that NQ is realized as a copy of (some part) of the following predicate, and an inserted negative morpheme *bu*. It is far from clear what role negation plays in A-not-A questions, because it is a definitional characteristic of an A-not-A question; a question without negation is not an A-not-A question and has no NQ, and all questions with NQ show negation. There is clearly an 'or not' meaning associated with these questions, but it is impossible to say whether this is inherent in the interpretation of NQ or whether this is contributed by the negative morpheme. Note, for example, that the *kam-* and *ke*-type morphemes in other dialects (16–18) do not appear with a negative morpheme, although they are interpreted in the same way as A-not-A questions in Mandarin. Still, there are some respects in which the negative morpheme in A-not-A question behaves like meaningful negative morphemes elsewhere in Mandarin. McCawley (1994) provides several arguments to show that *bu* is not simply an unanalyzed expletive element, but is rather an actual negative morpheme. His arguments are reviewed below.

In Mandarin, the form in which the negative morpheme appears depends on the aspectual structure of the sentence. A fair approximation is that *bu* is used in clauses denoting states (19) and *mei(you)* is used in clauses denoting bounded and episodic events (20); see Ernst (1995), Lin (2003) for a more precise characterization. The choice of *bu* or *mei* in an A-not-A question is governed by the same conditions; an A-not-A question about a state interposes *bu* between the copies of the predicate (21), and an A-not-A question about a bounded event appears with *mei* (22). This pattern by itself rules out the possibility that *bu* is an unanalyzed connective morpheme; as far as the morphology is concerned, NQ is a negative morpheme.

(19) wo bu chi mugua.
I not eat papaya
'I do not eat papaya.'

(20) wo mei-you chi mugua.
I not-have eat papaya
'I did not eat papaya.'

(21) ta xi(huan)-bu-xihuan neiben shu?
he like-not-like that book
'Does he like that book?'

(22) ta kan(jian)-mei-kanjian neiben shu?
he see-not-see that book
'Did he see that book?'

McCawley further observes that lexical restrictions on the appearance of negation are observed in A-not-A questions. Where a predicate cannot be negated, as is the case for some lexically negative predicates like *weijue* 'unsolved', neither can the predicate be questioned using NQ. Not only are absolute co-occurrence restrictions observed, but intermediate judgments are also parallel; in each of the examples (23–26), the acceptability of the (a) sentences matches the acceptability of the (b) sentences. While judgments seem to vary on the sentences in (23–26), McCawley's point is secure so long as the (a) examples have the same status as the (b) examples:

(23) a. *neige wenti bu/mei weijue.
that problem not unsolved
('That problem isn't unsolved.')
b. *neige wenti weijue be/mei weijue?
that problem unsolved not unsolved
('Is that problem unsolved?')

(24) a. ??zheiyang zuo bu wuli.
thus do not without-reason
'It isn't unreasonable to do this.'
b. ??zheiyang zuo wu bu wuli?
thus do without not without-reason
'Is it unreasonable to do this?'

(25) a. ?zheiyang zuo bu feifa.
thus do not illegal
'It isn't illegal to do this.'
b. ?zheiyang zuo fei-bu-feifa?
thus do it-not-illegal
'Is it illegal to do this?'

(26) a. ta bu wuchi.
he not without.shame
'He isn't shameless.'
b. ni shuo ta wu(chi)-bu-wuchi?
you say he without.shame-not-without.shame
'Do you say he's shameless?'

McCawley's argument shows that, as far as the morphology is concerned, the negation in an A-not-A question is a real negation, but does not decisively show

that the negative morpheme is part of the syntax and interpretation. The negation in NQ could as easily be similar to the supportive verb *do* in English, which inflects like a real verb, but is arguably not part of the syntax (Chomsky 1957; Halle and Marantz 1993). It could be that NQ carries a negative feature, one that is realized in the Mandarin morphology, but has no exponent in the hypothetically parallel *kam*-type questions in Taiwanese.

3 Movement of NQ and parallels to *weishenme* 'why'

Unlike yes/no questions formed with *ma*, A-not-A questions can be embedded, and can take scope beyond their own clause. However, a long-distance interpretation is blocked if the NQ and its would-be scope position are separated by an island boundary. On the basis of these facts, Huang (1982b, 1991) argues that A-not-A questions involve covert movement of NQ to its scope position for interpretation. Below, we will first review the evidence that A-not-A questions can be embedded when no island interferes, and then the evidence that islands can interfere. The distributional characteristics of NQ are parallel to those of non-nominal adjunct question words like *weishenme* 'why', for which a movement-based analysis is relatively uncontroversial.

3.1 A-not-A questions can be embedded

The statement in (27) has an embedded A-not-A question and it is grammatical, indicating that A-not-A questions are not exclusively a matrix clause phenomenon.

(27) [ta qu bu qu Meiguo] bu qingchu
he go not go America not clear
'Whether he will go to America is not clear.'

The question in (28), due to Huang (1982b), can also make this point, in a slightly more sophisticated way. The main verb in (28) is the question-embedding verb *xiang-zhidao* 'wonder', and the interpretation of this question has the *wh*-word in the embedded clause taking wide scope. While the English translation of this question would be somewhat marginal (due to extraction of the *wh*-word from the embedded interrogative), Huang rates the Mandarin question as fine, and the embedded clause is clearly an A-not-A question. Care is required in judging this sentence; the intended interpretation is one in which a person's identity is sought, and some speakers find it helpful to emphasize the embedded *wh*-word:

(28) ni xiang-zhidao [shei xi-bu-xihuan ni] (ne)?
You want-know who li-not-like you
'Who is the person *x* such that you wonder whether *x* likes you or not?'

The ability to embed A-not-A questions is fairly restricted – enough so to lead Li and Thompson (1979) to view the situation in the opposite way: they claim that A-not-A questions are only possible in matrix clauses except under special circumstances. According to Li and Thompson, a certain class of "semantically bleached" verbs (including *xiang/kan* 'think', *shuo* 'say', and *juede* 'feel') is semantically transparent enough to allow the embedded verb to "count as" a matrix verb, and thereby permit the attachment of NQ morphology. McCawley (1994) makes essentially the same observation, putting forth the idea that those verbs that allow 'embedded A-not-A questions' are susceptible to a parenthetical interpretation, and in that case are not truly embedding the A-not-A question. However, the examples above are sufficient to show that it is at least in principle possible to embed an A-not-A question.

3.2 A-not-A questions cannot appear in islands

The dominant view in the literature on A-not-A questions, arising from the influential arguments presented by Huang (1982b, 1991), is that NQ is something akin to a *wh*-word, related by movement to a CP-level scope position.

In addition to giving us a window into the syntactic structure of A-not-A questions, these facts also provide evidence that alternative questions, with *haishi* 'or', are different from A-not-A questions. To see the sensitivity of A-not-A questions to islands, we can compare them to alternative (*haishi*) questions, which are very similar in meaning but are syntactically relatively unconstrained. In particular, alternative questions can occur inside islands without difficulty. In (29) we have *haishi*-questions inside sentential subjects, and in (30) we have *haishi*-questions inside relative clauses. The questions in (29–30) differ in how much material is elided, but all have the disjunctive *haishi*.

(29) a. [wo qu Meiguo haishi bu qu Meiguo] bijiao hao? (AltQ)
I go America or not go America more good
'Is it better that I go to America or that I do not go to America?'

b. [wo qu Meiguo haishi bu qu] bijiao hao?
I go America or not go more good
'Is it better that I go or not go to America?'

c. [wo qu haishi bu qu Meiguo] bijiao hao?
I go or not go America more good
'Is it better that I go or not go to America?'

(30) a. ni xihuan [renshi ni haishi bu renshi ni] de ren? (AltQ)
you like know you or not know you DE person
'Do you like people who know you or people who don't know you?'

b. ni xihuan [renshi haishi bu renshi ni] de ren?
you like know or not know you DE person
'Do you like people who know or don't know you?'

c. ni xihuan [renshi ni haishi bu renshi] de ren?
you like know you or not know DE person
'Do you like people who know you or don't?'

The questions in (31–33) are A-not-A questions, the counterparts to (29–30) but without the word *haishi*, and all are ungrammatical as a result of being embedded in an island. The questions in (31–33) are intended as matrix questions, with NQ inside a sentential subject, a relative clause, and a *because* clause, respectively.

(31) *[wo qu bu qu Meiguo] bijiao hao?
I go not go America more good
('Is it better that I go to America or not?')

(32) *ni xihuan [ren(shi) bu renshi ni de ren]?
you like kn(ow) not know you DE person
('Do you like people who know you or don't know you?')

(33) *ni [yinwei Lisi lai-bu-lai] shengqi ne?
you because Lisi come-not come angry Q
('Are you angry or not because Lisi came?')

Example (27) in the previous section showed a grammatical A-not-A question inside a sentential subject, but there the scope of the question is itself within the island, hence the hypothesized movement need not cross the island boundary.

In addition to the islands noted by Huang (1982b), verbs that take nominal complements, including *yihan* 'regret', *jide* 'remember', and *tongyi* 'agree', also prevent A-not-A questions from appearing in their complements (Tsai 1994b). Note that to judge (35) requires some care, since *jide* 'remember' can also be read parenthetically.

(34) *ni hen yihan [Lisi xi-bu-xihuan Meiguo]?
you very regret Lisi li-not-like America
('Do you regret that Lisi likes or doesn't like America?')

(35) *ni jide [Lisi xi-bu-xihuan Meiguo]?
you remember Lisi li-not-like America
('Do you remember that Lisi likes or doesn't like America?')

3.3 A-not-A questions are like weishenme *'why' questions*

The observed sensitivity to movement islands suggests that NQ undergoes covert movement, presumably to a position in the CP system. In fact, the distribution of NQ is quite parallel to that of adverbial *wh*-words like *weishenme* 'why', also generally assumed to undergo covert movement to CP: the class of constituents from which A-not-A questions are excluded appears to be the same as the class

of constituents from which non-nominal adjunct *wh*-phrases like *weishenme* 'why' are excluded. To capture this, parallel, Huang (1982b, 1991) proposed that NQ is, in essence, a non-nominal adjunct *wh*-phrase. Examples showing the parallel ill-formedness of *weishenme* in islands are given below. Of course, *weishenme* questions are grammatical when *weishenme* is not embedded in an island.

(36) *[women weishenme chuli zhejian shi] bijiao hao?
we why handle this matter more appropriate
('What is the reason *x* such that it is more appropriate [for us to handle this matter for *x*]?')

(37) *ni bijiao xihuan [[ta weishenme zhu] de cai]?
you more like he why cook DE dish
('What is the reason *x* such that you like better [the dishes which he cooks for *x*]?')

(38) *Lisi hen yihan [ta weishenme cizhi]?
Lisi very regret he why resign
('What is the reason *x* such that Lisi regrets [that he resigned for *x*]?')

(39) *ni jide [Lisi weishenme cizhi]?
you remember Lisi why resign
('What is the reason *x* such that you remember [that Lisi resigned for *x*]?')

A-not-A questions and *weishenme* questions pattern together in several other ways as well, as will be noted in later sections. For example, both must have scope over focus-sensitive adverbs like *ye* 'also' and *zhi* 'only' (section 4.3), and over quantifiers like *meiyouren* 'nobody' (section 5.3).

3.4 A-not-A questions can be embedded: a further note

To complete the argument that movement is implicated in the ill-formedness of A-not-A questions within islands, it is important to establish that A-not-A questions can be embedded within non-islands. This was shown in section 3.1, but there has been some debate on this point. Most prominently, McCawley (1994) objected that Huang's examples used matrix verbs that lend themselves to a parenthetical interpretation. Countering Huang's examples, McCawley provided the example (40), in an attempt to choose a matrix verb that would not be likely to receive a parenthetical interpretation. Indeed, using the verb *xihuan* 'like' as a matrix verb results in ungrammaticality when an A-not-A question is embedded as or in its complement.

(40) *Lisi xihuan [women he bu he pijiu]?
Lisi like we drink not drink beer
('Does Lisi like for us to drink beer?')

However, given that verbs that take nominal complements (as *xihuan* clearly does, cf., e.g., (1)) induce islands for both *weishenme* (39) and A-not-A questions (35), the ungrammaticality of (40) is unsurprising, and does not undermine the generalization that A-not-A questions can be embedded, just not in islands.

4 Focus marking and A-not-A questions

Focus constructions in Mandarin interact with A-not-A questions in an interesting way. In this section we will first review some restrictions on these focusing constructions in general, and then turn to their interactions with and implications for A-not-A questions.

4.1 Restrictions on focus marking

The copula *shi* is used in Mandarin as a focus marker, resulting in a cleft-like interpretation, as illustrated by the examples in (41–43).

(41) shi wo mingtian yao mai neiben shu
be I tomorrow want buy that book
'It is I that want to buy that book tomorrow.'

(42) wo shi mingtian yao mai neiben shu
I be tomorrow want buy that book
'It is tomorrow that I want to buy that book.'

(43) wo mingtian shi yao mai neiben shu
I tomorrow be want buy that book
'I do want to buy that book tomorrow.'

Huang (1982b) observes that only one *shi* is allowed per clause (44–45), and that *shi* is not possible in *wh*-questions (46–48) except when the *wh*-word itself is focused by *shi* (49–50). Huang analyzes this as a consequence of there being a single focus position (high in the clause) to which both foci and *wh*-words must move for interpretation (see also Rizzi 1997 for essentially the same claim). Since both clefted constituents and *wh*-phrases compete for the same position, only one or the other is allowed.

(44) *shi Zhangsan shi mingtian yao lai
be Zhangsan be tomorrow want come
('It's Zhangsan, tomorrow that *t* will come *t*.')

(45) shi Zhangsan shuo Lisi shi mingtian lai
be Zhangsan say Lisi be tomorrow come
'It's Zhangsan who said that it's tomorrow that Lisi will come.'

(46) *shi Zhangsan da-le shei?
be Zhangsan beat-perf who
('Who is it Zhangsan who beat *t*?')

(47) shi Lisi xiang-zhidao [shei da-le ta]
be Lisi wonder who beat him
'It is Lisi that wonders who beat him.'

(48) *shi Lisi xiangxin [shei da-le ta]
be Lisi believe who beat him
('Who is it Lisi that believes that *t* beat him?')

(49) shi shei da-le ta?
be who beat-perf him
'Who is it that beat him?'

(50) ta xiang-zhidao [shi shei da-le ta]
he wonder be who beat him
'He wonders who it is that beat him.'

In further support of the idea that the focused constituent must undergo covert movement, Huang (1982b) observes that the focus marker *shi* cannot occur within movement islands (much like the NQ morpheme introduced in section 2), e.g., the sentential subject in (51):

(51) *[Zhangsan shi mingtian lai] mei guanxi.
Zhangsan be tomorrow come not matter
('It's tomorrow that [that Zhangsan will come *t*] does not matter.')

4.2 Focus markers in A-not-A questions

Focusing elements interfere with the formation of A-not-A questions in revealing ways. Focus-sensitive adverbs such as *zhi* 'only' and *ye* 'also' are incompatible with NQ in cases where the adverb takes scope over the NQ on the surface. A simple example is given in (52):

(52) *ni zhi xi bu xihuan yige ren?
you only li-not-like one person
('Do you only like one person?')

Recall that a modal accepts NQ (53), and notice that *zhi* can precede a modal (54) or follow it (55). However, putting the two together is fine only if NQ precedes *zhi* (56), and not if NQ follows *zhi* (57) (see Soh 2005 for further discussion).

(53) ta hui-bu-hui tiaowu?
he can-not-can dance
'Can he dance?'

(54) ta zhi hui shuo Yingyu.
he only can speak English
'He can only speak English (no other languages)'

(55) ta hui zhi shuo Yingyu.
he can only speak English
'He can only speak English (since none of us speak Chinese)'

(56) ta hui-bu-hui zhi shuo Yingyu?
he can-not-can only speak English
'Can he only speak English?'

(57) *ta zhi hui-bu-hui shuo Yingyu?
he only can-not-can speak English
('Can he only speak English?')

The focus marker *shi* can take NQ (a B-not-B question), enabling NQ to take scope over *zhi* on the surface. Again, when this obtains, *zhi* is acceptable in an A-not-A question (58):

(58) ta shi-bu-shi zhi hui shuo Yingyu?
he be-not-be only can speak English
'Is it the case that he can only speak English?'

It is not, however, possible to have NQ realized on *zhi* itself (59):

(59) *ni zhi bu zhi xihuan yige ren?
you only not only like one person
('Do you only like one person?')

This interaction with focus-sensitive adverbs is peculiar to A-not-A questions; *zhi* does not cause similar problems in *ma*-questions (60), nor do the effects appear in full alternative questions with an explicit *haishi* 'or' (61):

(60) ni zhi xihuan yige ren ma?
you only like one person Q
'Do you only like one person?'

(61) ni zhi xihuan yige ren haishi bu zhi xihuan yige ren?
you only like one person or not only like one person
'Do you only like one person or not only like one person?'

4.3 *Parallels to* weishenme *'why' questions*

The surface scope restrictions on NQ seem to be for the most part parallel to the restrictions on *weishenme* 'why', as observed by Soh (2005). Just as *zhi* 'only' and *ye* 'also' interfere with the association of NQ to its scope position, so do they interfere with the association of *weishenme* to its scope position (62), unlike the association of nominal argument *wh*-phrases like *shei* 'who' (63):

(62) *ni zhi renwei Lisi weishenme kan zhentan-xiaoshuo?
you only think Lisi why read detective-novel
('What is the reason *x* such that you only think Lisi reads detective novels for *x*?')

(63) ta zhi renwei shei you qiantu?
he only think who has prospect
'Who does he only think has prospect?'

With respect to the interaction with clefting using *shi*, *weishenme* behaves differently from other *wh*-words, as Hu (2002) observes. Whereas a nominal argument *wh*-word like *shenme* 'what' cannot co-occur with a clefted constituent but can itself be focused (46–50), the distribution of *weishenme* is the reverse: *weishenme* can co-occur with a clefted constituent (64), and cannot usually itself be focused with *shi* (65–66):

(64) weishenme shi Zhangsan bixu cizhi?
why be Zhangsan must resign
'Why is it Zhangsan that must resign?'

(65) *women shi weishenme nianshu?
we be why study
('Why is it that we study?')

(66) *shi weishenme Zhangsan bixu cizhi?
be why Zhangsan must resign
('Why is it that Z must resign?')

Inspired by the other parallels we have seen between NQ and *weishenme*, we might expect to find that the same properties hold of NQ. However, it turns out to be difficult to test. Hu (2002) attempts to show this by noting that NQ in A-not-A questions repels focusing by *shi* (67), as *weishenme* does (65–66):

(67) *ni shi qu-bu-qu meiguo?
you be go-not-go America
('Do you go or not go to America?')

However, it is not clear that we can draw any real conclusions from the ungrammaticality of (67). First, as was noted earlier (11–12), the NQ morphology necessarily appears on a modal/auxiliary when present, and *shi* in (67) is arguably such an element, ruling (67) out independently. The other property of *weishenme* noted above is that it can co-occur with *shi*, which arguably holds between NQ and *shi* in B-not-B questions like (58). We will return to some other parallels in section 5.3 as well.

It seems that the distribution of NQ is at least consistent with that of *weishenme*, even if it is difficult to show the parallelism directly.

4.4 Discourse conditions on A-not-A questions

A-not-A questions and yes/no questions differ with respect to the types of discourse they fit into. One of the earliest discussions of this was in Li and Thompson (1979), who observed that A-not-A questions have an essential 'neutrality' causing them to seem inappropriate when the questioner has a predisposition toward one of the alternatives; in such a circumstance, a yes/no question with *ma* is used. A more recent study by Schaffar and Chen (2001) examined some of the pragmatic requirements of A-not-A, B-not-B, and *ma*-questions in some detail.

Schaffar and Chen (2001) put Li and Thompson's observation into more precise terminology by proposing that A-not-A questions are questions with a 'wide focus', where neither the entire proposition nor its negative alternative are presupposed. A-not-A questions contrast with B-not-B questions, formed using the narrow focus marker *shi*, and which are only felicitous where narrow focus is appropriate. Both types of questions differ from *ma*-questions, which do not have any information structure restrictions. The examples and contexts that follow are from Schaffar and Chen (2001).

The first context to consider is an 'out of the blue' question, with no presumption about what the answer is. An example is given in (68), where either an A-not-A question or a *ma*-question is felicitous:

(68) Context: After spending an evening at the cinema, a friend and I are hungry and are driving by a restaurant called 'Tabula Rasa.' I ask my friend:
   a. ni lai-mei-lai guo Tabula Rasa?
      you come-not-come asp Tabula Rasa
      'Have you been to the Tabula Rasa before?'
   b. ni lai guo Tabula Rasa ma?
      you come asp Tabula Rasa Q
      'Have you been to the Tabula Rasa before?'

In a more 'slanted' context like (69), where one alternative does have the upper hand, an A-not-A question is not appropriate, but either a B-not-B question or a *ma*-question (with sentence stress, indicated by capitals) is possible. Schaffar and Chen characterize this as 'verum focus', or contrastive narrow focus on the truth

value, taking as background the proposition (either affirmative or negative) as a whole.

(69) Context: I invite a friend to Tabula Rasa, which I have recently discovered. As we enter the restaurant, a waiter I don't know breaks into a smile and waves. I ask my friend:
   a. ni shi-bu-shi lai guo Tabula Rasa?
      you be-not-be come asp Tabula Rasa
      'Have you been to the Tabula Rasa before?'
   b. ni LAI guo Tabula Rasa ma?
      you come asp Tabula Rasa Q
      'Have you been to Tabula Rasa before?'

Narrow focus is of course possible on other constituents as well, for example in (70). In (70a), the focus is expressed entirely by the sentence stress, and in (70b) it is expressed with the help of the focus marker *shi*. The example in (70b) is interesting in that the sentence accent takes priority in marking the focused constituent, which in fact precedes *shi*. Often the use of the focus marker *shi* is characterized as focusing any constituents following it in the sentence, but (70b) suggests that this is not an absolute constraint:

(70) a. Peitela ZUOTIAN zuo-le suxi ma?
      Petra yesterday make-perf sushi Q
      'Did Petra make sushi YESTERDAY (not today)?'
   b. Peitela ZUOTIAN shi-bu-shi zuo-le suxi?
      Petra yesterday be-not-be make-perf sushi
      'Did Petra make sushi YESTERDAY (not today)?'

Based on facts like this, Schaffar and Chen (2001) propose that B-not-B questions unambiguously indicate narrow focus, either verum focus if there is no special sentence accent, or on the constituent marked with sentence accent. A-not-A questions, on the other hand, unambiguously indicate wide focus. Yes/no questions with *ma* do not have any special focus constraints; the same focus options are available to yes/no questions as to declaratives.

Judgments on what can be focused are quite difficult, and it is not surprising that there are conflicting judgments reported in the literature. To give an example, Zhang (2001) reports that the subject and any adverbials that precede NQ are unavailable to focus (71). Although Schaffar and Chen only address the A-not-A and B-not-B cases (71a, b), their analysis predicts that no narrow focus reading should be possible in (71a), and that all narrow focus readings should be possible in (71b):

(71) a. Lisi gangcai zheng-mei-zheng jidan?
      Lisi just steam-not-steam egg
   b. Lisi gangcai shi-bu-shi zheng-le jidan?
      Lisi just be-not-be steam-ASP egg

c. Lisi gangcai zheng jidan meiyou?
Lisi just steam egg not
d. Lisi gangcai zheng jidan mei-zheng?
Lisi just steam egg not-steam
'Did Lisi STEAM eggs just now?'
'Did Lisi steam EGGS just now?'
'Did Lisi STEAM EGGS just now?'
*'Did LISI steam eggs just now?'
*'Did Lisi steam eggs JUST NOW?'

Nevertheless, the basic characterization of A-not-A questions as being strictly restricted to neutral contexts (in which neither alternative is presupposed), as opposed to *ma*-questions (that allow – but do not require – a more slanted context), is undisputed. Future research may provide more clarification of the focus properties of sentence accent as compared to focusing with *shi*, and better diagnostics for discerning what can and cannot be focused in Mandarin questions. The null hypothesis is that *shi* has the same properties whether it carries NQ or not.

5 Further surface scope restrictions on NQ

Along with the restrictions discussed above on the surface scope of focus-sensitive adverbs and NQ in A-not-A questions, there are a number of other similar restrictions that have been discussed in the literature. We will review several such restrictions in this section, on adverbs, indefinites, and quantifiers.

5.1 Adverbs

In one of the earliest serious discussions of A-not-A questions, Li and Thompson (1979) pointed out that certain adverbs interfere with A-not-A formation, giving as examples *man-man-de* 'slowly' or *jing-jing-de* 'quietly'. Ernst (1994) explores these restrictions in much greater detail, showing that there is a structural explanation for this interference.

Ernst considers three classes of adverbial modifiers. The first class includes adverbs like *yiding* 'definitely'. Such adverbs seem to require an interpretation that puts them within the scope of a question. To give analogs from English, a question like 'Is he definitely going?' is fine, whereas 'Definitely: is he going?' is anomalous. A second class of adverbs includes the adverb *daodi*, which Ernst glosses as 'after all'. This adverb seems to require interpretation outside the scope of the question: an interpretation like 'After all: is he going?' is fine, whereas 'Is he after all going?' is anomalous. The third class, including adverbs like *jintian* 'today' do not seem to have any particular scope requirements.

Ernst shows that the scope requirement for any given adverb must be satisfied by the surface scope relation between the adverb and the NQ morphology. Ernst makes the further assumption (adopting Huang's (1982a) Isomorphism Principle)

that the surface scope relations must be preserved in the LF structure that feeds interpretation, so that if the adverb outscopes the NQ on the surface, it must also be interpreted outside the scope of the question (at LF).

Assuming, along with an essentially unanimous literature, that the question particle *ma* occupies a complementizer position high in the structure taking scope over the rest of the clause, we have a straightforward explanation for why adverbs like *yiding* 'definitely' are compatible with *ma*-questions like (72) but are incompatible with A-not-A questions like (73). In (72), *yiding* is in the scope of *ma*, so the adverb is interpreted within the scope of the question, as required for this class of adverbs. In (73), *yiding* outscopes NQ on the surface and thus would be forced to take scope outside of the question operator at LF, in violation of the requirements of this adverb class. Where the scope of NQ and *yiding* is reversed, as in the B-not-B question in (74), the question is fine:

(72) ta yiding qu ma? (Y/NQ)
he definitely go Q
'Is he definitely going?'

(73) *ta yiding qu-bu-qu? (A-not-A)
he definitely go-no-go
('Is he definitely going?')

(74) ta shi-bu-shi yiding qu? (B-not-B)
he be-not-be definitely go
'Is he definitely going?'

The class of adverbs that includes *jintian* 'today' is compatible with both A-not-A and *ma*-questions, as in (75) and (76).

(75) ni jintian qu-bu-qu? (A-not-A)
you today go-not-go
'Are you going today?'

(76) ni jintian qu ma? (Y/NQ)
you today go Q
'Are you going today?'

The remaining class, exemplified by the adverb *daodi* 'after all' shows the opposite pattern from the first. The adverb *daodi* is allowed in A-not-A questions (77), but not in *ma*-questions (78). The explanation of the patterning of *daodi* is the same as the explanation of *yiding*, but for the fact that *daodi* and *yiding* have opposite requirements. Since *daodi* must take scope outside the question operator at LF in order to be interpreted, (78) is ruled out because *daodi* is in the scope of *ma* on the surface. On the other hand, (77) is fine, since *daodi* has scope over NQ and if the scope relation is maintained at LF, the interpretive requirements of this

adverb class are satisfied. Testing B-not-B questions shows that *daodi* is permitted only when it outscopes NQ on the surface (79–80).

(77) Jinrong daodi qu-bu-qu? (A-not-A)
Jinrong after-all go-not-go
'Is Jinrong going or not?!'

(78) *Jinrong daodi qu ma? (Y/NQ)
Jinrong after-all go Q
('Is Jinrong going or not?!')

(79) *ta shi-bu-shi daodi qu? (B-not-B)
He be-not-be after-all go
('Is he really going?!')

(80) ta daodi shi-bu-shi qu? (B-not-B)
He after-all be-not-be go
'Is he really going?!'

The conclusion is that there is something interpretively significant about the surface position of NQ in A-not-A questions, and moreover, NQ is invariably in a lower structural position in A-not-A questions than the question particle *ma* is in yes/no questions.

It is also possible for NQ to appear on adverbs themselves, such as on *chang* 'often' in (15) above. Not all adverbs can appear with NQ, however; Hsieh (2001) notes that some adverbs, such as *guyi* 'deliberately', cannot be marked with NQ (81):

(81) *Ta guyi-bu-guyi qu?
he deliberately-not-deliberately go
('Did he not go deliberately?')

It is generally assumed that frequency adverbs like 'often' are lower in the structure than subject-oriented adverbs like 'deliberately' (see, e.g., Cinque 1999; Ernst 2002), and extending that line of thought, one avenue to explore would be to suppose that *guyi* 'deliberately' necessarily has a higher place in the structure than NQ, as does *daodi* 'after all', while other adverbs (possibly including *chang* 'often', *yiding* 'definitely', and *jintian* 'today') are more flexible and (may) attach lower than NQ – in fact, future research might be profitably done looking for subtle differences in meaning depending on the relative positions of NQ and such adverbs.

5.2 *Indefinite* wh-*words*

It is well known that *wh*-words in Mandarin act something like 'polarity items', acting like a variable bound by question or negation operators elsewhere in the

sentence (see, e.g., Li 1992; Lin 1996 for discussion). In a simple affirmative sentence, *wh*-words are disallowed (82), but they receive an indefinite interpretation under negation (83) and in conditionals (84). In *wh*-questions, of course, *wh*-words function as *wh*-words (85).

(82) *wo xihuan shenme ren.
I like what person
('I like somebody.')

(83) wo mei mai shenme (dongxi).
I not buy what (thing)
'I didn't buy anything.'

(84) yaoshi shenme ren qifu ni . . .
if what person bully you
'If someone bullies you . . .'

(85) ni xihuan shenme ren?
you like what person
'Who do you like?'

The indefinite interpretation for *wh*-words is also available in other contexts, for example in (86), with the sentence-final particle *le* indicating an inference, rather than a direct observation, and in yes/no questions formed with the sentence-final particle *ma* (87):

(86) ta kandao shenme le
he see what LE
'(It seems that) he saw something.'

(87) ta xihuan shenme ma?
he like what Q
'Does he like something/anything?'

The contexts in which a *wh*-word can be interpreted as an indefinite are characterized by Li (1992) as being 'uncertain' and by Lin (1996) as not entailing the existence of a referent for the indefinite. What allows the indefinite interpretation in (87), for example, is the presence of the question particle *ma*.

The prevailing opinion has been that *ma* will license an indefinite interpretation of a *wh*-word in any position, including the subject position. However, conflicting judgments have been reported in the literature (and in my own informal consultations), which may undermine the use of indefinites in subject position as a useful diagnostic for structure in A-not-A questions.

The paradigm examples are these: In A-not-A questions, a *wh*-word in object position (88), but not in subject position (89), can be interpreted as an indefinite.

However, in B-not-B questions, a *wh*-word in subject position can receive an indefinite interpretation (90).

(88) ta xi-bu-xihuan shenme ren?
he li-not-like what person
'Does he like someone?'

(89) *shenme ren xi-bu-xihuan ta?
what person li-not-like him
('Does someone like him?')

(90) shi-bu-shi shenme ren xihuan ta?
be-not-be what person like him
'Does someone like him?'

Li (1992) interprets this paradigm as an indication that NQ is the licensor of the indefinite interpretation, and can only license *wh*-words in its scope. It has also been pointed out (see Lin 1996; Schaffar and Chen 2001) that a B-not-B question in which the NQ appears question-finally also allows a subject *wh*-word to be interpreted as an indefinite (91). Assuming that this sentence-final position is within CP, at or near the position in which *ma* is found in yes/no questions, this again shows an indefinite interpretation licensed in the scope of NQ.

(91) shei/shenme ren xihuan ta shi-bu-shi?
who/what man like him be-not-be
'Does someone/anyone like him?'

The judgments above are not much in dispute, but whether the yes/no question operator *ma* can license an indefinite interpretation of a *wh*-word in subject position, and by extension, the validity of the generalization that a question operator (NQ or *ma*) can always license such an interpretation for *wh*-words in its scope, is less clear. Li (1992) gives (92) as an example of an indefinite in subject position licensed by *ma*, glossing it as shown, yet Huang (1982a) gives a nearly identical question (93), rating it as ungrammatical, a judgment endorsed by Cheng (1997):

(92) shenme ren xihuan ta ma?
what person like him Q
'Does someone like him?' (Li 1992: 128)

(93) *shei xiang chi pingguo ma?
who want eat apple Q
'Does someone/anyone want to eat apples?'
(Huang 1982a: 244; Cheng 1997: 108)

Lin (1996) provides (94) as an example like (92), but it is not completely clear whether *ma* or *le* is responsible for its acceptability:

(94) shei you qifu ni le ma?
who again bully you ASP Q
'Did somebody bully you again?'

Schaffar and Chen (2001) rate (92) as grammatical, but suggest that it actually has a reading much more like a *wh*-question, not allowing an answer of *shi (xihuan)* 'yes' or *bu (xihuan)* 'no', but only an answer like *Lisi xihuan ta* 'Lisi likes him', and suggesting a meaning more like 'Who likes him, doesn't somebody?' This interpretation is unusual in light of the fact that the question particle *ma* is almost universally judged to be incapable of appearing in *wh*-questions.

Schaffar and Chen (2001) and Hua (1999), in discussing examples like (91), observe that when a modal or auxiliary element bears NQ, even when it appears sentence internally, it can license an indefinite interpretation of a *wh*-subject. They provide examples like (95) and (96), to be compared to (89):

(95) shei/shenme ren shi-bu-shi xihuan ta?
who/what man be-not-be like him
'Does someone/anyone like him?'

(96) shei you-mei-you du-guo zhe-ben shu
who have-not-have read-asp this-cl book
'Has someone/anyone read this book?'

We cannot further resolve or clarify the disagreements in the judgments here, although this is clearly an area in need of more thorough investigation. It appears that judgments are particularly volatile on the availability of indefinite interpretations of *wh*-subjects. This may be due to independent factors affecting the subject position, which under most circumstances is construed as a topic and hence incompatible with an indefinite interpretation. In this connection, it is worth mentioning that placing *you* 'have' before a *wh*-subject in a sentence like (92) will uncontroversially permit an indefinite interpretation of the *wh*-word, which may interfere somewhat with judgments of such sentences lacking *you*. The *wh*-object examples in the first part of this section suggest that NQ is capable of licensing an indefinite interpretation, but several issues remain unresolved.

5.3 Intervening quantifiers

Wu (1997a) observes that in contrast to yes/no questions formed with the question particle *ma* (97), A-not-A questions have a restriction against having quantifiers outside the NQ. In (98), the quantifier is outside the A-not-A morphology, and the examples are degraded or ungrammatical.

(97) a. meigeren dou pao ma?
everyone all run Q
'Does everyone run?'
b. you ren pao ma?
someone run Q
'Does someone run?'
c. meiyou ren pao ma?
no body run Q
'Does nobody run?'

(98) a. ?meigeren dou pao ba pao?
everyone all run-not-run
'Does everyone run or not?'
b. *you ren pao bu pao?
someone run-not-run
('Does someone run or not?')
c. *mei you ren pao by pao?
no body run-not-run
('Does nobody run or not?')

The fact that (98a) is rated better than (98b, c) is attributed to the possibility of *meigeren dou* getting a group interpretation, parallel to (99):

(99) tamen pao bu pao?
they run not run
'Do they run or not?'

In a B-not-B question, such subject quantifiers are fine (100), so long as NQ is actually outside (101). In the absence of subject quantifiers, either position for *shi-bu-shi* is fine (102).

(100) a. shi-bu-shi meigeren dou pao?
be-not-be everyone all run
'Is it the case or not that everyone runs?'
b. shi-bu-shi you ren pao?
be-not-be someone run
'Is it the case or not that someone runs?'
c. shi-bu-shi meiyou ren pao?
be-not-be no body run
'Is it the case or not that nobody runs?'

(101) a. *meigeren dou shi-bu-shi pao?
everyone all be-not-be run
('Is it the case that everyone runs?')

b. *you ren shi-bu-shi pao?
someone be-not-be run
('Is it the case that someone runs?')
c. *meiyou ren shi-bu-shi pao?
no body be-not-be run
('Is it the case that nobody runs?')

(102) (shi-bu-shi) Zhangsan (shi-bu-shi) pao?
be-not-be Zhangsan be-not-be run
'Is it the case or not that Zhangsan runs?'

With respect to *meigeren dou* 'everyone', Wu observes that the scope requirements are actually on *dou*, as can be seen by comparing (101a) to (103). In the grammatical (103) and (100a), *shi-bu-shi* takes scope over *dou*, but in the ungrammatical (101a), the scope relation between them is reversed.

(103) meigeren shi-bu-shi dou pao?
everyone be-not-be all run
'Is it the case that everyone runs?'

It is worth noting that these same elements seem to block association of *weishenme* 'why' with its scope position (104), in contrast to nominal *wh*-words like *shei* 'who' (105) (Soh 2005). Sentence (106) makes the same point as (98), but is provided for parallelism to (104–105), showing the incompatibility of these subject quantifiers in A-not-A questions. Thus, if movement of the same type is implicated for both *weishenme* and NQ, this might be viewed as a type of weak island phenomenon, further supporting the view that NQ undergoes movement.

(104) *meiyouren/henshao ren/zuiduo liang-ge ren weishenme cizhi?
nobody/few person/at most two-cl person why resign
('What is the reason *x* such that nobody/few people/at most two people resigned for *x*?')

(105) meiyouren/henshao ren/zuiduo liang-ge ren gan gen shei dajia?
nobody/few person/at most two person dare with who fight
'Who is the person *x* such that nobody/few people/at most two people dare(s) to fight with *x*?'

(106) *meiyouren/henshao ren/zuiduo liang-ge ren qu-bu-qu?
nobody/few person/at most two-cl person go-not-go
('Is nobody/few people/at most two people going?')

6 Negative particle questions and VP-not-V questions

There are two other question forms that appear on the surface to be very similar to A-not-A questions. The first of these question types is the negative particle question, which ends in a negative morpheme (107); the second is what we will refer to as the VP-not-V question, which ends with a negative morpheme and a second copy of the verb (108):

(107) Hufei kan-wan-le nei-ben shu meiyou? (NPQ)
Hufei read-finish-perf that-cl book not-have
'Has Hufei finished reading that book?'

(108) ta xihuan neige dianying bu-xihuan? (VP-not-V)
he like that movie not-like
'Does he like that movie?'

A natural null hypothesis is that both NPQs and VP-not-V questions are derived from A-not-A questions; that is, we might suppose that a VP-not-V question arises from movement of the not-V from the V-not-V complex, and that an NPQ arises from additionally omitting the copy of the verb. However, appearances can be deceiving, and there has been debate as to which of these constructions, if any, are related to the others. Much of the discussion in this section draws upon work by Cheng et al. (1996), Zhang (1997), and Hsieh (2001).

6.1 Distributional similarities and differences

We will begin by looking at ways in which these question types are similar to one another. One property they have in common is that the verb being questioned cannot already be negated. While it is perfectly acceptable to ask a negative yes/no question with *ma* (109), such questions cannot be asked in the VP-not-V (110), NPQ (111), or A-not-A forms (112):

(109) ta bu chang jing-ju ma?
he not sing Beijing-Opera Q
'Does he not sing Beijing-Opera?'

(110) *ta bu chang jing-ju bu-chang?
he not sing Beijing-Opera not-sing
('Does he not sing Beijing-Opera?')

(111) *ta bu chang jing-ju bu?
he not sing Beijing-Opera not
('Does he not sing Beijing-Opera?')

(112) *ta bu qu qu?
he not go go
('Isn't he going?')

Just as in simple declaratives and in A-not-A questions, the choice of the negative morpheme in NPQs depends on the aspectual structure of the clause. Recall that there are two forms negation can take in Mandarin, *bu* (for bare verbs and modals, generally unbounded events), and *mei(you)* (for verbs that are marked with aspectual particles, and generally for bounded events), demonstrated in (113). NPQs can be formed with either (114), as can A-not-A questions (115), but which form of negation is used depends on the aspectual properties of the sentence in the same way it does in declaratives.

(113) a. Hufei bu/*meiyou hui qu
Hufei not/not-have will go
'Hufei will not go.'
b. Hufei meiyou/*bu qu-guo
Hufei not-have/not go-exp
'Hufei has not been (there).'

(114) a. Hufei hui qu bu?
Hufei will go not
'Will Hufei go?'
b. ta qu-guo meiyou/*bu
he go-asp not.have/not
'Has he been (there)?'

(115) a. Qiaofeng qu-bu-qu
Qiaofeng go-not-go
'Is Qiaofeng going?'
b. ta you-meiyou qu-guo meigo?
he have-not-have go-exp America
'Has he been to America?'
c. Qiaofeng qu-mei-qu? (Beijing Mandarin)
Qiaofeng go-not-go
'Did Qiaofeng go?'

VP-not-V questions show the same type of aspect agreement; for example, if *meiyou* is used instead of *bu* with an unbounded event, the result is ungrammatical (116); compare to (108):

(116) *ta xihuan neige dianying mei(you)-xihuan?
he like that movie not-like
('Does he like that movie?')

A natural question to ask is whether the three kinds of questions pattern together with respect to sensitivity to islands. Initially, this appears to be the case. As Hsieh (2001) observes, NPQs, like A-not-A questions, cannot take scope out of movement islands such as sentential subjects (117), relative clauses (118), or reason adjuncts (119):

(117) *[you qian meiyou] bijiao hao?
have money not.have more good
('Whether to have money is better?')

(118) *ni bijiao xihuan [you qian meiyou de ren]?
you more like have money not.have DE person
('Who do you like better, the people who have money or the people who do not?')

(119) *Zhangsan [yinwei ni chi-le fan meiyou], suoyi hen shengqi?
Zhangsan because you eat-asp rice not.have therefore very angry
('Zhangsan got angry because whether you ate or not?')

This would be a suggestive similarity, but for the fact that, as Zhang (1997) notes, neither NPQs nor VP-not-V questions are content inside such clauses even when they take scope inside. While A-not-A questions can be embedded in islands if the scope of the question is contained within the island as in (120), neither NPQs (121) nor VP-not-V questions (122) permit even this type of embedding. While the incompatibility with islands in A-not-A questions has to do with establishing a relation between NQ and the scope of the question, this cannot be the explanation for the ungrammaticality of (121–122) nor can it be the only explanation for the ungrammaticality of (117–119). This, then, seems to be a true difference between A-not-A questions on the one hand and NPQs and VP-not-V questions on the other.

(120) a. wo zai kaolu [ta mai-bu-mai shu] de wenti.
I at consider [he buy-not-buy book] DE question
'I am considering the question whether he will buy the books.'
b. ta qu-mei-qu-guo Beijing gen wo wuguan.
he go-not-go-asp Beijing to me irrelevant
'Whether he has been to Beijing is irrelevant to me.'
c. wulun/buguan ni xi-bu-xihuan ta, wo dou yao jia ta.
no-matter/regardless you like-not-like he, I all want marry he
'Regardless of whether you like him or not, I want to marry him.'

(121) a. *wo zai kaolu [ta mai shu bu] de wenti.
I at consider [he buy book not] DE question
('I am considering the question of whether he will buy the books.')
b. *ta qu-guo Beijing mei-qu-guo gen wo wuguan.
he go-asp Beijing not-go-asp to me irrelevant
('Whether he has been to Beijing is irrelevant to me.')

c. *wulun/buguan ni xihuan ta bu-xihuan, wo dou yao jia ta.
no-matter/regardless you like he not-like, I all want marry he
('Regardless of whether you like him or not, I want to marry him.')

(122) a. *wo zai kaolu [ta mai shu bu-mai] de wenti.
I at consider [he buy book not-buy] DE question
('I am considering the question of whether he will buy the books.')
b. *ta qu-guo Beijing meiyou gen wo wuguan.
he go-ASP Beijing not to me irrelevant
('Whether he has been to Beijing is irrelevant to me.')
c. *wulun/buguan ni xihuan ta bu, wo dou yao jia ta.
no-matter/regardless you like he not, I all want marry he
('Regardless of whether you like him or not, I want to marry him.')

There are other reasons to differentiate A-not-A questions from NPQs and VP-not-V questions as well. Zhang (1997) observes that, while the NQ morphology is possible on different kinds of predicates in A-not-A questions, for example the preposition in (123a), only verbs can participate in VP-not-V questions (123b):

(123) a. ni gen-bu-gen ta shuohua?
you to-not-to him speak
'Do you speak to him?'
b. *ni gen ta shuohua bu-gen?
you to him speak not-to
('Do you speak to him?')

Moreover, whereas in A-not-A questions the predicate copy can consist only of the first syllable (124a), the reduplicated verb cannot be truncated in a VP-not-V question (124b, c). Likewise, the negative morpheme *meiyou* may appear in its full form in an NPQ, but must be truncated to *mei* in an A-not-A question (125).

(124) a. ta xi-bu-xihuan zheiben shu?
he like-not-like this book
'Does he like this book?'
b. *ta xi-zheiben shu bu xi-(huan)?
he like-this book not like
('Does he like this book?')
c. *ta xi(huan) zheiben shu bu xi-?
he like this book not like
('Does he like this book?')

(125) a. ta chi-mei-chi zaofan?
he eat-not-eat breakfast
'Has he eaten breakfast?'

b. *ta chi-meiyou-chi zaofan?
he eat-not-eat breakfast
('Has he eaten breakfast?')
c. ta chi zaofan mei(you)?
he eat breakfast meal not
'Has he eaten breakfast?'

Cheng et al. (1996), citing a historical study by Zhang (1990), note that NPQs are much older than the other types of yes/no questions. In Classical Chinese, such questions were formed with a negative particle and an interrogative particle in final position. Over time the interrogative particle disappeared, leaving the negative particle alone to mark the question. Such evidence suggests that we may not want to derive NPQs from other A-not-A constructions, since in Classical Chinese only the NPQs existed. It also suggests that in Classical Chinese, and perhaps by extension in modern Chinese, the negation in an NPQ is doing 'double duty', carrying features of both negation and interrogativity.

Cheng et al. (1996) bring up a further potential difference between these question types. Recall that certain preverbal adverbs are disallowed in A-not-A questions (discussed in section 5.1), such as *chang* 'often' and *yijing* 'already' in (126). Cheng et al. observe that these adverbs are also ungrammatical in VP-not-V questions (127). Further, they rate these adverbs as being fine with NPQs (128).

(126) a. *ta chang qu-bu-qu?
he often go-not-go
('Does he go often?')
b. *ta yijing you-meiyou kan-wan shu?
he already have-not-have read-finish book
('Did he already finish reading the book?')

(127) a. *ta chang pian-ni-bu-pian?
he often cheat-you-not-cheat
('Does he often cheat you?')
b. *ta yijing kan-wan shu mei-kan-wan?
he already read-finish book not-read-finish
('Did he already finish reading the book?')

(128) a. ta chang qu bu?
he often go not
'Does he go often?'
b. ta yijing kan-wan shu mei(you)?
he already read-finish book not-have
'Did he already finish reading the book?'

Subsequent literature has not unanimously agreed with the judgments reported by Cheng et al. for (128), however; Hsieh (2001) judges (128a) to be ungrammatical,

and Zhang (1997) rates (128b) the same. At least for dialects in which all of the examples in (126–128) are ungrammatical, they cannot serve to support an argument for differentiating NPQs, VP-not-V questions, and A-not-A questions. There may in fact be prosodic constraints that have not been thoroughly explored influencing the acceptability of these sentences. Zhang (1997) agrees with Cheng et al. that (128a) is acceptable, but finds that replacing the monosyllabic adverb *chang* with the disyllabic synonym *jingchang* 'often' renders it ungrammatical, unless the sentence is longer, e.g. with an expressed goal argument (129). Pending further systematic investigation, the diagnostics based on the acceptability of adverbs with NPQs are of uncertain status.

(129) a. *ta jingchang qu bu?
he often go not
('Does he go often?')
b. ta jingchang qu Shanghai bu?
he often go Shanghai not
'Does he go to Shanghai often?'

6.2 *The location of* neg*(-V)*

Cheng et al. (1996) propose that the negative morpheme at the end of NPQs (in Mandarin) is located in a complementizer position, like the question particle *ma* in yes/no questions. In support of this conclusion, they observe that the negative particle in NPQs cannot co-occur with the question particle *ma*. Yet, *ma* is generally not allowed with alternative questions of any sort, so the inability of *ma* to co-occur with NPQs may well be due to an independent semantic constraint.

Cheng et al. (1996) also judge that the sentence-final particle *ne*, which can appear both in *wh*-questions and A-not-A questions, cannot appear in NPQs. However, both Zhang (1997) and Hsieh (2001) take issue with this judgment, indicating that for them questions such as (131–132) are grammatical:

(130) ta xihuan ni bu-xihuan ne?
he like you not-like Comp
'Does he like you?'

(131) ni gei-le ta qian meiyou ne?
you give-asp he money not.have prt
'Did you give him money?'

(132) ta chi-le fan meiyou ne?
he eat-asp meal not.have prt
'Has he eaten?'

James Huang (p.c.) suggests that (131–132) might be acceptable with *ne* if the final *meiyou* allows them to be analyzed as VP-not-V questions (negating the auxiliary

you) rather than as NPQs; he notes that if *meiyou* is shortened to *mei* (rendering the questions unambiguously NPQs), these examples degrade considerably.

Hsieh (2001) puts forth two further arguments against the claim that the negative morpheme in NPQs is in the same position that sentence-final particles such as *ne* and *ma* occupy. First, NPQs are possible in an embedded clause (133), while sentence-final particles are not (134–135). Examples (133b, c) show that the embedded clause is in fact an embedded clause, by showing that it can be circumscribed by *lian . . . dou* ('even') and can be replaced by *zhe-ge* 'this' (136):

(133) a. ta xiang zhidao [ta lai le meiyou]
he want know he come asp not.have
'He wants to know whether he came.'
b. ta bu zhidao ta ziji pang le meiyou
he not know he self fat asp not.have
'He does not know whether he gained weight.'
c. ta lian ta ziji pang le meiyou dou bu zhidao
he even he self fat asp not.have all not know
'He does not even know whether he gained weight.'

(134) ta xiang zhidao [shei lai-le (*ne)]
he want know who come-asp prt
'He wants to know who came'

(135) wo bu zhidao ta qu-guo Beijing le (*ma).
I not know he go-asp Beijing asp Q
'I do not know whether he has been to Beijing'

(136) ta lian zhe-ge dou bu zhidao.
he even this-cl al not know
'He did not even know this.'

Hsieh's (2001) second argument has to do with the distribution of *daodi* 'after all', which (as discussed in section 5.1) seems to be prohibited from the scope of the interrogative morpheme. Recall that this explained why *daodi* is not allowed in yes/no questions with the question particle *ma*: *ma* is so high in the structure that it takes scope over everything else. If the negative/interrogative particle in NPQs were also that high in the structure, it should have the same effect on *daodi*. However, as Cheng et al. themselves observe, *daodi* is just fine in NPQs (137), as it is in the other A-not-A questions.

(137) ni daodi gei-le ta qian meiyou?
you indeed give-asp he money not.have
'Did you indeed give him the money?'

Assuming that the constraint on where *daodi* can appear is accurately characterized, this, like (133) above, tells us that the position of the negative morpheme in NPQs is not as high in the structure as the position of *ma* in yes/no questions.

It is of course a separate question whether the negative morpheme in NPQs moves to its sentence-final position from lower in the clause. The arguments above suggest that there are at least two sentence-final positions, the position occupied by negation in NPQs being lower than the position occupied by *ne* and *ma*. Cheng et al. (1996) argue that in Mandarin NPQs, the negative morpheme has moved to its surface position based on the aspect agreement facts reviewed next.

Which negative morpheme is used in an NPQ depends on the aspectual properties of the sentence, just as in declaratives. Assuming that such agreement must be determined locally, this negative particle must have originated within the clause being questioned. As evidence for this, they observe that the form negation takes can disambiguate which verb is being questioned when there is an embedded clause. The question in (138) is ambiguous, since both the matrix and embedded clauses would use the *bu* form in the negative, and the question in (139) is ungrammatical, since *meiyou* is not compatible with either clause. Only a reading in which the matrix verb is being questioned is possible for (140), since *bu* is incompatible with the aspect-marked embedded verb, and only a reading in which the embedded verb is being questioned is possible for (141), since *meiyou* is incompatible with the modal *hui* 'will' in the matrix clause.

(138) ta yiwei ni qu bu?
he think you go not
'Does he think or not think that you are going?'
'Does he think that you are going or not going?'

(139) *ta hui yiwei ni yinggai qu meiyou?
he will think you should go not-have
('Will he think or not think that you should go?')
('Will he think that you should go or not go?')

(140) ta yiwei ni qu-guo bu?
he think you go-exp not
'Does he think or not think that you have been (there)?'

(141) ta hui yiwei ni qu-guo meiyou?
he will think you go-exp not-have
'Will he think that you have been (there) or you haven't been (there)?'

The question in (141) is of particular interest because, although the agreement is with the embedded verb, it is still a matrix question. Cheng et al. take this as an indication that the sentence-final particle has moved from the embedded clause to the matrix CP system, responsible for both interrogative and negative features.

One last point we might consider to help determine where in the structure *neg*-V appears in VP-not-V questions is the distribution of another clause-final particle, the (inchoative, perfective) *le*. Zhang (1997) observes that nothing can follow *neg*-V in a VP-not-V question, and furthermore that *neg*-V must follow the otherwise clause-final (inchoative) *le* (142). To this, I add (143), which shows that the same is true of NPQs.

(142) ta chi fan le mei chi?
he eat meal LE not eat
'Has he eaten the meal?'

(143) ta chi fan le mei(you)?
he eat meal LE not
'Has he eaten a meal?'

6.3 *Distributional similarities and differences revisited*

Collecting together the observations from this section, the picture we arrive at is that there are at least three distinct clause-final positions. The highest of these is where the yes/no question marker *ma* appears, and the lowest is where the sentence-final perfective/inchoative *le* appears. Between the two is the position in which *neg* and *neg*-V appear in NPQs and VP-not-V questions. For convenience, I will call these *ma*P, *le*P, and *npq*P, respectively.

That *npq*P is higher than and distinct from *le*P is clear from the surface forms, e.g., (142–143). The evidence from the distribution of *daodi* 'after all' indicates that *npq*P is distinct from and structurally lower than *ma*P: NPQs and VP-not-V questions are compatible with *daodi*, but yes/no questions with *ma* are not, indicating that there is a place in the structure for *daodi* that is between *npq*P and *ma*P.

The fact that NPQs and VP-not-V questions cannot be embedded within islands, regardless of the scope of the question (121–122), might be attributed to a syntactic impossibility: clause-embedding verbs embed structures smaller than a *ma*P (135), and for clausal adjuncts, even an *npq*P is too much structure (121–122).

Following Cheng et al. (1996), we can suppose that the long-distance agreement between the form of negation in NPQs and VP-not-V questions and the internal aspectual properties of the clause diagnoses an overt movement of NQ from its clause-internal position (presumably the position in which it would appear in an A-not-A question) to *npq*P.

This sketch of an analysis leaves unaddressed some of the facts in the preceding sections; in particular, it provides no clear explanation of the restriction to verbs in VP-not-V questions (as opposed to A-not-A questions, which allow NQ on adjectives, prepositions, and adverbs), nor does it add any immediate understanding of the prosodic requirements and restrictions on truncation of the predicate. However, it can serve as a simple model to work from in further exploration of these questions, and does at any rate serve as a reasonable synthesis of the facts so far accumulated.

7 VP-not-VP questions as VP-VP questions

There is still one further question type that has appeared in the literature in the context of A-not-A questions: the VP-not-VP question. These are questions in which the entire VP is repeated after the negative morpheme. It is tempting to think that these are simply alternative questions with *haishi* omitted, but there are some distributional differences between VP-not-VP questions and alternative questions.

As McCawley (1994) observes, VP-or-not-VP alternative questions are possible (even if somewhat unusual) when the order of the disjuncts is reversed: (144) is fine, but if *haishi* is missing, only the positive-negative order is possible (145–146):

(144) ni bu xihuan ta haishi xihuan ta?
you not like him or like him
'Do you not like him or like him?'

(145) ni xihuan ta bu xihuan ta?
you like him not like him
'Do you like him or not like him?'

(146) *ni bu xihuan ta xihuan ta?
you not like him like him
('Do you not like him or like him?')

Huang (1991) points out that it is possible to ask alternative questions without *haishi*; e.g., (147) and (148) receive essentially the same interpretation. The interpretation they receive is as a straightforward alternative question, not asking for a choice between two alternatives that differ only in truth value, but between two distinct propositions:

(147) ta chi fan haishi chi mian?
he eat rice or eat noodle
'Does he eat rice or noodles?'

(148) ta chi fan chi mian?
he eat rice eat noodle
'Does he eat rice or noodles?'

Zhang (1997) makes the interesting observation that even these affirmative disjunctive questions, when they lack *haishi*, cannot appear in islands (149–150). The implications of this observation are beyond the scope of this survey article, but it does suggest that the island sensitivity we see in A-not-A questions may not be specific to the properties of NQ, but rather to formation of this kind of alternative question in general (though not to alternative questions with *haishi*).

A similar effect arguably occurs in English with the association between *either* and *or* (Larson 1985b): in (151), the disjunction is easily interpretable outside of the embedded clause, but in (152) this reading disappears (leaving only the irrelevant reading comparing noodles to people who eat rice). Questions remain about what allows *haishi* its freedom from this kind of scope constraint.

(149) ni xihuan [chi fan haishi chi mian] de ren?
you like eat rice or eat noodle DE person
'Do you like people who eat rice or who eat noodles?'

(150) *ni xihuan [chi fan chi mian] de ren?
you like eat rice eat noodle DE person
('Do you like people who eat rice or who eat noodles?')

(151) I either like to eat rice or noodles (but I can't remember which).

(152) I either like people who eat rice or noodles.

James Huang (p.c.) also points out that disjunctive VP-VP questions (without *haishi*) are subject to a peculiar constraint requiring the two VPs to bear some phonological similarity: either the verb or the object must be identical between the two VPs; synonyms or pronouns will not satisfy the constraint.

The VP-not-VP question has not been much discussed compared to NPQs, VP-not-V questions, and A-not-A questions. From these initial observations, it seems that the VP-not-VP questions are most properly considered to be essentially VP-VP disjunctive questions like (149), but for the incidental property that the second VP is the negated version of the first.

8 Cross-linguistic notes

Although Mandarin Chinese is the language in which this family of question types has been most thoroughly studied, such questions appear in other languages as well. A full cross-linguistic and cross-dialectal comparison of question types is well beyond the scope of this review, and in fact only exists in the literature in bits and pieces, but we will briefly note some of the more prominent observations that have been made in this connection.

Huang (1991) noted that Taiwanese and several other dialects feature a question particle that appears to be parallel to the NQ of Mandarin A-not-A questions, and hypothesized that it is an alternative realization of the same underlying morpheme (recall section 2.1). In Taiwanese, *kam* appears in the same place that NQ does in Mandarin (153). Given that the evidence for the existence of NQ as a single morpheme is rather indirect (even if convincing) in Mandarin, the fact that NQ is realized as a free morpheme in other dialects lends credence to the NQ hypothesis in Mandarin. Huang (1991) provides more support for the parallel by

noting that *kam* in Taiwanese can take long-distance scope (154), and cannot appear in islands (155–156).

(153) li kam u chi:?
you Q have money
'Do you have money?'

(154) li siu: i kam e lai?
you think he Q will come
'Do you think he will come?'

(155) *[i kam u lai] kha hou?
he Q have come more good
('Is it better that he has come or has not come?')

(156) *li kha ai [kam u chi: e] lang?
you more like Q have money REL person
('Do you like the person who has money or doesn't?')

Huang (1991) also cites Zhu's (1985) cross-dialectal study, which showed, among other things, that A-not-A questions and *kam*-type questions generally do not co-occur in the same dialect, further supporting the idea that NQ and *kam* realize the same underlying morpheme.

It should be noted that much subsequent literature has questioned Zhu's (1985) conclusion about the complementary distribution of *kam* and A-not-A questions across dialects (see, e.g., Crosland (1998) for discussion), but it remains unclear to what extent this is theoretically problematic. In this connection, we can even point to Taiwanese as discussed by Huang (1991) which, in addition to the *kam*-type questions, does have a limited form of A-not-A questions that appear with a highly restricted subset of verbs. Hsieh (2001) provides a short list, including *si* 'be', *bat* 'know', and *kaN* 'dare', but notes that there does not seem to be a unifying property to the verbs which allow A-not-A questions and concludes that they must be lexically marked.

Cole and Lee (1997) explore the properties of Singapore Teochew (ST) which also seems to have both A-not-A and *kam*-type questions, which, moreover, can co-occur in the same question. In the ST example in (157), the *kam*-type particle is *ka*, and it precedes an A-not-A sequence:

(157) Ah Meng ka su m suka ji bun zi? (ST)
Ah Meng Q li- not like this CL book
'Does Ah Meng like this book?'

Cole and Lee review a number of syntactic tests, which show that the A-not-A forms are relatively unconstrained, able to appear within sentential complements and within movement islands. On the other hand, the *ka* question particle cannot

be contained in movement islands, even though it can appear in embedded clauses when not within an island.

These facts suggest that not everything that looks like an A-not-A question is the same: the A-not-A questions in Mandarin appear to be the analogs to *kam* questions in Taiwanese and to *ka* questions in ST, but crucially not analogs to the A-not-A questions in ST. Rather, ST A-not-A questions behave more like Mandarin alternative (*haishi*) questions. Although Cole and Lee essentially take this line, that ST A-not-A questions are just disjunctive questions, it is worth pointing out one fact that leans away from such a view: notice that in (157), the A-not-A formation shares with Mandarin the property that the first copy of the affected predicate is reduced to only its first syllable. This same phenomenon was used as an argument in favor of the existence of NQ in Mandarin, given that ellipsis of the non-initial syllables of a word is not generally a possible syntactic operation. Given the syntactic evidence, we seem to be forced to conclude that ST A-not-A questions are basically just alternative questions, but that leaves us in the position of having to allow this type of 'sub-word-level' ellipsis into the grammar.

The facts just reviewed from ST reveal that the sort of typological study embarked upon by Zhu (1985) is more daunting than it might at first appear. Specifically, Cole and Lee's evidence shows that identifying what qualifies as an A-not-A question in the relevant sense is not straightforward from the surface forms and requires more detailed investigation into the distributional properties within a given language/dialect.

Cheng et al. (1996) explore the properties of NPQs across Mandarin, Taiwanese, and Cantonese. In the discussion above (section 6), the conclusion for Mandarin was that NPQs and VP-not-V questions appear to result from movement of NQ into a clause-final position we called *npq*P. The movement analysis was primarily supported by the long-distance aspect agreement shown on the negative morpheme. Neither Taiwanese nor Cantonese, however, show the same kind of long-distance agreement in NPQs, despite the fact that there is agreement in both languages between clause-internal (*in situ*) negation and aspect. In Taiwanese, the negative morpheme used in NPQs is always the same (*mei*), and cannot be used in A-not-A questions. In Cantonese, on the other hand, NPQs can freely use any of the negative morphemes without regard to the aspect of the clause. Cheng et al. conclude from this lack of agreement that in Taiwanese and Cantonese, NPQs do not involve movement to a clause-final *npq*P position, but instead simply have a negative particle base-generated in its surface position.

9 Conclusion: closing remarks

In the sections above, we have reviewed a number of the characteristics of several kinds of questions that have fallen under the label 'A-not-A question', and most of their major distributional characteristics as they have been described in the generative literature. For the most part, we have steered clear of minute

syntactic analysis (e.g., debates about whether a [Neg] feature or a [+Q] feature is attracted to a functional head $\sum$ in overt syntax), but the broad characteristics that such an analysis must have and the facts it is responsible for should nevertheless be clear.

To review, it is clear that there are a number of different types of questions to consider. Alternative questions, which appear in Mandarin with an overt disjunctive word (*haishi*), are almost completely unconstrained, while questions formed by reduplication of a predicate *in situ* (A-not-A questions) are rather tightly constrained. Both kinds of questions are distinct from true yes/no questions, formed in Mandarin with the sentence-final question particle *ma*, as is clear from the kinds of answers they allow, the contexts they are allowed in, and from the distinctness of the syntactic constraints on *ma* questions and A-not-A questions. The VP-not-V questions and NPQs are not clearly different from one another, but have some properties that distinguish them from A-not-A questions, even if they may be derived from an underlying form that is very similar to A-not-A questions.

Cross-linguistically, the existence of a question type parallel to Mandarin A-not-A questions is relatively well-attested, e.g., the *kam*-questions in Taiwanese, but we also saw that not all questions with an apparent A-not-A form should properly be considered analogs to Mandarin A-not-A questions.

There is much more to say on the cross-linguistic implications and parallels, as well as on language-internal implications, some of which exists in the literature already but not covered here, but much of which remains to be systematically explored. Our understanding of this family of 'yes-no-like' questions has advanced a great deal over the last 20 years, and the field is now ready for more systematic, broad-ranging, and deeper cross-linguistic comparison. Also important for future theoretical understanding will be a concentration on points where judgments differ; as noted in a few places above, there are conflicting reports in the literature on certain crucial data points, some of which may be cleared up by more careful control of regional dialects and registers. One area that remains only relatively cursorily explored in the literature to date is the (admittedly difficult) determination of the pragmatic properties of the different types of questions: what can and cannot be focused, whether a certain type of question can be used in a pragmatically 'slanted' context. Such facts are increasingly widely assumed to have structural correlates (e.g., movement to a functional 'focus phrase' projection) and are at least potentially a fairly rich source of data.

  6.3 Bare nouns in French and Chinese
  6.4 Non-existential readings
7 Conclusion: summary

1 Introduction: the empirical issues

It is normally believed that noun phrases (NPs) in argument position must be introduced by a determiner, that is, they are in fact, under the so-called 'DP-hypothesis', determiner phrases (DPs). This requirement does not hold for NPs which do not count as arguments, for instance, NPs in predicative position (English is rather idiosyncratic in that respect) or vocatives. This contrast is shown in (1):

(1) a. Bill è medico. (Italian, predicative)
       Bill is a doctor.
    b. Doctor, come here! (vocative)
    c. *Doctor came immediately.
    d. *I saw doctor.

However, this observation does not seem entirely correct, since a large variety of languages apparently admit determinerless nouns in argument position. In certain languages (such as Chinese, where the count/mass distinction is apparently neutralized) there does not seem to be any restriction on the occurrence of bare nouns in argument position.[1] In many other languages, what seems to be relevant in order to establish which cases are grammatical is the count vs. mass distinction. Bare forms of mass nouns are admitted, but bare count nouns can be realized only as bare plurals (BPs).[2] This is shown, for English, in (2) below:

(2) a. Water is scarce in this country.
b. Dogs are intelligent.
c. *Dog is intelligent.

Nevertheless, it would not be correct to conclude that *every* language allows at least certain uses of bare nouns in argument position. There are in fact languages, exemplified by Modern French, where bare nouns are uniformly excluded from argument positions, quite independently of the interpretation they are assigned. Moreover, even in languages that allow bare nouns (bare plurals and bare mass nouns) to occur as arguments, there are, it seems, important constraints on their distribution. A relatively well-studied case is the fact that in most Romance varieties subject BPs tend to be excluded from the subject position unless modified or coordinated, whilst BPs occurring in other argument positions are more freely admitted as bare nouns.[3]

It should be noticed, at this point, that the distributional issue cannot be satisfactorily settled if we abstract away from the *interpretation* that BPs receive in argument positions. At first sight, it seems that BPs are interpreted as if a determiner were in fact present, with extralinguistic information deciding the choice between the universal and the existential reading of this (implicit) determiner. This is shown in (3):

(3) a. Dogs are mammals. (universal reading)
b. Dogs were sitting on my lawn. (existential reading)

However, matters are arguably somewhat more complex. It is clear what a sentence like (4a) should mean if the subject BP were assigned the existential reading (something like *some dogs are black (around here)*), on strict parallelism with one of the admissible interpretations of the subject BP in (4b) (*some firemen are available around here*). Nevertheless, no possible contextual setting is able to rescue the existential reading in (4a), whereas this interpretation is readily accessible in the case of (4b):

(4) a. Dogs are black.
b. Firemen are available.

Similarly, stressing the subject BP in (5a) strongly favors an existential reading, whereas assigning prosodic emphasis to the subject BP in (5b) is not sufficient

to elicit an existential reading (notice that, on pragmatic grounds, there is no compelling reason why the existential reading should be most readily accessible in (5a) than in (5b)):

(5) a. She thinks that COUNTEREXAMPLES are known to us.
b. Dogs are altruistic. (only: *all dogs are altruistic*)

On comparative grounds, it becomes clear that interesting constraints also apply to the universal reading. In Romance, for example, the universal interpretation of BPs appears to be uniformly ruled out (see, however, Chierchia 1998 for different idealizations concerning this set of data and the discussion in section 6 below). BPs are exclusively licensed with the existential reading, as shown by the ungrammaticality of (6a) and (6b) in Italian:

(6) a. *Cani sono mammiferi.
'Dogs are mammals.'
b. *Cani sono altruisti.
'Dogs are altruistic.'

This sketchy survey of some of the empirical issues that arise suffices to show that an empirically adequate theory of bare plurals has to account at least for the following facts:

(i) the relevance of argumenthood for the licensing of BPs (it is the distribution and interpretation of *argument* BPs that appears to be severely constrained in many languages);
(ii) the relevance of the mass/count distinction for the licensing of bare plurals and bare singulars (there is a rather solid cross-linguistic generalization according to which bare singulars of mass nouns and bare plurals of count nouns behave similarly);
(iii) the typological variation as to the presence of subject-object asymmetries in the licensing of BPs (for instance, Spanish does not allow bare nouns in subject position, contrary to English);
(iv) the total prohibition on bare nouns in languages such as modern French;
(v) the prohibition on the existential reading of subject and object BPs with certain predicates, even in contexts where this reading would be perfectly felicitous on pragmatic grounds (cf. 4a);
(vi) the interaction with focus (focusing a BP not only affects its informational status but also favors the existential reading in certain contexts, whereas it does not affect the quantificational reading in other contexts);
(vii) the strong comparative contrast found with respect to the licensing of BPs interpreted universally: the universal reading is possible and in some cases compulsory in English, but is arguably excluded in Romance, quite independently of the nature of the predicates/contexts involved.

To these, many other facts should be added, some of which we will take into account in the following sections. However, the data reviewed above suffice to show that the analysis of bare nouns is likely to involve many delicate issues concerning the syntax–semantics interface.

2 Theoretical issues

One might think that the analysis of BPs raises a number of intriguing but relatively circumscribed problems. However, it should be emphasized that BPs have constituted, especially in the last 20 years, one of the central and most inspiring case studies into the logical form of natural language and one of the most challenging empirical domains for generally (and quite often implicitly) accepted hypotheses on the syntax–semantics interface. Here are some of the reasons why a relatively peripheral set of facts has acquired a central role within the theorizing in formal linguistics (both syntax and semantics).

(i) The ambiguity of noun phrases which are not introduced by some quantifier, determiner, or article cannot be easily explained in terms of other well-known cases of quantification. We have seen, for instance, that this ambiguity might be tentatively expressed in terms of optionality between existential and universal quantification. Unfortunately, a closer examination of the data immediately reveals that this position is not tenable (cf. Carlson 1977a). Consider the sentences in (7):

(7) a. Dogs are mammals.
b. Dogs bark.
c. Musk-rats were brought to Europe in 1906.
d. Dogs are common.

If universal quantification (*all dogs*) seems to represent a convenient formal device for the expression of the interpretation of the BP in (7a), it cannot certainly be claimed that it constitutes an adequate solution in the other cases exemplified in (7). As for (7b), it is clear that the sentence would remain true even though not all, but just most dogs barked (as is probably the case in the real world). One might thus think that BPs are ambiguous between quantificational forms involving either the determiner *all* or the determiner *most*. This cannot be correct, however, since the truth of (7c) does not require that most musk-rats were brought to Europe in the year mentioned; rather, it suffices that a certain representative set of the kind of musk-rats has been imported to Europe, even though the actual cardinality of such a set is quite small (in fact, only some musk-rats have been brought to Europe). Finally, notice that the meaning of *dogs* in (7d) does not admit any logical paraphrase of the sort *all dogs*, *most dogs*, or *some dogs*. In the

presence of these facts, it is quite an issue to establish what all instances of BPs exemplified in (7) have in common, that is, which semantics must be associated to determinerless nouns.

Similar complications have been detected in the case of the existential reading of BPs. Consider the sentences in (8):

(8) a. John didn't see spots on the floor.
b. Dogs were everywhere.

At first sight, the BPs in (8) behave as the plural counterparts of the indefinite article *a(n)*, receiving the same reading as unstressed *some* in English (often referred to as *sm*). In other words, (8) should be logically equivalent to the sentences in (9):

(9) a. John didn't see some spots on the floor.
b. Some dogs were everywhere.

This is not quite true, however. As for (9a), it is easily assigned a quantificational reading involving wide scope of the indefinite object (*John possibly saw many spots on the floor, but there are some that he failed to see*). This reading is not available in (8a), which can only mean that John saw no spots on the floor (and not that he failed to see some of the spots). A solution to this asymmetry might consist in the assumption that the set of readings realized with BP indefinites is a subset of the readings realized with other lexical existential determiners (like *a* or *some*). Carlson (1977a) shows that there are reasons to assume that the two classes of readings are actually partially disjoint, as revealed by the observation that the narrow scope of the subject BP (*for every relevant place, a different group of dogs was present at that place*) is naturally instantiated in (8b), but is simply impossible in (9b) (which can only receive the absurd reading according to which a certain group of dogs was omnipresent), in spite of any consideration of pragmatic plausibility.

In view of these observations, which represented some of the main reasons for Carlson to reject the quantificational approach to BPs (cf. section 3.2 for a full discussion), the view that the semantics of BPs can be easily accounted for in terms of an ambiguity between canonical existential and universal quantification turns out to be more problematic than was expected at the onset.

(ii) The inquiry into the syntax and semantics of BPs revealed itself a productive tool in order to achieve a better understanding of the distinction between episodic and generic sentences in natural language (that is, the nature of genericity as represented in the logical form of natural language). Notice that all the sentences in (7) (including (7c), which seems to be about a specific event) appear to involve a sort of *generic* reading of the BP, in the sense that the relations involved by these sentences intuitively concern the kind of *dogs* or the kind of *musk-rats*, independently of the number of members of the kind

which enter the relations expressed by the different predicates. Consider now (10) below:

(10) Smokers are rude.

Although (10) would be naturally assigned the existential reading (*some smokers are rude*) on pragmatic grounds, this reading is completely inaccessible to (10), which exclusively exhibits the universal/generic reading of the BP. In other words, the problem raised by BPs is not limited to the difficulty of characterizing their interpretation in logical terms. It is also clear that sentences involving BPs are not simply ambiguous among different readings. There are many contexts in which only the universal/generic reading is available, and also contexts where the BP exclusively receives an existential reading.[4] Further inquiry reveals that lexical factors such as the choice of the predicate involved (for instance, *to be rude* vs. *to be available*) and morphosyntactic factors such as aspectual morphology might play a crucial role in explaining the absence of ambiguity in many contexts. An investigation into the nature of these factors is apparently of great importance to establish some of the properties of generics.

(iii) The interpretive properties of BPs, and in particular the traditional idea that BPs count as the plural counterpart of singular indefinites, are certainly relevant in order to evaluate the different theoretical approaches to indefinites, for instance the hypothesis that indefinites correspond to free variables, as has been developed in the framework of Discourse Representation Theory (cf. especially Kamp 1981a; and Heim 1982). At first sight, singular indefinites appear to behave as BPs, in that, for example, the former can give rise to the same sort of ambiguity detected with the latter, as shown in (11):

(11) a. A dog was sitting on my lawn. (existential)
b. A dog is intelligent. (universal)

A closer scrutiny immediately reveals that only a subset of the cases in which the BP can be assigned a universal/generic interpretation preserves this reading when the BP is replaced with a singular indefinite. This is shown by the paradigm in (12–13):

(12) a. Madrigals are polyphonic.
b. A madrigal is polyphonic.

(13) a. Madrigals are popular.
b. ??A madrigal is popular.

Carlson (1977a) provides other empirical arguments against the view that BPs are just plural indefinites, concerning the different behavior of singular and (allegedly) plural indefinites in pronominalization and deletion contexts (to be further

discussed in section 3.2). For instance, the interpretive effects of NP-deletion in coordinate structures seem to depend on the nature of the indefinite that has been deleted: deletion of the singular indefinite turns the sentence in (14a) into a pragmatically strange one (as shown in (14b)), whereby the same building must appear in two different cities. This effect is simply not detected in (15):

(14) a. A building will collapse in Berlin tomorrow, and a building will burn down in Boston the day after.
b. A building will collapse in Berlin tomorrow, and ___ will burn down in Boston the day after. (the same building must be involved, differently from 14a)

(15) a. Buildings will collapse in Berlin tomorrow, and buildings will burn down in Boston the day after.
b. Buildings will collapse in Berlin tomorrow, and ___ will burn down in Boston the day after. (different groups of buildings may be involved, exactly as in 15a)

Despite these observations, which show that merely assimilating BPs to other well-known instances of indefinite NPs would leave many facts completely unexplained, we will see that many scholars assumed that BPs can indeed behave as indefinites in certain circumstances. The behavior of BPs has constituted an important empirical argument in favor of the hypothesis that indefinites provide free variables with a predicative restriction which have to be bound from outside (that is, DP-externally), as in the different versions of the so-called Mapping Hypothesis.[5] Proponents of this approach assume that the nature of the binder depends on the syntactic position of the indefinite: indefinites realized VP-internally undergo a restricted operation of existential closure, whereas indefinites realized VP-externally are bound by some (implicit) adverb of quantification (roughly corresponding to frequency adverbs such as *often*, *always*, etc.), and are therefore mapped into the restrictive clause of the adverb of quantification. It has been argued that there are languages, such as German and Dutch, in which the syntactic position of the indefinite relevant for the mapping into quantificational structures is computed in overt syntax:[6] the VP-internal BP in (16a) can only be interpreted existentially, whilst the VP-external BP in (16b) is assigned a universal/generic interpretation (a crucial assumption here is that the adverbial particle *ja doch* in German marks the VP-boundary, cf. the discussion in Diesing 1992b):

(16) a. Weil [$_{IP}$ ja doch [$_{VP}$ Haifische sichtbar sind]]
. . . since 'indeed' sharks visible are
'. . . since there are sharks visible'
b. Weil [$_{IP}$ Haifische ja doch [$_{VP}$ sichtbar sind]]
. . . since sharks 'indeed' visible are
'. . . since (in general) sharks are visible'

Given these considerations, it is difficult to escape the conclusion that accounting for the syntactic and interpretive properties of BPs has to be an essential ingredient of any general theory of indefinites.

(iv) Last but not least, it seems that the inquiry into the semantics of BPs may have important consequences for an exact characterization of the domain of quantification presupposed by the semantics of natural language. In particular, the claim that BPs denote *kinds* (as in Carlson 1977a) entails that the domain of discourse must contain 'pluralities' as a specific sort of individual objects and that a multi-sorted (first order) language (that is, a logical language endowed with different sorts of variables) may well be needed in order to provide an adequate representation of the logical forms associated with the sentences of natural language.

Again, these sketchy considerations suffice to show the considerable theoretical potential of the topic we are investigating. In the next three sections, we will consider the main theoretical contributions that have been produced in this area of research, starting with the seminal hypothesis put forward in Carlson (1977a) for the analysis of English BPs and considering successively how the enlargement of the empirical domain has brought about significant changes in the theoretical formulations of the issues around the syntax and semantics of BPs.

3 Bare plurals as names of 'kinds'

The ambiguity of the sentences containing BPs between an existential and a universal reading has long been analyzed in terms of the presence of an ambiguous null determiner.[7] As noticed in Carlson (1977a) there has also been a certain amount of discussion over which form (either the zero determiner or unstressed *some*) can be assumed to constitute the plural correlate of the indefinite article *a*.[8] The quantificational analysis of BPs as the plural counterpart of a singular determiner has been rejected by Carlson (1977a), which represents the most influential approach to BPs that has been elaborated in the framework of formal semantics and generative grammar. We will first present Carlson's proposal about the nature of BPs (section 3.1) and successively discuss the empirical motivation used by Carlson in order to discard the quantificational analysis.

3.1 Individuals and stages

Carlson's main hypothesis is that BPs are kind-referring expressions (roughly, names for kinds). Formally, a kind is conceived of as a particular sort of individuals in the domain of discourse, on a par with the ordinary objects which provide the reference of pronouns and names.[9] Carlson does not provide any extensive discussion of the relation between his notion of *kind* and the philosophical notion of *natural kind*. Kinds are objects, and most BPs are assumed to refer to kinds, even those which cannot be easily assumed to refer to natural or well-established

kinds (for example, one might be inclined to think that a predicate like *Coke bottle* more readily individuates a kind than a predicate like *green bottle*, but in fact both *Coke bottles* and *green bottles* are assumed to denote kinds).[10] There are of course some enigmatic instances of BPs that appear to resist the kind-referring interpretation (cases such as *parts of that machine*, *people in the next room*, *books that John lost yesterday*, *bears that are eating*, etc.), but these are assigned a marginal and unclear status in Carlson's analysis (cf. Carlson 1977a: 5.4). If BPs uniformly denote kinds (and do not necessarily involve the presence of an ambiguous empty determiner or two phonetically unrealized homonymous determiners), the source of the apparent quantificational ambiguity must be independent of the semantics (and syntax) of BPs. Carlson's insight is that it is the predicate with which the BP combines that determines the observed variation between an existential and a universal reading. Roughly, verbal predicates may either make reference to specific events or ascribe a (stable) property to an individual. This bipartition has been extremely influential and has been successively analyzed, as we will see, in terms of a difference in argument structure, as in Kratzer (1995) and Diesing (1992a). However, Carlson's technical implementation of the proposed bipartition relies on a primitive ontological distinction between predicates denoting individuals (*i(ndividual)-level predicates*) and predicates denoting spatio-temporal 'slices' of those individuals (*s(tage)-level predicates*). Event predicates (that is, predicates that refer to specific events rather than ascribing a stable or essential property to an individual) are analyzed as stage-referring predicates. On conceptual and technical grounds, it is relatively easy to see why Carlson has adopted an *ontological* solution for the ambiguity between event and non-event predicates. The hypothesis that *kinds* are particular sorts of objects in the domain of discourse entails that what is needed for an adequate representation of the logical form of English sentences is a multi-sorted language (that is, a formal language containing at least two sorts of variables, one ranging over common objects and the other ranging over *kinds*). It is thus not particularly costly, from a conceptual perspective, to enrich the domain of quantification with a third sort of objects, corresponding to 'stages', that is, spatio-temporal slices of the first two sorts of individuals. Let us briefly see how the proposed account actually works.

Consider the sentences in (3), repeated below:

(3) a. Dogs are mammals. (universal reading)
b. Dogs were sitting on my lawn. (existential reading)

Let us start with (3a). Since *to be a mammal* is an individual-level predicate, that is, a predicate which denotes a set of individuals, and individuals are analyzed, within the formal language into which Carlson translates sentences of English (some version of Montague's Intensional Logic), as sets of properties, sentences such as (3a) will correspond to the assertion that the property denoted by the predicate belongs to the property set denoted by the subject BP. This means that (3a) will be true in the world *w* if and only if the kind referred to by the BP is in

the extension of the predicate at *w*. These truth-conditions are formally expressed in (17):

(17) λP P(d) (is_a_mammal) = is_a_mammal(d),

where 'd' is the individual constant which refers to the kind *dogs*.

If (17) is the logical form assigned to (3a), the apparent quantificational ambiguity exhibited by some of the sentences in (7) receives a rather straightforward explanation. The facts that a different quantifier seems to be involved in (7a, b) (*all* and *most* respectively) and that no form of quantification over the set members yields a convenient logical paraphrase in (7d) can be uniformly attributed to the pragmatically-conditioned vagueness typical of properties ascribed to kinds and of relations involving kinds. Kinds are inherently 'plural' objects. Associating a certain property with a 'plural' object does not entail that the same property holds of the individual members of this plurality. The same ambiguity arises in fact with the so-called 'collective' reading of singular definites (Carlson 1977a: 4.1).[11] An important consequence of this analysis is that the quantificational structures that seem to be associated with *generic* BPs are not part of the semantic interpretation, but rather correspond to the application of extralinguistic cognitive tasks directed at establishing what counts as 'evidence' for the claim expressed by the logical representations associated with a given sentence. This becomes extremely clear when Carlson's analysis is applied to *habitual* sentences, that is, sentences that have been traditionally interpreted as involving quantification over events/times (cf. Lawler 1973 and others). A sentence like (18) is likely to be perceived as true if there is more than one event in which Abigail is involved in car-chasing activities, whereas (19) appears to indicate that Abigail always (or at least most of the times) barks when the mailman arrives:

(18) Abigail chases cars.

(19) Abigail barks at the mailman.

In other words, the nature of the implicit quantifier over events seems crucially to depend on the lexical meaning of the predicate and, more indirectly, on the complex cognitive systems involved in our knowledge of the world. Carlson argues that this complies quite well with the predictions made by the analysis that he proposes. According to this analysis, the meaning expressed by the logical representation associated with (18) is merely that there is a set of individuals chasing cars and that Abigail belongs to this set. Similarly, the truth-conditions expressed by the logical form associated with (19) roughly establish that Abigail belongs to the set of individuals barking at the mailman. We know, of course, that (18) is true (that is, the individual referred to by Abigail belongs to the set of individuals that chase cars) if and only if Abigail has chased cars on a certain number of occasions. However, this knowledge corresponds to the pragmatic

knowledge that we need in order to look for empirical evidence that the truth-conditions established by the semantic component are actually satisfied. Quantification over events is certainly relevant, as well as the question how we infer this sort of quantification as part of the process of assessing the truth of sentences like (18) and (19). However, quantification over events is not part of the logical forms which express the meaning of these sentences, just as quantification over the members of a kind is not part of the semantic representation of *generic* sentences containing BPs. As a result of this discussion, it should be emphasized that Carlson's approach is not intended as a 'solution' of the quantificational puzzles that arise with BPs interpreted generically, but rather as a proposal to shift the burden of explanation from the semantic component (or, better, the system of formal representations which is assumed to encode the truth-conditions associated to the sentences of natural language) to the pragmatic component of linguistic knowledge.

Having examined Carlson's proposal with respect to the set of issues raised by sentences like (3a), let us now consider Carlson's solution to the issue raised by (3b), that is, sentences which apparently involve an existential interpretation of the BP. In intuitive terms, this interpretation has to follow from the presence of an s-level predicate: since s-level predicates refer to stages, the truth-conditions associated with (3b) should correspond to the claim that there exists a stage of the kind *dogs* (that is, a particular set of dogs at a given spatio-temporal location, not necessarily consisting of all or most dogs) and that this stage belongs to the set of stages referred to by the predicate *be_sitting_on_my_lawn*. However, on conceptual and technical grounds, this solution is not acceptable. Remember that Carlson's proposal is mainly motivated by the need of a unitary analysis of BPs (to be further justified, empirically, in section 3.2). This unitary analysis essentially consists in the hypothesis that BPs are names for kinds. This entails that the combination of a BP with a stage-denoting predicate (such as the predicate in (3b)) would give rise to a 'sortal' mismatch: the subject BP refers to a sort of objects (an *individual*, in Carlson's terminology) which cannot be a member of the set of objects (*stages*) referred to by the predicate. The solution consists in assuming that the relation between the subject and the predicate is mediated by a relation R (*realizes*) such that R(a, b) means that *a* is a stage of *b*. S-level predicates are thus formally defined as properties of individuals who have a stage-level predicate applying to one of their stages:

(20) $\lambda x \exists y [R(y,x) \text{ and } P'(y)]$,

where y is a variable ranging over *stages*, that is, spatially and temporally bounded sorts of things and P' is a stage-denoting predicate. In the case of a sentence like (3b), for instance, there will be an existential quantifier over stages introduced as a part of a predicate of individuals. In this way, the sortal mismatch is avoided while the logical representation can be reduced to one expressing the claim that there is a stage to which a predicate of stages applies, exactly what we were looking for:

(21) $\lambda P\ P(d)\ (\lambda x \exists y[R(y,x)\ \text{and}\ S'(y)]) = \exists y[R(y,d)\ \text{and}\ S'(y)]$,

where *d* is a constant for the kind 'dogs' and S' is the predicate *be_sitting_on_my_lawn*, applying to stages of things.

Notice that the source of the existential reading of the BP contained in (3b) is the existential quantifier introduced as part of the predicate (appearing not only when the subject is a BP, but also when the subject is a pronoun, a proper name, or a quantified DP) and not a hidden existential quantifier associated with the subject BP.[12] As we will see in section 3.2, this is intuitively the key for the solution of the puzzle posed by the narrow scope properties of existential BPs.

This completes our discussion of Carlson's proposal. The reader is referred to Carlson (1977b) (in particular section 5.2) for interesting amendments of the original approach.[13] The main fact to be kept in mind is that BPs are assigned a uniform analysis (they are names of kinds). The fact that BPs denote plural objects explains why they appear to be ambiguous among many quantificational readings. As for the existential reading that BPs are obligatorily assigned in certain contexts, it depends on the nature of the predicate with which the BP combines. The relevant distinction between stage-level and individual-level predicates is technically implemented in terms of a primitive ontological distinction between individuals and stages.

3.2 Against a quantificational analysis of BPs

In the course of the preceding discussion, we have already examined some of the observations that Carlson used as empirical evidence against the quantificational analysis of BPs (that is, the idea that the different readings of BPs are brought about by the interpretation of the empty determiner counting as their head). Here is a brief summary.

(i) Given the large variety of quantificational readings exhibited by BPs, it is very hard to establish what the quantificational interpretation of the empty determiner should actually be in order to produce the correct empirical results. A solution in terms of inherent ambiguity is quite problematic, since different lexical choices often force a particular interpretation and exclude others. Moreover, Carlson shows that modifying the semantics of the implicit operator in apparently ingenious ways (for example, by treating the generic quantifier as a universal operator ranging over *normal* instances of a certain kind) leads to wrong truth-conditions and even to contradictions (Carlson 1977a: ch. 3). Conversely, as we have seen in section 3.1, the hypothesis that generic sentences involving BPs essentially correspond to instances of predication over kinds permits an account in terms of the inherent vagueness of the semantics associated with structures where a property is applied to "plural" objects, even though this simply shifts the issue concerning the inferred modes of quantification from semantics to pragmatics.

(ii) Existential BPs are always assigned a narrow-scope reading with respect to other scope-taking elements (cf. 8a), even in contexts where this reading is excluded with other indefinites (cf. the interpretive contrast (8b/9b)). This fact is nicely accounted for as a direct consequence of the logical form associated to sentences like (8a). Namely, we have seen that the existential quantifier associated with the BP is formally represented as part of the logical form associated with the predicate (see the discussion about (21) as the logical representation of (3b)). If this is the case, the narrow scope of existential BPs can be directly reduced to the impossibility for a quantifier 'within' a (verbal) predicate to hold scope over elements that combine with that predicate (i.e., the actual arguments of the predicate). Under the usual hypothesis concerning the relevance of hierarchical structural conditions for the determination of relative scope, this is intuitively the correct result. Moreover, narrow scope is predicted to arise even in cases where it is blocked, for some reason or another, with other existential arguments (thus accounting for the contrast between (8b) and (9b)).

(iii) A similar explanation can be invoked in order to account for the lack of the 'transparent' reading of existential BPs realized in the scope of *intensional* predicates. It is well-known that (22) cannot be assigned the reading according to which 'there are certain policemen that Miles wants to meet', whereas this interpretation is naturally available in the case of (23):

(22) Miles wants to meet policemen.

(23) Miles wants to meet some policemen.

Again, the source of this phenomenon lies in the fact that the existential quantifier associated with the BP is formally part of the predicate *meet* and cannot therefore be assumed to hold scope over the higher intensional predicate *wants*.

(iv) In addition to the ellipsis facts already reviewed in (14–15), the deviant behavior of BPs with respect to quantificational arguments is further confirmed by the observation that pronominalization forces the transparent reading of indefinites in coordinated structures such as (24), but is perfectly compatible with the opaque reading of a BP in the analogous (25):

(24) Paul is trying to find a policeman, and Kate is trying to find him, too.

(25) Paul is trying to find policemen, and Kate is trying to find them, too.

The interpretive effect detected in (24) easily follows from the requirement that a pronoun, in order to be interpreted as a variable, be in the scope of the quantifier that semantically binds it. After the raising of *a policeman* to a position from which it holds scope over both conjuncts, the interpretation will be something like 'there is a certain policeman such that both Paul and Kate are trying

to find him'. Since wide scope is impossible with BPs, the prediction seems to be that (25) is anomalous, contrary to the facts. However, notice that raising of *policemen* in (25) to a position where it gets scope over both conjuncts and correctly binds the pronoun is likely to yield, under Carlson's approach, a semantic representation of the sort 'there is a kind p (*policemen*) such that Paul is trying to find some stage of p, and Kate is trying to find some stages of p'. These stages may well be different in the two cases (giving rise to the apparent opaque reading), but notice that the kind is always the same (*policemen*), accounting for the striking compatibility between opacity and wide scope exhibited by the BP in (25).[14]

(v) The same kind of explanation can be provided for the fact that a BP that is assigned an existential interpretation can serve as antecedent for a pronoun which is interpreted universally/generically (26). This is impossible with quantificational arguments, as shown by the fact that (27) cannot be assigned the pragmatically plausible reading according to which 'several critics left the movie, even though all critics have strong stomachs':

(26) Bill trapped eagles last night, even though he knows full well that they are on the verge of extinction.

(27) Several critics left the movie, even though they had strong stomachs.

Under the hypothesis that BPs uniformly refer to kinds, with the existential interpretation brought about by the presence of an existential operator over stages in the formal definition of the predicate, even this contrast receives a direct explanation. Both the BP and the pronoun represent in fact a kind-referring expression: the interpretive difference between pronoun and antecedent depends on their combination with two different sorts of predicates.

3.3 Problems with Carlson's analysis

Carlson's analysis is conceptually appealing and empirically well motivated. Although not all the empirical arguments he provides against the quantificational analysis are equally convincing (cf. for instance the doubts expressed over the argumentation at point (iv) of section 3.2), there is a large consensus, in the literature, that some of Carlson's insights still retain all their validity. However, many authors have pointed out (as well as Carlson himself in later work) that the theory as a whole has to face serious empirical difficulties. These problems have led to the proposal that at least some instances of BPs are in fact quantificational (or 'predicative', under the view of indefinites as free variables provided with a restriction), as we will see in section 4, and that the presence of an empty determiner, to be syntactically licensed and semantically interpreted, might well play a crucial role in explaining some of the most intriguing distributional and interpretive properties of BPs, as shown in section 5. In the remainder of this section,

I want to offer an overview of the problems that arise with Carlson's analysis, discussion of which has led to a number of influential proposals over the syntax–semantics interface.

(i) Carlson's analysis is essentially limited to English. It is not immediately obvious whether and how it can be extended or adapted in order to account for the comparative differences in the distribution and interpretation of BPs that we have observed above. How to derive, for instance, the prohibition on generic BPs that is almost generally observed in Romance? Or the neutralization of the count/mass distinction that is arguably found in another group of languages (like Chinese and Japanese)?

(ii) It has been observed that there are cases where a subject BP combining with an i-level predicate can be assigned an existential reading, a fact that is absolutely unexpected under Carlson's theory (see the discussion in section 3.1), as in (28) below:[15]

(28) a. Hurricanes arise in this part of the Pacific.
b. Computers compute the daily weather forecast.

It has also been suggested that this reading is possible (or at least particularly plausible) with subject BPs of unaccusative predicates and/or when the subject BP is focused (Kratzer 1995), raising the question, which does not receive an immediate explanation in Carlson's framework, why this should be the case.

(iii) There are also somewhat less debated cases in which a predicate that seems to express a transient property, and is thus likely to be s-level, is not compatible with subject BPs receiving an existential interpretation, as in the cases below:[16]

(29) People are sad/at work/rich. (*only generic*)

How can we derive the contrast between (29) and the cases, also involving non-verbal predicates, in which the existential reading is a rather natural option, as in *Firemen are available*? Moreover, there seem to be cases where s-level verbal predicates admit individual-referring subject BPs, as in (7c), repeated here as (30a), whose truth-conditions are intuitively distinct from those associated with the 'existential' (30b):

(30) a. Musk-rats were brought to Europe in 1906.
b. Some musk-rats were brought to Europe in 1906.

(iv) The narrow scope effects to which BPs give rise, while remaining one of the most convincing empirical arguments in favor of Carlson's analysis, are quite problematic in a number of respects. Subject BPs can in fact be assigned wide scope in certain contexts. As for generic BPs, this is certainly the case with sentences

like *Beavers have a tail*, and the formalism Carlson develops in ch. 5 (consisting among other things in the introduction of an intensional operator *G'* which maps predicates of individuals into predicates of kinds) is intended to provide an explanation for these facts, under the hypothesis that the object (*a tail* in the case under consideration) finds itself in an intensional context after the application of *G'* (in this way, the narrow scope of *a tail* is arguably reduced to the narrow scope of *a unicorn* in sentences like *John believes that a unicorn is approaching*). However, this solution cannot be applied to cases such as (31), where it is an existentially interpreted BP that may hold wide scope (since the predicate is s-level, no intensional operator is arguably present). Wide scope of subject BPs thus constitutes a problem for Carlson's approach:

(31) Influential scientists have endorsed many wrong ideas.

4 Bare plurals as indefinites

As mentioned in the previous section, sentences like (28a) (repeated below), discussed in Milsark (1974) and Carlson (1989), represent a serious difficulty for Carlson's (1977a, b) approach:

(28) a. Hurricanes arise in this part of the Pacific.

The point is that (28a) admits an interpretation according to which 'it is a property of this part of the Pacific that there are some hurricanes arising there'. In other words, there is a reading of (28a) in which the subject is interpreted existentially. In Carlson's approach, however, the existential reading is a function of the 'hidden' existential operator contained in s-level predicates, and the verb *arise* in (28a) is *not* an s-level predicate, to the effect that the reading of (28a) under discussion cannot be derived.[17] Facts like this have been taken to strongly suggest that the unitary interpretation of BPs proposed by Carlson cannot be maintained on empirical grounds and BPs *do* behave as indefinites in certain contexts, for instance in (28a) (cf. in particular Wilkinson 1986; and Krifka 1987). Similarly, it has been proposed that the analysis of genericity in terms of intensionally interpreted subject-predicate structures should be abandoned in favor of a view in which genericity may correspond to inherently relational meanings, whereby a relation is established between two classes of intensional objects, which are defined by an apparently arbitrary partition of the lexical material contained in the sentence (cf. especially Carlson 1989). According to this view, clearly inspired to the analysis of indefinites as free variables developed in the framework of Discourse Representation Theory (cf. especially Kamp 1981a; and Heim 1982), a sentence such as (28a) would receive a logical representation of the kind exemplified in (32) below, at least under the assumption that definites are also interpretable as free variables:

(32) Gen x [x is this part of the Pacific]$_{\text{restrictor}}$ [∃y (y are hurricanes and y arise in x)]$_{\text{scope}}$

A logical form such as (32) encodes the view that genericity expresses a relation between two sets (in the case under scrutiny, the set of locations which are in this part of the Pacific and the set of locations which have some hurricanes arising in them). The intensional/nomic force typically associated with generic sentences depends here on the *modal* interpretation of *Gen*, which is in fact analyzed as the intensional counterpart of extensional adverbs of quantification (or Q-adverbs, cf. Lewis 1975) such as *often*, *always*, etc.[18] As for the subject BP whose interpretation was problematic in Carlson's framework (*hurricanes* in our case), it is proposed that it corresponds to a *propositional function* of the form *Px*, mapped into the nuclear scope of the quantificational structure and hence undergoing, by hypothesis, an operation of existential closure of the kind proposed by Heim and Kamp. The generic reading that was not problematic for Carlson will obviously correspond, within this framework, to the logical representation with the BP in the restrictive clause, as in (33) below:[19]

(33) Gen x [x is a hurricane] [∃y (y is this part of the Pacific and x is in y)]

This view of genericity has especially gained support when the interpretation of indefinites as free variables has been combined with the Davidsonian analysis of predicates as endowed with an additional event argument, which seems able to provide suitable variables for *Gen* to quantify over in contexts where there are no other expressions interpretable as free variables. A case in point is constituted by (34), which is roughly assigned the logical form in (35) under the quantificational approach to genericity under discussion here (cf. Chierchia 1995b):

(34) Fred smokes.

(35) Gen s [C(F,s)] [smoke (F,s)]

The formal representation in (35) expresses a relation between a set of situations in which Fred is somehow involved (this is the meaning of the context variable *C*) and the set of situations in which Fred smokes. Here, the basic insight is that the modal force of *Gen* imposes the satisfaction of a specific set of felicity conditions to the situations in which we check the smoking habits of Fred. Accordingly, (35) encodes the fact that (34) will be true if and only if a pragmatically constrained set of situations involving Fred (for instance, those in which there is sufficient oxygen for Fred to engage in smoking, Fred feels compelled to smoke, etc.) overlaps with the situations in which Fred actually smokes.

Let us try to determine what all of this implies for the analysis of BPs. The essential hypothesis concerning BPs is that Carlson's kind-referring BPs are variables bound by an (often implicit) adverb of quantification provided with modal force (*Gen*), whereas Carlson's stage-referring BPs are existentially quantified

variables.[20] Since the domain of existential closure is assumed to correspond with the scope of *Gen*, it follows that the instances of BPs interpreted as kind-referring have to be mapped into the 'restrictor' of *Gen*, whereas the instances of BPs interpreted as existentially quantified variables have to be mapped into the 'scope' of *Gen*. This clearly entails that the explicative power of the theory that regards BPs as indefinites crucially depends on the possibility of providing an explicit clause-splitting algorithm for the production of the tripartite quantificational structures associated with Q-adverbs (cf. (32)), that is, on the possibility of determining in a principled way whether an arbitrary instance of BP is to be projected into the restrictor or the scope of the Q-adverb. In this respect, the strongest hypothesis that has been formulated is Diesing's Mapping Hypothesis (MH), according to which there exists a straightforward mapping between syntactic structures and tripartite logical representations which encode either the generic or the existential reading of BPs. Namely, *the material contained in the VP is uniformly projected into the scope, whereas the material present outside the VP is mapped into the restrictive clause of the relevant Q-adverb, possibly Gen* (cf. Diesing 1988a, 1992b). Empirically, MH is supported by the existence of languages in which the mapping procedure arguably applies to surface syntactic structures, as in the case of German subjects exemplified in (16) above (where the adverbial particle *ja doch* is assumed to mark the VP-boundary). The same facts essentially hold in Dutch, where the possibility of filling the spec-of-IP position with the expletive particle *er* gives rise to the sort of syntactic alternations exemplified in (36) (cf. Reuland 1988):

(36) a. Fred denkt dat koeien op het dak liggen.
'Fred thinks that cows are on the roof.'
b. Fred denkt dat er koeien op het dak liggen.
'Fred thinks that there are cows on the roof.'

The relevant observation is that only (36b) can be assigned an existential interpretation (*Fred thinks that there are some cows on the roof*). This reading is completely excluded in (36a), which can be interpreted only generically (*Fred thinks that cows have the habit of lying on roofs*): the truth of (36b) is still compatible with a scenario in which Fred is experiencing vision problems at the moment of utterance, whereas the truth of (36a) is likely to raise some more serious concerns about Fred's mental conditions. Under the reasonable hypothesis that the subject occupies the spec-of-IP position in (36a), but not in (36b), where this position is arguably filled by *er*, we might propose that the generic/existential reading of the subject depends on its overt syntactic position: subject BPs which are realized VP-internally, as in (36b), can be existentially closed (giving rise to the episodic reading of (36b)), whereas subject BPs which are external to VP are necessarily projected into the restrictor of an (implicit) Q-adverb (giving rise to the generic reading of the embedded clause in (36a)).

A related but more controversial claim is that the same interpretive effects are detected, in German and Dutch, with object scrambling: BPs that appear to the

left of an adverbial can be interpreted only generically, as shown by the contrast in (37) (cf. De Hoop 1992):

(37) a. Fred denkt dat de politie gisteren taalkundigen opgepakt heeft.
'Fred thinks that yesterday the police arrested some linguists.'
b. ?*Fred denkt dat de politie taalkundigen gisteren opgepakt heeft.
'Fred thinks that yesterday the police arrested some linguists.'
c. Fred denkt dat de politie taalkundigen altijd opgepakt heeft. (*only generic*)
'Fred thinks that the police always arrested linguists.'

The trouble with MH is that there are many languages, English among them, in which the surface position of the verb's arguments is not really telling with respect to the possibility that these arguments be interpreted generically or existentially.[21] This is revealed by the contrast detected with minimal pairs like (38): in both sentences the subject BP surfaces VP-externally (as a consequence of the Extended Projection Principle (EPP) or related conditions, let's assume), but only (38a) allows the existential reading of the subject BP (*there are some firemen available around here*), which is uniformly blocked in the case of (38b), independently of prosodic or contextual considerations:

(38) a. Firemen are available.
b. Firemen are altruistic.

In order for MH to be empirically feasible, one has to resort to extra hypotheses, for example the assumption that 'reconstruction' of subjects into their original VP-internal position (spec-of-VP, let's assume) applies in English. Furthermore, one has to assume that reconstruction is possible in the case of predicates such as *to be available*, but is ruled out with predicates such as *to be altruistic*. Again, the explicative power of such a theory would essentially depend on the possibility of deriving the required constraints on reconstruction in a principled way. Two proposals can be found in the literature. Diesing (1992b) suggests that the contrast between (38a) and (38b) essentially overlaps with the demarcation line between s-level and i-level predicates, in the sense of Carlson (1977a) (see the detailed discussion in section 3). The subject of i-level predicates would originate in spec-of-IP, and would be coindexed with an empty category (PRO) generated in spec-of-VP. The subject of s-level predicates, on the other hand, would be directly generated in spec-VP, and would successively undergo movement to spec-IP for independent syntactic reasons (say, case and EPP). Under this hypothesis, the difference detected in (38) reduces to the familiar contrast between control structures (38b) and raising structures (38a), whereby only the latter permit reconstruction, that is, obliteration of an NP-trace in the original VP-internal position. The syntactic difference argued for by Diesing receives some conceptual foundation within the analysis of i-level predicates put forward in Kratzer (1988) and Kratzer (1995), according to which the opposition between

the two predicate classes individuated by Carlson reduces to a difference in argument structure. Kratzer capitalizes on Davidson's proposal (cf. Davidson 1967) that predicates are endowed with an additional event argument by suggesting that the requirement that one of the predicate's arguments be realized VP-externally (cf. Williams 1980; Rothstein 1983) is satisfied, in the case of the s-level predicates, by the extra event argument. Thus, this is the reason why the subject BP *firemen* in (38a) can be generated VP-internally (undergoing existential closure as a consequence of MH). Conversely, i-level predicates are analyzed as inherently non-eventive, that is, as devoid of the event argument which counts as 'external' in the case of stage-level predicates. This immediately explains why the subject BP in (38b) must be generated VP-externally (being mapped into the restricted clause of an implicit Q-adverb and receiving thus a generic interpretation).[22]

Diesing/Kratzer's view is apparently corroborated by the observation that subjects of unaccusative predicates (for which it has been independently argued that they are generated VP-internally) lend themselves to the existential interpretation more easily than the non-unaccusative i-level predicates, for which this interpretation is virtually excluded, as emphasized above. The behavior of unaccusative i-level predicates is exemplified in (39) below, with (39a) corresponding to example (5a) of section 1, where the existential reading is actually favored, at least if the subject BP is assigned narrow focus:

(39) a. She thinks that COUNTEREXAMPLES are known to us.
b. PONDS belong to this lot.

A weaker version of MH, still fully compatible with a quantificational analysis of genericity and with the view of BPs as indefinites has been developed in Chierchia (1995b), where both Kratzer's analysis of the s-level/i-level distinction and Diesing's proposal that the domain of existential closure be identified with the VP are rejected.[23] As reasons for this choice, Chierchia provides both empirical and conceptual arguments. Empirically, one of the problems with Diesing's version of MH concerns the behavior of the predicates which are ambiguous between an s-level and an i-level interpretation, which already represented a serious issue within Carlson's approach (see section 3). A case in point is constituted by sentences involving non-unaccusative predicates such as (40) below:

(40) Computers route modern planes.

This sentence easily admits the interpretation according to which 'it is a general property of modern planes that they are routed by (some) computers' (the existential reading of the subject BP is especially prominent when the subject is focused). However, in Kratzer's terms the interpretation of the predicate in (40) is arguably i-level, since the predicate is assigned a non-eventive reading, consisting in the ascription of a property to an object. The subject BP should therefore count as the designated *external* argument, which originates VP-externally

and does not admit reconstruction into a position in which it can undergo existential closure. In order to circumvent this empirical difficulty, Chierchia proposes a version of MH *according to which the restrictor corresponds to the lexical material that is not c-commanded by the Q-adverb (say, Gen) in the (covert) syntactic representation*. *Gen* is assumed to freely adjoin to any 'propositional' projection (VP, IP, CP), and arguments may be (covertly) scoped out of its c-command domain via adjunction. In this way, the scope of *Gen* may but need not be identified with VP, subsuming Diesing's proposal concerning the 'syntactic domain' of existential quantification as one of the cases that may arise. In particular, the reading of (40) which has the subject interpreted existentially will correspond to a covert syntactic representation in which *Gen* has been adjoined to IP, with the direct object scoped out of IP:

(41) $[_{IP}$ modern planes$_i$ *Gen* $[_{IP}$ computers $[_{VP}$ route $t_i]]]$

This analysis has two important implications. First of all, the ambiguity of a large class of predicates between an s-level and an i-level interpretation is attributed to aspectual morphology: imperfective aspect is assumed to realize a polarity feature which has to be licensed by *Gen*. In this way, the burden of the explanation is partly shifted from the lexical meaning of predicates to *morphosyntax*. Second, the proposed approach can fully dispense with the idea that the subject of i-level predicates is generated VP-externally and represents thus an exception to the VP-internal subject hypothesis. Given the format of the LF-representations which are assumed to constitute the input for the mapping into quantificational structures, the fact that a subject BP is generated in spec-IP is not sufficient to ensure that it be projected into the restrictor, as shown by (41), apparently the correct empirical result. It is thus possible to adopt the VP-internal subject hypothesis in its most general form, assuming that subjects are uniformly generated in spec-VP, a position for which there seems to exist independent syntactic motivation. However, the issue becomes now how to account for the observation that unambiguous i-level predicates are *not* compatible with the existential interpretation of the subject BP: sentences such as (42) (cf. also (38b) above) cannot be assigned the pragmatically plausible meaning 'some smokers are rude', a fact that is elegantly explained under Diesing/Kratzer's version of MH but might well constitute a problem for Chierchia's weaker version:

(42) Smokers are rude.

Chierchia's proposal consists in the so-called 'inherent genericity hypothesis', according to which the polarity feature triggering the presence of *Gen* is *lexically* encoded in the case of unambiguous i-level predicates, instead of being optionally realized as an *aspectual* feature in the extended projection of the predicate, as is the case with verbs that are ambiguous between an s-level and an i-level interpretation. Since the polarity feature which is part of the lexical endowment

of the predicate must be locally licensed, *Gen* has to be obligatorily realized in the checking domain of the predicate (that is, as adjoined to the maximal projection of the predicate, VP in the case of verbs). This local licensing requirement explains why the subject of *inherent generic* predicates cannot be interpreted existentially: subjects are displaced to spec-IP for independent syntactic reasons, and thus find themselves outside the c-command domain of *Gen* (which cannot be inserted into a position higher than VP for local licensing reasons).[24]

Let us try to summarize. The view that BPs are indefinites seems to be supported by several empirical facts. It accounts for the existential interpretation of BPs in cases such as (28) and (40), which were problematic for Carlson's analysis. Moreover, it arguably explains the parallelism found between the cases of unselective binding that involve singular indefinites and those that involve BPs. This parallelism is shown in the minimal pair below (both sentences naturally admit the interpretation according to which 'most dogs are easy to train'):

(43) a. Dogs are usually easy to train.
b. A dog is usually easy to train.

There are two distinct ways of interpreting these facts. We may assume that BPs can behave as indefinites (roughly, this is the position originally taken in Wilkinson 1986; Krifka 1987). If this is the case, however, it is not obvious how to account for the asymmetries between BPs and singular indefinites detected in Carlson (1977a) (for instance, the scope asymmetries exhibited by the canonical pair *John didn't see a spot on the floor* vs. *John didn't see spots on the floor*). A second, perhaps empirically superior, approach might consist in adopting Carlson's hypothesis that BPs are in fact names of kinds. The fact that they are interpretable as free variables in contexts such as (43a) would depend on the application of a type-shifting operation mapping names into propositional functions of the form Px, on a par with the type-shifting operation which projects indefinites (interpreted as generalized quantifiers in the framework of Dynamic Intensional Logic) into propositional functions (Chierchia 1995b: 192). More explicitly, we may propose that BPs are shifted into propositional functions when the presence of an (implicit) Q-adverb requires the introduction of a free variable (in order to avoid vacuous quantification). There are, however, at least two problems with such a view. First of all, consider the pair in (44):

(44) a. Lions have manes.
b. Mice hate cats.

The object BP is interpreted existentially in (44a) and generically in (44b). The question is whether the existential reading found in (44a) follows from the interpretation of the object BP as a name or from the application of the type-shifting procedure that turns names of kinds into propositional functions. The first solution immediately raises the issue concerning the status of the predicates

involved in (44): which properties of the predicate can be taken to be responsible for the different interpretation of the object in the two cases exemplified in (44)? On the other hand, the second solution is likely to represent an important difficulty for both versions of MH considered above: the fact that the propositional function corresponding to the object BP is mapped into the scope of *Gen* in (44a) (undergoing existential closure) and into the restrictor of *Gen* in (44b) (giving rise to the universal/generic reading) is certainly in need of a principled explanation.

There is, anyway, a second and more important difficulty. If the application of the type-shifting operation that converts names into free variables depends on the presence of *Gen*, the prediction is that singular indefinites and BPs should pattern uniformly in contexts such as (45) below, as was the case in (43):

(45) a. Madrigals are polyphonic.
b. Madrigals are popular.

Both sentences exhibit the nomic force proper to generic contexts, with the subject BP interpreted generically. The trouble is that replacing the subject BP with a singular indefinite is acceptable only in the case of (45a), as shown in (46):

(46) a. A madrigal is polyphonic.
b. ??A madrigal is popular.

The issue is thus to understand why the type-shifting operation that applies to the BP in (45b) is apparently blocked in the case of the singular indefinite in (46b).[25]

The analysis of BPs as *propositional functions* leaves other problems unsolved. Here are some of them:

(i) According to this analysis, BPs are variables bound by an (implicit) Q-adverb. It is further proposed that generic sentences derive their 'nomic' force from the inherent modal semantics of the implicit *Gen* or some overt Q-adverb provided with modal force. However, the same intensional/modal interpretation is found in the variants of (43a) containing 'extensional' Q-adverbs, exemplified in (47), casting serious doubts on the feasibility of this 'quantificational' analysis of genericity:[26]

(47) Dogs are often/sometimes easy to train.

(ii) It is proposed that the existential interpretation of the subject BP in (38a), repeated here as (48), depends on the s-level interpretation of the predicate involved: the episodic reading intuitively assigned to (48) is incompatible with the presence of *Gen* in the corresponding logical representation:

(48) Firemen are available.

However, in section 3.3 we have already emphasized that many other predicates that seem to express a transient property, and are thus arguably s-level, are *not* compatible with the existential reading of the subject BP, as shown by (49) (= (29) above):

(49) People are sad/at work/rich. (*only generic*)

It is not obvious how the inherent genericity hypothesis might handle the difference between (48) and (49). It has been proposed (cf. Higginbotham and Ramchand 1996; Delfitto 2004) that the existential reading depends on the presence of an implicit spatio-temporal argument involving proximity to the speaker. Assuming that this is correct, it remains to be established what implications this observation has for the familiar distinction between s-level and i-level predicates and the presence of *Gen*.

(iii) Many of the comparative facts reviewed in section 1 (concerning for instance the constraints on the existential and generic interpretation of (subject) BPs) are still in need of a principled explanation. In the next section, we will examine some proposals that point to the possible relevance of the internal syntactic structure of BPs (and DPs in general) for a better understanding of the comparative issue.

5 The internal syntax of BPs

The distribution of BPs in Romance languages has given rise to new and stimulating comparative perspectives in the study of the syntax and semantics of BPs. Empirically, the research has mainly concentrated on the subject–object asymmetry that characterizes the distribution of existential BPs in Spanish and Italian: BPs are arguably licensed in governed positions in these languages, but are generally ruled out (unless some additional syntactic and/or prosodic requirements are satified) in the preverbal and (at least as far as Spanish is concerned) postverbal subject position. The proposals that have been formulated in the literature deal with a number of genuine syntactic issues and are relatively independent of the complex interpretive issues that characterize the literature on BPs in English (with some significant exceptions, such as Longobardi 1994). This does not really come as a surprise if we consider that the issue of genericity, which has long constituted the core of the reflections around BPs in English (starting from the canonical proposal in Carlson 1977a), essentially lies outside the scope of the empirical issues that have been debated in the analyses of Romance BPs. The fact is that determinerless nouns can be interpreted only existentially in Romance (with some potential exceptions, to be discussed later). The generic interpretation that is assigned to BPs in English (depending on factors whose nature has been investigated in the previous two sections) is normally realized, in Romance, by resorting to definite DPs (that is, noun phrases introduced by a definite article). The relevant contrast is instantiated in the examples below:

(50) a. Lions have manes.
b. I leoni hanno la criniera (Italian)
the lions have the mane

In Spanish, the literature on BPs in the framework of formal grammar includes at least Suñer (1982), Contreras (1986), Lois (1989), and Torrego (1984). As for Italian, the nature of the constraints affecting the distribution of BPs has been mainly investigated in Benincà (1980), Delfitto and Schroten (1991), Longobardi (1994, 1996, 2001), Chierchia (1998), Delfitto (2002), Zamparelli and Heycock (2003).

The constrained distribution of BPs in Spanish has been analyzed by Contreras (1986) in terms of an effect induced by the Empty Category Principle (ECP): BPs in direct object or prepositional object position can be assumed to be licensed by V or P under lexical government (51), whereas subjects and indirect objects yield a violation of the lexical government requirement (52):

(51) a. Quiero tortillas.
'(I) want tortillas.'
b. Ayer salí con amigos
yesterday went-(I) with friends
'Yesterday, I went out with friends.'

(52) a. *Esclavos construyeron las pirámides.
'Slaves built the pyramids.'
b. *El director ha devuelto los documentos a empleados.
'The director has returned the documents to employees.'

If BPs are analyzed as introduced by an empty determiner or quantifier (cf. the discussion in Carlson 1977a), the syntactic constraints on BPs can be arguably reduced to the requirement that empty categories, and especially empty functional heads, be lexically governed (cf. the licensing conditions for empty complementizers in Stowell 1981). On the other hand, Lois (1989) explains the acceptability of BPs in governed positions (as in (51) above) in terms of the requirement that the BP incorporate into its governor (a verb or a preposition). The nature of this incorporation requirement (hopefully related to case-theoretical considerations) remains however essentially unclarified (for the semantic side of incorporation processes, see especially Van Geenhoven 1998).

The proposals by Contreras and Lois have been largely influential on the subsequent literature on BPs. In particular, Contreras' hypothesis that the distribution of existential BPs depends on their internal syntax (that is, the conditions on licensing of DPs whose head is empty) has been essentially adopted, within a larger framework of assumptions concerning the syntax and the semantics of DPs, by Longobardi (1994). Longobardi observes that the relevance of the lexical government requirement is apparently confirmed by the exclusion of BPs from

other arguably non-lexically governed positions, such as the postcopular argument of 'inverted' copular constructions (see Higgins 1979; Moro 1993c):

(53) La causa delle rivolte sono spesso marocchini. (Italian)
'The cause of the riots are often Moroccans.'

The main interest of Longobardi's approach lies in the fact that he tries to account for the comparative differences between English and Italian (and, more generally, between Romance and Germanic) in the distribution of BPs: the fact that BPs cannot be interpreted generically in Romance and the fact that English, contrary to Romance and, arguably, the rest of Germanic, does not seem to impose constraints on the occurrence of existential BPs in the subject position. The source of this comparative contrast is essentially reduced to an important parameter on N-to-D raising: Longobardi convincingly argues, on the grounds of a large set of facts concerning the relative order of several categories of proper names and other DP-internal elements such as adjectives and possessives, that proper nouns *overtly* move from the N- to the D-position in Italian, whereas this kind of movement, which is assumed to be necessary in order for a name to be interpreted referentially, that is, as a *rigid designator*,[27] *takes place covertly* in English (i.e., at the more abstract level of syntactic representation (often referred to as LF) which represents the syntactic input to interpretation, as already pointed out, in section 4, in the course of our discussion of the Mapping Hypothesis). The relevant contrast between Italian and English is exemplified by the paradigm found in (54–55): the fact that the adjective must occur postnominally in Italian but prenominally in English is derived from the requirement that names overtly move to D in the former language but not in the latter:

(54) a. Old John came in.
b. *John old came in.

(55) a. E' venuto Cameresi vecchio.
has come Cameresi old
b. *E' venuto vecchio Cameresi.
has come old Cameresi

Longobardi 1994 essentially interprets the requirement that names fill the D-position overtly in Italian as the manifestation of a more general parametric difference between Italian and English, according to which the syntactic and interpretive conditions which are responsible for the licensing of DPs (including BPs) as well-formed interpretable objects necessarily apply in *overt* syntax in Italian (probably as a consequence of some Earliness Principle of the kind proposed in Pesetsky 1989), but can wait until LF in English.[28] These abstract conditions are identified with the requirement that an empty D, as every other empty (functional) head, be lexically governed (much in the spirit of Contreras 1986), and with a universal interpretive principle which establishes that empty

Ds be assigned a default *existential* reading at the interpretive interface (arguably corresponding with the semantic option that leads, in most cases, to the least easily falsifiable statements, to be related to criteria of interface economy). Given these conditions and their parametric application at different levels of syntactic representation, the contrast between Italian and English with respect to the interpretation and the distribution of BPs follows rather straightforwardly. A sentence like (56) in English not only has a BP in a non-lexically governed position, but also involves a generic interpretation of this BP:

(56) Beavers build dams.

In Longobardi's framework, the two facts are obviously related: since the syntactic licensing condition on empty Ds applies at LF in English, the presence of an empty D in overt syntax will not suffice to rule out the syntactic derivation; at LF, the noun can be assumed to substitute for the empty D, preventing a lexical government violation and ruling out the existential reading which would be associated with the empty D. As emphasized above, proper nouns are assumed to move to D (in syntax or at LF) as a consequence of their referential status. Common nouns are normally interpreted, in contexts where the D-position is filled by lexical determiners interpreted as variable-taking operators, as providing the range of quantification of these operators: in other words, common nouns refer to the *kinds* that provide the domains of restricted quantification in natural language.[29] On these grounds, it is quite natural to propose that abstract movement of a common noun to D assigns this noun the status of a kind-referring expression, that is, common nouns in D will be interpreted as names for *kinds*, essentially along the lines of Carlson's analysis.

In Italian, on the contrary, the sentence corresponding to (56) can be interpreted neither generically nor existentially:

(57) *Castori costruiscono dighe.

The reason arguably lies in the fact that the empty D must be licensed and interpreted in overt syntax in this language. Obliteration of the empty D by means of substitution of N into D (which leads to well-formedness and to a generic reading in English) comes too late in Italian, that is, after the relevant syntactic and interpretive conditions have already applied, ruling out the syntactic representation associated with (57) as ill-formed.

An important consequence of Longobardi's analysis is that generic DPs (or, better to say, *kind-referring* DPs) cannot be syntactically realized as determinerless nouns in Romance. In fact, the grammatical counterpart of (57) in Italian is a sentence containing a definite DP in subject position:

(58) I castori costruiscono dighe.
'The beavers build dams.'

A uniform analysis of genericity, that is, the hypothesis that the generic reading of BPs is produced by the application of a universal interpretive procedure to a uniform syntactic input, seems to require that the definite determiner found in (58) be accurately distinguished from the definite determiner which heads definite DPs that are not interpreted generically. Namely, remember that the kind-referring interpretation of BPs has been associated with a syntactic structure in which the common noun substitutes for D: (58) is compatible with this hypothesis only if the definite article is assigned the status of an *expletive* element, blocking the existential interpretation of the empty D in overt syntax and being replaced with N at the level of representation that constitutes the input to semantic interpretation. In other words, what is essential to the kind-referring interpretation of BPs is the requirement that a syntactic dependency be established between N and D: this abstract dependency is realized in the form of an LF-chain in English and in the form of an expletive-headed chain in Italian (cf. the notion CHAIN in Chomsky 1986b).[30] According to this analysis, *expletive* determiners are not a lexical peculiarity of Romance. In fact, they are attested also in English, in the context where the kind-referring interpretation is expressed by a singular count noun, as shown in (59) below, even though the derivation of these facts from abstract selection properties of the empty determiner requires a very intriguing line of argumentation (cf. Longobardi 1994: n. 45):

(59) a. *Lion has four legs.
b. The lion has four legs.

As we will see in section 6, the analysis put forward in Longobardi (1994) leaves a number of issues still unsettled. However, it represents a far-reaching attempt to derive the comparative differences noticed at the onset from the hypothesis that *the same* set of syntactic and interpretive conditions applies at *different levels* of syntactic representation. This analysis assigns a crucial role to the hypothesis that noun phrases (including BPs) are uniformly analyzed as DPs, with the NP coinciding with a complement of the head D (cf. especially Abney 1987), and to the head-movement processes which have been claimed to take place, on independent empirical grounds, within DPs, accounting for important aspects of the syntax of noun phrases.[31] It is worth noticing, in this respect, that the abstract operation of N-to-D movement may be interpreted as providing a convenient syntactic input, on compositional grounds, for the reading of BPs as kind-referring expressions (that is, names for kinds) and therefore represents a sort of *syntactic* implementation of Carlson's original proposal (or, if one wants to assume that BPs may also be interpreted as free variables, on a par with the other indefinites, of the type-shifting operation necessary to map predicative expressions into names).[32] Of course, some of the typical problems raised by a uniform analysis of genericity and bare plurals can be easily restated in Longobardi's framework. There is a clear sense, however, that the comparative dimension taken into account by Longobardi's approach has enriched the formal theorizing about bare plurals with a strong syntactic component which cannot be eluded by

any analysis which wants to meet acceptable standards of descriptive and explanatory adequacy.

6 Open issues and topics for future research

At the end of our discussion of the issues which are typically related to the syntax and semantics of BPs, it seems convenient to present a brief survey of the topics that have emerged as still in need of further investigation. We will also refer the reader to recent contributions that might be relevant for a better assessment of these problems and for possible suggestions towards their resolution.

6.1 The issue of reconstruction

As already mentioned in the course of our discussion in sections 4 and 5, the existential reading that may be associated to subject BPs in English is still something of a puzzling phenomenon. Diesing (1992b) proposes reconstruction into spec-VP as a solution, and this proposal is essentially adopted in Longobardi (1994). However, the question arises why reconstruction is generally excluded in Germanic, as revealed by the absence of an existential reading in Dutch examples such as (36) above. Diesing's answer consists in the hypothesis that clause-splitting applies to overt syntax representations in languages such as German and Dutch, to the effect that reconstruction is irrelevant. This claim certainly requires further qualification, since the spec-CP position, often moved into by subjects as a consequence of verb-second, is quite compatible with the existential reading across Germanic, suggesting an obvious parallelism with topicalization in Romance (cf. Longobardi 1994: n. 10 and n. 39):

(60) a. Studenten hebben gisteren het Academisch Gebouw bezet. (Dutch)
yesterday, (some) students have occupied the University building
b. ACQUA, ho preso dalla sorgente! (Italian)
WATER I took from the spring!

The whole issue is made even more complex by the observation that the existential reading of subject BPs in English is sensitive to a number of constraints whose precise nature is still poorly understood. The contrast between (48) and (49), discussed at the end of section 4, seems to indicate that the s-level/i-level distinction, interpreted as a primitive lexical distinction between two classes of predicates, is not sufficient to derive the facts. As far as verbal predicates are concerned, it has been suggested that subjects of unaccusatives and focused subjects are more easily assigned the existential reading (cf. (39) and (40) above, respectively). The aspectual distinction between perfective and imperfective contexts is also arguably relevant, as shown by the fact that sentences in the present tense (which exclusively admits an habitual, hence imperfective, reading in English) cannot be interpreted existentially, whereas sentences in the past tense

(which is clearly compatible with an episodic, hence perfective, interpretation) are essentially ambiguous between the existential and the generic reading.[33] This is shown by the minimal pair in (61):

(61) a. Firemen extinguish the fire. (only generic)
b. Firemen extinguished the fire. (ambiguous)

As for non-verbal predicates, it has been suggested that those compatible with the existential reading of the subject BP, as *available* in the canonical (48) above, crucially involve a notion of spatio-temporal location in their interpretation, in the form of spatio-temporal proximity to the speaker. This hypothesis seems to be confirmed by the subtle contrast exhibited by the minimal pair (62), under the plausible assumption that the proximity requirement is violated in (62b) (cf. Higginbotham and Ramchand 1996; Delfitto 2004):

(62) a. (Guess whether) firemen are nearby/at hand.
b. ?(Guess whether) firemen are far away/a mile up the road.

It is worth noting that the relevance of a lexical government requirement of the sort argued for by Longobardi (1994) is apparently corroborated by the observation, found in Higginbotham and Ramchand (1996), that the existential interpretation is *never* available in contexts without copular support, as shown by the contrast in (63) below:

(63) a. I consider firemen available/on strike. (only generic)
b. I consider firemen to be available/on strike. (ambiguous)

6.2 *Bare plurals, indefinites, and genericity*

As already observed in section 4, and confirmed by the paradigm in (12–13) above, singular indefinites and BPs are not interchangeable in generic contexts. Another case in point (cf. Dobrovie-Sorin and Laca 1996) is offered in (64) below:

(64) a. Americans are taller than Italians. (generic)
b. #An American is taller than an Italian. (awkward with the generic reading)

It has been noticed that (64b) substantially improves when an adverb of quantification is overtly realized, as shown by the fact that (65) is more acceptable than (64b) as a generic sentence:

(65) An American is always taller than an Italian.

These facts may be taken to indicate that generic sentences containing BPs, on a par with generic sentences containing other individual-referring expressions, are

not dependent, for the realization of the generic reading, on the presence of an implicit Q-adverb with an inherent modal semantics (i.e., *Gen*). When the 'normative' force associated with *Gen* is uncontroversially present, as in (66), generic sentences are in fact acceptable even with singular indefinites (cf. Dobrovie-Sorin and Laca 1996). For example, notice that *being polyphonic* is just a necessary condition that *every* madrigal must satisfy in order to count as a madrigal:

(66) A madrigal is polyphonic.

This state of affairs is compatible, in principle, with two different approaches. One might argue that the quantificational analysis of genericity (according to which generic sentences contain an implicit Q-adverb, *Gen*, endowed with modal force) cannot be empirically correct, given the contrast between singular indefinites and BPs exemplified above (cf. Delfitto 1998, 2002). Genericity must thus follow from the semantics of subject-predicate structures, much in the spirit of Carlson's original proposal. This neo-Carlsonian analysis has been implemented in Delfitto (2002), in terms of a general proposal concerning the semantics of grammatical aspect and predication. Alternatively, one might try to explain the contrast between (singular) indefinites and BPs by adopting Carlson's hypothesis that BPs are names for kinds (possibly undergoing type-shifting operations that explain their behavior as free variables in certain contexts), while still sticking to the insight that genericity is an essentially quantificational phenomenon (cf. Chierchia 1995b, 1997b, 1998).

6.3 Bare nouns in French and Chinese

A third class of problems concerns the presence of languages in which BPs in argument position are uniformly ruled in (Chinese, Japanese) or uniformly ruled out (Modern French).

As for the first group of languages, an interesting proposal for a principled approach is found in Chierchia (1997b), where the interpretation of NPs as argumental or predicative categories is essentially considered a matter of primitive parameter setting. In Chinese, for example, NPs are uniformly interpreted as arguments, a property to be put in relation with the absence of the mass/count distinction in the morphological system and with the presence of a generalized classifier system. In French, NPs would always be 'predicative' (and hence uniformly excluded from argument positions), whereas in other languages the setting depends on the mass/count distinction (for instance, argument bare NPs are mass in English) and shifting operations from the predicative to the argument type are allowed under certain conditions.

A specific proposal for French (which incorporates many insights of Longobardi's analysis) is found in Delfitto and Schroten (1991), where the comparative contrast between Spanish/Italian and English with respect to the licensing of existential BPs is argued to follow from the hypothesis that the empty D heading the BP is subject to an extra identification requirement. The latter is argued to be

satisfied under a local relation with a number agreement morpheme, via the independently motivated assumption that the number morpheme realized on the noun may have a different syntactic status crosslinguistically (cf. also Longobardi 1994: fn. 11).[34] This proposal can be further implemented in terms of an identification condition on the licensing of empty Ds as variable-taking operators. More specifically, it has been proposed that the interpretation of an empty D as an existential operator with the abstract form 'Ox' requires an event predicate for the identification of the operator type as existential, and abstract raising of the number morpheme to the D-position for the identification of the 'sort' of objects which constitute the range of quantification of the operator (see Delfitto 2002: ch. 3, section 2.1). According to this line of analysis, the lack of argument BPs in French depends on the absence of number agreement morphemes on the noun; namely, it can be argued that in these conditions the range of quantification of the existential operator cannot be defined and BPs are ruled out since they cannot be interpreted as quantificational structures at the interpretive interface (see Delfitto and Schroten 1991 for a detailed discussion of the morphological issues involved). There seems to be evidence that what has to be *identified* is not only the variable (by determining its 'sort') but also the operator (by determining its 'semantic content'). In fact, only *event* predicates are able to license existential BPs under government: object BPs lead to ungrammaticality in Italian in contexts such as (67) (notice that only the generic reading is available in its English counterpart):

(67) *Mario odia cani.
'Mario hates dogs.'

Here two issues arise. The first consists in establishing what counts as an event predicate. At first sight (as noticed by Dobrovie-Sorin and Chierchia) there seem to be stative (that is, non-eventive) predicates which are perfecty able to license object BPs with an existential reading, as shown by the Italian sentence in (68) (notice that its English counterpart also admits the existential reading besides the generic one, contrary to what happens in (67)):

(68) Mario possiede case. (existential)
'Mario owns houses.'

As noticed by Dobrovie-Sorin, verbs like *own* and *hate* appear to differ as to their capacity of licensing locative phrases, in that only *own* is compatible with a reading according to which the locative phrase modifies the predicate (cf. Kratzer 1995 for similar observations concerning the individual/stage level distinction). This seems to suggest that event predicates have to be identified with those which admit spatio-temporal modification: the predicate in (68), but not the predicate in (67) would thus qualify as eventive, as confirmed by the contrast detected in (69) in the acceptability of *where*-questions (see also Delfitto 2002, 2004):

(69) a. *Where does John hate dogs?
b. Where does John own houses?

Assuming this much to be on the right track, what remains to be established is the precise mechanism by means of which event predicates (and only event predicates) are able to *identify* an empty D as an existential operator under a government relation. For proposals somehow related to this important issue see Higginbotham and Ramchand (1996), Delfitto (1998, 2002).[35]

6.4 Non-existential readings

Finally, the set of non-existential interpretations found with BPs gives rise to rather intricate paradigms, leading to different idealizations and (thus) to different theories. A good example of this situation is the hypothesis, put forward in Chierchia (1998), that BPs in Italian admit a kind-referring interpretation, to the effect that Italian and English would pattern together in allowing type-shifting from predicative categories (logical type <e, t>) to object-referring categories (logical type <e>). As empirical evidence for his claim, Chierchia adduces the kind-referring reading found in Italian examples such as (70) below:[36]

(70) a. Cani di grandi dimensioni sono (spesso) aggressivi.
'Dogs of big size are (often) aggressive.'
b. Da queste parti, ragazze in minigonna sono rare/diffuse/scarse/abbondano.
'In this area, girls in miniskirts are rare/widespread/scarce/abundant.'

However, it has been noticed that the sentence-types exemplified in (70) arguably involve some form of *unselective binding*, turning the predicative BP into a generalized quantifier: *adverbial* quantification (by means of a possibly implicit frequency adverb) in (70a) and *lexical* quantification (by means of predicates that inherently express quantification over events) in (70b) (see Carlson and Pelletier 1995; Longobardi 2001; Delfitto 2002 for a detailed discussion of the issues involved).[37] The evidence points rather uncontroversially to the conclusion that unambiguous individual-level predicates cannot be assigned kind-reference in Italian (*contra* Chierchia's suggestion). It is a fact that kind-reference is marginally possible with the predicates that can easily be understood as involving event reference (*to be intelligent* can be easily reinterpreted as *to exhibit intelligent behavior*), whereas it is excluded with predicates that are less easily prone to this reinterpretation process (*to be dark* or *to be big*, for instance). Italian speakers have serious trouble interpreting/producing sentences like those in (71a) with the meaning proper to those in (71b), where the definite DP is clearly assigned kind-reference (see Longobardi 2001; Delfitto 2002):

(71) a. *Uccelli di zone paludose sono scuri/grandi.
'Birds from marshy areas are dark/big.'

b. Gli uccelli di zone paludose sono scuri/grandi.
'The birds from marshy areas are dark/big.'

Moreover, Longobardi (2001) discusses at least three other important pieces of evidence in favor of the view that kind-reference is not available to BPs in Italian.

First of all, there is the behavior of predicates for which the property ascribed to the kind cannot be ascribed to individual members of the kind. A case in point is the contrast between (72a) in English, that readily admits kind-reference for the subject BP, and its Italian counterpart in (72b), where the subject BP can be interpreted only existentially, in spite of pragmatic awkwardness:

(72) a. Tomatoes of big size taste nicer if one drives South.
b. Pomodori di grandi dimensioni diventano sempre più saporiti man mano che si va a Sud.

Second, it has been observed that Italian BPs pattern exactly like Italian singular indefinites. Since singular indefinites cannot be interpreted as kind-referring expressions (witness the well-known contrast between singular indefinites and BPs in English), this arguably constitutes an independent argument against kind-reference for Italian BPs. Third, the hypothesis according to which the non-existential reading of Italian BPs depends on the licensing of a non-existential unselective binder in the relevant linguistic structure makes the prediction that contexts that do not involve lexical quantification or frequency adverbs will not be able to license a non-existential interpretation of BPs, so that kind-reference effects will be excluded in these contexts. A case in point is aspectually perfective sentences, where non-existential quantification can be induced only by an overt frequency adverb (cf. the discussion in Delfitto 2002: ch. 2, section 3.3). The minimal pair in (73) exemplifies the clear contrast arising here between Italian and English: the Italian BP in (73a) admits only the existential interpretation, whereas the subject BP in its English counterpart (73b) freely allows kind-reference. In order to express the kind-reference effect proper to (73b), Italian has to resort to (73c), where the BP has been replaced by a definite DP:

(73) a. Elefanti di colore bianco passeranno il Giudizio Universale alle 5.
b. White colored elephants will pass the Final Judgment at 5 o'clock.
c. Gli elefanti di colore bianco passeranno il Giudizio Universale alle 5.

On the grounds of these facts, it is fair to conclude that English and Italian bare nouns differ radically, in that the kind-referring reading proper to the former is precluded to the latter. This conclusion arguably supports Longobardi's hypothesis that the range of interpretive variation concerning kind-reference is linked to the range of morphosyntactic variation concerning N-to-D raising.

7 Conclusion: summary

Let us try to recapitulate. There seems to be some consensus on the fact that Carlson's analysis of BPs as names for kinds still represents, in many respects, the most adequate theoretical foundation of the semantics of BPs. To put it in different terms, the assimilation of BPs to other sorts of indefinites (and in particular to singular indefinites), as in Kratzer/Diesing's approach, leaves the important asymmetries noticed by Carlson essentially unexplained. In a similar vein, it may be argued that the *quantificational* approach to genericity (at least in the variant according to which generic BPs are free variables bound by an implicit Q-adverb with modal force) does not score better, on empirical and conceptual grounds, than Carlson's original analysis, according to which genericity corresponds to the semantics of subject-predicate structures whereby subjects combine with individual-level predicates. One of the most promising lines of analysis of the syntax–semantics interface in this domain tries to combine Carlson's insights with more adequate assumptions on the internal syntax of BPs and the role of DP-internal syntactic processes such as the licensing of empty determiners and N-to-D raising. On the other hand, these analyses seem to indicate that one of Carlson's essential proposals, namely the idea of reducing the existential reading of BPs to the semantics of the predicate with which they combine, is in fact not correct, at least in the radical version proposed by Carlson. The existential reading of BPs arguably has its roots in the semantics associated with DPs headed by an empty determiner, even though the semantics of the predicate might well be crucial in order to recover the lexical content of this empty position. However, as we have seen, the precise interaction between syntax and semantics is still a matter of debate. According to a first class of proposals (cf. Longobardi 1994), BPs are uniformly DPs and the cross-linguistic variation is crucially limited to *syntactic* parameters. According to another class of proposals (cf. Chierchia 1997b), variability extends to the setting of semantic parameters. Future research will have to decide on this important issue.

NOTES

For useful comments on a previous version of this case study, I am indebted to Hagit Borer, Jacqueline Guéron, Giuseppe Longobardi, and two anonymous reviewers.

1 In Chierchia (1996, 1998), the fact that bare nouns are freely allowed in Chinese/Japanese is derived from the hypothesis that bare nouns are generally set to type *e* in this group of languages, whereas they are set to type *e* depending on the mass/count distinction in languages such as English, where bare singulars of count nouns, contrary to BPs, have a *predicative* nature (type <*e*,*t*>).

2 Quite often in the text we will adopt the standard terminology (essentially dating back to Chomsky 1975b), which has the term 'bare plural' (properly referring to noun phrases that merely consist of a plural head noun) as covering all instances of noun phrases which are *not* introduced by a quantifier, a determiner, or more generally a

specifier or functional head of some sort. In this use, the term 'bare plural' (BP) 'improperly' extends to all instances of determinerless noun phrases, including modified head nouns and 'bare singulars' of mass (and in certain languages count) nouns.

3 Many Romance varieties seem to exhibit the behavior exemplified in the paradigm below for Italian, showing that BPs with an existential interpretation (that is, roughly interpreted as 'some N') are generally ruled out from the subject position (abstracting away from the cases where the subject is assigned narrow focus, corresponding to the application of a marked focus assignment procedure), but freely allowed in internal argument positions:

(i) ??Ieri, pompieri hanno spento l'incendio. (BP = subject)
'Yesterday, firemen have extinguished the fire.'
(ii) Non ho visto macchie sul pavimento. (BP = direct object)
'I have not seen spots on the floor.'
(iii) Sono uscito spesso con amici. (BP = indirect object)
'I have often gone out with friends.'

Determinerless subjects are quite acceptable, however, as far as the head noun is modified (by a relative clause, an adjective, or a PP) or coordinated, as shown below:

(iv) Ieri, pompieri con equipaggiamento speciale hanno spento l'incendio.
'Yesterday, firemen with special equipment have extinguished the fire.'
(v) Ieri, pompieri efficientissimi hanno spento l'incendio.
'Yesterday, very efficient firemen have extinguished the fire.'
(vi) Ieri, pompieri che non avevo mai visto hanno spento l'incendio.
'Yesterday, firemen that I had not seen before have extinguished the fire.'
(vii) Ieri, pompieri e volontari hanno spento l'incendio.
'Yesterday, firemen and volunteers have extinguished the fire.'

As is well known, the availability of subject BPs (with the limitations mentioned above) does not extend in Romance to the contexts in which the BP is interpreted 'generically', that is, roughly corresponds to a universal quantifier (see sections 2 and 3 for a more adequate characterization of the *generic reading* of BPs).

The constraints on the occurrence of BPs in the standard subject position (spec-of-IP under current versions of X-bar theory) are not a prerogative of Romance, being also found in Germanic SOV languages such as Dutch (see especially the discussion in Reuland (1988); and Diesing (1992a, b)), as exemplified below:

(viii) *Fred zag dat brandweerlieden het vuur aan blussen waren.
'Fred saw that firemen were extinguishing the fire.'

However, it should be emphasized that Dutch appears to behave like English (allowing the existential reading of subject BPs) in main clauses, where verb-second applies and the subject occupies the spec-of-CP position under current analyses:

(ix) Brandweerlieden waren het vuur aan het blussen.
'Firemen were extinguishing the fire.'

It seems we have clear evidence that different subject positions behave differently in licensing BPs with an existential interpretation. If we adopt the position that Dutch is like Romance with respect to the distribution of existential BPs, we have to account for the different status of the spec-of-CP position. Conversely, if we take Dutch to be like English, in that it freely allows subject BPs, it is the special status of the spec-of-IP position that has to be accounted for.

4 Carlson discusses examples such as *John notices plumbers in Jersey City,* which cannot mean that *all* plumbers were noticed in Jersey City, even though one might easily think of contexts which would clearly favor such a reading, for instance if there is a plumbers convention there attended by all, or most, plumbers.

5 See especially Diesing (1992a, 1992b), Kratzer (1995), and Chierchia (1995b).

6 We are presupposing a model of syntax in which covert operations may apply to surface structures. This possibility is clearly linked to the existence of a level of syntactic representations (traditionally referred to as LF) which may or may not be distinct with respect to the syntactic representations associated with surface structures (that is, the structure in which the elements of the syntactic elements have undergone phonological realization). In Chomsky (1995c) this idea is implemented by assuming that syntax corresponds to a computational system performing derivations, and that mapping to PF (that is, phonological realization) may take place at an arbitrary step of the derivation.

7 See Chomsky (1965), Gough (1969), Dowty (1972), Delorme and Dougherty (1972), Kroch (1974), Bartsch (1972).

8 See Stockwell et al. (1973), Perlmutter (1970a).

9 An important qualification is in order here. Strictly speaking, proper names are not individual-referring expression (type *e*) in the formal semantics framework in which Carlson embeds his analysis. In the Montague tradition proper names are in fact assigned a quantificational analysis (type <<e,t>, t>): they represent sets of properties (*Bill* is identified with the set of properties that hold of Bill), on a par with standard generalized quantifiers such as *most dogs*, *every man*, etc.

10 For the relevance of the notion of 'well-established kind' in the analysis of other sorts of generics, like singular definite generics, see especially Krifka (1987), Zwarts (1992).

11 The following examples clearly differ as to the quantificational import associated with the definite subject. If (i) tends to get interpreted as involving universal quantification over the members of the battalion, (ii) is better understood with an implicit quantifier of the kind of *most*, and (iii) can arguably be true even if a minority of the members of the battalion is involved in handling ammunition. As for cases like (iv), it is clear that the the predicate true of the battalion is completely false for any of its members:

(i) The battalion was wiped out.
(ii) The battalion is quite tired now.
(iii) The first battalion handles ammunition.
(iv) The first battalion has served its country for 200 years.

This kind of interpretive variation represents an important correlate of the sort of ambiguity that has been detected with BPs. Since the different readings cannot be consistently analyzed in terms of hidden quantification over the members of the relevant plurality, the claim that BPs are not quantified expressions gains further support.

12 A related consequence of Carlson's proposal is that natural language contains only expressions referring to ordinary objects and kinds, and not expressions referring to 'stages'. The presence of objects corresponding to spatio-temporal slices of things and of stage-referring expressions can be detected only by means of the explicit logical representations which express the semantic interpretation of the relevant sentences.

13 These amendments essentially consist in the assumption that in the case of predicates ambiguous between an s-level and an i-level interpretation, the i-level reading is derived by applying the 'generic' operator *G* to the s-level predicates. It is further assumed that a distinct operator *G'* maps predicates of individuals into predicates of kinds. These modifications certainly have some conceptual significance: in particular, the claim that the interpretive ambiguity detected with BPs extends in principle to sentences involving pronouns or proper names (an essential claim of Carlson's original proposal) can hardly be restated in the new framework, where predicates of kinds are derived from predicates of individuals by means of the operator *G'*. However, the motivation for these changes is essentially technical: the introduction of the new operators permits us, according to Carlson, to account for cases where a *generic* BP is assigned wide scope with respect to other scopal elements (as in *Beavers have a tail*). Given the role that hidden generic operators have played in successive analyses, it is worth emphasizing that Carlson's *G* neither corresponds to an implicit Q-adverb quantifying over events/situations nor can be identified with the empty determiner position postulated in the pre-Carlsonian quantificational analyses of BPs. Rather, *G* is an operator mapping predicates into predicates (technically, intensions into intensions).

14 Here, it should be noticed that not all speakers agree about the full acceptability of (25) and, to the extent they tend to accept it, they also tend to rule in the opaque reading of (24) besides the transparent one. There are also theoretical problems with Carlson's approach. He claims that *him* in (24) is a bound pronoun, and that the indefinite is raised to a position from which it has scope over both conjuncts (hence also over the conjuncts containing the pronoun). Both assumptions are problematic. Even if the raising operation is performed at an abstract level of representation (LF), it provides the wrong result with non-indefinites, as revealed by the ungrammaticality of **John is trying to find every policeman, and Kate tried to find him, too* (this observation has in fact provided important motivation for the analysis of the cases under discussion as involving E-type anaphora, cf. Evans 1980). Moreover, raising the indefinite to a position from which it takes scope over both conjuncts is likely to violate a well-known condition on movement (ATB-violation), as shown by the ungrammaticality of the cases where movement is overt (**Which book is John trying to find and Kate is trying to find it, too*).

15 Cf. Gerstner and Krifka (1993), Wilkinson (1986, 1989), Carlson (1989).

16 Cf. Dobrovie-Sorin (1996), Higginbotham and Ramchand (1996) for a detailed discussion of this issue and some articulated proposals for a principled derivation of the existential reading of subject BPs in English. For a recent analysis based on aspectual considerations and argument structure properties, see Delfitto (2004).

17 According to Carlson's formalism, verbs such as *arise*, which are aspectually ambiguous between an s-level and an i-level interpretation, are considered either as radically homophonous forms, corresponding in fact to two distinct lexical items, or as lexically related forms, the second of which derives from the application of the intensional operator *G* to the form that corresponds to the s-level predicate. According to the latter approach, the form of 'arise' present in (28a) results from the application

of *G* to the original form of the verb, which is intuitively s-level. Empirically, there can be no doubt about the fact that the predicate in (28a) is i-level: if it were s-level, we should expect an episodic interpretation roughly paraphrasable as 'some hurricanes are arising in this part of the Pacific'. This is not, however, an admissible reading of (28a), at least in English.

18 In Carlson's model, the nomic force of generic sentences is a function of the intensional interpretation of the subject-predicate structures that constitute the syntactic input to genericity, whereby the predicate expresses a property (that is, a function from possible worlds to sets) and the subject expresses a set of properties.

19 The operation of existential closure is actually not limited to nuclear scopes of quantificational structures in Kamp/Heim's original framework, but extends in fact to a more general sort of existential closure affecting texts. The original view is in many ways problematic, see Kratzer (1995) for an interesting discussion of this issue.

20 As the reader will remember, the terminology we have adopted for expository purposes is in fact partially misleading: for Carlson, all BPs are kind-referring, and the existential quantification on stages associated with certain BPs depends on the formal definition of the predicate with which the BP combines (it is this predicate which is formally characterized as containing an existential quantifier on stages).

21 For a radical criticism of the Mapping Hypothesis on empirical and conceptual grounds, based on the distribution and interpretation of postverbal subjects in languages such as Italian, see Longobardi (2000a).

22 The reader is referred to Kratzer (1995) for a detailed presentation of the empirical arguments in favor of the hypothesis that only s-level predicates are endowed with either a Davidsonian event argument, or a distinct spatio-temporal argument, arguably responsible for the spatio-temporal proximity to the speaker involved by the reading associated to sentences such as (38a) (*there are firemen available around here*, cf. Higginbotham and Ramchand 1996) and for the awkwardness of locative modification with i-level predicates (cf. the contrast between *??John is always a linguist in his car* and *John is always sick in France* especially discussed in Carlson 1982; Dobrovie-Sorin and Laca 1996; and Chierchia 1995b). One of the most intriguing arguments presented in Kratzer (1995) concerns the contrast between (i) and (ii), arguably derivable from the hypothesis that the implicit Q-adverb has a variable to quantify over (that is, the event variable) in (ii) but not in (i):

(i) *When Mary knows French, she knows it well.

(ii) When Mary speaks French, she speaks it well.

23 Chierchia argues that his analysis is neutral with respect to the choice among the most influential approaches to BPs, that is, the view that BPs are names for kinds and the view that BPs are indefinites translated into propositional functions of the form *Px* at the interpretive interface (Chierchia 1995b: 192). In fact, Chierchia emphasizes that Carlson's arguments in favor of a non-quantificational analysis of BPs cannot be conveniently addressed within the Discourse Representation Theory (DRT) approach. The question, however, is whether this is sufficient to really differentiate Chierchia's approach from the view that BPs may be indefinites. Chierchia acknowledges that sentences such as *Dogs are usually easy to train* can be naturally assigned the interpretation *Most dogs are easy to train*, involving the analysis of BPs as indefinites. However, he proposes that the status of variables attributed to BPs can be derived from the

application of a type-shifting operation to BPs as names of kinds, on strict parallelism with the type-shifting operations generally applied to indefinites in the framework of Dynamic Intensional Logic, which map generalized quantifiers into propositional functions. The availability of these type-shifting operations raises important issues concerning possible constraints on their application and the derivation, within this enlarged framework, of the properties of BPs reviewed by Carlson and discussed in section 3.

24 Technically, however, matters are less straightforward. Chierchia acknowledges that the explicative power of his proposal crucially depends on the possibility of ruling out movement of *Gen* to a higher position after *Gen* has licensed the polarity feature encoded on the predicate. Chierchia interprets this prohibition as a general fact about polarity licensing items. He claims that sentences like *Every student didn't come to the party* are acceptable with scope of the negation over the subject (a fact on which many speakers do not agree). On the contrary, he observes, negation cannot license a polarity word in subject position (**Anyone didn't come*), which suggests that the trace of the licenser is generally too weak to license polarity features. Even if we accept this analysis, some problems remain. Namely, notice that the local licensing requirement is also operative with those generic predicates for which it holds that the polarity feature is aspectually encoded. In this case, however, subjects *can* be interpreted existentially, as shown by (40) and the corresponding LF-representation in (41). Chierchia seems to suggest that the possibility that *Gen* be scoped out at LF depends on the fact that the polarity feature encoded in the aspectual projection is displaced to a higher position as a consequence of verb movement (the verb moves higher up combining with tense and aspectual morphology). One might assume, for instance, that once the polarity feature finds itself in Agr, *Gen* can simply be inserted as adjoined to AgrP, still satisfying the local licensing requirement. However, notice that the same reasoning might apply to 'inherently generic' predicates: at least in some languages, the verb moves higher up and the possibility arises for the licensing requirement to be satisfied in a syntactic configuration which has the subject BP in the scope of *Gen*, predicting the availability of the existential interpretation in cases such as (42), contrary to the facts. The conclusion is that Chierchia's hypothesis gives rise to non-trivial syntactic issues as for its precise technical implementation.

25 If singular indefinites are interpreted as inherent free variables, as in DRT, the issue boils down to consideration of how type-shifting can apply to yield a free variable in contexts where an inherent free variable is apparently excluded.

26 Notice that this problem does not arise within Carlson's original framework, according to which the intensional/nomic interpretations of generic sentences depends on the intensional semantics associated with subject-predicate structures. For a detailed defense of the advantages of a (neo-)Carlsonian analysis that explicitly links genericity to predication, see Delfitto (2002).

27 For a philosophical discussion on proper names as rigid designators, the canonical reading is Kripke (1980).

28 See Longobardi (1996) for technical and conceptual refinements of this analysis, related to the fact that the most recent trends in theoretical syntax admit only *one* interface level at which interpretation applies (cf. Chomsky 1995c), to the effect that earliness principles lose their conceptual foundation. For a different (though conceptually related) analysis, see Delfitto (2002). For a radically different view of the comparative difference between English and Italian BPs in terms of semantic parameters regulating type-shifting, see Chierchia (1998).

29 It is essential to Longobardi's analysis that *predicative* expressions referring to kinds and providing the domain of quantification of variable-taking operators be in N in surface structure. The assumption is that for an expression to be interpreted as *kind-referring*, this expression must be in the N-position at some level of syntactic representation. More generally, one could say that the D-position encodes reference/quantification and that the N-position encodes *predication*, in the sense that it hosts *predicative*, i.e., set-referring, elements.

30 The view that certain instances of the definite article are actually interpreted as expletives is apparently confirmed by the behavior of some Romance and Germanic varieties in which the form of the article used with proper nouns is different with respect to the form used in all other contexts (including the generic ones). These varieties include at least Catalan and the Frisian dialect studied in Ebert (1971; cf. Longobardi 1994). The presence of expletive determiners in the lexicon of Romance languages has also been advocated, on different empirical grounds (that is, the analysis of constructions of inalienable possession), by Vergnaud and Zubizarreta (1992).

31 For a recent overview of the syntax of noun phrases, see especially Longobardi (2000b).

32 It is important to emphasize that Longobardi's approach to existential BPs in terms of a lexical/proper government requirement on the empty D which is assumed to head these BPs provides a general alternative to the approaches inspired to Diesing's Mapping Hypothesis, according to which BPs are uniformly interpreted as free variables bound either by an existential or by a generic operator, depending on the syntactic position of the BP at the relevant level of syntactic representation.

33 As already discussed in section 4, the role of aspectual morphology in encoding a habitual or episodic reading of verbal predicates is explicitly acknowledged within the approach to genericity developed in Chierchia (1995b). In this way, the systematic ambiguity of event predicates such as *extinguish* between an s-level and an i-level interpretation receives a morphosyntactic explanation instead of being made dependent on the presence of two homophonous lexical items (as in Carlson's original proposal) or on the presence of an implicit operator *Gen* mapping s-level predicates into i-level ones.

34 Delfitto and Schroten (1991) argue that the D-position cannot be identified as a variable-taking operator by means of abstract Num(ber)-to-D movement in languages such as Italian and Spanish. The reason is that covert head-movement of the number affix to D gives rise to a Minimality violation in these languages (contrary to what happens in English). This idea is technically implemented in the following way. The N + Num complex is analyzed in terms of an X^{-1} affix (Num) that morphologically selects the incorporee (that is, the noun). The incorporee can be an X^0-level category (as in English, where stems qualify as independent words) or an X^{-1}-level category (as in Italian and Spanish, where nouns arguably qualify as bound morphemes). As a consequence, the noun counts as a potential antecedent for the number affix in Italian and Spanish (blocking excorporation of Num to the D-position), but not in English, given the categorial asymmetry between Num and N (excorporation of Num will therefore be possible, explaining why the existential reading is legitimate with subject BPs; see however section 6 for the constraints on the existential reading of subject BPs in English). For a detailed discussion of the issues involved, see Delfitto and Schroten (1991).

35 A problem which clearly deserves further investigation is the set of syntactic conditions which interacts with the possibility of the existential reading of subject BPs in

languages such as Italian and Spanish. As for (adjectival) modification, Longobardi (1994) suggests that the presence of a modifier seems to suffice in order to license an empty D as an existential operator (presumably under some form of spec–head agreement which induces the required feature in D). However, the real issue is the mysterious nature of the features involved, especially under the view that licensing requires recovering the semantic content of the empty position as an operator of the form ∃x (cf. Delfitto 1998 for detailed discussion). For a radically different approach to the existential interpretation of modified determinerless nouns in Romance, based on the insights offered by Kayne's theory of antisymmetry, see Delfitto (2002: ch. 3, section 2.2). It is worth emphasizing that modification seems able to rescue the existential interpretation of BPs governed by a non-eventive predicate (cf. the ungrammatical (67) in the main text), as shown by the acceptability of (i) below:

(i) Mario odia cani piccolissimi.
'Mario hates some very small dogs.'

36 All these examples concern modified BPs. According to Chierchia, this is a consequence of a formal licensing requirement on empty Ds that does not hold for English: bare nouns are excluded in Italian on purely formal syntactic grounds, independently of issues of interpretation. In this way, Chierchia seems to enrich his semantic framework with some of the results of the most recent syntactic investigations, according to which noun phrases (crucially including BPs) are DPs. However, it is fair to say that Chierchia's style of explanation is essentially Montagovian, in that syntactic choices (BPs as NPs or DPs, existence of a formal licensing requirement on empty Ds) are not independently motivated but rather made totally parasitic on the requirements of semantic analysis, and in particular on the model of semantic parameterization proposed by Chierchia. For a critical discussion of these and related matters, see Delfitto (2002: ch. 3, section 3).

37 As a confirmation of this line of analysis, notice that kind-reference is completely excluded in Italian with kind-level predicates such as *to be extinct* (contrary to what happens in English), as shown by (i) below:

(i) *Da queste parti, ragazze in minigonna sono estinte.
'In this area, girls in miniskirts are extinct.'

6 Reflexivity and licensers
7 Types of anaphoric expressions
8 Long-distance anaphora
9 Binding vs. logophoricity

1 Introduction

Natural language allows different expressions to receive identical values in some actual or virtual world. To take a venerable example, in the world as we know it, English *morning star* and *evening star* both have the planet Venus as their value. That is, both *refer* to Venus. Such expressions are *coreferential*. Coreference may hold on the basis of an empirical fact, as in the Venus case, but also speakers' intentions may suffice to establish coreference. A pronominal such as *he* can be used to refer to any object that is linguistically classified as masculine and singular, as in *John's mother thought he was guilty*. Here, *he* may refer to John but also to some other masculine individual.

Coreference is not the only way in which the interpretation of two elements can be related. *No one* in *no one believes he is guilty* does not refer to an individual, hence *a fortiori*, *he* cannot refer to that individual. Under the most salient reading *he* does, nevertheless, depend on *no one* for its interpretation. In this case the dependency is linguistically encoded, and is called *binding*.

The difference between binding and coreference can be further illustrated by the contrasts between the following mini-texts (as discussed in Heim 1982). Although coreference is possible across sentences, as in (1a), where *John* and *he*

can be independently used to refer to the same individual, *everyone* and *no one* in (1b) are not referential; hence, an interpretive dependency between *he* and these expressions cannot be established through coreference. Binding, the other option, is not available cross-sententially. Hence the sequel in (1b) is not felicitous. That there is nothing wrong with *he* being *bound* by a quantificational expression is shown by (2):

(1) a. *John* has a gun. Will *he* shoot?
b. *Everyone*/*No one* has a gun. *Will *he* shoot?

(2) a. *John* was convinced that *he* would be welcome.
b. *Everyone*/*No one* was convinced that *he* would be welcome.

Binding is thus an interpretive dependency that is linguistically encoded by means available within sentence grammar. Not only is it the case that some elements can be bound, other elements must be bound. As any traditional grammar of Latin notes, certain elements (*se*, *sibi*, etc.) must have an antecedent. Similar facts are duly observed in traditional grammars of Dutch, English, etc.

Traditional grammars, generally, do not devote much space to this type of fact. There is usually just a brief paragraph about reflexives and reciprocals, and that's it. A typical statement is that a reflexive pronominal is used in the object position (to avoid 'repetition of the subject') when the verb expresses a reflexive relation (e.g. Jespersen 1933/1983; Gleason 1965).

On the other hand, after the emergence of Generative Grammar, with its focus on explicit description and explanation, binding increasingly attracted attention. Starting out with seminal works such as Lees and Klima (1963), Postal (1969, 1971), Ross (1970), Helke (1971), to mention a few, it soon developed into an important grammatical field.

Providing an overview of the development of binding theory and the various issues it gives rise to is surely beyond the scope of this contribution. Doing so would require more than a book. Recent works with such an ambitious aim include Safir (2004a, 2004b) and Büring (2005). Huang (2000) presents an overview attempting to cover a range of variation in anaphoric systems. An earlier endeavor within the framework of Lexical Functional Grammar is Dalrymple (1993). Binding also plays a significant role in the framework of Head-driven Phrase Structure Grammar (Pollard and Sag 1992, 1994).

Here I will limit myself to a number of issues that arose over the last decades in works following up on the approach to binding set out in Chomsky (1981) and subsequent work. My main goal is to provide the background necessary to assess the various discussions of binding phenomena in other chapters in these volumes. Therefore this will not be a 'comprehensive' overview and many issues in binding that are not discussed elsewhere in this *Companion* will not be dealt with here.

2 Binding

Over the last decades many ideas have been developed about the linguistic mechanisms involved in encoding of binding. A recurrent idea is that at least at some level binding reflects a logical operator–variable relation. For instance, Reinhart (2000a) presents the following definition of binding:

(3) *Logical syntax binding: Binding is the procedure of closing a property*
A-binding
α A-binds β iff α is the sister of a λ-predicate whose operator binds β.

The way this definition captures binding in contrast with coreference is illustrated by the two readings of (4a), given in (4b) and (4c):

(4) a. Only Lucie respects her husband.
b. Only Lucie (λx (x respects y's husband)) (y could be valued as any female individual)
c. Only Lucie (λx (x respects x's husband))

In (4b) the property that is ascribed only to Lucie is that of respecting a certain individual (Mr X), who happens to be her or somebody else's husband. All other women do not respect this person, but they may well respect their own husbands. In (4c) the property ascribed only to Lucie is that of respecting her own husband. By implication, all other women do not respect their own husbands.

In order for binding to obtain at all, it is necessary that the dependent element can be translated as a variable in logical syntax. But, as is well known, binding is subject to further constraints, which cannot be explained on the basis of its logical properties alone. These constraints will be discussed below.

3 The canonical binding theory of Chomsky (1981)

In Chomsky's binding theory (1981), the theory of A(rgument)-binding describes the interpretive dependencies between phrases in argument positions, or A-positions, briefly arguments. A-positions are taken to be the positions in which a lexical item assigns a semantic role (*agent*, *patient*, *beneficiary*, etc.) to an expression, or in which the latter's Case is determined (nominative, accusative, etc.).[1] Arguments can be dislocated ending up in a non-A-position (by topicalization, question formation, etc.), as in (5). Here, *t* indicates their canonical position.

(5) a. *Him*, I never believed the baron to have pulled out *t*.
b. *Which man* did he think *t* fell off the bridge?
c. *Himself*, the driver pulled *t* out immediately.

The rules of A-binding apply to dislocated elements in their canonical position (for complex phrases this is an approximation; for current purposes any complications can be disregarded).

Arguments are classified as R-expressions, pronominals, or anaphors. If the head of a phrase has lexical features (or certain grammatical features, such as *wh*) this phrase is an R-expression. Thus *the merry linguist*, *the idiot*, *no one*, *everyone*, *which man*, etc., are all R-expressions. R-expressions cannot be bound.[2] *Pronominals* (*I*, *you*, *he*, etc.) are elements that are only specified for person, gender, and number (the phi-features) and grammatical category. They may, but need not, depend on another argument for their interpretation and they can be accompanied by a pointing gesture, that is, used deictically. Anaphors are referentially defective nominal elements. They cannot be used deictically. In the literature the term reflexive is often used as a synonym for anaphor. One also finds pronoun as a cover term for anaphors and pronominals.[3]

Anaphors can be classified in two general types: simplex anaphors and complex anaphors. In many respects, reciprocals, such as *each other*, behave as anaphors as well, although their semantics is rather more complex (see, for instance, Heim, Lasnik, and May 1991).[4] Also elements like *(his/her) own*, *(the) other*, *(the) same* are inherently anaphoric, see Safir (1996b). Their binding properties differ from canonical anaphors, however, and I will not discuss them here.

Lexically, simplex anaphors are like pronominals; they are different in that they are underspecified for certain features. Quite generally a specification for number is lacking, as is a specification for gender; a specification for person may be lacking as well (as, for instance, (Mandarin) Chinese *ziji*, Japanese *zibun*, or Slavic (Russian *seb'a*, Serbo-Croation *sebe*, etc.)). English lacks simplex anaphors, but cross-linguistically they occur frequently. Some well-studied examples are Dutch *zich*, Icelandic *sig*, Chinese *ziji*, and Japanese *zibun*. In many contexts their interpretation just corresponds to English *himself*.

Complex anaphors generally consist of a pronominal or a simplex anaphor and some other element. These other elements may be of various sorts (doubled pronominal forms, intensifiers, body-parts, etc.); see section 6.

If *a* binds *b*, it is said that *a* is the antecedent of *b*. Since potential binding relations cannot be read off from the content of the expressions involved they must be annotated in the linguistic representations. To this end, Chomsky (1981) and much of the subsequent literature uses a system of indexing. Each argument is assigned a certain integer as its index. If two arguments are assigned the same integer they are co-indexed. In practice one uses subscripts such as *i*, *j*, *k*, etc. as variable indices. If *a* and *b* are co-indexed this is indicated by an identical subscript. Thus, in an expression ($a_i \ldots b_i$) *a* and *b* are co-indexed. Since indices are nothing more than linguistic markers in the structure it is still possible for two expressions to be assigned the same object in some outside world if they are not co-indexed (*morning star* and *evening star* are not necessarily co-indexed). Binding without co-indexing is not possible, though. In order for *a* and *b* to be co-indexed (6) must be satisfied:

(6) *a* and *b* are non-distinct in features for person, number, and gender.

Non-distinctness, rather than identity of features, is required for co-indexing, since in many languages one anaphoric element is compatible with masculine or feminine, singular or plural antecedents. This property is illustrated by, for instance, Dutch *zich* and Icelandic *sig*. On the other hand, both are specified as 3rd person, and cannot have 1st or 2nd person antecedents. In other languages (for instance Slavic languages like Russian) a person specification is lacking as well, and we find one anaphoric form for all persons.

Whereas the use of indices as descriptive devices is generally accepted, their precise status in the grammar has been the subject of considerable debate.[5] It has become an important theoretical issue whether they can be eliminated from the grammar, and their effects reduced to more basic properties of the grammatical system.[6]

In order for binding to be possible the binder must c-command the element to be bound. The standard definition is given in (7).

(7) *a* c-commands *b* if and only if *a* does not contain *b* and the first branching node dominating *a* also dominates *b*.

More schematically, one can say that *a* c-commands *b* iff *a* is a sister to γ containing *b*:

(8) [a [$_{\gamma}$ . . . b . . .]]

Binding by a non-c-commanding antecedent is impossible as illustrated by the ungrammaticality of **John$_i$'s mother loves himself$_i$*. Putting both conditions together yields (9) as the standard condition on binding:

(9) *a* binds *b* iff *a* and *b* are co-indexed and *a* c-commands *b.*

In addition, anaphors and pronominals impose specific locality conditions on their binders. A binder of an anaphor may not be 'too far away', the binding of a pronominal may not be 'too nearby'. One of the recurrent themes in binding theory is how precisely these locality conditions are to be captured. (10) presents the binding conditions proposed in Chomsky (1981):

(10) Binding Conditions:
(A) An anaphor is bound in its governing category.
(B) A pronominal is free in its governing category.
(C) An R-expression is free.

This formulation of the binding conditions expresses that bound pronominals and anaphors are in complementary distribution. Although, as discussed below, binding theory has subsequently undergone considerable revision, the conditions

as formulated here still constitute a fairly good first approximation. These definitions express locality by the notion of a 'governing category', as in (11). In the case of anaphors, the basic intuition is that they do not allow a binder that is beyond the nearest subject.

(11) γ is a governing category for α if and only if γ is the minimal category containing α, a governor of α, and a SUBJECT *(accessible to α).*

A governor of α, in this framework is an element assigning a semantic role or Case to α. (12) illustrates the paradigm case that is captured by (11). Binding is indicated by italics; $[_{GC\text{-}\alpha}$ stands for the *governing category of α.*

(12) a. *John* expected $[_{GC\text{-himself/him}}$ the queen to invite *him/*himself* for a drink]
b. $[_{GC\text{-himself/him}}$ *John* expected $[_{IP}$ *himself/*him* to be able to invite the queen]]

Ignoring, for the moment, the italicized condition, (12) exemplifies what is knows as the Specified Subject Condition (SSC); the governing category of α is the domain of the subject nearest to α. For *him/himself* this subject is *the queen* in (12a) and *John* in (12b). Unlike what is seen in infinitives, a finite clause comes out as the governing category for its subject. One way of capturing this is to assume that the finite inflection, which is a carrier of nominal features (agreeing for person, number) also counts as a subject for the computation of the governing category. The notion SUBJECT (in capitals) thus generalizes over the DP in canonical subject position and the Agreement on the tensed verb/auxiliary.

Under certain conditions, an anaphor can be appropriately bound by an antecedent that is outside the finite clause containing the anaphor. This is illustrated in (13):

(13) *The boys* were afraid [that [pictures of *themselves*] would be on sale]

This 'domain extension' is captured by the italicized condition in (11). In order to count for the computation of the governing category of an anaphor, a SUBJECT must be accessible to the anaphor. Accessibility is defined in (14):

(14) α is accessible to β if and only if β is in the c-command domain of α, and assignment to β of the index of α would not violate the i-within-i condition.
i-within-i condition
$[_{\gamma} \ldots \delta \ldots]$, where γ and δ bear the same index.

In the case of (13), co-indexing *[pictures of themselves]* and *would* by 'subject-verb' agreement (irrespective of the fact that the auxiliary *would* does not carry overt agreement in English), and subsequently co-indexing *themselves* and *would* by the 'test indexing' of (14), yields the indexing configuration of (15):

(15) *The boys* were afraid [that $[_{\gamma}$ pictures of *themselves*$_i]_i$ would$_i$ be on sale].

This configuration violates (14), hence is marked illicit, and therefore *would* does not count as an accessible SUBJECT for *himself*. Hence, γ is not a governing category for *himself*, which may therefore look for an antecedent in the next higher clause. As will be discussed in section 9, the configuration in (15) is not the only case where an anaphor may be unexpectedly bound by a more distant antecedent. This is one of the reasons for exploring alternative ways to account for this type of fact.

4 Chomsky (1986b)

As noted by Huang (1982a) the canonical binding theory as summarized above does not capture the fact that in the possessor position of a DP bound pronominals and anaphors are not in complementary distribution, as illustrated in (16):

(16) a. *The girls* admired [$_{\gamma}$ *their* friends]
b. *The girls* admired [$_{\gamma}$ *each other*'s friends]

On the basis of this, Chomsky (1986b) following insights from Huang (1982a), develops an alternative for computing the local domain. The core domain is that of a Complete Functional Complex (CFC), a domain in which all grammatical functions of a given predicate are realized. It is, then, proposed that the Binding domain of some element α is the smallest CFC containing α for which there is an indexing I which is BT compatible, where BT-compatibility reflects the following assumptions: (i) anaphors must be bound; (ii) pronominals need not be bound; (iii) that any indexing to be taken into consideration must obey the i-within-i condition; (iv) nominal heads may carry indices, but are not possible antecedents. So, for an anaphor the binding domain is the smallest CFC in which it can be bound under some indexing I, for a pronominal the binding domain is the smallest CFC in which it can be free under I. So, for *their* in (16a) it is sufficient if it is free in γ, which it is. For *each other* in (16b) it is sufficient if it is bound in the next higher binding domain, which it is too.

In order for an anaphor in the subject position of a finite clause to be correctly ruled out Chomsky adopts a proposal by Lebeaux (1983), who assumes that anaphors undergo abstract movement towards their antecedents at LF; anaphor-movement from the subject position of a finite clause leaves a trace that does not meet general conditions on traces.[7]

5 Predicates and reflexivity

Languages often have a richer anaphora system than modern English. Many languages have a three-way or even four-way distinction between pronominals, simplex anaphors (henceforth SE-anaphors), and complex anaphors (with a possible subdivision), instead of the two-way distinction found in English. Furthermore,

certain languages admit bound pronominals in environments where the canonical binding theory only allows anaphors.

Much of the complexity of binding systems results from the interaction between binding and properties of predicates. Consider a situation where binder and bindee are both arguments of the same predicate. This is represented in (7), where *Pronoun* is used as a cover term for anaphors and pronominals:

(17) DP_i P(redicate) $Pro(noun)_i$

Such a predicate is defined to be reflexive, as in (8):

(18) A predicate is reflexive iff two of its arguments (e.g. subject and object) are co-indexed. (Reinhart and Reuland 1993)

On the basis of the surface form the following two cases can be distinguished: (i) P allows subject and object to have different values; (ii) P does not allow this. In the latter case P is intrinsically reflexive. In English this is exemplified by predicates such as *behave*, and in Dutch by its counterpart *gedragen*: *John behaved X* is ill-formed for any expression but *himself*. The only options are *John behaved* and *John$_i$ behaved himself$_i$*. In the former, *behave* clearly denotes a property. Assuming standard translation procedures from syntactic structure to 'logical syntax' (19a) yields the logical syntax representation in (19b):[8]

(19) a. John behaved
b. John (λx (x behaved))

On the other hand, the form *John$_i$ behaved himself$_i$* is technically reflexive. Both *John* and *himself* are syntactic arguments of *behave*, and they are co-indexed. Given standard translation procedures (in which a bound anaphor translates as a bound variable) (20a) will be translated as a logical syntax representation of the form (20b):

(20) a. $John_i$ behaved $himself_i$.
b. John (λx (x behaved x)).

However, semantically it makes no sense to interpret the sentence (20a) as denoting a reflexive relation. Despite the differences in surface syntactic form and in logical syntax, semantically (19a) and (20a) are equivalent, simply because *behave* denotes a property, not a relation. Consequently, either some process must allow (20b) to reduce to (19b), or else some process must prevent (20a) being translated as (20b), and instead translate it as (19b).

Other verbs, such as *wash* allow a transitive use, but also allow object omission. Thus, one can have the transitive *John washed the kids*, a reflexive *John washed himself*, and also *washed* without an object as in *John washed* (note that this use of *washed* is infelicitous if inserted in *John washed the kids and . . .*). This raises the

question of how the two types of *wash* are related. (That it has a dual entry shows up independently in the fact that in nominalizations with no marking whatsoever, it allows a reflexive interpretation as in *wassen in gezond* 'washing (oneself) is healthy'. Non-reflexive predicates do not allow such a reflexive interpretation under nominalization.)

Reinhart (2002) develops a general theory about relations between verbal concepts and about the way their properties are formally coded to be legible to the computational system. Her approach to lexical alternations captures by a limited set of operations the different ways in which one verbal concept can be realized. One of these is a lexical operation that reduces the internal role.[9] So, the predicate resulting from applying this reduction operation to the transitive predicate *wash* is an intransitive variant of *wash*, denoting a property.

In Dutch, verbs like *gedragen* 'behave', *schamen*, 'be ashamed', etc. do not allow the object to be absent. Instead they require the simplex anaphor *zich*. Verbs such as *wassen* 'wash' do not require the simplex anaphor, but allow it. Reinhart (2002) argues that Dutch, like English, allows internal role reduction, but, unlike what happens in English, a reflex of transitivity is left in the form of a structural Case residue. This Case residue is also there in the other verbs discussed, and what the simplex anaphor *zich* does is check this Case (as would be independently required by current theories of Case as in Chomsky 1995c).

In English only a limited number of verbs (primarily verbs of 'grooming') allow object omission. In Dutch such verbs all have *zich*, but the class of Dutch verbs allowing *zich* is considerably larger. It includes transitive verbs like *verdedigen* 'defend', *snijden* 'cut', verwonden 'hurt', *ontwapenen* 'disarm', etc. Unlike the verbs of the *behave* class these verbs also allow a complex anaphor. Vikner (1984) describes a relatively small closed class of verbs with mixed reflexivization properties in Danish. In Dutch, however, this class of verbs appears to be open; Barnes (1986) describes a similar situation for Faroese. Yet, there is an important class of verbs that do not allow *zich*, but instead require the complex anaphor *zichzelf* = *himself*, as in *George*$_i$ *bewondert zichzelf*$_i$/**zich*$_i$ 'George admires himself'. This class of verbs includes: (i) transitive verbs such as *haten* 'hate', *bewonderen* 'admire', *kennen* 'know', *bezitten* 'possess'; (ii) all verbs with a subcategorized PP object, such as *vertrouwen op* 'rely on', *afhankelijk zijn van* 'depend on'.

In some of its uses Dutch *zich*, like its cognates in other languages, looks like an expletive, as the counterpart of object omission in English. Yet, *zich* cannot be an expletive intrinsically, since in other environments it behaves as a real argument anaphor. For instance, it alternates with the pronominal *hem* in *Jan*$_i$ *legde het boek naast zich*$_i$/*hem*$_i$ 'John put the book next to him' and it occurs as a small clause subject in *Jan*$_i$ *voelde* [*zich*$_i$ *wegglijden*] 'John felt [himself slide away]'. Given that *zich* is a possible argument it is surprising that it cannot occur in the object position of predicates of the non-mixed type, such as *bewonderen* 'admire'.

This leads to the following conclusions: (i) The lexical operation of internal role reduction is restricted in its scope; (ii) Where role reduction does not apply some independent principle must rule out the simplex anaphor. That is, apparently, role reduction cannot apply to *bewonderen* 'admire', but, if it does not, why cannot

Jan bewonderde zich nevertheless be interpreted as *John (λx (x admired x))*? Although the complex anaphor has a somewhat wider distribution than just the environments where it is required (it may also be used for contrast, etc.), the general pattern comes down to this: A complex anaphor is required in cases where binding creates a reflexive predicate by 'brute force'. It is not required when the predicate is 'prepared' for reflexivity, either as a primitive property, or as a result of role-reduction. If the anaphor and its antecedent are not co-arguments, as in *Jan$_i$ voelde zich$_i$ wegglijden* 'John felt himself slide away', where the anaphor is a small clause subject, a complex anaphor is not required either. In Dutch sentences with locative of directional PPs, the simplex anaphor is allowed as well. Here, a pronominal is also possible (*Jan$_i$ zag een slang achter zich$_i$/ hem$_i$* 'John saw a snake behind him'). *Zichzelf* is infelicitous here. For further discussion, see section 6.[10]

6 Reflexivity and licensers

A recurrent cross-linguistic pattern is that reflexivity of predicates must be licensed. Reflexivity of a predicate can be licensed by its lexical properties, as we saw in the previous section, or if one of its arguments is a SELF-anaphor (i.e., an element such as English X-*self*, or Dutch X-*zelf*, where X may vary over (a subset of) pronominals or SE-anaphors). This is represented in (21):

(21) A reflexive predicate is reflexive-marked.

The requirement that reflexivity must be licensed is pervasive across languages. Faltz (1977) and Schladt (2000) present extensive overviews. Schladt, for instance, includes in his overview 147 languages from many different linguistic families, which all require special marking of reflexive constructions instead of a locally bound pronoun (simplex anaphor or pronominal). The means languages employ to license reflexive constructions are varied, but the need to do so is rather general. Faltz's typology distinguishes between 'head-reflexives' and 'adjunct reflexives'.[11] Schladt presents a wider variety of possibilities. Languages may use SELF-type elements as in various branches of Germanic, but also forms duplicating the bound element, clitics, a range of verbal affixes, and prepositional constructions are used in addition to clear instances of body-parts or focus markers. Not all licensers are part of the anaphoric element, or even nominal. In some languages even a different construction is used, such as embedding the bound element in a PP.

Whether the element used to license reflexivity is infelicitous or ungrammatical if it does not reflexivize a predicate may vary. In English, certain environments exempt a SELF-anaphor from this requirement. (22a), where the SELF-anaphor is not a syntactic argument of the predicate, is felicitous with *himself* bound by *Max*, whereas (22b), where *himself* is a syntactic argument of *invite* is ill-formed (see section 9 for further discussion):

(22) a. *Max* boasted that the queen invited Mary and *himself* for a drink.
b. **Max* boasted that the queen invited *himself* for a drink.

In some other languages, for instance Malayalam, the licensing anaphor does not need to be locally bound at all (Jayaseelan 1997). This is illustrated by (23):

(23) a. raaman$_i$ t̲an-ne$_i$ *(t̲anne) sneehikunnu
Raman SE-acc self loves
'Raman loves himself.'
b. raaman$_i$ wicaariccu [penkuttikal t̲an-ne$_i$ t̲anne sneehikkunnu ennə]
Raman thought [girls SE-acc self love Comp]
'Raman thought that the girls loved him(self).'

In (23a) local binding requires the presence of the full *t̲an-ne$_i$ tanne*. But in (23b) the anaphor *t̲an-ne t̲anne* in the downstairs clause is bound by the upstairs *raaman*, indicating that it is not subject to a local binding requirement.

As discussed in chapter 38 in this volume and section 9 below, certain exempt anaphors receive a logophoric interpretation. The core property of logophoricity is that the logophoric element is felicitous only in reportive contexts transmitting the words or thoughts of an individual or individuals other than the speaker or narrator and designates the individual or individuals whose words or thoughts are transmitted in the reported context in which the logophoric pronoun occurs (Clements 1975: 171–172). Also exempt anaphors in English may show such an effect, as illustrated in (37) below.

7 Types of anaphoric expressions

As discussed in section 3, the canonical binding theory distinguishes between anaphors, pronominals, and R-expressions. For present purposes no further discussion of R-expressions is needed.

We thus have an anaphoric system with essentially a two-way distinction between anaphors and pronominals. Pronominals have the capacity for independent reference (abbreviated as [+R]), anaphors lack this capacity (abbreviated as [–R]). The typology of anaphoric expressions in Chomsky (1981) and subsequent work also includes the element PRO, as the understood subject of nonfinite clauses (*Gerhard asked George [PRO to leave]*). In the canonical binding theory PRO was analyzed as <+pronominal, +anaphoric>. The binding conditions as formulated in (10) entail that bound pronominals and anaphors are in complementary distribution. Hence, PRO's distribution is limited to positions where it is exempted from the binding requirements.[12] Although the details of the original analysis do not carry over to current theories (as in Chomsky 1995c and related work), one insight has turned out to be important: whether or not an element requires a binder is not only determined by its intrinsic properties. It may also depend on how these properties interact with the syntactic environment. This is

relevant for an understanding of the phenomenon of exemption in general (see section 9 for further discussion of exemption and its relation to logophoricity).

If we make the proviso that in certain environments SELF-anaphors in English are exempt from a binding requirement (as illustrated in (22)), this two-way system essentially captures the situation in English. Other languages have a three-way or a four-way distinction however.

Dutch, for instance, distinguishes between pronominals (1st and 2nd person singular and plural; 3rd person singular masculine, feminine, and neuter; 3rd person plural common gender). Furthermore, pronominals occur in a weak or a strong form. The pronominal paradigm has rudimentary Case distinctions. Furthermore, there is a simplex anaphor *zich*, which only occurs in 3rd person (no singular/plural contrast). Here, and elsewhere we will use the term SE-anaphor as follows:

(24) A SE-anaphor is a non-clitic pronoun that lacks a specification for gender and number, and is therefore deficient in phi-features.[13]

In environments where *zich* would be used for 3rd person, 1st and 2nd person are realized by a canonical pronominal form (either the strong or the weak form in 1st person, the weak form in 2nd person). There is a complex anaphor *zichzelf* consisting of *zich* plus the morpheme *zelf*, which is a cognate of English *self*. *Zichzelf* is thus a SELF-anaphor in our terms. In 1st and 2nd person the SELF-anaphor is realized as the corresponding pronominal with *zelf*. The contexts in which SE-anaphors occur include the object position of predicates that are intrinsically reflexive, whereas SELF-anaphors occur with predicates that are not. This pattern is reflected in the following typology for anaphors and pronominals (see Reinhart and Reuland (1993)).

(25)

	SELF	SE	(Pro)nominal
Refl(exivizing function)	+	−	−
R(eferential independence)	−	−	+

It is to be expected that the properties of complex anaphors follow from the properties of their parts (Hellan 1988). Hence, an element of the form SE-SELF is expected to combine referential dependence with a reflexivizing function, as is the case. Contrary to what one would expect, in many contexts the combination pronominal-SELF in English or Frisian behaves identically, that is also as [+Refl, −R]. Anagnostopoulou and Everaert (1999) show that, in any case, the Modern Greek anaphor *o eafto tu* is [+Refl, +R]. Therefore these feature values are not incompatible. They show that *eafto* is a nominal head and argue that Modern Greek instantiates a more general pattern of inalienable possession anaphors.

Full pronominals also combine with *zelf* in Dutch. Koster (1985) argues that the resulting element is an anaphor that is not subject to a local binding requirement. In fact, its interpretation is arguably logophoric. For instance, the Dutch

counterparts of the English (37) discussed below show the very same contrast. Logophoric interpretation of *zich* and *zichzelf* is only marginal to impossible in Dutch. Logophoric interpretation of 1st and 2nd person SELF-anaphors is easily available, though, and subject to similar constraints as their English counterparts.[14] The facts that English SELF-anaphors just like 1st and 2nd person SELF-anaphors in Dutch, and Dutch 3rd person pronominal + SELF can be interpreted when they are in an exempt position, but *zichzelf* cannot, should follow from their differences in feature composition. Further exploring the insights of Hellan (1988) they do. In the standard case the properties of a complex element are determined by the properties of its components together. In the case of a Pronominal + SELF, it must be the SELF that in interaction with the environment contributes the –R-property. However, exemption implies that SELF is not the active component.[15] Hence, it cannot determine –R-status of the expression as a whole. As a consequence, in the relevant environments the properties of the other component, namely the pronoun, will determine whether the expression of the form <*pron SELF*> is +R or –R. *Zich* is phi-feature deficient, hence it cannot be anything else but –R, hence <*zich SELF*> is illicit if not bound. However if *pron* is not phi-feature deficient, nothing precludes its interpretation as +R if SELF cannot come into play. This is precisely the pattern found.

Scandinavian languages (Icelandic, and Norwegian with the other mainland Scandinavian languages) uncontroversially have a four-way system: Pronominals, SE-anaphors, SE-SELF, and Pronominal-SELF. Anaphor selection has a similar sensitivity to predicate structure as in Dutch, but complex anaphors come in two types: pronominal-SELF and SE-SELF; SE-SELF is required if the antecedent is a subject, pronominal-SELF if it is not. Moreover, these languages have a possessive anaphor, in addition to a possessive pronoun. The possessive anaphor must be selected if the antecedent is a subject. In Icelandic, the SE-anaphor allows a logophoric interpretation, notably in the domain of a subjunctive. Logophoric interpretation of the other forms has not been reported. See Hellan (1988), Thráinsson (1991), Sigurjónsdóttir (1993), Sigurjónsdóttir and Hyams (1992).

Frisian has a two-way system, but different from English. Its system is, in fact, rather like Dutch. Only, it lacks the SE-anaphor *zich*. Instead it has the pronominal *him* 'him', *har* 'her', *har(ren)* 'them' (given in their strong forms) where Dutch has *zich*. Frisian has local binding of pronominals in all persons (see Everaert 1986b, 1991). These elements are true pronouns. Consequently, a sentence like *Jan fielde him fuortglieden* 'John felt PRON slip away' is ambiguous between a reading in which John slips away and a reading in which someone else slips away, unlike its Dutch counterpart with *zich*. Reuland and Reinhart (1995) relate local binding of this class of pronominals in Frisian to an independent property of the Case system; these pronominals are underspecified for structural Case. Although, just like Dutch, Frisian pronominals have weak forms alongside strong forms, the weak/strong distinction is irrelevant to local binding. In other respects the Frisian anaphoric system is like Dutch. Where Dutch has *zichzelf*, Frisian has *himsels*, etc.

German (notably, the standard variant High German) superficially has a two-way system, distinguishing between pronominals and anaphors. The canonical 3rd person anaphor is a monomorphemic *sich*. It occurs regardless of the properties of the predicate. So, one has *er schämt sich* 'he is ashamed' alongside *er hasst sich* 'he hates himself'; the same holds true for all persons. The one indication of a potential structural difference is that the *sich* in *er hasst sich* can be topicalized and stressed as in *sich hasst er*, whereas the sich in *er schämt sich* cannot. In Dutch *zich* can never be topicalized, even when it is a true argument, as in **zich voelde hij t wegglijden* 'himself he felt slip away'. In such a case *zichzelf* must be used. If the possibility to bear stress is reflects differences in internal structure, the two types of *sich* could be argued to be structurally distinct. Although German allows the morpheme *selbst* to be attached to *sich* and pronominals, there is little evidence that it is more than an emphatic element (but see the discussion of datives in Reinhart and Reuland 1993; and Reuland and Reinhart 1995).

It follows from this typology that SELF-anaphors are local, unless they are exempt. For the binding properties of SE-anaphors, see section 8.

Extending this discussion to cover a substantial part of the languages of the world would lead beyond the confines of a quick overview. The literature contains substantial discussion of contrasts in Mandarin Chinese between a simplex anaphor *ziji* and a complex anaphor *ta ziji*, where the former is often classed as long-distance and the latter as local (see the literature cited in section 8). A contrast between a simplex anaphor *zibun* and a complex anaphor *zibun zisin* has been reported in Japanese. Whereas *zibun zisin*, like other complex anaphors based on *zibun* is local, the precise properties of *zibun* are much debated. It has been typed as an element much like a typical SE-anaphor (Aikawa 1993), but also as an element more like a Frisian type pronominal, which in some of its uses hides the more complex structure that has been claimed for German *sich* (Hara 2001). Matters tend to be obscured by the fact that its interpretation is much more sensitive to discourse factors that generally enter into logophoric interpretation than its counterparts in Germanic.

8 Long-distance anaphora

In general an anaphoric relation is defined as long-distance when the antecedent is outside the governing category of the anaphoric element as defined in (11), or, to put it informally, when the binding relation crosses a subject. Since in the case of pronominal binding this is nothing special, more specifically the term is used whenever an anaphor depends for its interpretation on an antecedent outside its governing category. Much of the discussion in the literature centers on the question of whether long-distance anaphora is restricted to certain anaphor types, and on the question of what motivates it. Another issue, discussed in section 9, is that not all anaphor-antecedent relations are of the same type. Structural binding relations must be distinguished from relations governed by a logophoric strategy. In this section we will summarize the structural binding part.

Bouchard (1984) argued that in order to be interpreted, an argument must be fully specified for phi-features. Many languages have anaphors that lack a full specification for phi-features. If so, it follows from this requirement that they must acquire a full specification in order to be interpreted. This type of element includes Dutch *zich*, Icelandic *sig*, Norwegian *seg*, (Mandarin) Chinese *ziji,* and Japanese *zibun*, etc. In line with a proposal by Lebeaux (1983), for such anaphors, binding is taken to require abstract movement to an element supplying them with phi-features. If the moved element is just a head, standard conditions on movement yield that subjects do not count as interveners. Hence, one would expect only those locality restrictions on their binding domains that follow from general properties of movement (see Faltz 1977; Pica 1987, 1991).

Following this line, it has been proposed that long-distance anaphora in Chinese is licensed by abstract movement of the anaphor *ziji* in Chinese to a source for phi-features (Battistella 1987; Cole et al. 1990). These authors assume that *ziji* is an X^0 constituent that undergoes head-movement to a suitable target. A c-commanding NP will not do, since it is a maximal projection. The only element that meets the requirements that it c-commands the anaphor, is in head position, and carries phi-features is AGR. The result is summarized in (26):

(26) SE-heads move to AGR at LF.

It is assumed that AGR is inside I, so the movement is to I. Since AGR is always co-indexed with the subject and SE-anaphors always associate with AGR, it follows that SE-anaphors, in their grammatical (non-logophoric) use are subject-oriented. It is assumed that movement of *ziji* is not restricted, since any higher subject is a possible antecedent, provided no blocking effect obtains.

The blocking effect in Chinese can be briefly characterized as follows: the path between *ziji* and its envisaged antecedent may not contain a possible antecedent with a different specification for person from the latter.

Huang and Tang (1991) retain the idea of LF-movement, but argue that *ziji* is syntactically *pro-ziji*. Movement of *ziji* is, then, in fact successive-cyclic A'-movement of an XP, adjoining it to IP, instead of X^0-movement. This movement, they argue is not subject to antecedent-government requirements. They assume that *ziji* picks up its phi-features immediately in the local domain. Once it has phi-features it may be interpreted as bound by any potential higher-up antecedent provided it has moved into the latter's domain. Thus, in each of the positions it occupies *ziji* may undergo local binding. The blocking effect reduces to a mismatch between phi-features initially acquired and the phi-features of an intervening potential binder. Once movement leads to a configuration in which there is a mismatch, as between 3rd person and 1st person, the derivation is blocked. Such blocking effects have not been reported for languages with a relatively strong verbal inflection.[16]

This relation between verbal inflection and blocking can, then, be understood on the basis of the following informal representation, with the relevant dependencies indicated regardless of details of order and hierarchical structure:

(27) 
As a widely adopted implementation runs, an INFL entirely without phi-features is susceptible to adopting features from the anaphor, which leads to a clash with the subject features if they are different. An INFL with phi-features stays firm and limits feature exchange to the subject as its canonical 'mate'. An LF-movement approach has also been argued for Japanese *zibun* (Katada 1991).

Across the Germanic languages the binding domain of SE-anaphors shows considerable variation. From the LF-movement perspective this requires an independent explanation. See chapter 40.

9 Binding vs. logophoricity

Many approaches to long-distance binding make the empirical assumption that the dependencies under consideration invariably reflect structural binding relations. One of the important results of the study of anaphora is the discovery of a systematic distinction between true structural binding, either local or long-distance, and the interpretation of anaphoric elements in exempt positions. Already in the seventies Ross (1970b), Cantrall (1974), and Kuno (1972b, 1975, see also Kuno 1987a) observed that 1st and 2nd person anaphors in English can occur without a linguistic antecedent, as illustrated in (28):

(28) Physicists like yourself are a godsend. (Ross 1970b)

In fact, violations of condition A are not limited to 1st and 2nd person anaphors. As noted by Pollard and Sag (1992), already Postal (1971) observed that picture nouns reflexives are not subject to the same constraints as ordinary reflexives. Bouchard (1984) concluded that a general distinction exists between true anaphors and exempt anaphors. In line with this, Zribi-Hertz (1989) discusses about 130 examples from actual texts of English anaphors not obeying the binding conditions, hence logophoric in our present sense, including cases with a 1st person anaphor like (29a) as well as cases with a 3rd person anaphor like (29b):

(29) a. She gave both Brenda and myself a dirty look.
b. It angered him that she . . . tried to attract a man like himself.

The earliest discussion pointing towards a systematic distinction between structural binding and logophoricity is by Clements (1975), elaborating on Hagège (1974) (see chapter 38), followed by Sells (1987). Extensive investigation of logophoricity versus structural binding has been conducted on Icelandic (based on

Thráinsson 1976a; and Maling 1984, 1986). Anderson (1986), Hellan (1991a), and Thráinsson (1991) found systematic differences in Icelandic between long-distance 'binding' into finite clauses (indicative or subjunctive) and long-distance binding into infinitival clauses indicating that only the latter falls under the structural binding theory. The other occurrences of long-distance anaphors are logophoric. As such, their distribution is much freer, and they are governed by discourse, rather than by purely structural considerations (see chapter 33 for further discussion). Some of the earlier work on anaphors in Italian also addresses issues that in retrospect typically involve binding versus logophoricity (Napoli 1979; Giorgi 1984; see Reuland 1990 for some discussion).

English shows a clear and systematic pattern in the distribution of bound versus exempt anaphors, which is illustrated by the contrasts in (30–34):

(30) a. Physicists like yourself are a godsend.
b. *A famous physicist has just looked for yourself.

(31) a. She gave both Brenda and myself a dirty look.
b. *She gave myself a dirty look.

(32) a. It angered him that she … tried to attract a man like himself.
b. *It angered him that she tried to attract himself.

(33) a. Max boasted that the queen invited Lucie and himself for a drink.
b. *Max boasted that the queen invited himself for a drink.

(34) a. This letter was addressed only to myself.
b. *This letter was addressed to myself.

What the exempt cases have in common is that the anaphor is not itself a syntactic argument of the main predicate, rather it is contained in such an argument. For instance, in (32a), the object argument of *attract* is *a man like himself*, in (33a) the object argument of *invite* is *Lucie and himself*, not just *himself*, in (34a) *myself* bears focus. Systematic accounts of the distribution of true versus exempt anaphors are presented in Reinhart and Reuland (1991, 1993) and Pollard and Sag (1992, 1994).

Pollard and Sag base their approach on an obliqueness hierarchy:

(35) An anaphor must be co-indexed with a less oblique coargument, if there is one.

If an anaphor fails to have a less oblique coargument it is exempt.[17]

Reinhart and Reuland (1991, 1993) analyze anaphors such as *himself* (SELF-anaphors) as reflexive markers. SELF-anaphors mark a predicate of which they are arguments as reflexive. A syntactic predicate, i.e., a predicate with a subject, must be interpreted as reflexive if it is reflexive marked. If a SELF-anaphor is not an argument of a syntactic predicate, it is exempt.[18]

Regardless of further differences in scope, in this particular domain both theories capture essentially the same pattern, and both entail that the interpretation of exempt anaphors, and only of these, is subject to processing and discourse constraints, rather than to structural conditions. The role of processing constraints is illustrated by sensitivity to the nature of interveners, as illustrated in (36) (examples from Pollard and Sag (1992), with some indexings added):

(36) a. Bill_j remembered that *Tom*$_i$ saw [a picture of $\text{himself}_{i/*j}$] in the post office.
b. Bill_j remembered that the *Times*$_i$ had printed [a picture of $\text{himself}_{*i/?j}$] in the Sunday Edition.
c. Bill_j thought that *nothing*$_i$ could make [a picture of $\text{himself}_{*i/j}$ in the *Times*] acceptable to Sandy.

As these examples show, an intervening argument does or does not block a crossing dependency depending on whether it qualifies as a potential antecedent. The relevance of discourse conditions to the interpretation of exempt anaphors is illustrated by contrasts as in (37):

(37) a. John_i was going to get even with Mary. That picture of himself_i in the paper would really annoy her, as would the other stunts he had planned.
b. *Mary was quite taken aback by the publicity John_i was receiving. That picture of himself_i in the paper had really annoyed her, and there was not much she could do about it.

There is a clear difference in well-formedness between these two discourses. Yet, structurally the position of the anaphor *himself* is identical in both cases. The only relevant contrast is in the discourse status of the antecedent. In (37a) John's viewpoint is taken, in (37b) Mary's. Hence, in (37b) *John* does not yield a proper discourse antecedent for *himself*.

It is important to distinguish between the syntactic notion of an exempt position, and the semantic notion of logophoricity. It is an empirical issue to what extent all English anaphors in exempt position are indeed sensitive to the factors typically involved in logophoricity. The same holds true for exempt anaphors in other languages. In (37) exemption and logophoricity coincide. In other cases, for instance (22), this remains to be established. But note, that discourse based interpretation strategies may vary. See Cole et al. (2001a) for much material and discussion, and Cole et al. (2001b) for a case of striking variation between closely related languages. Hence, certain discourse based interpretation strategies may in fact not involve logophoricity in any strict sense.

We can conclude this overview with an important methodological conclusion for the study of long-distance anaphora:

In each case of a non-local dependency it is crucial to determine whether interpretation involves binding or a discourse based strategy.

NOTES

I would like to thank an anonymous reviewer for helpful comments.

1 Pre-theoretically, these are the positions associated with grammatical functions, such as subject, object, etc. I will refrain from discussing issues in current theories of Case assignment or Case checking.

2 This does not imply that they cannot be used anaphorically, or that for some an anaphoric use cannot be strongly preferred, as in the case of epithets.

3 In part of the literature the term *anaphor* is used for any expression that refers back to an individual previously mentioned. So, under that use *the idiot* in *George decided to attack. The idiot thought he could fool everyone* is an anaphor. Here I will follow the standard usage in the generative literature and reserve the term *anaphor* for 'specialized' anaphors. So, *the idiot* 'is' not an anaphor, although it 'is used' here as anaphoric to George.

4 For discussion of reciprocals see also Williams (1991), or Dalrymple et al. (1994).

5 Roughly, the issue is whether indices directly reflect the referential properties of nominal expressions, or are annotations of the structure that can only be interpreted when they express binding relations. See Chomsky (1980a), Fiengo and May (1994), Lasnik (1989a), and Reinhart (1983a) for different stands on that issue.

6 See, for instance, Pollard and Sag (1994), Chomsky (1995c), Reinhart (2000a), Reuland (2001), and with a different perspective, Kayne (2002), and Hornstein (2001).

7 Within the framework of Chomsky (1986b) the trace was required to be antecedent-governed. Failing this it violated the empty category principle. In current theory these effects are derived from more fundamental properties of the grammar. Discussion would lead us beyond the scope of this contribution.

8 It is important to stress that 'logical syntax' does not equal semantics. Two different expressions in logical syntax may well be semantically equivalent as a matter of contingent fact. Such equivalences may even be systematic and stateable in terms of properties of their form. So one may well wish to say that one form reduces to another as a matter of fact, without implying that there is a logical equivalence relation between the two.

9 For earlier relevant discussion, see Chierchia (2004).

10 Note that strictly speaking role reduction is not the only factor that could account for the simplex anaphor being allowed. Also internal structure of the predicate could conceivably play a role. However, I will not pursue that here.

11 In Faltz's typology, head reflexives are based on an element that occurs independently as a nominal head (not rarely a body part), generally with a pronominal specifier. The relation may be understood as one of inalienable possession (Pica 1987, 1991). Faltz gives a few examples (including Basque, Fula, Malagasy, and Hebrew) one of which is repeated here for illustration:

Basque

(i) a. aitak bere burua hil du
father+ERG 3SGPOSS head+NOMDEF kill have+3SG+3SG
'The father killed himself.'

b. bere buruan txapeli ipiñi du
3SGPOSS head+LOCDEF cap+NOM put have+3SG+3SG
'He put the cap on his head.'

The same stem which occurs as a lexical N meaning 'head' in (ib) is used as a reflexive in (ia).

Adjunct reflexives are constructed of a pronoun or simplex anaphor and an adjunct, marking emphasis or focus, which may also attach to lexical NPs. According to Jayaseelan (1997), Malayalam represents this option. One of the examples Faltz gives is Irish:

Irish:

(ii) a. ghortaigh Seán é
'Sean hurt him.'
b. ghortaigh Seán é féin
'Sean hurt himself.'

12 Within the framework of Chomsky (1981) this explains why PRO's distribution is limited to positions where it lacks a governor/Case assigner, the 'subject' position of tense-less clauses. Consequently, in precisely these positions it lacks a governing category in which it 'has to be' bound or free.

13 Although clitics in Romance may share with *zich* a phi-feature deficiency, their clitichood may entail properties that do not necessarily obtain for *zich* and its cognates. Hence, they are not SE-anaphors in the present sense.

14 The following contrasts illustrate that Dutch *mezelf*, just like English *myself*, reflexivizes a syntactic predicate only if it is a syntactic argument of the latter:

(i) Er waren vijf toeristen in de kamer behalve mezelf.
'There were five tourists in the room apart from myself.'

(ii) *Vijf toeristen praatten met mezelf in de kamer.
'*Five tourists talked to myself in the room.'

15 For discussion of the precise role of SELF see Reuland (2001).

16 Romanian may be an exception, though (Anca Sevcenco, work in progress).

17 For ease of reference I summarize the definitions and conditions given in Pollard and Sag (1992):

(i) *Definitions of o-command and o-binding*
A *o-commands* B just in case A locally o-commands some C dominating B.
A *o-binds* B just in case A and B are co-indexed and A o-commands B. If B is not o-bound it is said to be *o-free*.

(ii) *Binding theory*
A. A locally o-commanded anaphor must be locally o-bound.
B. A personal pronoun must be locally o-free.
C. A non-pronoun must be o-free.

18 For ease of reference, I summarize the definitions and conditions from Reinhart and Reuland (1993):

(i) *Definitions*:
a. The *syntactic predicate* formed of (a head) P is P, all its syntactic arguments and an external argument of P (subject).

The *syntactic arguments* of P are the projections assigned theta-role or Case by P.

b. The *semantic predicate* formed of P is P and all its arguments at the relevant semantic level.
c. A predicate is *reflexive* iff two of its arguments are co-indexed.
d. A predicate (of P) is *reflexive-marked* iff either (i) P is lexically reflexive or (ii) one of P's arguments is a SELF-anaphor.

(ii) *Binding conditions*:
A: A reflexive-marked syntactic predicate is reflexive.
B: A reflexive semantic predicate is reflexive-marked.

(iii) *Generalized chain definition*:
$C = (\alpha_1, \ldots, \alpha_n)$ is a chain iff C is the maximal sequence such that:
(i) there is an index i such that for all j, $1 < j < n$, α_j carries that index, and
(ii) for all j, $1 < j < n$, α_j governs α_{j+1}

(iv) *Condition on A-chains* (condition on well-formedness):
A maximal A-chain $(\alpha_1, \ldots, \alpha_n)$ contains exactly one link – α_1 – which is completely specified for grammatical features.

10 Bridge Phenomena

NOMI ERTESCHIK-SHIR

1 Introduction
2 Structural approaches
3 Non-structural approaches
4 Bridge phenomena cross-linguistically and learnability

1 Introduction

The term 'bridge' was coined in Erteschik-Shir (1973) to characterize the matrix clause in cases in which extraction out of an embedded clause is licensed.[1] The (a) examples below illustrate such bridges. The (b) examples illustrate nonbridges:

(1) a. What did she say (that) Fred had done?
b. *What did she simper that Fred had done?

(2) a. What did she make a claim that he had done?
b. *What did she discuss the claim that he had done?

(3) a. What did she see a picture of?
b. *What did she destroy a picture of?

(4) a. This book she knows who has written.
b. *This book she inquired who had written.

(5) a. Det har jeg set mange der har gjort. Danish
That have I seen many that have done
'I have seen many that have done that.'
b. *Det har jeg drillet mange der har gjort.
That have I made fun of many that have done
'I have made fun of many that have done that.'

Example (1) shows that extraction out of simple *that*-clauses depends on the matrix verb. The verb *say* provides a bridge, the verb *simper* does not. (2) shows that a *that*-clause embedded in a complex NP may or may not allow extraction. Again this depends on the lexical content of the matrix. (3) shows that extraction out of picture noun phrases is also lexically determined. (4) illustrates a *wh*-island. Here again certain verbs which select embedded questions provide bridges, others do not. Finally (5) illustrates extraction out of Danish relative clauses. (5a) is a violation of the Complex Noun Phrase constraint which blocks extraction out of relative clauses. In Danish extraction out of object relative clauses is possible when the matrix provides a bridge.

There are two basic ways of looking at extraction phenomena. Under one view, certain subordinate clause types are viewed as islands. Extraction is predicted to be blocked only from these structures. According to Ross (1967), the examples in (2), (4), and (5) are islands predicting the ungrammatical cases in (b), but not the ones in (a), in which the matrix clauses can be viewed as providing bridges. The *that*-clauses in (1) are, however, not islands. Therefore only the grammatical case in (a) is predicted. The ungrammatical (b) case must be blocked by some additional principle. Under the other view the matrix clauses in all (tensed) subordinate clauses are islands. Extraction is therefore generally blocked except for the complements of certain matrix clauses which provide bridges. The latter view allows for a unified view of bridges

2 Structural approaches

Most of the references to bridge phenomena in the literature address the distinction between verbs of saying, which allow extraction, and manner-of-speaking verbs, which do not.[2] An early discussion of manner-of-speaking verbs is Dean (1967) who argues that the deletion of *that* converts a subordinate clause into a non-subordinate one. She suggests that those verbs that allow the deletion of *that* are the same verbs that license extraction:

(6) a. Mike quipped that she never wore this hat.
b. *Mike quipped she never wore this hat.
c. *Which hat did Mike quip that she never wore?

This is explained by the general hypothesis that extraction out of all subordinate clauses is blocked. Dean thus adheres to the view that all subordinate clauses are islands.

Dean herself notes the following problem with her generalization: extraction out of *that*-clauses does not depend on *that*-deletion:

(7) a. What do you believe that John bought?
b. What do you believe John bought?

She comments that for her (7b) is preferable to (7a), but does not offer a solution to the problem.

Ross (1967: 138–140) is intrigued by Dean's constraint on extraction from all (finite) subordinate clauses. Ross rejects Dean's proposal in view of the variation in acceptability of extraction out of different subordinate clauses.

Chomsky (1977b: 85) observes that *wh*-movement from within a clause is lexically determined (his (42)):

(8) a. *What did John complain that he had to do this evening?
b. *What did John quip that Mary wore?
c. ?Who did he murmur that John saw?

He notes that it is not clear what permits a matrix VP to be a bridge but assumes (following Erteschik-Shir 1973) that "the 'bridge' conditions fall within the interpretive rules," leaving the following condition on *wh*-movement: "where there is a bridge, there is an apparent violation of subjacency, PIC and SSC."[3] Bridge phenomena are thus used by Chomsky as one of the ways to identify an occurrence of *wh*-movement.

Bach (1977a: 149) notes that quantifier scope is sensitive to bridge properties as well:

(9) a. John thinks that everyone is crazy.
b. John regrets that everyone has a nickel.
c. Sally disputed the claim that everyone had a nickel.
d. Walter knows a man who every woman loves.

(9a) and (9b) exhibit bridge properties and allow a wide scope interpretation of the quantifier. (9a), for example, receives the following wide scope interpretation in (10a) and the narrow scope interpretation in (10b):

(10) a. for every x, John thinks that x is crazy
b. John has the belief that everyone in the universe is crazy

The complex noun phrases in (9c) and (9d) allows only narrow scope of the quantifier. Bach argues that if sensitivity to bridge properties is limited to *wh*-movement, there is no explanation for the data in (10) due to there being no movement.

May (1977) argues that the wide scope of quantifiers is accounted for by Quantifier Raising, an interpretive movement rule which applies in Logical Form (LF). May shows that Quantifier Raising is sensitive to the same bridge conditions described in Erteschik-Shir (1973).

Koster (1978a) also adheres to the view that clauses are islands, i.e., *wh*-movement is bounded. For Koster this has to be the case in view of the fact that many languages have only bounded rules, and unbounded processes are very limited in all languages. According to Koster extraction is, however, possible

from the complements of a subclass of categories of the type [+V] (verbs and adjectives). For Koster bridge phenomena are thus limited to verbs and adjectives. His account is therefore also limited to those bridge phenomena involved with extraction from *that*-clauses.

Chomsky (1980a) adapts Koster's idea that bounded *wh*-movement is the unmarked case and that 'bridge conditions' must be specifically stipulated. It follows that languages such as Russian, which do not appear to permit unbounded *wh*-movement, would reflect the unmarked case. Chomsky attributes this to Subjacency according to which extraction is blocked across more than one bounding node. For English, at least, S is a bounding node for Subjacency. If S' is also a bounding node then *wh*-movement is always 'local' (bounded). The bridge conditions would in effect state that with certain matrix verbs, S' does not count as a bounding node for Subjacency, a marked property of these verbs.

Stowell (1981, 1986) and Fukui (1986) base their analyses on the intuition that the complements of nonbridge verbs are not real complements, but are more like adjuncts. Stowell's implementation of this idea is that manner-of-speaking verbs do not assign a theta-role to their 'complements'.

Stowell proposes an interesting account of bridge phenomena: complements with overt complementizers are argued to be adjuncts and extraction out of adjuncts is blocked. He thus predicts that nonbridge verbs such as *mumble*, *quip*, and *simper*, which require an overt *that*-complementizer, do not allow extraction. Note that nonbridge verbs generally do not require complements in accordance with Stowell's proposal:

(11) a. John mumbled/quipped/simpered.
b. *John thought/believed/said.

According to Stowell, the correlation between the possibility of that-deletion and extraction possibilities follows from the ECP.[4] This he derives from a distinction between the properties of bridge verbs and nonbridge manner-of-speaking verbs. Only the former assign a theta-role directly to the *that*-clause:

(12) a. Ben knew [[e] [the teacher was lying]]
b. [Who]$_i$ did Ben know [[e]$_i$ was lying]?

(13) a. *Bill muttered [[e] [Denny was playing too much poker]]
b. *[Who]$_i$ did Bill mutter[[e]$_i$ [[e]$_i$ was playing too much poker]]?

In (12a), the empty complementizer is properly governed by the matrix verb, since it is the head position of the clause to which the verb assigns the direct object theta-role. In (12b), the trace in subject position is properly governed by the trace in the head position in COMP. The trace in COMP, in turn, is properly governed by the matrix verb, by virtue of appearing in the head position of the clause.

In (13a) the governing head, the nonbridge verb, does not assign a theta-role directly to the clause of which the empty COMP position is the head. And in

(13b) the trace in COMP violates the ECP, since there is no external governor with which it can be co-indexed.

Whereas Stowell's analysis in terms of the ECP predicts a strong correlation between *that*-deletion and extraction, the correlation is, in fact, weak, as noted by Dean (1967) and also shown in (14) and (15) (from Erteschik-Shir 1973: 62):

(14) a. *He regretted you did it.
b. What did he regret that you did?

(15) a. *It alarmed me she liked it.
b. What did it alarm you that she liked?

Stowell's analysis predicts that extraction from object position, as in (16), should always be possible since this position is always governed. He cites the following examples to support this prediction.

(16) a. $[\text{What}]_i$ did John just whisper to you $[_{S'}$ that [he ate $[e]_i$]]?
b. $[\text{Who}]_i$ did Bill mutter $[_{S'}$ that [he doesn't like $[e]_i$]]?

Although it is generally agreed that ECP infractions are worse than extraction from the object position of nonbridge verbs, the sentences in (16) are clearly ungrammatical.

Depiante (1993) offers a lexical account of manner-of-speaking verbs which explains why they do not assign a theta-role to their complement. Nonbridge verbs are derived verbs (as in Hale and Keyser 1993a). These verbs contains an adverb of manner that has been incorporated into a light verb with the semantic import of *say*. The process of incorporation discharges the internal theta-role and makes the verb intransitive.

Chomsky (1986a) proposes an explanation for island constraints in terms of Barriers. Whether or not extraction is licensed depends on the number of barriers between the moved constituent and the extraction site. Barrierhood is indirectly dependent on L-marking (only a non-L-marked maximal projection can be a barrier) and the latter is defined in terms of government as follows (Chomsky 1986a: 15):

(17) α L-marks β iff α is a lexical category that θ governs β.

Chomsky (1986a: 35) employs L-marking to explain the weak island effect (see chapter 64) in noun complements:

(18) a. which book did John hear $[_{NP}$ a rumor $[_{CP}$ that you had read t]]
b. which book did John announce $[_{NP}$ a plan $[_{CP}$ for you to read t]]
c. which actor did you see $[_{NP}$ a picture of t]

In (18a) and (18b) the CP is L-marked and therefore does not transfer barrierhood to the complex NP. In the picture noun phrase in (18c) the NP is L-marked and

therefore not a barrier. These examples do not exhibit island violations as does extraction out of relative clauses:

(19) a. *which book did John meet [$_{NP}$ a child [$_{CP}$ who read t]]
b. *which book did John have [$_{NP}$ a friend [$_{CP}$ to whom to read t]]

The relative clause CP is a barrier since it is not L-marked; the NP inherits barrierhood from CP. The two barriers cause a Subjacency violation, explaining the ungrammaticality of these sentences.

Chomsky (1986a: 34) states that it is a property of Subjacency violations (but not ECP violations) that they are variable and weak. He also notes that "a number of factors (including lexical choice) appear to enter into acceptability judgments in these cases, many of them poorly understood." He chooses to factor out the subpart of the phenomena which can be explained by Subjacency and thus does not offer an account of bridge phenomena.

Cinque (1990c) argues that the weak islandhood (see chapter 64) of the CP complements of both factive and manner-of-speaking verbs is due to their not being L-marked by V. He achieves this result by assuming that these complements are not dominated by V', but are adjoined in a higher position, hence not governed by V, a condition for L-marking. The problem with this type of structural analysis is that manner-of-speaking and factive verbs do not form a uniform class with respect to islandhood. The examples of manner-of-speaking verbs in (20) and factive verbs in (21) are from Erteschik-Shir (1973: 51–56):[5]

(20) a. ?What did she mumble that he had done?
b. ??What did the paper editorialize that McGovern had done?
c. *What did she simper that home economics was?

(21) a. This is the girl that I regret that Peter likes.
b. ?This is the girl that I resent that Peter likes.
c. *This is the girl that I rejoice that Peter likes.

Cinque's account would predict that all the examples in (20), in which the extracted element is non-referential, are equally bad and that the examples in (21), in which the extracted element is referential are equally good.

Manzini (1998) develops a minimalist theory of weak islands revising the Minimal Link Condition in Chomsky (1995c). Within this framework she offers a syntactic account of factive islands which builds on the idea that a factive complement is a Topic. Her idea is that a Topic is licensed only in the presence of a Focus which is syntactically projected:

(22) a. *Why do you regret [that they fired him t_{why}]
b. [do-Q] [you [F regret [that they fired him why]]]

According to Manzini, it is the projecting of F that prevents Q from attracting *why*. Although Manzini's account explains the fact that factives generally are

more resistant to extraction than nonfactives, her structural implementation of topic/focus concepts cannot explain squishes within factives such as illustrated in (21).

The main concern of Fodor (1992) is to account for the repercussions of bridge phenomena on learnability. In that context she argues that bridge verbs are subcategorized for both an S sister and an S[SLASH NP] sister, whereas nonbridge verbs are subcategorized only for the former. (In GPSG a SLASH category is a category which includes a gap, i.e., a category from which extraction has occurred.)[6]

Erteschik-Shir (1973) argues that subcategorization cannot explain bridge phenomena even for simple cases such as *that*-complements. The first argument is that such an approach predicts that extraction is either completely good or completely bad. The data in (20) and (21) show that the extraction facts are squishy, an indication that subcategorization cannot provide the correct explanation. Another argument has to do with contextual effects on extraction: if a verb is subcategorized as a nonbridge verb then extraction should not be licensed in any context, but extraction is contextually determined as the following example shows:

(23) a. *What did John lisp that he'd do?
b. ?What did Truman Capote lisp that he'd do?

(19b) shows that if it is contextually known that the subject has a lisp, as it is in the case of Truman Capote, then extraction is much improved. This follows, according to Erteschik-Shir, from the fact that *lisp* in (19b) is stripped of much of its meaning and is almost equivalent to *say*.

A similar example of how context influences extraction facts is offered by Kuno (1987a):

(24) Speaker A: Right after Chairman Mao died, they started taking pictures of the Central Committee members off the wall.
Speaker B: Who did they destroy more pictures of, Chairman Mao or Jiang Qing?

Again, the meaning of the verb *destroy* is contextually given by Speaker A's assertion.[7]

A third argument against the subcategorization approach is provided by (25) in which the matrix verb is emphatically stressed and extraction is degraded:

(25) ??Who did you BELIEVE that Bill would hit?

Speaker-specific squishy data, contextual factors, and emphasis not only provide strong arguments against an account in terms of lexical subcategorization, they also indicate that any purely structural analysis will fail to account for bridge phenomena.

3 Non-structural approaches

Erteschik-Shir (1973) argues that extraction is conditioned by focusability:[8] only those subordinate clauses which can be focused allow extraction. Focus is roughly defined as a constituent which the speaker intends to draw the attention of the hearer to. This condition on extraction explains all island effects including bridge phenomena according to the intuition that *wh*-movement is restricted to focused or foregrounded constituents to which the attention of the hearer is drawn. Backgrounded constituents to which the attention of the hearer is not drawn are processed in a different manner and therefore gaps within them cannot be detected. The unmarked case is for subordinate clauses to be backgrounded, i.e., in the unmarked case, syntax mirrors the discourse function in that main clauses are foregrounded and subordinate clauses are backgrounded. In order for a subordinate clause to be focused the main clause must not draw the attention of the hearer. It follows that bridges are those matrix clauses that need not be focused, and the question arises as to which factors are involved in the assignment of foci to sentences. In Erteschik-Shir (1973) it was argued that semantically complex and/or infrequent lexical items are necessarily focused. An explanation for the problematic data illustrated in (23–5) follows naturally. Squishy data is predicted since semantic complexity and frequency are themselves squishy notions. Context is predicted to determine the assignment of focus in such a way that focus will not be assigned to a contextually given constituent (as in (23) and (24)) and finally in (25) focusing the verb blocks the assignment of focus to the subordinate clause, in turn blocking extraction. Similarly, the rest of the data listed in the introduction are accounted for.[9]

Cattell (1978: 61) discusses the ambiguity of interrogative sentences such as the following:

(26) Why do the police believe (that) Sue killed Harry?

According to Cattell, verbs that allow the interrogative to be interpreted within the subordinate clause, i.e., verbs that allow extraction, are those he calls volunteered-stance verbs. Stance verbs are those verbs for which the complement is NOT part of the common background. Volunteered-stance verbs are a subset of stance verbs, namely those for which "their subject accepts some kind of responsibility for the proposition that follows." The class of stance verbs has in common with bridge verbs (as characterized in Erteschik-Shir 1973) that their complement must not be backgrounded. It is not easy, however, to apply Cattell's classification of stance verbs to verbs he does not discuss, e.g., manner-of-speaking verbs. These must be stance verbs since their complement is not part of the common background, but it is not clear whether Cattell would classify them with *say* as volunteered-stance verbs. It is therefore unclear whether Cattell's approach can make the correct prediction for these verbs.

Kluender (1992: 247) introduces the Predication Principle to account for extraction facts:

(27) Predication Principle: initial argument expression NPs must be as referentially specific as possible; all heads and specifiers occurring in complex predicates must be as non-specific in reference as possible.

He shows how bridge phenonema follow from this principle. For example his account of bridge verbs is that they "are typically statives or achievements. Manner-of-speaking verbs, on the other hand, are invariably activity verbs. Since the lexical semantics of manner-of-speaking verbs includes not only the meaning of 'say' but also a specific manner component . . . there is a sense in which these verbs are referentially more highly specified than bridge verbs" (p. 245).

The intuitive basis of the Predication Principle is similar to the account offered in Erteschik-Shir (1973). Kluender (1992: 249) concludes that the basic effect of the Predication Principle is to ensure that logical subjects of predication are as salient as possible while the heads and specifiers occurring in complex predicates remain as unobtrusive as possible.

In the framework of Erteschik-Shir (1997), the basic intuitions of Erteschik-Shir (1973) have been developed into a comprehensive theory of focus structure which provides an account of all island phenomena, weak and strong.

4 Bridge phenomena cross-linguistically and learnability

A serious problem for both structural and nonstructural approaches is to explain why languages differ with respect to bridge phenomena.

Fodor (1992: 109–180) points out that Polish does not permit extraction out of tensed clauses except for complements of a very small number of verbs (*say, tell, think*), a small subset of the verbs which allow extraction in English. None of the approaches to bridge phenomena cited above can explain this. Fodor (p. 123) argues as follows: "the existence of even one non-bridge item in even one language would constitute a serious challenge for learnability. Once an extraction rule . . . is in a grammar, limiting its application to some items and not others would apparently call for complication of the grammar. And why would a learner bother, when his (positive) data are perfectly compatible with the unrestricted rule?" Fodor further reasons that "linguistic theory must FORCE extraction to be described in such a way that the lexicon is necessarily implicated." Fodor suggests (following Erteschik-Shir 1973, 1982) that synonymous verbs in English and Polish occupy identical positions on a scale and that the two languages have different cut-offs with respect to extractability. In other words bridge phenomena might be conceived of as a universal property of language. Extraction in a particular language will be constrained syntactically and limited by the

cut-off point identified for a particular language on these scales. An argument in favor of this approach offered in Erteschik-Shir (1973) is the fact that the English equivalents of acceptable extractions out of relative clauses in Danish, although degraded, are not as bad as those that are also unacceptable in Danish. Thus the English version of (5a) is much better than that of (5b).

NOTES

1 Extraction is *wh*-movement out of a subordinate clause.
2 See Zwicky (1971) for a systematic account of some properties of manner-of-speaking verbs.
3 PIC and SSC are the Propositional Island Constraint and the Specified Subject Condition, respectively.
4 ECP: A trace must be properly governed.

Proper Government: α properly governs β if and only if
(i) α governs β, and
(ii) α is lexical
(iii) α is co-indexed with β.

5 Kiparsky and Kiparsky (1970) categorize verbs whose complements are presupposed as factive. They argue that the reason extraction is blocked from the complements of factive verbs is that they are derived from complex noun phrase islands. Under this analysis the source of (i) would be the structure of (ii):

(i) I resent that Peter likes this girl.
(ii) I resent the fact that Peter likes this girl.

6 Fodor argues for a modified version of GPSG which she calls LPSG (Learnable Phrase Structure Grammar). We return to Fodor's discussion of learnability with respect to bridge phenomena in section 4.
7 Kuno explains these and other extraction facts as follows: only constituents which qualify as the topic of a sentence can be extracted. For arguments against this type of approach see Erteschik-Shir and Lappin (1981).
8 The term Dominance was used in this work instead of Focus.
9 See Erteschik-Shir (1973), Erteschik-Shir and Lappin (1979), and Erteschik-Shir (1981) for details. In this work independent tests for focusability are also provided.

1 Introduction

Surface case distributions reflect an intricately interrelated system of semantic roles, grammatical relations, and language-particular case marking systems. A historical review of the development of research in this area in the generative theoretical framework reveals an illuminating process of integration and disintegration.

Research on case has a long history covering a variety of surface phenomena involving morphology, syntax, and semantics. It is rather curious that in the generative tradition case had not been a central research topic until the emergence of Government and Binding Theory (henceforth abbreviated as GB) in the early part of the 1980s, which proposed Case Theory, a theory of abstract case (often termed 'Case'), closely tied to Theta Theory.[1] These theories are part of the subsystems of principles proposed by GB. The reason for the non-central role that research on case played in this era lies partly in the assumption of Standard Theory (ST) that grammatical relations, subject, object, and so on, are derivatively determined by syntactic structures and that structurally determined grammatical relations determine grammatical functions of noun phrases.[2]

In this general theoretical trend, research on case played a central role in Japanese grammars supporting the transformational approach to syntax. For example, the hypothesis of ST of the cyclic application of transformations was supported by Japanese case marking transformations, and the adequacy of assumptions of sentential complementation and Equi-NP deletion was attested by the derivation of Japanese complex predicates like causative and passive verb complexes.

The purpose of this chapter is, in the first place, to show the main issues involved in research on case in Japanese, which have contributed to the formation of a series of new theories up to the Minimalist Program (henceforth abbreviated as MP). Second, this chapter attempts to contribute to the refinement of

the MP by revealing the syntactic mechanism employed in the construction of Japanese major syntactic structures, in which structural and inherent case particles play significant roles.

This chapter contains reviews of major generative works on case in Japanese during the past 35 years. Sections 2 through 5 review how research on the Japanese case system developed within the frameworks of ST and Extended Standard Theory (EST) with their basic tenet of structural determination of case. It is shown that during this period of transformational pursuits, most of the relevant facts were discovered, and these facts have been used as crucial data and recast over and over again in new frameworks as theoretical changes evolved. Gruber's prelexical transformation and Fillmore's 'Case grammar' are outlined because they have played important roles in the development of a syntactic theory of case. Section 5 brings up technical improvements made in the transformational approach during the 1980s within the framework of GB, later called the Principles and Parameters Approach (PPA). In this period, case in various typologically different languages was studied extensively from the point of view of Universal Grammar. Marantz (1984) and Baker (1988a) are representative of these studies. Unfortunately, their works are not included in this review because our main task is elucidating the results of research on Japanese case.

Section 6 presents an outline of case checking theory, a fast developing theory within the framework of MP. It is shown that as far as Japanese is concerned the descriptive data coverage of the works examined in this section is almost the same as previous works, only with a few additions of novel data. Their merits seem to be basically the effort to deal with case variations among many languages in the framework with minimum mechanical tools. To the extent they are successful, they achieve the goal of filling out Universal Grammar. This section is included despite the fact that the section itself is unduly brief and schematic due to its fast changing nature, because it is necessary to see the actual working of MP in dealing with the Japanese case phenomena.

Now let us point out some specific features of representative works reviewed in this chapter. The first stage in the 1960s emerged as a reaction to the thesis of ST, which claimed that semantic interpretation of a sentence is based solely on deep structure. Gruber (1965) proposed that prelexical structures in which semantic roles, represented by abstract prepositions like FROM, TO, and so on, are subject to prelexical transformations, which depend on the specification carried by each verb as to which role can be the subject. On the other hand, Fillmore (1968), for example, proposed that semantic roles, labeled as AGENT, PATIENT, GOAL, and the like called case (C) are syntactic primitives and a transformation called 'subjectivization' moves the highest case in the case hierarchy to the surface subject position. Both of these approaches are based on an awareness of the fact that semantic roles and grammatical relations do not maintain one-to-one correspondences. The important aspect of these claims is that they are sensitive to the case alternations observed in pairs of sentences with verbs like *sell* and

those like *buy,* and some other sentence relations of this type. In this point of view, there is no basic line of demarcation between structural cases and inherent cases (or semantic cases) marked by postpositions in Japanese grammars. Section 3 gives details of their proposals.

Kuroda (1965) emphasized the distinction between structural and inherent cases and made a proposal for cyclic linear case marking transformations for the structural cases. Inherent case particles, called postpositions, did not attract attention from generative researchers at that time. Kuno (1973c) is an extension of Kuroda (1965). Details of these analyses are given in section 4.

Kuroda's transformational approach was followed persistently through the 1960s, 1970s, and to the middle of the 1980s, with minor modifications or refinements. All these grammars tried to relate grammatical relations to surface case alignments, disregarding the semantic roles noun phrases bear. Section 5 deals with modifications and attempts to refine Kuroda (1965, 1978) and Kuno (1973c).

With the appearance of GB, case theory and theta theory were highlighted as core principles of syntax. In its later development as the PPA in the middle of the 1980s, its case theory, enforcing case checking in terms of agreement, aroused lively discussions. One is Kuroda's proposal for the parameter of forced vs. non-forced agreement, discussed at the end of section 5.

Marantz (1992) also called into question the validity of case checking in the PPA, making an alternative proposal for the case realization rules, which are discussed in section 6, together with an application of some of his rules to Japanese by Aoyagi.

These and other works along this line of argumentation against case theory have motivated a good deal of research on case in Japanese in the Minimalist framework. Watanabe (1996), Koizumi (1998), Ura (1996, 1999, 2000, 2001), and Fukui and Takano (1998) are reviewed in section 6 as representatives of these works.

2 Semantic roles, grammatical relations, and case marking (case realization)

The term 'case' has been used ambiguously at least in the following three ways: one standing for 'theta-roles' in the recent framework of generative grammar, the second used in place of grammatical relations such as 'subject', 'object', and 'indirect object', and the third as the actual case realization such as *ga* (nominative), *o* (accusative), and *ni* (dative) in Japanese.

The ambiguous uses do not necessarily mean that there has been little awareness of the fact that there are not always one-to-one correspondences among these three types of case. It is closer to the truth to say that due to this awareness the linguists working on this problem have investigated how some semantic roles come to be identified with grammatical relations. Gruber (1965) and Fillmore (1968, 1971b, 1973, 1977) represent this approach. These works made a

tremendous contribution to the theory of case by showing that well-formed syntactic structures are guaranteed mostly by lexical information carried by predicates (usually verbs and adjectives) as to the number of co-occurring obligatory noun phrases and semantic roles they bear. Information of this kind has later been formalized as argument structures of predicates (Grimshaw 1990, for example). In the framework of the PPA, 'theta-positions' play a crucial role in guaranteeing well-formed syntactic structures.

The study of case in Japanese in the generative framework started with the investigation of the Japanese case marking mechanism on the basis of grammatical relations, assuming the distinction between structural case markers, *ga*, *o*, *(ni)*,[3] and semantic case markers (conventionally called postpositions) such as *de* (locative: 'at' or 'in', or instrumental: 'with'), *kara* (ablative: 'from'), and *to* (commitative: 'with'). Since changes of grammatical relations lead to changes in distribution of structural case particles, the study of case in this sense has developed hand in hand with the study of major Japanese syntactic structures such as causatives, passives, desiderative sentences, and so on, whose derivations involve changes in grammatical relations. As a result it has been revealed that there is a considerable discrepancy between grammatical relations and the distribution of structural case particles. For example, nominative *ga* does not necessarily mark the subject, the particle *o* is the surface realization of both the structural accusative case and the semantic role 'path', and the *ni* of so-called 'double object constructions' is treated as a structural case by a group of linguists, while it is a postposition according to another group. Moreover, *ni* appears as a postposition denoting 'location'.

Traditional Japanese linguists regard all noun phrases with case particles as modifiers of predicates. This school has never given special status to the subject, nor has it recognized the unique syntactic functions of the subject. One of the influential Japanese linguists Akira Mikami (1953, among other works by the same author) reacted against the use of the notion of subject in some Japanese grammars, claiming that the notion is not relevant to the Japanese language but was simply borrowed from grammars of European languages where subject–verb (in the generative framework subject–auxiliary) agreement is observed. In contrast to this opinion, Shibatani (1978) argues that the notion of subject and the nominative *ga* as a marker of subject should be distinguished, pointing out the functions of the subject as the trigger of subject-orientated honorification, which is independent of *ga* marking, as is shown by the sentences in (1), and its function as the antecedent of the reflexive form *zibun* ('self'), as in (2):

(1) a. Katoo- sensei ga kono hon o o- kaki-ni nat-ta.
Katoo teacher Nom this book Acc Hon- write-Hon- Past
'Mr Kato wrote this book.'

b. Katoo-sensei ni wa konpyuuta ga o- tukai-ni nar-e-ru.[4]
Dat Top computer Nom Hon- use- Hon-Pot-Pres
'Mr Kato can use a computer.'

In (1a) the nominative subject triggers subject-orientated honorification, *o-V-ni naru*, while in (1b) the dative subject is the trigger.

(2) a. Hirosi$_i$ ga zibun$_i$ o seme- te i-ru no wa kare no hutyuui kara
Hirosi Nom self Acc accuse Prog that Top his carelessness due to
kazi ga de- ta kara de-su.
fire Nom take place-Past because Cop
'The reason why Hirosi accuses himself is that his carelessness caused the fire.'

b. Hirosi$_i$ ni (wa) zibun$_i$ no kangae ga umaku hyoogen deki na- i.
Dat Top self Gen idea Nom well express can Neg- Pres
'Hirosi cannot express his own ideas well.'

In (2) the subjects marked with *ga* and *ni* stand as the antecedents of the reflexive form *zibun*.

On top of the emphasis on distinct status given to the subject by generative grammarians, the nominative and accusative agreements have been given an important role of licensing argument noun phrases since the inception of the PPA. In view of the fact that Japanese does not show case agreement, it is very natural that various recent works on Japanese syntax claim licensing mechanisms other than agreement. The details of this new direction in the study of case will be given in section 5.

3 Semantic roles in relation to grammatical relations

In this section, a review will be given of two representative works that emphasize the semantic roles noun phrases bear as the basis of grammatical relations, 'subject' and 'object'. There was keen awareness underlying all of these works that the interpretation of a sentence cannot be determined solely by deep structure, as assumed by ST.

3.1 Gruber: prelexical transformation

Gruber's prelexical structures depend on the following assumptions:

(i) base rules:
(a) S ⇒ (Agt)[5] Event
(b) Event ⇒ Theme Qualifier
(c) Qualifier ⇒ Verb PP*

(PP* means that more than one prepositional phrase can be selected by a verb.)

(ii) lexical verb classification:

	Positional	*Possessional*	*Identificational*	*Circumstance*
Motional	go	lend	change	coerce
Durational	remain	keep	leave	prevent
Non-descript	be	have	be	be

A motional verb *go*, for example, has the following prelexical structure:

(3) $[_{\text{Theme}}\ \text{NP}][_{\text{Qualifier}} \begin{bmatrix} \text{V} \\ \text{Motional} \\ \text{Possessional} \end{bmatrix} [_{\text{PP}}\ [_{\text{Prep}}\ \text{FROM}]\ \text{NP}][_{\text{PP}}[_{\text{Prep}}\ \text{TO}]\ \text{NP}]$

The structure (3) underlies (4a) given below:

(4) a. The car went from John to my brother.
b. John sold the car to my brother.
c. My brother bought the car from John.

When the prelexical transformation moves $[_{\text{PP}}[_{\text{Prep}}\ \text{FROM}]\ \text{NP}]$ to the sentence initial position replacing $[_{\text{Theme}}\ \text{NP}]$ followed by incorporation of FROM into the verb, the prelexical structure (5a) is derived, into which verbs like *sell* are inserted (as in (4b)), while the replacement of the theme with $[_{\text{PP}}[_{\text{Prep}}\ \text{TO}]\ \text{NP}]$ results in the prelexical structure (5b) which permits the insertion of verbs like *buy* (as in (4c)). (The incorporation of the preposition is indicated by + in (5).)

(5) a. NP FROM+ $\begin{bmatrix} \text{V} \\ \text{Motional} \\ \text{Possessional} \end{bmatrix}$ Theme TO NP

b. NP TO+ $\begin{bmatrix} \text{V} \\ \text{Motional} \\ \text{Possessional} \end{bmatrix}$ Theme FROM NP

Verbs like *sell*, *lend*, *give*, and so on have the specification (6a) as the frame for their insertion into deep structures, while those like *buy, borrow, obtain*, and so forth are with (6b):

(6) a. /sell/ in environment of FROM V, Motional Possessional

b. /buy/ in environment of TO V, Motional Possessional

Thus, Gruber is the first to explicitly point out the discrepancy between semantic roles and grammatical relations. The important facts accounted for by this grammar

are that the subject bears various semantic roles such as source (FROM in Gruber), Goal (TO), and theme and that theme can both be a subject and an object in syntactic structures. The incorporation of prepositions into verbs fits well in the syntax of languages in which the subject and the object appear without any case marking. For languages with overt case marking on every noun phrase, this grammatical model apparently does not seem appropriate. However, it is undeniable that Kuroda's (1965) hypothesis (to be summarized in section 4) of unmarked noun phrases, standing for structural case bearers, shares the same insight with Gruber. Gruber's term 'theme' is employed by the later generative grammars in their technical terms 'thematic structure', 'theta-role', 'theta position', and so on.

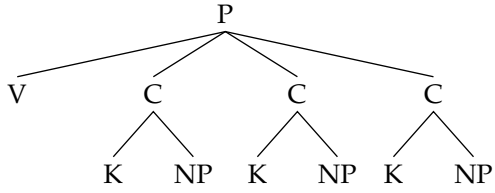
3.2 Fillmore: 'Case grammar'

Fillmore (1968) claims that a structure deeper (or more abstract) than the deep structure as conceived of by ST is necessary for adequate interpretation of a sentence. According to him the primitives of syntactic structure must be 'cases' (or semantic roles) such as agent, patient, source, goal, and so on, which are introduced by the base rules in (7):

(7) a. $S \Rightarrow M + P$
b. $P \Rightarrow V + C_1 + \ldots + Cn$
c. $C \Rightarrow K + NP$

In (7) M stands for modals including negation, tense, mood, and aspect. P stands for proposition consisting of a verb and any number of Cs (Cases), K for any types of case markers, prepositions, postpositions, inflection, and so on, C (Case) for A(gentive), D(ative), O(bjective), I(nstrumental), L(ocative), and the like. The rules in (7) generate structures like the following:

(8)



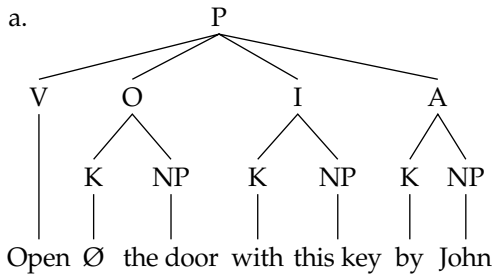
Each verb carries the specification for the case frame (like (9)) that it can be inserted into:

(9) V : + [___ C (C) (C)]

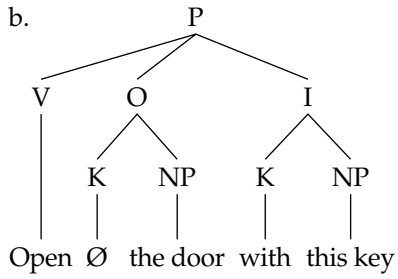
Take the verb *open* for example. It has the specification (10), which can be realized as the structures (11a–d):

(10) open : + [___ O (I) (A)]

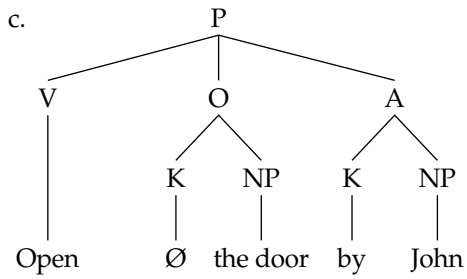
(11) a.



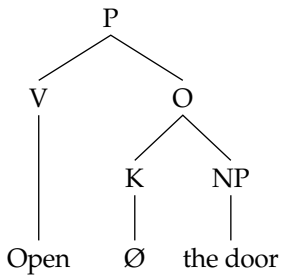
b.



c.



d.



(Fillmore 1968)

In Case grammar, the subject is derived by a transformation called 'subjectivization', which chooses as a subject the highest C in the case hierarchy, which goes as follows: agent, experiencer, instrument, object, source, goal, location, time (Fillmore 1971b).

The deep structures (11a–d) are realized as (11'a–d) by 'subjectivization':

(11') a. John opened the door with this key.
b. This key opened the door.
c. John opened the door.
d. The door opened.

The distribution of Cs is constrained by the condition that "P must be thought of as a list of formulas of the form seen in (11) [(7b) above] where at least one case category must be chosen and where the same case category never appears more than once" (Fillmore 1968: 24). This condition was adopted by the PPA as the Theta Criterion, with the addition of a clause that each noun phrase must have only one theta-role.

Fillmore shares with Gruber the idea that deep structure assumed by ST does not give sufficient information for the interpretation of sentences. Both of them contributed to the advancement of generative theory by showing the importance of semantic roles, which have a function distinct from grammatical relations of showing lexical relations of transitive and intransitive verbs, relations of sentences with source or goal for subjects, and similar structural relations. Fillmore went a step ahead by making claims for Universal Grammar, in particular claims

for the condition of "only one instance of each case in a simple sentence" and "subjectivization." His 'K', standing for all sorts of case markers, makes it easier to use the Case Grammar for analysis of languages with various types of case marking systems. For example, some Japanese linguists, especially those working on machine translation, found Case grammar most adequate to the description of Japanese syntactic structures, mainly because Japanese noun phrases, both arguments and adjuncts, are followed by case particles and because the Japanese subject does not have the same syntactic roles as the subject in languages like English.

With the works represented by Gruber and Fillmore, semantic roles, grammatical relations, and actual case marking started to be integrated into a modular system of grammar.

4 Transformational analyses of case in Japanese

In this section, systems of transformational case marking (or assignment) are reviewed, covering works ranging from Kuroda (1965) up to those based on the PPA in the 1980s.

Kuroda's seminal work (1965) laid the foundation for the transformational analysis of case in Japanese generative grammar. For more than 15 years, the basic tenet of his work was retained with only minor modifications. Kuroda himself summarizes his study along the line of this work in 1978, which will be reviewed in this section together with important modifications and additions by other linguists, working in the framework of EST in the 1970s and the PPA in the 1980s.

4.1 Structural cases vs. postpositions (unmarked vs. marked NPs in deep structure)

Kuroda (1965) proposed to introduce certain NPs without case particles into deep structures. Those NPs are called unmarked NPs, which are ready to get structural cases *ga* and *o* by case marking transformations. All the other NPs are introduced into deep structures already marked with postpostions. At the time of its appearance, the idea of distinguishing structural case particles from postpositions was in sharp contrast with the idea of introducing NPs marked by case particles (both structural case particles and postpositions) into the base. These particles were assumed to subcategorize verbs and adjectives (Inoue 1964, 1969, for example). Kuroda's concentration on the study of structural cases laid the foundation for research on the Japanese case system. This idea is maintained basically even in works under the MP.

The salient feature of Kuroda's approach is the cyclic assignment of *ga* and *o* according to the linear order of unmarked NPs. Let us call this approach linear cyclic case marking.

The ideas of unmarked NPs and transformational case marking were challenged by lexicalist approaches in the late 1970s and the early 1980s. However, the idea of linear case marking itself had never been called in question until the

emergence of recent works based on the PPA and the MP. The recent development in the framework of MP will be outlined in section 6.

4.2 Structural case marking dependent on transformational derivation of complex predicates

Beyond simple sentence structures, namely, transitive and intransitive sentences with root predicates, Japanese major sentence structures involve suffixation of bound forms with syntactic properties and semantic contents, such as the causative *(s)ase*, passive *(r)are*,[6] potential *(r)e* or *(r)are*, desiderative *ta(k)*, and so on. Furthermore, it is possible to chain them together as, for example, root-*sase-rare-tak* ('want to be caused to root'), deriving complex predicates. Under this circumstance it seems natural to assume lexical derivation of complex predicates disregarding syntactic changes caused by such derivational processes. However, this alternative has a serious drawback because it is impossible to show the case particle alternations caused by affixation of this sort by simply analyzing internal structures of predicates.

The sentence types extensively discussed by supporters of the transformational approach in relation to the Japanese case system are as follows:

A *o*- and *ni*-causatives

(12) a. Taroo ga Hanako o hatarak- ase- ta. (*O*-causative)
Taroo Nom Hanako Acc work- Cause- Past
'Taro made Hanako work.'

b. Taroo ga Hanako ni hatarak-ase-ta. (*Ni*-causative)
Nom Dat
'Taro let Hanako work.'

B Double object construction

(13) Titioya ga Taroo ni taikin o watasi-ta.
father Nom Taroo Dat a lot of money Acc give-Past
'Father gave Taro a lot of money.'

C Direct and indirect passives

(14) a. Katoo-san ga sinyuu ni damas-are-ta.
Katoo Nom best friend by deceive-Pass-Past
'Mr Kato was deceived by his best friend.' (Direct passive with an animate subject)

b. Seimon ga syuei niyotte maiasa ake- rare- ru.
main gate Nom guard by every morning open- Pass-Pres
'The main gate is opened by the guard every morning.' (Direct passive with an inanimate subject)

c. Taroo ga ototoo ni zyuuyoo syorui o yom-are- ta.
Taroo Nom brother by important document Acc read-Pass- Past
'Taro had his brother read the important document.' (Indirect passive)

D Sentences with stative psychological predicates

(15) a. watasi-tati ni mondai no honsitu ga yoku
we Dat problem Gen real nature Nom well
wakar-u koto.[7]
understand-Pres that
'that we can understand well the real nature of the problem.'

b. Boku ga Mary ga kowa- i koto.
I Top Nom fearful of-Pres that
'I am afraid of Mary.' (Kuno 1973c: 82)

c. watasi-tati ga mondai no honsitu ga yoku wakar-u koto.
Nom Nom

E *Ga-o*, *ni-ga*, and *ga-ga* potentials

(16) a. Katoo-san ga konna muzukasi-i zi o yom-e-ru.
Katoo Nom such difficult character Acc read-Pot-Pres
'Mr Kato can read such difficult characters.' (*ga-o* Potential)

b. Katoo-san ni konna muzukasii zi ga yom-e-ru.
Katoo Dat Nom (*ni-ga* Potential)

c. Katoo-san ga konna muzukasii zi ga yom-e-ru.
Katoo Nom Nom (*ga-ga* Potential)

F Desiderative sentences

(17) a. watasi-tati ga ongaku o narai-ta-i koto.
we Nom music Acc learn-want-Pres
'that we want to practice music.' (*ga-o* desiderative)

b. watasi-tati ga ongaku ga narai-tak-i koto.
Nom Nom (*ga-ga* desiderative)[8]

G Multiple nominative construction

(18) Bunmeikoku ga dansei ga heikinzyumyoo ga mizika-i.
civilized countries Nom men Nom average life span Nom short- Pres
'It is civilized countries that men-their average life-span is short in.'
(Kuno 1973c: 71)

H 'Tough' sentences

(19) Sensyu ni wa kono dai (kara) ga tobi-niku-i.
athlete Dat Top this springboard (from) Nom jump-hard-Pres
'This springboard is hard for athletes to jump from.' (Inoue 1978b: (6))

Hot issues involved in these sentence types are: (i) case marking with *ni* in (A), (B), (C), (D), (E), and (H); (ii) optional *ga* case marking on the object in (D) to (H), whose predicates are all stative.

On top of these sentence types the Double *O* Constraint as exemplified by (20) has been an issue involving the case system. (20a) is an *o*-causative with a transitive complement sentence:

I *O*-causative with transitive complement sentences

(20) a. Katoo-san ga kodomo ni nimotu o hakob-ase-ta.
Katoo Nom child Dat baggage Acc carry-Caus-Past
'Mr Kato made the child carry the baggage.'

b. *Katoo-san ga kodomo o nimotu o hakob-ase-ta.
Nom Acc Acc

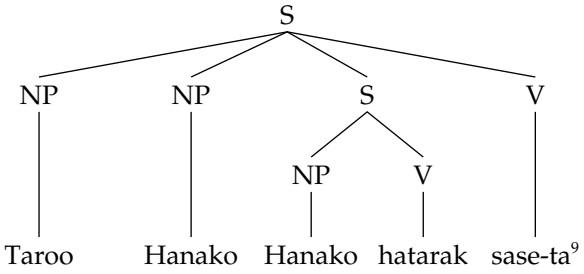
(20b) is derived by the regular *o*-causative derivation, but is ungrammatical due to the violation of the Double *O* Constraint. Details are given in 4.2.3.

4.2.1 Sentential complementation

The transformational approach assumes, in the first place, that the predicative affixes such as *(s)ase* (causative), *(r)are* (passive), *(r)e*, *(r)are*, (potential), *ta(k)* (desiderative), and so on are independent predicates requiring sentential complementation. (21b) is a rough sketch of the sentential complement structure of *o*-causative (12a), repeated below as (21a) (Kuno 1978b):

(21) a. Taroo ga Hanako o hatarak-ase-ta.
Taroo Nom Hanako Acc work-Caus-Past
'Taro made Hanako work.'

b.



The fact that in Japanese only the subject can be the antecedent of the reflexive form *zibun* was used as evidence for the assumption of sentential complement structures for complex predicates. Take (22) for example, both *Taro* and *Hanako* can be interpreted as the antecedents of *zibun*:

(22) [Taroo$_i$ ga Hanako$_j$ o [Hanako$_j$ ga zibun$_{i/j}$ no heya de hatarak] aseta]

Unless Hanako$_j$ is assumed to be present as the complement subject in deep structure, as indicated by (21b), its function as the antecedent of *zibun* cannot be accounted for.

As a corollary to the assumption of sentential complement structures for complex predicates, case marking is assumed to apply cyclically to this structure. This

assumption, originated by Kuroda (1965) and shared by the linguists supporting transformational case marking (Kuno 1973c; Inoue 1976; Kuroda 1978; Tonoike 1978, among others), reflects the insight that both simple and complex predicates require the same basic case alignments, namely, *ga*, *ga-o*, *(ga-ni-o)*.[10]

4.2.2 Cyclicity, verb raising, and Equi-NP deletion

Cyclic case marking and verb raising have been employed in all transformational case marking systems, with differences only in the treatment of the particle *ni* and Equi-NP Deletion. As for the analysis of major sentence structures, there have been various different proposals. Kuroda (1965) is based on ST. With the basic ideas of Kuroda (1965) intact, Kuroda (1978) extended its coverage of data, taking into consideration various claims and proposals made through the 1960s and 1970s, among which the most influential were Kuno (1973c) and Harada (1973). To discuss the whole range of structural case particle distribution, Kuroda (1978) is summarized as the point of departure, followed by alternative proposals relevant to case marking.

Despite all the original contributions to the theory of case marking in Japanese, Kuroda's system has certain limitations. One limitation is given here, because it is a keystone of the whole system. That is his admission of only *ga* and *o* as structural cases, as shown by (23), excluding all kinds of *ni* as postpositions, which results in an inability to account for the fact that an indirect object is readily passivized, as shown by the passive counterpart of (13), given below as (24).

(23) Mark the first unmarked noun phrase with *ga*, and mark any other unmarked noun phrase or phrases with *o*.

(24) Taroo ga titioya ni taikin o watas-are-ta.
Taroo Nom father by a lot of money Acc give-Pass-Past
'Taro was given a lot of money by his father.'

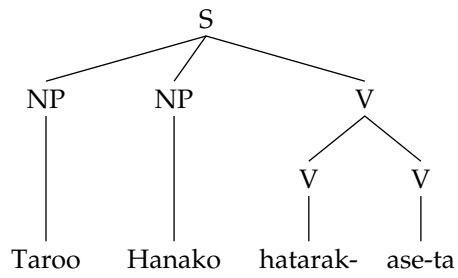
Applied to a simple transitive sentence, (23) derives the standard *ga-o* (Nom-Acc) case array of simple transitive sentences.

With this much overview, let us proceed with the discussion of Kuroda's case marking system.

Taking (21b) as an example let us see how (23) is applied. First *Hanako* in the complement sentence gets *ga* marked, since it is the first unmarked NP on this cycle. There is no other unmarked NP in the complement sentence, so we proceed to the second cycle, deleting the already case-marked NP *Hanako* by Equi-NP deletion on the basis of its coreferentiality with the object NP *Hanako* in the matrix sentence. (For the analysis of *o*-causative without the matrix object (Inoue 1976; Tonoike 1978), Equi-NP deletion is inapplicable.) Next the complement predicate *hatarak-* ('work') is raised and adjoined to the matrix predicate *(s)ase* deriving the complex predicate *hatarak-ase* ('cause to work'). Since the complement sentence loses its subject and predicate by Equi NP deletion and

Verb Raising respectively, the complement S node is deleted, resulting in the structure in (25):

(25)



To this structure rule (23) applies again. Since *Taroo* is the first unmarked noun phrase it gets *ga* marked, and Hanako, the other unmarked noun phrase, gets *o* marked on it. Thus, case marking proceeds cyclically based on the linear order of unmarked NPs. This is how (23) derives the case alignment of transitive sentences both simple and complex.

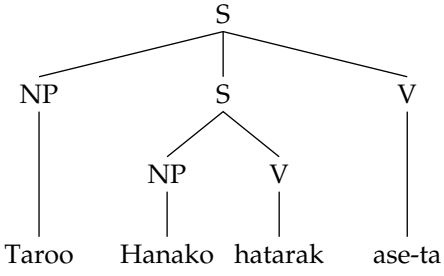
4.2.3 Subject ni*-raising and counter Equi-NP deletion*

To account for the other type of causative, namely *Ni*-causative, Kuroda introduces a transformational rule called subject *ni*-raising, "which makes the embedded subject a clause mate of the matrix verb and assigns it the particle *ni*"[11] (Kuroda 1978: 30).

The *Ni*-causative such as (12b), given below as (26a), is assumed to have the structure in (26b):

(26) a. Taroo ga Hanako ni hatarak-ase-ta.
'Taro let Hanako work.'

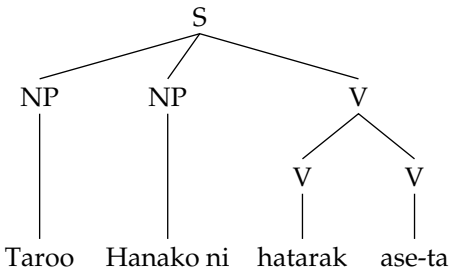
b.



Note that there is no extra NP in the matrix of this sentence. In the first cycle the first unmarked NP *Hanako* gets *ga* marked on it, followed by subject *ni*-raising and verb raising. Due to subject *ni*-raising, the complement subject *Hanako* receives *ni* on top of *ga*, resulting in Hanako *ga ni*. Since a noun phrase with *ga* or *o* is regarded as unmarked, doubling of structural cases as in *Hanako ga ni* is an inevitable consequence of cyclic case marking, so the deletion of the first case particle from such a sequence of structural case particles becomes obligatory.

(This rule is formalized by Kuno (1973c: 335) as *ga/o* Deletion, which reads: Delete *ga* and *o* if they are followed by some other particle.) After the embedded S node is deleted the sentence has the following structure:

(27)



Since *Hanako* is already marked with *ni*, Taroo is the first and only unmarked NP which receives *ga* by Rule (23). Thus, (A) sentence types, i.e. both *o*- and *ni*-causatives, are derived with the two additional rules, subject *ni*-raising and *ga/o* Deletion. This much has been widely accepted through the 1970s and the early part of the 1980s.

Subject *ni*-raising is employed extensively by Kuroda, in the derivation of the (A) *ni*-causative as given above, (C) indirect passive (14c), (E) *ni-ga* potential (16b), and (I) *o*-causative with a transitive complement sentence (20), most of them different in syntactic properties. They are all repeated below in (28):

(28) a. Taroo ga otooto ni zyuuyoo syorui o yom-are- ta. (= (14c))
Taroo Nom brother by important document Acc read-Pass-Past
'Taro had his brother read the important document.' (Indirect Passive)
b. Katoo-san ni wa konna muzukasii zi ga yom- e- ru. (= (16b))
Katoo Dat Top such difficult character Nom read-Pot-Pres
'Mr Kato can read such difficult characters.' (*Ni-Ga* Potential)
c. Katoo-san ga kodomo ni nimotu o hakob-ase-ta. (= (20a))
Katoo Nom child Dat baggage Acc carry-Caus-Past
'Mr Kato made the child carry the baggage.' (*o*-causative with a transitive complement sentence)

The complement sentences for those in (28) are (29a–c):

(29) a. Otooto ga zyuuyoo syorui o yon-da.
'His brother read the important document.'
b. Katoo-san ga konna muzukasii zi o yom-u.
'Mr Kato reads such difficult characters.'
c. Kodomo ga nimotu o hakon-da.
'The child carried the baggage.'

The indirect passive such as (28a) has a structure similar to that of *ni*-causatives like (26a), the only difference being in the matrix predicate selection, namely,

the selection of the passive *-are-* instead of the causative *-ase-*. The derivation proceeds exactly the same way as that of *ni*-causative.

For the analysis of direct passives, there have emerged two significant proposals, the uniform and non-uniform theories. The former proposes the same deep structure with a complement sentence for both direct and indirect passives. The latter proposes a derivation of direct passives distinct from that of indirect passives. (See Howard and Howard 1976 for details.) An early example is Kuno's (1973c) derivation of direct passives from their active counterparts.[12] The non-uniform analysis in the EST framework like Kuno (1973c) proposes a deep structure similar to that for English passives, as shown by (30):

(30) a. ___ be Verb-en NP (by NP) (English)
b. ___ (NP ni) NP Verb-rare (Japanese)

Both of these deep structures involve an empty subject position, which is filled by the moved object NP. In Kuno (1973c) the movement of the object NP precedes the case marking transformation, thus preventing the accusative case marking from applying to the object NP. In the subject position the object NP gets *ga* marked by subject *ga* marking. In the PPA, a rationale is given to object NP movement, roughly as motivated by the passive morpheme absorbing abstract case assigning ability from the transitive predicate it is attached to and suppressing the theta-role assigned by the predicate to the empty subject position. Thus, the object is left caseless, and its movement to the subject position is obligatory due to the case filter requiring that every lexical NP must have case assigned to it. Because of the subject theta-role suppression, the object NP carries on the theta-role assigned by the verb without violating the theta criterion, which requires only one theta-role for each NP. This basic tenet of passive derivation remains the same regardless of the changes of the case system through the development of generative theory.

Going back to Subject *ni*-Raising, which assigns *ni* to complement subjects, the use of this rule for the derivations of *ni*-causative and indirect passive has enjoyed acceptance, but the same does not hold with the use of this rule for potentials like (28b, c).

The base structure of a potential was assumed to be something like (31):

(31) [Katoo-san [Katoo-san konna muzukasii zi yom]e]ru

Applying rule (23) on the first cycle, we get [Katoo-san ga konna muzukasii zi o yom]. Equi-NP deletion and verb-raising derives [Katoo-san konna muzukasii zi o yom-e-ru]. To this structure (23) applies again, deriving (16a), repeated below as (32):

(32) Katoo-san ga konna muzukasii zi o yom-e-ru.
Katoo Nom Acc

Ni-ga potential sentences ((16b) = (28b) for example) pose a problem for Kuroda's system. To derive (28b) from (31), Kuroda has to resort to a nonstandard device, namely Counter Equi deletion, "a deletion rule that wipes out the copy of a noun phrase in the matrix clause under the control of the coreferential copy of the same noun phrase" (Kuroda 1978: 30). Here lies a theoretical problem, since this device is hardly legitimate under the present framework of generative grammar, because the structures derived by Equi-NP deletion were reanalyzed in EST as structures with PRO occupying the complement subject position. Application of Counter Equi results in a structure with PRO in the matrix subject position of (31) governed by the matrix I(nflection). This is counter to the PRO theorem, which requires that PRO be ungoverned. In Kuroda (1978) after Counter Equi wipes out the matrix subject, the complement subject is marked by *ni* and raised to the matrix clause. Since *ni* is treated as a postposition, and the complement subject is marked with a postposition, the first unmarked NP is *konna muzukasii zi* ('such difficult characters'), which is to be marked with *ga*. Thus (28b) is derivable in this system only by positing Counter Equi.

Even though the *Ni-ga* Potential case alignment is accounted for by this device, there are a few empirical problems. First, simple sentences of the (D) type, for example (15a), given below as (33a), can have the same case array. (33b) is an additional example:

(33) a. watasi-tati ni mondai no honsitu ga yoku
we Dat problem Gen real nature Nom well
wakar- u koto
understand-Pres that
'that we can understand well the real nature of the problem.'

b. kono gakusei ni konpyuuta ga deki- ru koto.
this student Dat computor Nom can do-Pres that
'that this student can use computers.'

In Kuroda's system, simple predicates like *wakar* ('understand') and *deki* ('can do') have to be analyzed as complex predicates involving a sentential complement structure.

The second empirical problem is the inability of this system to account for the *ga-ga* potential ((16c) for example, repeated below as (34)), since the object *ga* marking is dependent on the dative subject derived by subject *ni*-raising:

(34) Katoo-san ga konna mutukasii zi ga yom-e-ru.
Nom Nom

Due to the same reason, Kuroda (1978) is unable to derive (G) multiple nominative construction.

Counter Equi is also used by Kuroda to derive (28c), *o*-causative with a transitive complement, whose deep structure is assumed to be (35). In the first cycle of (35), *kodomo* ('child') and *nimotu* ('baggage') are assigned *ga* and *o* respectively.

In the second cycle Counter Equi is applied deleting the matrix object *kodomo*. The complement subject gets *ni* and is raised to the matrix:

(35) [Katoo-san kodomo [kodomo nimotu hakob] ase-ta]
'Mr Kato made his child carry the baggage.'

Putting this analysis in the EST framework, we have the deleted matrix object (kodomo) in (35) appear as PRO, governed by the matrix verb *-ase*. Thus, neither the PRO in (28b) nor that in (28c) is legitimate in EST and its followers.

If Equi-NP deletion is applied after *ga* and *o* marking to the complement subject and object, the complement subject *kodomo ga* is deleted and the case marking rule (23) is applied in the second cycle, resulting in (36):

(36) *Katoo-san ga kodomo o nimotu o hakob-ase-ta. (= (I) – (20b))
Nom Acc Acc

This sentence is ungrammatical due to the so-called Double *O* Constraint, originally proposed by Harada (1973). This is a problem for those following EST and subsequent theories along this line. One of the solutions by Kuno is given in the following section.

Finally Kuroda proposes the templates called 'canonical sentence patterns', which apply at the end of each cycle. These templates are necessary because he assumes that both Equi and Counter Equi-NP deletion are applied freely. The free application of these rules leads to overgeneration, which requires some filters to screen out ungrammatical case alignments.

(37) Canonical sentence patterns:

I	Transitive sentence pattern:	NP *ga* NP *o*
II	Ergative sentence pattern:	NP *ni* NP *ga*
III	Intransitive sentence pattern:	NP *ga*

Since Counter Equi-NP deletion is not permitted in the present framework, the templates (37), applied cyclically, have ceased to function in the intended way. Moreover, the surface filter makes cyclic transformational case marking redundant, since the filter admits only correct forms regardless of what kind of derivational processes have been followed.

The redundancy of cyclic transformational case marking was noted by lexicalist approaches, such as those proposed by Miyagawa (1980), Ostler (1980), Farmer (1980), and Inoue (1982a, 1982b), which worked out mechanisms for surface case marking.

However, surface templates of this type may be necessary anyway. (See for example Inoue 1997a for discussion of the Double *O* Constraint as a surface phenomenon.) There is also an important claim made by (37), namely the requirement that every sentence must have one Nominative NP. (Minimum One Nominative Requirement (Inoue (1998).) This requirement was called into

question by Inoue (1998), in the face of sentences with subjects marked with postpositions like *kara* ('from') and *de* ('with'), rather than *ga*.

Kuroda's original contributions to the theory of case can be summarized as follows: (i) the distinction between structural and inherent cases in terms of unmarked and marked NPs; (ii) the cyclic transformational case marking by which structural case alternations among *ga*, *o*, and *ni* are captured on the basis of syntactic derivation of complex predicates; (iii) the formulation of case marking rules as general as possible, avoiding the use of specific rules to deal with distributional facts.

Shortcomings of Kuroda's work on case in Japanese are amply revealed in (i) his proposals for Counter Equi-NP deletion, deriving the *ni-ga* potential as well as avoiding the Double *O* Constraint; (ii) the failure in accounting for multiple nominative constructions including the *ga-ga* potential; (iii) the inability to account for the occurrences of the *ni-ga* case alignment in sentences without sentential complements; (iv) the inability to account for the structural function of the indirect object, as exemplified by (24); (v) the proposal for canonical sentence patterns applying at the end of every cycle, invalidating his own cyclic case marking system.

4.3 Structural cases and grammatical relations 'subject', 'object', and 'indirect object'

Kuno (1973c) proposed a modification and extension of Kuroda (1965). His case marking system uses the notion of grammatical relations, as those in (38), in sharp contrast with Kuroda's linear case marking. Since grammatical relations are identified by syntactic structures, namely, the subject is defined as the NP immediately dominated by S, and the object as the one immediately dominated by VP, Kuno's case marking appears to be configurational. However, syntactic configuration is not crucially used in Kuno's system, as is clear from (38):

(38) a. Indirect object marking: Attach *ni* to the second of three unmarked NPs, that is, to the NPs that do not yet have a particle.
b. Subject marking: Attach *ga* to the subject NP.
c. Object marking: Attach *o* to the first nonsubject unmarked NP to the left of the main verb if it is [–stative], and *ga* if it is [+stative].

(Kuno 1973c: 330)

Employing Equi-NP deletion, Kuno has (38b, c) for marking both the subject and the object of potentials like (16c) with *ga* in the second cycle, deriving the *ga-ga* case alignment, thus overcoming Kuroda's limitation (ii). Since (38b, c) apply to sentences with simple stative predicates as well, the *ga-ga* case array, as in (15c), is also derivable. This saves Kuno's system from Kuroda's limitation (ii). As Object *ga* marking of stative predicates (38c) is optional in case the object is already marked with *o*, the *ga-o* potential case alignment (as in (16a) is derivable. Kuno avoids using Counter Equi and subject *ni*-raising to derive *ni-ga* combinations,

but uses the surface case alternation rule deriving the surface *ni-ga* sequence from the *ga-ga* case alignment (Kuno's *ga/ni* conversion). The problem with this device will be taken up in section 4.4 in relation to Saito's (1982) analysis.

In Kuroda's system the *ni* that marks the indirect object is a postposition rather than a structural case. However, the indirect object functions as a structural case, as shown by (24). Kuno provides indirect object *ni* marking (38a). Thus, the *ni* that marks the indirect object is a structural case particle in Kuno's system, which frees the system from Kuroda's limitation (iv) in relation to passivization using the indirect object.

4.4 Subjectivization

Sentence (18), repeated as (39), is a celebrated example of sentences with multiple nominative noun phrases given in Kuno (1973c). Multiple nominative noun phrases are restricted to sentences with stative predicates and predicates with the generic sense.

(39) Bunmeikoku ga dansei ga heikinzyumyoo ga mizika-i.
civilized countries Nom male Nom average life span Nom short- Pres
*'It is in civilized countries that men are such that their average life-span is short.'[13]

Kuno derives sentences like (39) by the transformational rule called Subjectivization:

(40) Subjectivization (tentative formulation) [optional]:
Change the sentence-initial NP-*no* to NP-*ga*, and make it the new subject of the sentence.
(Kuno 1973c: 71)

Rule (40) is applied to structures like the following:

(41) Bunmeikoku no dansei no heikinzyumyoo ga mizika-i.
Gen Gen Nom

By iterative application of this rule, (42) and (39) are generated step by step:

(42) Bunmeikoku ga dansei no heikinzyumyoo ga mizika-i.
Nom Gen Nom

Subjectivization was extended to apply to the first noun phrase either with *no* or *ni* (locative) iteratively. (43b) is an example of Subjectivization of a locative noun phrase:

(43) a. Sinsyuu ni taka-i yama ga takusan ar- u.
Sinsyuu Loc high mountain Nom many exist-Pres
'In Sinsyuu there are many high mountains.'

b. Sinsyuu ga taka-i yama ga takusan ar-u.
Sinsyuu Nom Nom

Subjectivization certainly filled the gap left by Kuroda's system.

The relevant transformational rules proposed by Kuno on top of Kuroda's rules are as follows:

(44) (i) Indirect object marking, (ii) Object *ga* marking in a sentence with a stative predicate, (iii) *ga*/*ni* conversion, (iv) Subjectivization.

To summarize, transformational analysis of case in Japanese made various claims, which laid the foundation for later development of this area of research. Important claims are repeated in (45) given below:

(45) a. distinction of structural cases from postpositions (unmarked vs. marked NPs in deep structure),
b. sentential complement structure for complex predicates,
c. cyclic application of case marking rules,
d. marking of the complement subject with *ni*,
e. linear case marking.

The following distributions of structural case particles were given special attention by those supporting transformational case marking and have continued to be targets of intensive study of case in Japanese. It is interesting to note that most of the important distributional facts about structural cases were already elucidated by the transformational study of case.

(46) a. *ga*:
i. assigned to subjects of sentences with finite predicates,
ii. assigned to objects of stative predicates,
iii. assigned to the first genitive or locative noun phrases in sentences with stative predicates (the case of multiple nominative construction).
b. *o*: 'Double *O* Constraint.'
c. *ni*:
i. assigned to subjects of certain stative predicates, those in (D), (E), and (H) in section 4.2,
ii. assigned to complement subjects of *ni*-causative and indirect passive,
iii. assigned to indirect objects.

The underlying principles of transformational case marking were maintained up to the end of the 1980s, with various modifications within the framework of the PPA. Among quite a number of proposals for refinements, Saito (1982), Takezawa (1987), and Kuroda (1986, 1988) will be taken up in section 5.

5 Refinements of transformational case marking under GB theory

Most of the works during the 1980s deal with the specifics of case marking mechanisms listed in (45). Saito (1982) makes various proposals for refinements of past works that depend upon a certain amount of specific structural devices.

Kuroda (1986) gives a detailed account of the *ga* marking of postpositional phrases in 'tough sentences' like (47):

(47) Sensyu ni wa kono dai (kara) ga tobi- niku-i.
athlete Dat Top this springboard (from) Nom jump- hard-Pres
'This springboard is hard for athletes to jump from.' (Inoue 1978b: (6))

Kuroda (1986) is a detailed study of nominative case marking on the basis of the linear case marking system proposed in his work in 1978. Takezawa (1987) proposes the 'Configurational Case-Marking' system on the basis of GB Case theory, while Miyagawa (1989b) follows standard GB Case marking with emphasis on the distinction between arguments and adjuncts in terms of the phrase structural difference between structural case marking (Miyagawa's cliticization of case particles to the preceding NPs) and the projection of postpositions into postpositional phrases (PPs).

Kuroda (1988) makes a claim against uniform employment of agreement induced by the case checking mechanism, which was proposed in the later development of GB theory. This work of Kuroda's is a kind of bridge to the MP.

5.1 Saito (1982)

Saito (1982) argues against Kuno's object *ga* marking for sentences with stative predicates (38c) and Subjectivization (40). (Problems (46)a(ii), (iii)). He proposes to assume *ga*, together with *ni*, as a base generated inherent case marker. He starts building his theory using arguments and data from Inoue (1978b), which proposes some revision of Kuno's case marking on the basis of her analysis of 'tough sentences' of Japanese.

Inoue (1978b) classifies 'tough sentences' into the following four types:

Type I: Gakusei ni wa kono zisyo ga tukai- yasu-i.
student Dat Top this dictionary Nom use- easy-Pres
'This dictionary is easy for students to use.' (Inoue 1978b: (1)).
(More examples are given below in (48).)

Characteristics:

(i) Undergoes subject *ni*-raising by Kuroda and object *ga* marking for stative sentences by Kuno, resulting in the *ni-ga* case alignment.

(ii) Requires [+Self-controllable] complement predicates.[14]
(iii) Requires that an intransitive sentence have an additional NP other than the subject.
(iv) Permits *ga* marking on postpositional phrases.

Type II: Saikin watasi wa netuki- niku-i.
Recently I Top get to sleep hard-Pres
'It has recently been hard for me to get to sleep.' (Inoue 1978b: (10))

Characteristics:

(i) Disallows subject *ni* raising.
(ii) Requires [+Self-controllable] complement predicates.
(iii) Behaves like psychological predicates, expressing the subject's judgment. (See Inoue 1978b for details.)

Type III: Senzai wa yu ni toke- yasu-i.
detergent Top warm water in dissolve easy-Pres
*'Detergent is easy to dissolve in warm water.' (Inoue 1978b: (25))

Type IV: Awatemono wa ziko o okosi- yasu-i.
hasty people Top accident Acc cause tend to-Pres
'Hasty people tend to cause accidents.' (Inoue 1978b: (31))

Characteristics shared by types III and IV:

(i) Disallows object *ga* marking.
(ii) Requires [-Self-controllable] complement predicates.

The class most relevant to Saito's case system is type I, in which not only objects but also other oblique NPs originally with various postpositions are marked with *ga*, as shown in (48):

(48) a. Gakusei ni wa kono zisyo ga tukai- yasu-i.
student Dat Top this dictionary Nom use- easy- Pres
'This dictionary is easy for students to use.' (object NP)
b. Tosiyori ni wa kono toori ga kaimono o si- niku-i.
aged people Dat Top this street Nom shopping Acc do- hard-Pres
'This street is hard for aged people to shop around.' (NP with *de*)
c. Kodomo ni wa ano isu ga suwari- niku-i.
child Dat Top that chair Nom sit- hard-Pres
'That chair is hard for a child to sit on.' (NP with *ni*)
d. Sensyu ni wa kono dai (kara) ga tobi- niku-i.
athlete Dat Top this springboard (from) Nom jump- hard-Pres
'This springboard is hard for athletes to jump from.' (NP with *kara*)
(Inoue 1978b: (1), (2), (4), (6))

What is important here is that Kuno's rules cannot account for (48b, c, d), in which postpositions are replaced by *ga*. (48d) even has the possibility of retaining the postposition *kara*. Inoue proposes to generalize the application of object *ga* marking to cover NPs with postpositions.

In view of these facts, Saito (1982) assumes that the nominative case particle *ga* is inherent in that it is base generated with an NP, whereas accusative case is assigned by the verb. First he takes up sentences with multiple subjects like (39), repeated below as (49), those with objects and oblique arguments marked with *ga* as in (50) and (51) respectively, and those derived by a rule called *ga-no* conversion, exemplified by (52b):

(49) Bunmeikoku ga dansei ga heikinzyumyoo ga mizika-i.
*'It is in civilized countries that men are such that their average life-span is short.'

(50) Dare ga/ni kore ga deki- ru ka.
who Nom/Dat this Nom can-do-Pres Q
'Who can do this?' (Saito 1982: (3))

(51) Sensyu ni wa kono dai (kara) ga tobi- niku-i.
athletes Dat Top this springboard from Nom jump hard-Pres
'This springboard is hard for athletes to jump from.' (Inoue 1978b: (6))

(52) a. John ga hon o kai- ta.
John Nom book Acc write- past
'John wrote a book.'
b. John ga/no kai- ta hon
Nom/Gen write- Past book
'the book John wrote'
c. hon o/*no kai- ta John
book Acc/Gen write- Past

The sentences in (52) show that in a relative clause the nominative *ga*, but not the accusative *o*, can be converted to genitive *no*.[15]

Saito calls the *ga* phrases traditionally derived by Subjectivization 'focus with nominative case' in order to distinguish them from the 'subject'. He bases his assumption on distributional facts about multiple nominative phrases and semantic characteristics of sentences with them. In the first place, he argues that *ga* appears with a locative phrase as in (53b):

(53) a. Los Angeles ni nihonzin ga oo- i.
Los Angeles in Japanese Nom many- Pres
'There are many Japanese people in Los Angeles.'
b. Los Angeles ga [$_S$ nihonzin ga oo-i]
Nom
'Los Angeles is such that many Japanese reside there.' (Saito 1982: 7)

Next, the ungrammaticality of (54b) indicates that there should be some kind of 'aboutness' relation between the *ga* phrase and the remaining portion of the sentence:

(54) a. [$_{NP}$ ame no hi] ga tuzuite i-ru
rain Gen day Nom continuing Pres
'It has been raining for several days.'
b. *ame ga [$_{S}$ hi ga tuzuite i-ru]
Nom
(Lit. 'Rain is such that days are continuing.') (Saito 1982: 8)

Since it is impossible to perceive an 'aboutness' relation between *ame* and the rest of the sentence, (54b) is ungrammatical. The fact that multiple nominative phrases usually appear in sentences with stative verbs and verbs with generic tense can be accounted for by this requirement of 'aboutness' relation, which leads to the interpretation of the rest of the sentence as a statement about a property of the subject.

The 'focus with nominative' phrases in (49–51) and (53) can be replaced by topic phrases. Moreover, topic phrases require the 'aboutness' relation as well, and might be assumed to be base generated. This gives support to the assumption of base generation of 'focus with nominative case'. As additional support for this assumption, Saito uses the fact that 'focus with nominative case' behaves in the same way as topics in terms of the Double *O* Constraint:

(55) Kono hon wa [$_{S}$ Mary ga John *o/ni [e_i] yom- ase- ta].
this book Top Mary Nom John Acc/Dat obj read- cause- Past
'This book, Mary made John read it.' (Saito 1982: 17)

(56) a. John wa Tom *o/ni ano hon o yom- ase-ta-katta n daroo.
John Top Tom Acc/Dat that book Acc read- cause-want-Past tagQ
'John wanted to make Tom read that book, didn't he?'
b. Iya, kotti no hon no hoo$_i$ ga [$_{S}$ John wa Tom *o/ni [e_i]
No, this side Gen book Gen rather Nom Top Acc/Dat
yom- ase-ta- gatte i-ta.
read- Cause- want-appear- Past
'No, it was rather this book that it appeared that John wanted to make Tom read it.'

In order to support his assumption, rather than Subjectivization, Saito gives multiple nominative phrases underivable by this transformation. (53) with a Locative phrase is one of them. Some additional examples are given below:

(57) a. Kono atari no biru kara wa (gozi goro ni naru to)
this around Gen building from Top 5 o'clock about become when
hito ga oozei de-te ku- ru ne.
person Nom many getting out come- Pres Tag
'When it becomes about 5, there are many people coming out from buildings around here, aren't there?'

b. Aa, nakademo soniibiru (kara) ga [$_S$ itiban hito ga
yes among them Sony Building from Nom most person Nom
ooku dete kuru yo].
many getting out come
'Yes, among those buildings, the one from which the largest number of people come out is the Sony Building.' (Saito 1982: 13)

(57b) is an example of *ga* following an oblique argument, the *kara* phrase.

(58) ?Kono syu no hon$_i$ ga [$_S$ kodomo- tati ga [e$_i$] yomi-ta- gar- u].
this kind Gen book Nom child- pl Nom obj read-want- appear- Pres
'It is this kind of book that it appears that children want to read.'
(Saito 1982: 13)

(58) is the case of an object marked with *ga*, while in (59) the object modifier *Chicago no hoo* has this type of *ga*:

(59) Boston yori mo Chicago no hoo ga [$_S$ John wa (sono) huyu no
Boston than Chicago Gen rather Nom John Top its winter Gen
samusa ga tae rare-nakat- ta].
coldness Nom bear can not- Past
'It was Chicago rather than Boston that John could not stand its cold winter.'
(Saito 1982: 14)

Furthermore, in some cases the nominative phrase does not bind any position in the sentence, as in (60) and (61):

(60) (Yahari) natu ga [$_S$ biiru ga uma- i].
after all summer Nom beer Nom tasty Pres
'After all, it's during the summer that beer tastes good.'

(61) (Sizenkagaku no naka de wa) kotosi wa buturi ga
natural science Gen within Top this year Top physics Nom
[$_S$ syuusyoku ga taihen da].
getting a job Nom difficult- Pres
'Among the natural sciences, this year, physics is the area where it is difficult to get a job.' (Saito 1982: 14)

To account for all these facts Saito postulates (62), which recursively generates 'focus with nominative case':

(62) S $\Rightarrow$ XP S, where X = [–V]
[nom.] (Saito 1982: 16)

This rule permits free generation of "focus with nominative case," and in order to block over-generation, exemplified by (54b), the semantic constraint in terms of 'aboutness' requirement is utilized.

Examples like (63) indicate that nominative case is allowed in the subject position of a nonfinite clause. It is impossible to assume that the focus phrase in the complement of (63) gets *ga* assigned to it by Infl of the matrix, since this implies case assignment across the sentence boundary:

(63) [$_S$ ame ga huri] hazime- ta
rain Nom fall start- Past
'It started to rain.'

This is a piece of evidence in conflict with the assumption of nominative Case assignment by Infl(ection), which is one of the claims of GB Case theory.

Saito concludes, "both 'focus' and 'subject' take nominative case because nominative case marks the semantic role 'recipient' on the NPs that are immediately dominated by S, and their case is inherent in that it is not given by any element" (Saito 1982: 3). In this grammar, 'focus' and 'subject' are not distinct syntactic elements, but only different in the configurations in which they appear, as shown by (64):

(64) a. 
b. 
The object and oblique phrases marked by *ga*, as those in (48), are also claimed to be a case of 'focus with nominative case'. Saito's argument starts with *ga* marked objects in potential sentences like (34), and (28b), repeated below as (65):

(65) a. Katoo-san ga konna muzukasi-i zi ga yom-e- ru.
Nom such difficult character Nom read-Pot- Pres
b. Katoo-san ni (wa) konna muzukasi-i zi ga yom-e-ru.
Dat Nom
'Mr Kato can read such difficult characters.'

Compare this analysis with Kuno's. The objects are marked with *ga* in (65a, b) by Kuno's object *ga* marking for stative verbs, (38c) given above. Kuno further derives (65b) from (65a) by the *ga-ni* conversion rule.

Saito takes up potentials that contain oblique phrases with *ga*. The situation is the same as has been demonstrated with 'tough' sentences:

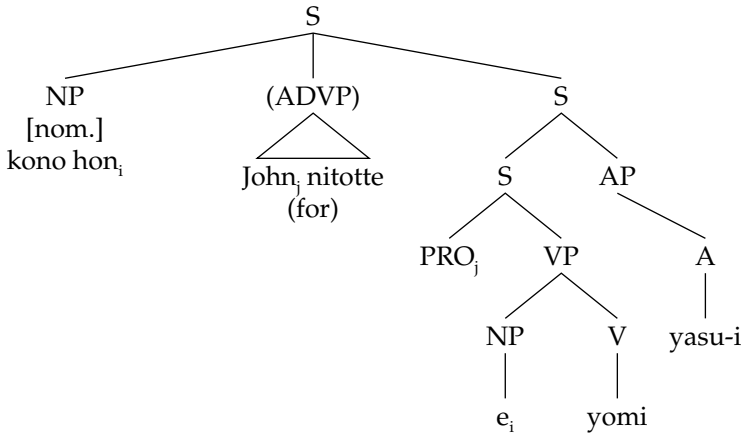
(66) Yahari bokura ni wa [daigaku no tosyokan ga itiban otituite
after all we for Top university Gen library Nom best calmly
benkyoo deki- ru.
study can- Pres
'After all, for us, the university library is the place we can study quietly.'
(Saito 1982: 64)

Using the fact that arbitrary PRO can appear only in an embedded clause as is shown by (67b), he argues for the underlying structure (67c), which he assumes for potentials like (67a):

(67) a. Kooitta gorakueiga ga rirakkususite tanosim-e- ru.
this kind of entertainment movie Nom relaxing while enjoy-Pot- Pres
'You can relax and enjoy this kind of entertainment movie.' (Saito 1982: 31)
b. *PRO_{ARB} kooitta gorakueiga o rirakkususite tanosim-e-ru
c. kooitta gorakueiga$_i$ ga [$_S$$PRO_{ARB}$ [e$_i$] rirakkususite tanosim-e-ru]

A discussion in the same vein is given to type I 'tough' sentences, with the proposal of (68b) as the underlying structure for a type I like (68a):

(68) a. kono hon ga (John nitotte) yomi-yasu-i (Saito 1982: 38–39)
b.



It is concluded that the *ni*-phrase in potentials and the *ni* or *nitotte* phrase in 'tough' sentences are postpositions "that govern an argument of a verb that cannot be lexically expressed as the subject or the object" (Saito 1982: 88). Their function is that "of specifying the semantic content of the unexpressed subject" (p. 86). This generalization is claimed to account for all the functions of *ni* in the following constructions: (i) the subject marker in a potential sentence such as (66), (ii) the complement subject marker in *ni*-Causatives like (12b), (iii) the *o*-causative with a transitive complement sentence such as (28c), (iv) the agent marker in direct and indirect passives such as those in (14), (v) the indirect object marker in double object constructions exemplified by (13).

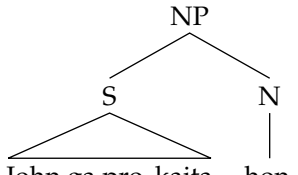
Thus, the case marking system is simplified tremendously in that *ga* and *ni* are treated as inherent case markers, and *o* is the only structural case assigned by the verb.

Finally, Saito follows Bedell's (1972) restructuring analysis of *ga-no* alternation in a relative clause, shown by (52), repeated below as (69):

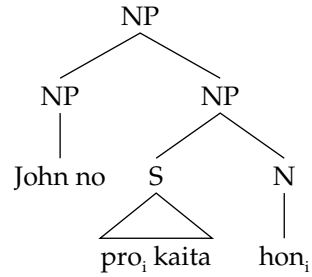
(69) a. John ga/no kai-ta hon.
'The book John wrote.'
b. hon o/*no kai-ta John

The reanalysis goes as in (70):

(70) a.



b.



No is assigned in the configuration (70b). Since restructuring does not leave a trace, the verb, an accusative case assigner, loses its assignee if the object NP undergoes restructuring. This is why (69b) with *o-no* alternation is not permitted. *ga-no* conversion does not cause ungrammaticality because pro$_i$ remains as the case assignee in (70b).

(71) and (72) give a summary of Saito's analysis in comparison with assumptions and specific proposals made by influential transformational analyses of Japanese case, given above as (45) and (46). (The proposals explicitly or tacitly adopted by Saito are omitted.)

(45) a. the distinction of structural cases from postpositions

(71) a. The distinction is kept, but the object is the only unmarked NP, the subject being marked inherently with *ga*.

(45) d. marking of the complement subject with *ni*

(71) d. All the following functions are borne by *ni* as an inherent case marker: (i) the subject marker in a potential sentence such as (65b), (ii) the complement subject marker in *ni*-causatives like (12b), (iii) the *o*-causative with a transitive complement sentence such as (28c), (iv) the agent marker in direct and indirect passives such as those in (14), (v) the indirect object marker in double object constructions exemplified by (13). (Due to this analysis the structural relations among relevant sentences are left unaccounted for.)

(45) e. linear case marking

(71) e. Rejected. In accordance with GB theory, accusative case marking by the verb is assumed.

(46) a. *ga*: (i) assigned to subjects of sentences with finite predicates

(72) a(i) *ga* is an inherent case, and an NP with *ga* is inserted in the position dominated by S as the sister to VP (see (64b)).

(46) a. *ga*: (ii) assigned to objects of stative predicates

(72) a(ii) inherent case, which marks foci. It is a well-known fact that *ga* marked objects are not necessarily interpreted as foci. (This is one of the weaknesses of this analysis.)

(46) a. *ga*: (iii) assigned to the first genitive or locative noun phrases in sentences with stative predicates.

(72) a(iii) inherent case, which marks foci. (The relation between sentences with genitive such as (41) and those with nominative like (39) is lost entirely.)

(46) b. Double *O* Constraint

(72) b. used only as a piece of evidence for the discussion of the similarity between sentences with foci and those with topics, saying that they both obey the Double *O* Constraint.

(46) c. *ni*: (i) assigned to subjects of potential and 'tough' predicates, (ii) assigned to complement subjects of *ni*-causatives and indirect passives, (iii) assigned to indirect objects.

(72) c. *ni*: (i), (ii), and (iii) are treated in the same way, as postpositional phrases adjoined to S. (i) and (ii) have the *ni*-phrases co-indexed with PRO in the complement sentences. These postpositional phrases specify the content of the empty subject PRO. (iii) has the *ni*-phrase co-indexed with a lexically unexpressed object, a kind of empty category, whose content is specified by this postpositional phrase.

Even though there is not much support for Saito's claim that there is no difference between 'focus with nominative case' and the subject in terms of their syntactic and semantic function, this work is a step toward a unified approach to the analysis of nominatives in Japanese, which involves three distinct rules in Kuno's system, namely, subject marking, stative object *ga* marking, and Subjectivization. It should be noted that this work rejects structure dependent *ga* assignment. By positing PRO co-indexed with 'focus with nominative case' or the subject, both of which are dominated by S, Saito maneuvers to account for the specific syntactic and semantic role the subject plays, that is, the role as the antecedent of anaphors and as the trigger of subject-orientated honorific expressions.

5.2 Kuroda (1986)

5.2.1 Movement of noun phrases

Kuroda (1986) is an extended study of *ga* marking on the basis of Kuroda (1978), more specifically, Linear Case Marking (LCM), Equi and Counter Equi, and verb raising, renamed Predicate Agglutination. His careful study of type I 'tough' sentences has led him to contend that movement of noun phrases to subject position (A movement) is involved in the derivation of this type of construction. This analysis is extended to the analysis of multiple *ga* constructions.

Note first the contrast between 'tough' sentences and potentials as revealed by the sentences in (73) and (74):

(73) a. Masao nitotte (wa) sono yuubinkyoku kara ga kozutumi o
Masao to that post office from Nom package Acc
okuri-yasu-i.
send-easy-Pres
'It is easy for Masao to send packages from that post office.' ('tough')

b. *Masao ni (wa) sono yuubinkyoku kara ga kozutumi o okur-e- ru
Acc send-Pot-Pres
'Masao is able to send packages from that post office.' (potential)
(Kuroda 1986: (14), (15))

(74) a. Masao nitotte (wa) sono yuubinkyoku kara kozutumi
from
ga okuri-yasu-i.
Nom ('tough')

b. Masao ni (wa) sono yuubinkyoku kara kozutumi
from
ga okur-e-ru.
Nom (potential)

Kuroda assumes the deep structures (75) and (76) for 'tough' and potential constructions respectively. [e] is in the matrix non-theta subject position.

(75) [Masao nitotte [e] [Masao sono yuubinkyoku kara kozutumi okuru] yasu-i]

(76) [Masao [Masao sono yuubinkyoku kara kozutumi okur] e-ru]

(74a) is the result of moving *sono yuubinkyoku kara* ('from that post office') to the empty subject position ([e]). To permit *ga* marking on this phrase, Kuroda introduces the following principle:

(77) NP movement makes an inherent case-marker (a postposition) attached to an NP invisible to LCM. (Kuroda 1986: 31)

'Invisible' means that LCM ignores the presence of postpositions attached to moved NPs and interprets them as unmarked NPs subject to LCM. Since no movement is involved in (74), there is only the possibility of *ga* marking of the object (as in (74b)), which is the first unmarked NP after Counter Equi is applied and the complement subject is marked with *ni* by subject *ni*-raising. (75) can follow the same procedure of *ga* marking on the object.

Thus, *ga* marking on postpositional phrases is permitted in 'tough' sentences but not in potentials. The former involves NP movement, while the latter does not. This is the cause for the difference in grammaticality.

When NP movement is applied to *sono yuubinkyoku kara* and object *ga* marking to *kozutumi*, the result is the multiple *ga* sentence (78a). A similar situation holds with potentials as revealed by (78b):

(78) a. Masao ni totte sono yuubinkyoku kara ga kozutumi ga okuri-yasu-i.
Nom Nom

b. Sono yuubinkyoku kara ga ookina kozutumi ga okur-e- ru.
that post office from Nom big package Nom send-Pot- Pres
'One can send big packages from that post office.'
(Kuroda 1986: (92))

Kuroda claims that potential and 'tough' sentences with multiple *ga* phrases can be derived by Subjectivization together with those already discussed in section 4.4, namely (39), (43b), and those introduced in section 5.1 as focus phrases by Saito, namely, (53b), (56b), (57b), (58), (59), (60), and (61). Subjectivization is assumed by Kuroda as a phenomenon "which results as an effect of a rule making a constituent of a surface sentence with a stative predicate a 'major' subject" (Kuroda 1986: 274). "A (syntactically defined) stative predicate may be generated with a non-theta subject site Chomsky-adjoined to the main S node" (p. 274). This non-theta subject site may be filled by an argument or an adjunct moved from inside S. The deep structure of sentences of this type of subject (called 'major' subject) is (79a) with the surface structure (79b). (79c) is the deep structure of further multiplication of *ga* phrases.

(79) a. $[[e]\ [\ \ldots NP \ldots\ ]_S]_S$
b. $[NP\ [\ \ldots [t] \ldots\ ]_S]_S$
c. $[[e]\ [\ \ldots [[e]\ [\ \ldots NP \ldots\ ]_S]_S \ldots\ ]_S]_S$

Instead of *nitotte*, *ni* may appear in 'tough' sentences, which is the result of Counter Equi and subject *ni* raising in Kuroda's grammar.

5.2.2 Two types of potentials

As stated before, Kuroda's system does not permit postpositional phrases in potentials to get *ga* marked, contrary to the case of 'tough' sentences, since there is assumed to be no non-theta empty subject position in potentials as indicated by the deep structure (76). (80) is judged as ungrammatical by Kuroda and many

other native speakers, since *kono bed* ('this bed') is originally marked with the postposition *de* ('in'):

(80) *Masao ni (wa) kono beddo ga nemur-e- ru.
Masao Dat Top this bed Nom sleep-Pot- Pres
'Masao can sleep in this bed.'

However, there are counterexamples like (66) given by Saito (1982), repeated below as (81):

(81) Yahari bokura ni wa [daigaku no tosyokan ga itiban otituite
after all we for Top university Gen library Nom best calmly
benkyoo deki- ru.
study can- Pres
'After all, for us, the university library is the place we can study calmly.'

(82) Kotosi wa Amerika-zin ni wa yooroppa (ni) ga yasuku ik-e- ru.
this year Top American Top Europe Nom cheaply go-Pot- Pres
'Americans can go to Europe economically this year.'

Since this type of potentials typically have adverbs like *itiban* ('best') and *yasuku* ('economically'), Kuroda proposes (83), similar to that of 'tough' sentences, for the deep structure of sentences like (81) and (82). *Nitotte* in (83) alternates with *ni*, as in the case of 'tough' sentences.

(83) NP_1 nitotte [e] [NP_1 . . . V] Adv e-ru (Kuroda 1986: (80))

5.2.3 Focus reading

The subject of a root (matrix) sentence with a stative predicate is interpreted as a focus, which is phrased as 'exhaustive listing' by Kuno. Since *yasu-i* ('easy') and *niku-i* ('hard') are adjectives and necessarily stative, the noun phrase or postpositional phrase moved to the empty subject position gets this 'focus' reading. Kuroda's focus is thus in sharp contrast with Saito's, which is assumed to be syntactically determined. Kuroda's focus reading is predicted by the general interpretive rule (84):

(84) The subject *ga* phrase of a root sentence describing a state (as opposed to a specific event, action, situation, etc.) is interpreted as 'focused'.
(Kuroda 1986: (42))

The major subject is given interpretation by (84) as well.

5.2.4 Wa-ga *alternation*

The *wa* attachment transformation proposed in his dissertation (1965) is one of the most important theoretical contributions Kuroda made. ST assumed that

transformations do not change meaning, which was called into question by this transformation because noun phrases, adverbs, verb and adjective stems assume an additional meaning 'topic' when they get *wa* attached to them. Since the time of appearance of this dissertation, topicalization has been intensively studied from the point of view of Universal Grammar. Among many questions raised in this process, the question of whether topic phrases are derived by movement transformation or are base generated is still a lively issue. Kuroda (1986) contends that all *wa* phrases are derived by movement.

As for the semantic distinction between *wa* and *ga*, Kuno (1973c) gives the following distinctions: *wa*: theme and contrast; *ga*: exhaustive listing, neutral description, and object marking (1973c: 38).[16] These distinctions have been accepted widely. Kuroda's focus reading, given above, corresponds to Kuno's exhaustive listing. Kuroda (1992) gives a detailed account of the judgment forms expressed by topicalized and nontopicalized sentences, more specifically the topic *wa* phrase as the subject in logic and the subject *ga* phrase as a syntactic subject. A sentence with a topic *wa* phrase expresses categorical judgment (subject–predicate relation in logic), while one with a subject *ga* phrase expresses thetic judgment, which describes perceived events.

Inoue (1982a) is a study of *wa* and *ga* as syntax and semantics interface problems. With regards to the syntactic aspect, Inoue points out that topic phrases and *ga* phrases with an exhaustive listing reading share the following characteristics: both must be definite or generic noun phrases, and both must permit multiple occurrences. Neither the contrastive *wa* nor the neutral description *ga* has these characteristics.

As Kuroda (1986) admits, the semantic and pragmatic functions of *wa* still await thorough studies before a relevant generalization emerges. Thus, an all round discussion of topic phrases will take us too much afield, so they are discussed here only with respect to *wa-ga* alternation.

Even though an extensive parallel distribution is observed between *wa* and *ga*, there are cases where *wa* phrases cannot be replaced by *ga* phrases as in (85c, d):

(85) a. Masao ga eigo o hanas- u.
Masao Nom English Acc speak- Pres
'Masao speaks English.'

b. Masao wa eigo o hanas- u.
Top English Acc speak- Pres (topicalized version)

c. Eigo wa Masao ga hanas- u.
English Top Nom speak- Pres
*'English, Masao speaks.'

d. *Eigo ga Masao ga hanas-u
English Nom Nom speak-Pres (subjectivized version)

(Kuroda 1986: 281)

Kuroda claims that some apparent in situ major subjects like those in (60), (61), and (66) are derived by Subjectivization, thus binding some positions in base sentences, and that subjects and major subjects can be moved to the topic position dominated

by S'. In (85b) the subject *Masao* is topicalized, while *eigo* in (85d) is unable to be subjectivized due to the non-stativity of the predicate *hanas* ('speak'). Even though *eigo* can be topicalized as in (85c), its subjectivization is impossible. In the potential sentences in (86), *eigo* can undergo topicalization as well as subjectivization:

(86) a. Masao ga eigo ga hanas-e- ru.
Masao Nom English Nom speak-Pot- Pres
'Masao can speak English.'
b. Eigo ga Masao ga hanas-e-ru. (subjectivized version)
Nom Nom
'It is English that Masao can speak.'
c. Eigo wa Masao ga hanas-e-ru. (topicalized version)
'As for English, Masao can speak it.'

5.3 Takezawa (1987)

By 'configurational case marking', Takezawa means a system within GB theory which crucially uses the principle of government,[17] structurally determined on the basis of the notion of C-command.[18] Even though the works by Kuroda, Kuno, and some others use configurational structures in their grammars, their case marking systems are linear rather than configurational.

Takezawa (1987) depends fully on GB Case theory, which consists of (i) abstract Case assignment, namely Nominative is assigned by (I)nflection to the NP in the specifier position of IP,[19] while accusative is assigned by V, and (ii) Case filter (87).

(87) *NP if NP has phonetic content and has no case. (Chomsky 1981: 49)

Besides case theory Takezawa makes crucial use of Chomsky's (1981) rule R (the former affix hopping, namely, lowering tense to attach to [+V] lexical items), and S' deletion to trigger exceptional case marking.

5.3.1 Ga *marking*

Let us start with the *ga* marking in Takezawa's analysis. First taken up are familiar examples (49), (50), and (51), which are representative of sentences with multiple *ga* phrases, the *ni-ga* case alignment, and postpositional phrases with *ga*:

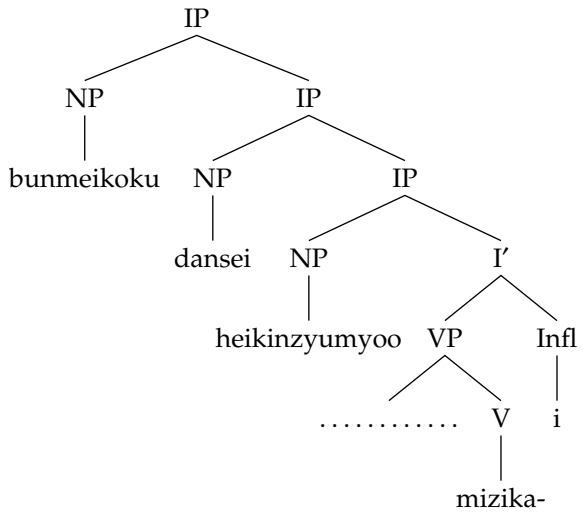
(49) Bunmeikoku ga dansei ga heikinzyumyoo ga mizika-i.
'It is in civilized countries that men are such that their average life-span is short.'

(50) Dare ga/ni kore ga deki-ru ka.
'Who can do this?'

(51) Sensyu ni wa kono dai (kara) ga tobi-niku-i.
'This springboard is hard for athletes to jump from.'

According to GB case theory, *ga* is marked by the tense dominated by Infl(ection) (Infl-tense by Takezawa). The subject of (49), *heikinzyumyoo* ('average life span') is generated in the IP Spec position, and case marked with *ga* by its governing head Infl-tense. The extra NPs, *bunmeikoku* ('civilized countries') and *dansei* ('men') can be similarly case marked by Infl-tense, by assuming the adjunction of these NPs to IP, generating a structure like (88):

(88)



Since in the structure (88) Infl governs all the NPs in the IP Spec position, Infl can be assumed to assign Nominative case to more than one NP, if the unique assignment of abstract case to one NP, as is assumed by GB, is discarded. Kuroda (1988) gives convincing arguments for this point. See section 5.4 for details. Ura (1996) uses the multiple nominative construction as evidence most relevant to the assumption of multiple feature checking (section 6).

Ga marking of the object of the stative predicate was first formalized by Kuno as (38c). Takezawa tries to give principled arguments, rather than a stipulative statement like (38c), to account for this phenomenon on the basis of each predicate's case assigning property. For example, *wakar* ('understand'), the potential *(r)are/(r)e*, the passive *(r)are*, and the tough morpheme *yasu-i/niku-i* are devoid of this property. Takezawa summarizes the object *ga* marking mechanism in (89):

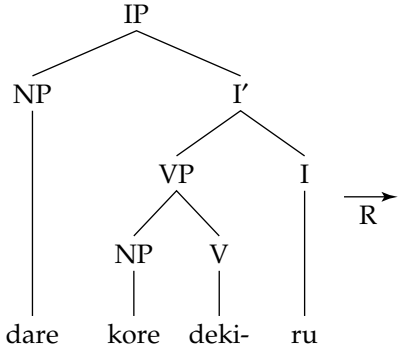
(89) a. Stative verbs like *wakar* ('understand') do not have case assigning ability, although they have an 'unmarked' (i.e., non-pp) internal argument.
b. Japanese does not have a P-insertion rule analogous to English *of*-insertion (that inserts a dummy P to the un-case marked object position).
c. The internal argument cannot undergo movement to the subject position because the subject position is a theta position.
d. Therefore, rule R, which lowers Infl into VP, must apply to assign case to the internal argument.

e. After being moved into VP, the lowered Infl may or may not govern the subject ("optionally governs" the subject). (Takezawa 1987: 104)

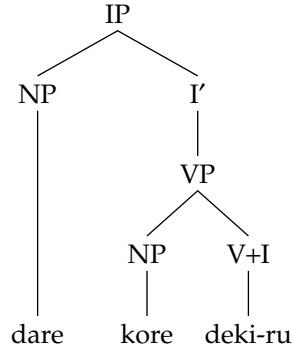
The analysis of stative sentences like (50) goes as follows, using rule R:

(50) Dare ga/ni kore ga deki-ru ka?
'Who can do this?' (Takezawa 1987: 84)

(90) a.



b.



R

Due to the factors listed as (89a–c), application of rule R yields the result that the internal argument *kore* is governed by the lowered Infl (I in (90b)) and assigned *ga*. Without Infl in the matrix the external argument (the subject) is no longer governed in the usual way. Here comes in the stipulation (89e). If the lowered Infl governs the subject, *ga* assignment to the subject takes place. Without government by Infl the subject must wait for another device to avoid the Case filter.

5.3.2 Ni *marking*

Takezawa continues his summary (89):

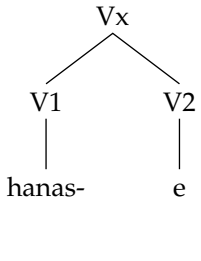
(89) f. Because Japanese has a rule which inserts the dummy postposition *ni* after the subject when the subject is not governed by the lowered Infl, the subject of stative sentences can be marked with *ni* and the non-accusative case pattern is obtained (the *ni-ga* case array).

g. When the subject is governed, *ga* can be assigned to it because Infl can assign case to more than one NP in Japanese, and the double-nominative case pattern is obtained (the *ga-ga* case array).

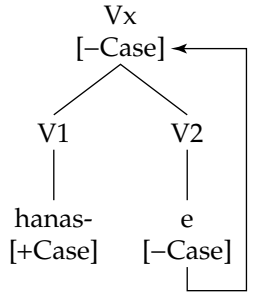
Ni insertion as specified in (89f) is similar to Kuroda's subject *ni*-raising. However, reformulation by Takezawa makes it possible to account for case alignments in sentences with simple stative predicates, which Kuroda fails to deal with.

Ga and *ni* marking in stative sentences is extended to those with complex stative sentences like potentials and 'tough' sentences. Verb raising in the previous transformational approaches is replaced by restructuring. However, its structural effect is the same as Verb Raising, creating complex predicates in the form (91a):

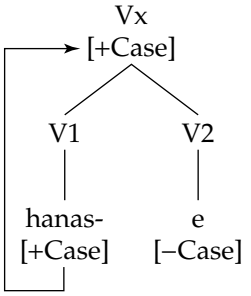
(91) a.



b.



c.

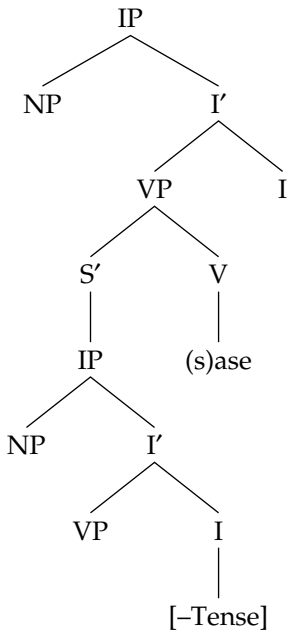


(Takezawa 1987: 144)

In (91b) the restructured complex predicate gets the feature [−Case] percolated to the complex verb Vx from the potential morpheme *(r)e*, while in (91c) [+Case] of *hanas* ('speak') is percolated up to the Vx, the former deriving the *ni-ga* and the *ga-ga* potentials by means of Infl lowering and the optional government of the complement subject by the lowered Infl. [+Case] on Vx in (91c) is responsible for the *ga-o* potential.

For *o*- and *ni*-causative, Takezawa does not assume an extra NP for either of them. The causative formative *(s)ase* selects S′ as the only internal argument. The distinction between these two types of causatives is due to optional S′ deletion. The structure (92) is the deep structure of both *o*- and *ni*-causatives. Deletion of S′ makes the matrix verb *(s)ase* govern and assign accusative case to the complement subject in the IP Spec position, resulting in an *o*-causative. In case S′ deletion does not take place, S′ blocks government of the complement subject by *(s)ase*. Then the ungoverned subject gets *ni* by (89f):

(92)



(Takezawa 1987: 163)

5.3.3 'Tough' sentences

Another important claim Takezawa makes is concerned with the analysis of 'tough' sentences. He refutes Kuroda's NP movement analysis on the basis of sentences like those in (93), in which the moved NPs, those italicized in (93a, b), are not the arguments of the verbs, which are raised and adjoined to 'tough' morphemes. They are in the complement sentences selected by these verbs.

(93) a. [*Kono te no zassi*]$_j$ ga (John$_i$ nitotte) [$_{S'}$ pro$_i$ maituki e$_j$
this kind of magazine Nom John for every month
teikikoodokusite-i- ru to] hito ni ii- niku- i.
subscribe regularly- Pres Comp people to say- hard- Pres
(Lit.) '[This kind of magazine]$_j$ is hard (for John$_i$) to say to (other) people [$_{S'}$ that he$_i$ takes e$_j$ regularly every month]'

b. [*Zibun no otooto kara*]$_j$ ga (John$_i$ nitotte) [$_{S'}$ pro$_i$ e$_j$ okane o
self's brother from Nom John for money Acc
takusan karite-i- ru to] mitome- niku-i
lot of borrow Pres Comp admit- hard-Pres
(Lit.) '[From self's brother]$_j$ is hard (for John$_i$) to admit [$_{S'}$ that he$_i$ has borrowed a lot of money e$_j$]' (Takezawa 1987: 195–196)

The syntactic structure of these sentences is roughly as follows:

(94) [$_S$ NP$_i$ [$_{AP}$ . . . [$_{S'}$ [$_S$ NP [$_{VP}$ . . . e$_i$ . . . V]] to] V-yasu]] (Takezawa 1987: 198)

If this is NP movement, as Kuroda claims, these traces are anaphors and must be bound in their minimal governing domain, in this case the embedded S'. Since the traces are not bound there, they violate Binding Condition A, which makes them ungrammatical, contrary to fact.

Takezawa claims that the movement, if involved in the derivation of sentences like (93a, b), must be an empty operator movement, since it seems to obey the characteristics of *wh*-movement: (i) it leaves a 'gap', (ii) where there is a bridge verb, there is an apparent violation of subjacency due to a COMP-to-COMP escape hatch; in other words, 'long distance' movement is possible, (iii) it observes island constraints (the Complex NP Constraint and the *wh*-island constraint) (Takezawa's slightly modified version of Chomsky 1977b: 86).

As a matter of fact, sentences with PP *ga* phrases such as (93b) show that they observe island constraints as in (95b), while those with NP *ga* phrases (like (93a)) are grammatical even when they violate island constraints, as shown by (95a):

(95) a. [Kono te no zassi]$_i$ ga (John nitotte) [$_{S'}$ e$_j$ maituki e$_i$
this kind of magazine Nom John for every month
teekikoodokusite-i- ru] hito$_j$ o sagasi-yasu- i.
subscribe regularly- Pres person Acc search-easy- Pres
(Lit.) 'This kind of magazine is easy for John to search a person who takes it regularly.'

b. *[Kono ginkoo kara]$_i$ ga (John nitotte) [$_{S'}$ e$_j$ e$_i$ okane o takusan
this bank from Nom John for money Acc a lot of
karite-i-ru] hito$_j$ o sirabe- niku- i.
borrow-Pres people Acc find out- hard- Pres
(Lit.) 'From this bank is hard to find out people who borrow a lot of money.'

On the basis of this fact Takezawa concludes that 'tough' sentences with PP *ga* phrases in the subject position are derived by an empty operator movement, as shown by (96a), while those with NP *ga* phrases can involve either an empty operator movement or a pronominal (pro) as indicated by (96b):

(96) a. [$_S$ NP/PP$_i$ ga [$_{AP}$ (NP$_j$ nitotte) [$_{S'}$ *0*$_i$ [PRO$_{(j)}$ . . . . . t$_i$ . . . . . V]] yasu]]
predication movement

b. [$_S$ NP$_i$ ga [$_{AP}$ (NP$_j$ niyotte) [$_{S'}$ [$_S$ PRO$_{(j)}$ . . . . . pro$_i$ . . . . . V]] yasu]]
aboutness relation

(Takezawa 1987: 218)

The empty operator (*0*) in (96a) is co-indexed with the NP or PP, base generated in the subject position, by the predication relation. This structure is the same as that proposed by Chomsky (1977b) for English 'tough' sentences. Pro in (96b), on the other hand, is co-indexed with the base generated subject NP by the aboutness relation. The use of pro is proposed by Saito (1985) for topicalization of NPs and relativization, which violate the subjacency condition. Takezawa uses the fact that topicalization and relativization may involve resumptive pronouns, as was first pointed out by Perlmutter (1972). The sentences in (97) contain resumptive pronouns (cited by Saito from Kuno (1973c)):

(97) a.[?] Sono hito$_i$ wa [John ga kare$_i$ no imooto o yoku sitte-i- ru
that person Top John Nom him Gen sister Acc well know- Pres
rasi- i.]
seem- Pres
'Speaking of that person$_i$, it seems that John knows his$_i$ sister very well.' (topicalized sentence)

b.[?] [$_{NP}$ [$_{S'}$ watasi ga kare$_i$ no namae o wasurete-simat- ta]
I Nom he Gen name Acc forget- Past
okyakusan$_i$]
guest
'the guest$_i$ who I have forgotten his$_i$ name' (relativized clause)

(Takezawa 1987: 208–209)

Inoue (1976) shows that in Japanese resumptive pronouns appear to avoid island constraints in island contexts, and that the more complex the contexts

the stronger the requirement for the use of resumptive pronouns. She also points out that the relativization of arguments generally prohibits the use of resumptive pronouns with a certain gradation among arguments and adjuncts (postpositional phrases) in their permissibility. (See Inoue 1976: 171–191 for details.)

Takezawa concludes, "Given the fact that overt resumptive pronouns and their antecedents can be related only by the 'aboutness' relation, phonologically null pronouns also should naturally be able to be related to their antecedents in the same way" (Takezawa 1987: 209).

Following Kuroda (1986), Takezawa admits the third possibility of 'tough' sentences with *ga* marked objects in situ. Rule R will lower Infl-tense to adjoin to the complement predicate and assign *ga* to the complement objects. In this case, the empty subject position remains empty, as it is claimed by Kuroda that Japanese allows the possibility of an unfilled subject position. Thus, 'tough' sentences with *ga* marked NPs have three derivations in Takezawa's grammar, namely, one involving movement of an empty operator as represented by (96a), the second with pro holding an aboutness relation with the matrix subject as in (96b), and the third with the *ga* marked object in situ leaving the matrix subject position unfilled.

The merit of Takezawa (1987) lies in the systematic application of GB theory to the analysis of the Japanese case system. In the framework of the PPA, this is one of the most dependable grammars. However, this structure dependent analysis of case along the PPA is replaced by agreement based case theory of the MP due to the elimination of theoretical artifacts like 'government' from the MP.

5.4 Kuroda (1988)

Kuroda (1988) is an attempt to solve problems involving the Japanese case system in the framework of the PPA. More specifically, he casts doubt on the Case theory of the PPA, which has Case checking by means of Agreement as its core. His conclusion is, "languages are parameterized as to whether Agreement is forced or not," and that Japanese is a language with non-forced Agreement.

Languages with forced agreement are subject to the principle of the uniqueness of agreement: An agreement inducing base category agrees with at most one Max (X) (maximal projection of X). This principle accounts for the fact that English, as a language with forced agreement, permits only one subject and one object per sentence. As a corollary from this principle it follows that languages with non-forced agreement are free from the uniqueness constraint. A clear cut support for this principle comes from the existence of multiple subjects in Japanese, exemplified by (39) and (43b) in section 4.4.

How about objects in Japanese? We have already mentioned a well-known constraint, the Double *O* Constraint (DOC), which is counter to Kuroda's claim. However, Kuroda goes on to deny the DOC itself, using the fact that unacceptability is ameliorated by clefting, which places adjacent *o* phrases apart from each other, as is shown by (98):

(98) a. *Masao ga ano uma o ano mon o toosita.
Masao the horse the gate pass through
'Masao passed the horse through the gate.'
(Kuroda 1988: (28))

b. Masao ga ano uma o toosita no wa ano mon o da.
'It was that gate that Masao passed the horse through.'
(Kuroda 1988: (29))

c. Masao ga ano mon o toosita no wa ano uma o da.
'It was that horse that Masao passed through that gate.'
(Kuroda 1988: (30))

Kuroda renames his linear case marking (used in 1978) as lower-case case marking and assumes that this case marking applies in deep structure. He admits the case marking (abstract case marking) by the PPA into his system as the case assignment to bare object noun phrases like those in (99) (a bare noun phrase = a noun phrase without a case particle):

(99) a. Masao wa dono uma o dono mon toosita no?
'Which gate did Masao let which horse go through?'

b. Masao wa dono mon o dono uma toosita no?

Dono mon (which gate) in (99a) is a bare noun phrase, whereas in (99b) *dono uma* is a bare noun phrase. The bare NPs in (99) are case checked by the head verb. Those with *o* are the result of the lower-case case marking.

Thus, Kuroda concludes, "a verb in Japanese may subcategorize for more than one object," and "the verb agrees with (assigns case to) only one of them; the other is licensed by lower-case case" (1988: 337).

However, 'case-drop' as in (99) is observed only in colloquial Japanese, whereas it is nonexistent in the formal standard Japanese, where all argument noun phrases are case marked. This means that all arguments are licensed by lower-case case marking.

It is significant that Kuroda dropped his former claim that the *o* phrases like *mon o* in (98), with the theta-role path, are adverbial, and that the particle *o* here is a postposition, not a case particle. Now he says, "I take the term object broadly and mean by it any complement of a verb that potentially receives case from it, that is, in other words, a complement of a verb which is not inherently case marked" (p. 337).

There are two other constructions Kuroda assumes to contain two objects, as in (100) and (101) given below:

(100) a. Masao ga Hanako no hoho o butta.
Masao Hanako cheek hit
'Masao hit Hanako's cheek.'

b. *Masao ga Hanako o hoho o butta.

c. Masao ga Hanako o butta no wa hoho (o) da.

d. Masao ga hoho o butta no wa Hanako (?o) da. (Kuroda 1988: (35))

(101) a. Masao ga kono sakazuki ni ano sake o mitasita.
this sake-cup that sake fill
'Masao filled that sake in this cup.'
b. Masao ga ano sake de kono sakazuko o mitasita.
'Masao filled this cup with that sake.'
c. *Masao ga kono sakazuki o ano sake o mitasu.
d. ?Masao ga kono sakazuki o mitasita no wa ano sake o da.
e. ?Masao ga ano sake o mitasita no wa kono sakazuki o da.
(Kuroda 1988: (44a–e))

On the basis of (100c, d) and (101d, e), in which the DOC is ameliorated by clefting, Kuroda assumes both (100a) and (101a) have double *o* constructions at some stages of the derivation. The particle *o* is distributed from the head *hoho* ('cheek') to *Hanako*, which is adjoined to it in the NP *Hanako no hoho* ('Hanako's cheek'). The predicate *mitasu* ('fill') in (101), on the other hand, is assumed to subcategorize for two objects. Thus, there are three double *o* constructions, the first, the second, and the third exemplified by (98), (100), and (101) respectively.

Kuroda's admission of double *o* constructions reveals the difficulty of setting a fast dividing line between structural and inherent cases. This fact is further elaborated in Inoue (1997a) motivating her claim that some inherent cases should not be excluded from syntactic accounts of case in Japanese.

In this grammar of Kuroda's, a subject is generated as Ext(V), the external argument of V, with the possibility of another subject and possibly still another adjoined to the same Max(V). These subject positions are not the case position, but the *ga* assigned by the lower-case case marking in deep structure licenses subject NPs. Ext(I) is not a case position, either, but the landing site for scrambled elements. Subjects thus generated in Ext(V) do not have to move to Ext(I) unless it is scrambled.

There are three multiple subject constructions, as exemplified by the sentences in (102–104).

(102) a. Zoo ga hana ga nagai.
elephant trunk long
'Elephants have long trunks.' (derived by Subjectivization of (102b)
(Kuroda 1988: (45))
b. Zoo no hana ga nagai.
'Elephants' trunks are long.'

(103) a. Kono koma ga iro ga kirei da. (Kuroda 1988: (48))
this top color beautiful
'This top is a pretty color.'
b. #Kono koma no iro ga kirei da.[20] (Kuroda 1988: (49))

(104) a. Watasi ga mizu ga hosii.
I water want
'I want water.' (Kuroda 1988: (56))
b. *Watasi no mizu ga hosii. (Kuroda 1988: (57))

While (102a) is the result of subjectivization, discussed in section 4.4, the (a) sentences of (103) and (104) are assumed to have different derivational processes. The double subjects in (103) are the result of distributed *ga* assignment to the underlying structure (103b) just in the way *o* phrases are distributed in (100). The *ga* marked object in (104a) is claimed to be a subject on some semantic grounds, with the predicate *hosi-i*, *-ta-i*, and the like subcategorizing for two subjects. Both these subjects are generated as Ext(V), one of which is adjoined to Max(V). All the multiple *ga* phrases in these three constructions may stay in the Ext(V) position unless scrambled out to the Ext(I) position.

These facts about *o* and *ga* phrases naturally follow from Kuroda's assumption that languages with nonforced Agreement do not obey the uniqueness condition.

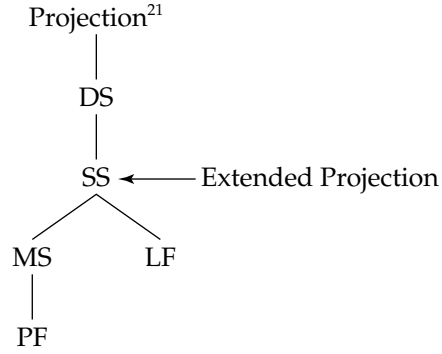
In restrospect, the transformational approach to the study of case in Japanese pointed out most issues relevant to this area of research through careful study of crucial data, which have been repeatedly used in attempts to build up theories of explanatory adequacy.

6 Studies of case in Japanese on the basis of the Minimalist Program

This section picks up only a few of the works relevant to the future development of this research area since it is impossible to make a general survey of the present state of research development in the fast changing theoretical framework.

Marantz (1992) is discussed because this work indicates a break from the syntactic analysis of case, establishing morphological structure (MS) as a representation between surface structure (SS) and phonological form (PF), as shown by (105). This approach is elaborated in Halle and Marantz (1993). Let us call this approach 'morphological case theory', following Aoyagi (1998).

(105)



This claim reflects one of the factors deciding a new direction of research in the MP since the MP reduces the functions of syntax to the minimum. Marantz (1995a) describes the MP as a computational system, a simple system of compositions, "constrained by a small set of economy principles, which Chomsky

claims enforce the general requirement, 'do the most economical things to create structures that pass the interface conditions'." He continues, "Chomsky's vision of the end of syntax should have the positive consequence of forcing syntacticians to renew their interface credentials by paying serious attention to the relevant work in phonology and semantics." The addition of MS on the PF branch is certainly a necessary step for the development of a theory.

Aoyagi (1998) presents the Japanese case system based on Marantz's morphological case theory. This is an extensive study of the distribution of case particles in relation to the relational particles *wa* (topic marker) and *mo* ('also') and adverbial particles such as *dake* ('only') and *sae* ('even'). Since a review of the whole work would take up too much space, only Aoyagi's case particle assignments, which are in fact a morphological spell-out of case features, will be reviewed.

Next, we take up Watanabe (1996), a revised version of his dissertation (1993a), which adopts agr(eement) based syntactic case checking for licensing argument NPs, a standard practice at that time. Koizumi (1995, 1998) follow this work. Ura (1996, 1999, 2000, 2001) are reviewed to the extent that they contain discussions relevant to the comparison with Watanabe's proposal for a system using a case checking mechanism without AgrP.

Finally, we review Fukui and Takano (1998), which discards the Case checking mechanism altogether, employing the function of case particles as licensers of NPs (or DPs).

All the reviews may be unduly brief, but this is inevitable due to the nature of these works reflecting the instability of the rapidly evolving theoretical models.

6.1 Case realization

6.1.1 Marantz (1992)

Marantz (1992) claims that the "mapping between semantic roles and argument positions, augmented by the subject requirement of the Extended Projection Principle (EPP), is suficient to license NPs in argument positions" (p. 234). This means that if abstract case theory functions only in licensing NPs, not in deciding actual case realization, it is eliminable from syntax. He shows that this is in fact true, using facts about Georgian with its split ergative system, Icelandic with its quirky case, and some other languages with rich morphological case and agreement.

It is well known that theta positions, positions assigned theta-roles by predicates, are relevant to abstract case assignment. This situation is depicted by Burzio's generalization, given below as (106).

(106) Burzio's generalization: A verb (with an object) case-marks its object if and only if it theta-marks its subject. (Chomsky 1986b: 139)

Marantz discusses the case of Georgian, in which nominative case on the subject and dative case (dative = accusative) on the object appear in present, future, and other 'series I' tenses, while in the aorist or simple past ('series II') ergative case and nominative case are found on the subject and the object respectively.

Furthermore, ergative case is restricted to subjects of transitive and unergative sentences, excluding derived subjects of unaccusatives. This means that ergative case does not appear when the predicate requires a non-thematic subject. This fact is stated as the 'ergative case generalization', given below as (107):

(107) Ergative case generalization: Even when ergative case may go on the subject of an intransitive clause, ergative case will not appear on a derived subject. (Marantz 1992: (6))

Such distribution of ergative case cannot be accounted for by abstract case theory.

Moreover, Georgian agreement is always based on the Nom-Dat pattern even when morphological case alignment follows the Erg-Nom pattern in the aorist. This means that the subject position is licensed by tense/aspect inflection. The Ergative case generalization is thus about the morphological realization of case on subjects, not about NP licensing, while Burzio's generalization is meant to be about NP licensing.

However, Marantz argues that there are cases in English where predicates, requiring a non-thematic subject position, still assign accusative case, as in (108).

(108) a. It struck me that I should have used 'Elmer' in the sentence.
b. There struck me as being too many examples in his paper.
c. Elmer_i struck her as [t_i being too stubborn for the job].
(Marantz 1992: (13))

As is shown by the sentences in (108), *strike* requires a non-thematic subject position, but it assigns case to the objects, *me* and *her* in (108).

Marantz further argues that the typical examples supporting abstract case theory, those in (109), can be accounted for by the EPP and an assumption that "movement comes for free while insertion of a dummy subject in environments (deep structures like (109e, f)) is a last resort option for satisfying the Extended Projection Principle (EPP)" (Marantz 1992: 240).

(109) a. The man arrived.
b. The porcupine was sold.
c. *It arrived the man.
d. *It was sold the porcupine.
e. e arrived the man.
f. e was sold the porcupine.

These facts make Marantz conclude that abstract case theory is eliminable from the theory of syntax.

Noting the similarity between the two generalizations, Burzio's and ergative, namely, that they both depend upon the presence of the thematic subject position, Marantz introduces the idea of 'dependent' case in his case realization disjunctive hierarchy, shown in (110):

(110) Case realization disjunctive hierarchy:
a. lexically governed case (so called inherent case),
b. 'dependent' case (accusative and ergative),
c. unmarked case (environment-sensitive),
d. default case. (Marantz 1992: (29))

(a) = takes precedence over everything else, for example, the Icelandic quirky case (lexically governed) is preserved when an NP moves from its original position, where it is marked by the quirky case, to a position of nominative or an ECM accusative case position. (b) = Acc and Erg are assigned by V+I to one argument position in opposition to another argument position (dependent case):

(111) Dependent case is assigned by V+I to a position governed by V+I when a distinct position governed by V+I is:
  a. not 'marked' (not part of a chain governed by a lexical case determiner),
  b. distinct from the chain being assigned dependent case.

(c) for example, genitive may be the unmarked case inside NPs (or DPs) while nominative may be the unmarked case inside IP's. (d) appears when no other case realization principle is available.

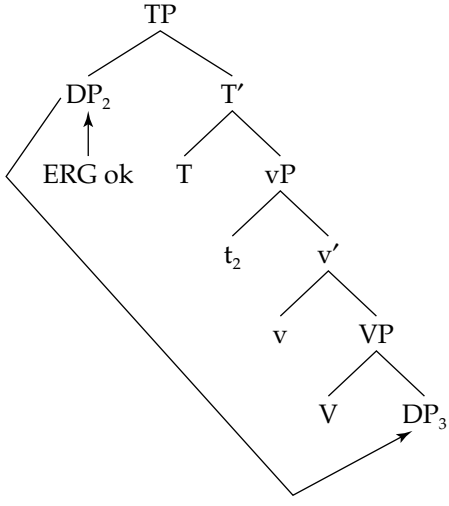
6.1.2 Aoyagi (1998)

Marantz assumes V-to-I movement, which makes him set the condition of dependent case realization as in (111b). Aoyagi rephrases it without using V+I:

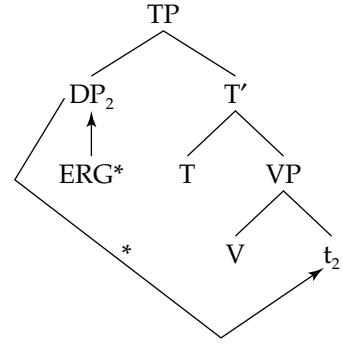
(112) A dependent case is assigned to a thematic position in a given domain (e.g., a finite tense) when there is a distinct unmarked thematic position in the same domain.

Aoyagi schematizes dependent case assignments as follows:

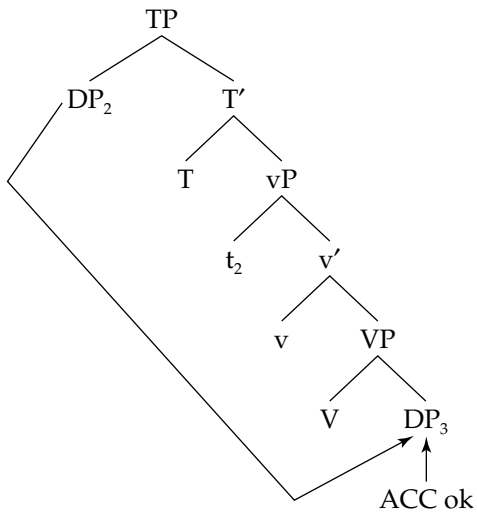
(113) a. Ergative languages
Transitives (unergatives)



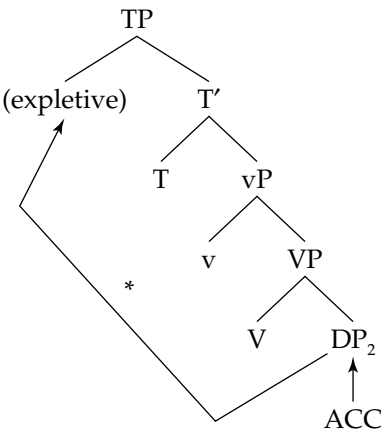
b. Unaccusatives/passives



c. Accusative languages
Transitives



d. Unaccusatives/passives



(Aoyagi 1998: 91–92)

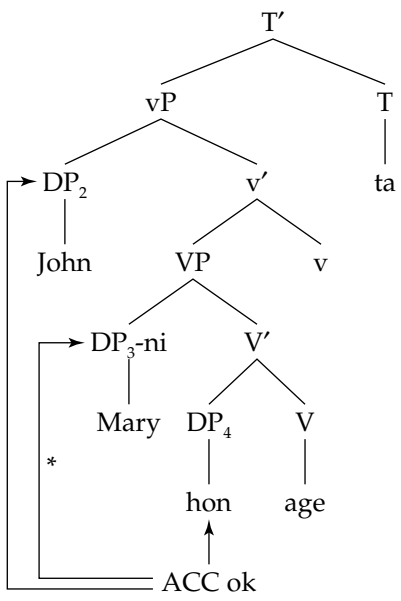
In (113a) DP_2 can refer to DP_3, a distinct unmarked thematic position, so it has ERG assigned to it, while in (113b) t_2 is not a distinct unmarked position because it forms a chain with DP_2. This accounts for the fact that ERG cannot be assigned to a derived subject. In (113c) DP_3 can refer to DP_2, the thematic subject position for DP_3 to refer to, while in (113d) the subject position is non-thematic, and may be filled by an expletive, so Acc cannot be assigned to DP_2, which ends up with the default case particle *ga*.

Now let us follow Aoyagi's application of this idea to the analysis of the Japanese case system. First, Kuroda's canonical sentence patterns are slightly modified with the addition of the inherent case *ni* in the transitive case alignment.

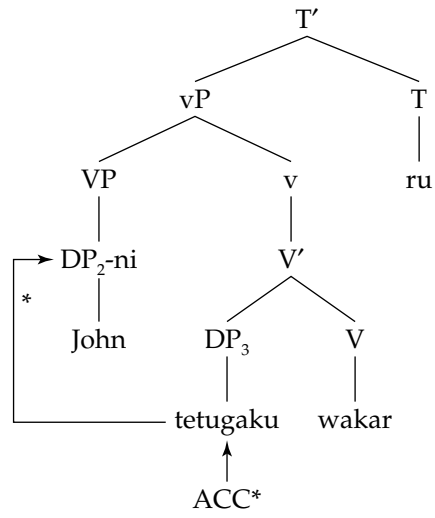
(114) a. (Di)transitive: NOM-(DAT)-ACC
b. Ergative: DAT-NOM
Intransitive: NOM

In Marantz's case realization hierarchy, DAT (*ni*) is lexically governed, ACC (*o*) is dependent, and NOM (*ga*) is unmarked or default in Japanese.

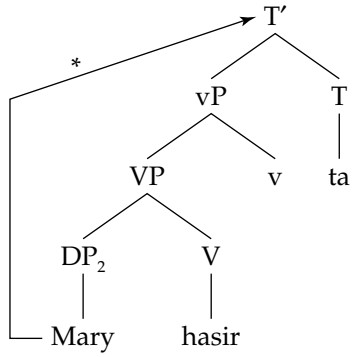
(115) a. (Di)transitive Pattern
(John ga Mary ni hon o age-ta.)
('John gave Mary a book.')



b. 'Ergative' Pattern
(John ni tetugaku ga wakar-u.)
('John understands philosophy.')



c. Intransitive pattern
(Mary ga hasit-ta.)
('Mary ran.')



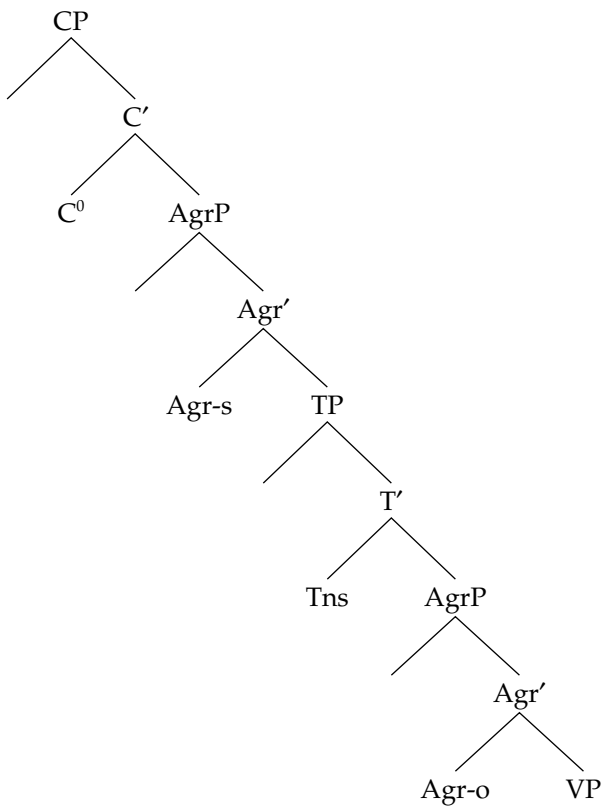
In (115a) DP_4 (*hon*) can refer to DP_2 in the unmarked distinct theta position, but not to DP_3 (Mary-*ni*) in the inherently marked position. Since DP_2 meets the condition of dependent case assignment, DP_4 is assigned ACC. In (115b) DP_3 (*tetugaku*) cannot refer to any unmarked distinct theta position; thus it is unable to get ACC assigned to it. Instead, it gets the default *ga*. The same situation holds in (115c).

The merit of dependent case theory is its capacity of giving a principled basis for Burzio's generalization together with the ergative principle within the framework of the morphological case system. Dependent case theory succeeds in specifying interrelationships of structural case particles. Aoyagi's work supports this hypothesis with data from Japanese. Unfortunately, the main theme of this work, the study of relative distributional facts among case particles, relational and adverbial particles, cannot be taken up in this review.

6.2 Watanabe (1996)

As a modification of the Agr-based case theory of Chomsky (1991, 1993), Watanabe proposes the Three-Layered Case Checking Hypothesis, which does not make use of the notion of government but employs an X-bar theoretical scheme with a crucial notion of the Spec–head and head–complement relations. Chomsky's Agr-based case theory adopts the split INFL Hypothesis by Pollock (1989), which is extended by Watanabe in (116) as the basis of the full clause structure:

(116)

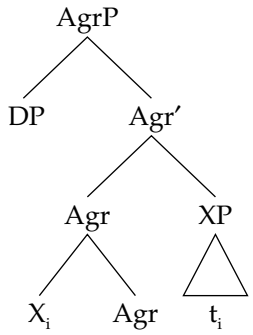


(Watanabe 1996: (1.8))

6.2.1 Nominative and accusative case checking

According to Agr-based case theory, the configuration necessary for both nominative and accusative case checking is (117), where X stands for case-bearing heads, the finite Tns for Nominative, a verb for Accusative, the infinitival Tns for null case borne by PRO:

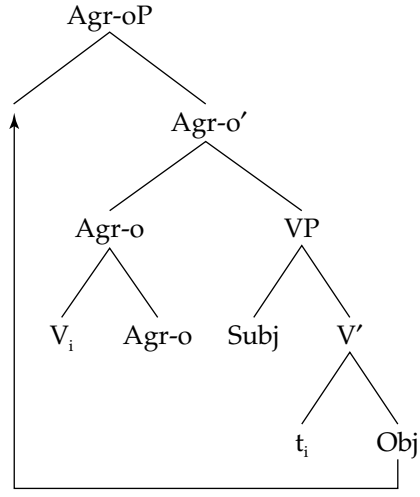
(117)



(Watanabe 1996: (1.10))

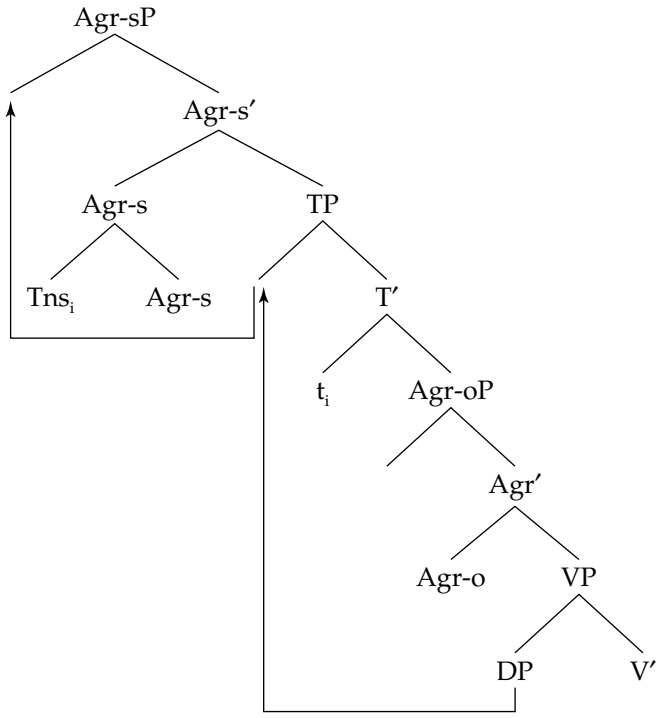
The DPs with nominative and accusative Case feature are moved to the Agr-Spec positions after the case-bearing heads are adjoined to Agr, as shown by (118a, b):

(118) a. Movement of a DP with the case feature accusative



(Watanabe 1996: (1.12) slightly modified)

b. Movement of a DP with the case feature nominative

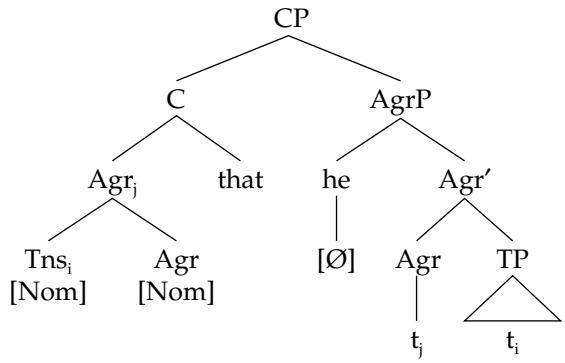


In (118a) the movement of the object DP is legitimate due to the minimal domain created by the adjunction of the case-bearing head V to Agr. In other words, the Spec of Agr-oP and the Spec of VP are equidistant from the object DP.[22] The nominative case feature is checked after the VP internal subject DP is moved to the Spec of Agr-sP as in (118b). For Watanabe, case checking is the transference of the case feature of the DP in the Spec of AgrP to Agr. Thus case checking is carried out between the DPs and the case-bearing heads standing in the Spec–head relation.

6.2.2 Follow-up case checking

On top of this basic assumption of the mechanism of Agr-based case checking, Watanabe makes precise the notion of case absorption crucially used to account for universal syntactic phenomena like passivization. His original contribution is his assumption of follow-up checking. In (118b) the DP, the VP internal subject, moves to the Agr-Spec position carrying the case feature [Nom], which is checked and transferred to Agr-s. The feature [Nom] copied onto Agr will become invisible in LF together with Agr itself. However, the feature [Nom] borne by Tns remains, waiting for elimination by the end of LF. Using *he* as an example of the subject DP, Watanabe gives (119a) as the syntactic representation after [$_{\text{Agr}}$ Tns Agr] is adjoined to C:

(119) a.

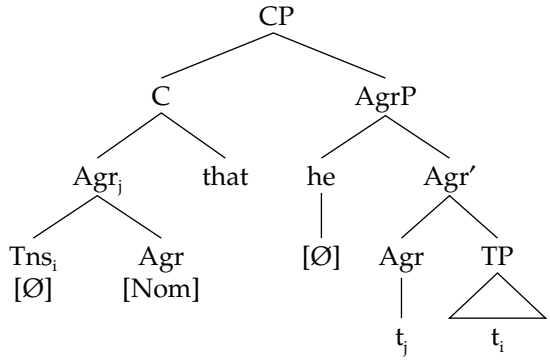


(Watanabe 1996: (1.20a))

The feature [Nom] transferred onto Agr will become invisible in LF together with Agr itself.

Now the [Nom] of Tns is checked by the follow-up checker C^0 *that*, as in (119b):

(119) b.



(Watanabe 1996: (1.20b))

Similarly V^0 with [Acc] is first adjoined to Agr and checks the [Acc] carried by the object DP, transferring its case feature to Agr. Then [$_{Agr}$ V^0 Agr] is adjoined to Tns, which checks the [Acc] carried by V^0. Thus, the follow-up checker for [Acc] borne by V^0 is Tns.

The follow-up case checking hypothesis accounts for the legitimate and illegitimate appearances of PRO as embedded subjects, whose structures are assumed to be (120a) and (120b) respectively.

(120) a. John tried [$_{CP}$ e [$_{Agr\text{-}sP}$ PRO to win the race]] (control construction)
b. *John believed [$_{Agr\text{-}sP}$ PRO to have won the race] (ECM construction)
(Watanabe 1996: (2.13))

The null Case feature borne by PRO is checked off by the same case feature of the infinitival Tns. This much is the same in both (120a and b). However, the

follow-up case checking is possible only in (120a) thanks to the presence of empty C^0 (*e* in (120a)), the head of CP, while (120b), which lacks CP, is not allowed this possibility. Thus, this hypothesis accounts for this distributional fact without using the PRO theorem based on the notion of government.[23]

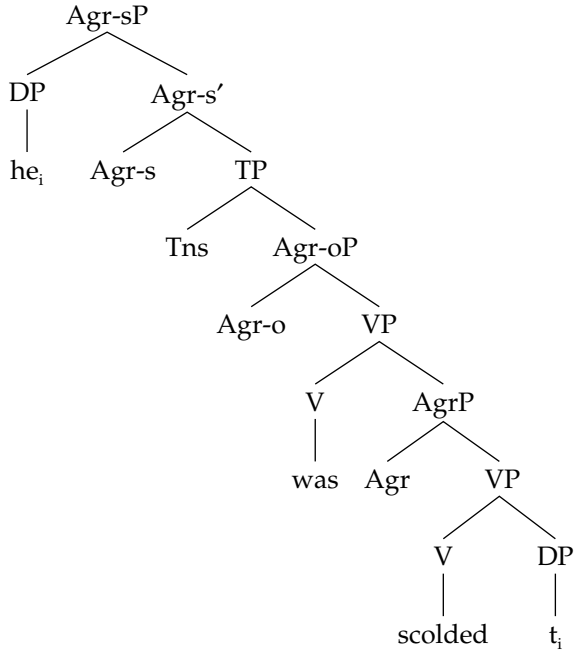
6.2.3 Case absorption

In case there is no follow-up checker in the appropriate position, as in the case of (120b), case absorption rather than case checking takes place, putting the case feature of the head onto Agr leaving the case feature of a DP unchecked. Now the DP must move to a position where its case feature can be checked. In the ECM construction, whose embedded clause is IP, rather than CP with the follow-up checker C^0, the embedded subject DP must move to Agr-o-Spec to get its [Acc] checked by V^0 adjoined to Agr-o. The follow-up checking of [Acc] on V^0 is carried out by Tns.

In the case of a Participial Passive such as (121a), the structure (121b) is assumed, omitting the 'by phrase' and including only relevant positions:

(121) a. He was scolded by Mary. (Watanabe (3.2b))

b.



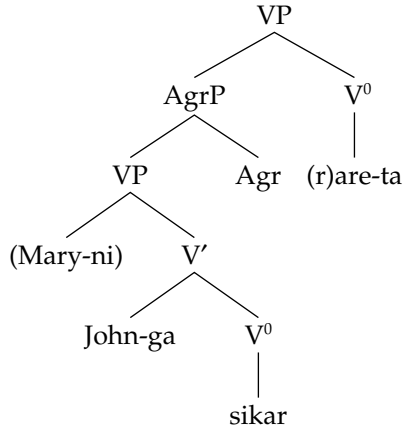
(Watanabe 1996: (3.4))

Since the verb *be* cannot check off [Acc], case absorption takes place transferring the [Acc] of the participle *scolded* to Agr. Agr can take only one case feature, so the object DP has to move to the Agr-sP-Spec position in order to get its remaining case feature checked off.

Parallel to the participial passive, the Japanese direct passive like (122a) is assumed to have (122b) as its underlying structure:

(122) a. John ga Mary ni sikar-are-ta

b.

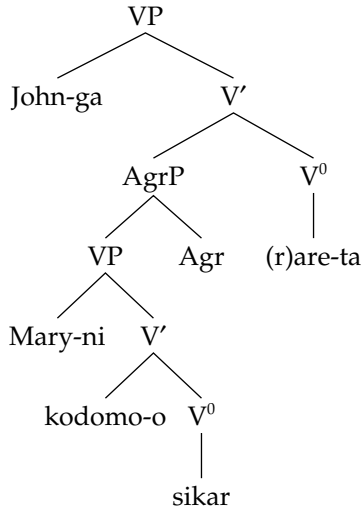


(structurally the same as Watanabe 1996: (3.86))

The passive morpheme *(r)are*, which corresponds to *be* in (121b), does not project an external argument, nor does it carry the accusative case feature. In contrast, the indirect passive morpheme *(r)are* projects an experiencer external argument and has the accusative case feature. The indirect passive like (123a) is assumed to have (123b) as its underlying structure:

(123) a. John-ga Mary-ni kodomo-o sikar-are-ta

b.



(structurally the same as Watanabe 1996: (3.87))

Since there is no follow-up checker beyond Agr in (122b), Agr absorbs the feature [Acc] borne by V^0 *sikar* leaving the DP *John-ga* with [Acc]. Thus, *John-ga* must move through the Spec of the embedded AgrP to the matrix Spec of Agr-sP to get its nominative case feature checked off, which results in the case switch from accusative to nominative.

As for the indirect passive, the object DP gets its case feature [Acc] checked in the matrix Agr-oP by *(r)are* with the same feature. The DP in the lower VP-Spec position in the indirect passive is assumed to stay there as an argument of V^0, to account for the fact that it binds an anaphor in the embedded clause.[24] The embedded subject DP in the direct passive is adjoined to the VP, since it is devoid of this capacity. Observe the following contrast:

(124) a. *John ga Mary$_i$ niyotte zibun$_i$ no heya ni tozikome- rare- ta.
John Nom Mary by self Gen room in lock up- Pass- Past
'John was locked up in her room by Mary.' (direct passive)

b. Tom ga Mary$_i$ ni John o zibun$_i$ no heya ni tozikome-
Tom Nom Mary Dat John Acc self Gen room in lock up-
rare- ta.
Pass- Past
'Tom was adversely affected by Mary's locking up John in her room.'
(indirect passive) (Watanabe 1996: (3.116a, b))

Schematically the direct and indirect passive have (125a, b) respectively as underlying structures:

(125) a. [$_{VP}$ BE [$_{AgrP}$ Agr VP]
b. [$_{VP}$ Experiencer V [$_{AgrP}$ Agr VP] (Watanabe 1996: (3.136))

6.2.4 Causatives

There is a type of causative, called the reduced causative, which shares a similar structure and syntactic behavior with the indirect passive, as shown by (126). It is to be noted that the reduced causative embeds a simple AgrP, which allows the embedded object *o* to get to the matrix Agr-oP moving through its Spec.

(126) [$_{VP}$ Agent V $_{Caus}$ [$_{AgrP}$ Agr VP]]

In this type of causative, the embedded object becomes the subject of the direct passive. The Japanese *o*-causative like (28c), with an embedded transitive sentence, does not permit this possibility, as is indicated by (127b), while the passivization with the embedded subject is legitimate, as in (127c):

(127) a. Katoo-san ga kodomo ni nimotu o hakob- ase- ta. (= (28c))
Katoo Nom child Dat baggage Acc carry- Caus- Past
'Mr Kato made the child carry the baggage.'
b. *Nimotu ga Katoo-san niyotte kodomo ni hakob-ase-rare-ta.
c. Kodomo ga Katoo-san ni(yotte) nimotu o hakob-ase-rare-ta.

In the reduced causative with an embedded transitive sentence case absorption takes place as in the case of the direct passive, that is, the Agr in the embedded clause takes in the accusative case feature of the embedded verb, so that the DP with [Acc] must move to the Spec of the matrix Agr-oP to get its Case feature checked off. With an intransitive embedded sentence, the complement subject DP simply moves to the matrix Agr-sP for feature checking, since there is no case feature borne by the verb.

Japanese causatives are not of this type as is clear from the contrast in (127). Watanabe assumes the underlying structure (128) for causative sentences like (127a):

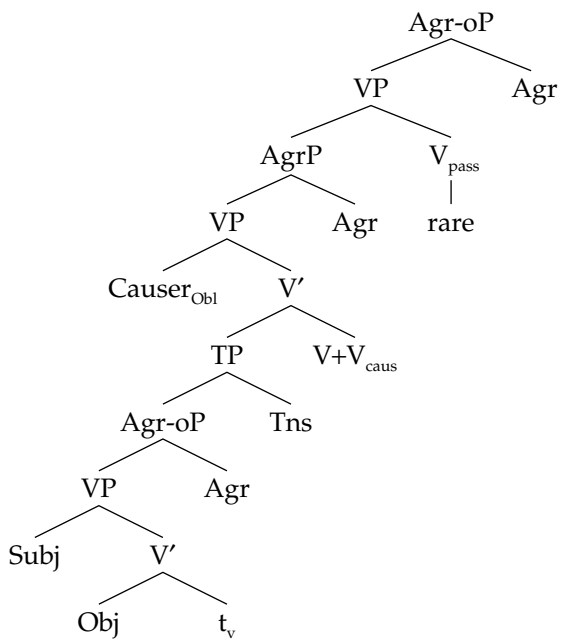
(128) $[_{VP}$ Agent V_{Caus} $[_{AgrP}$ Agr-s $[_{TP}$ T $[_{AgrP}$ Agr-o VP]]]]

(Watanabe 1996: (3.137a))

The subject DP must stay in its original position, Spec of the embedded VP, in overt syntax to achieve its function of binding an anaphor. It is not possible for this DP to move to the matrix Spec of Agr-oP in LF because the Agr-o chain created by adjunction of its head onto Tns is not available at LF due to deletion of Agr there. Oblique marking of the embedded subject (in Japanese by *ni*) saves this situation, that is, there is no need for movement of the subject DP. The object DP under the embedded VP gets its case feature checked in Agr-oP followed by follow-up checking by Tns in LF.

Causative passives such as (127c) are assumed to have something like (129) as their underlying structure:

(129)



(Watanabe 1996: (3.147))

In this case the subject DP is assumed to move to the Spec of the matrix Agr-sP in overt syntax before the object DP is moved to the embedded Spec of Agr-oP in LF. Thus, there is nothing blocking the movement of the subject. The embedded object has to be raised to the Agr-oP-Spec to get its case checked in LF. Thus, there is no hope of the embedded object turning to the passive subject, a result consonant with the fact revealed in (127). The causer argument gets an oblique marking.

So far we have seen the mechanism of the Three-Layered Case Checking System[25] as a representative of the refinement of Agr-based case theory. This theory clearly laid an important step toward a refinement of the new theory, discarding the government based case theory of the PPA.

As Watanabe admits, the main concern of this work is the licensing of argument DPs, rather than case realization. As far as the issues taken up in this work and the solutions given to them are concerned, it does not seem to have added very much to the empirical study of case in Japanese. However, its value lies in the fact that within the framework of the MP this theory gives an account of a variety of linguistic facts revealed by past works on quite a number of languages. In this respect the analysis of the Japanese case system in this framework has played an important role in leading the theory toward establishing a better universal grammar. As stated before, this work is not aimed at dealing with a wide range of facts about case realizations. Take for example the Japanese nominative *ga*, which appears not only with the subject of a finite clause or multiple subjects but also with the object of a stative predicate. Possible case alignments in major sentence structures such as potential and 'tough' sentences are actually out of consideration of this work. Therefore, from the point of view of case realization, it is doubtful whether or not efforts to deal with all these facts on the basis of this theory will prove to be revealing.

6.3 Koizumi (1998)

Koizumi (1998) is taken up in this review, as it offers an alternative mechanism supporting Watanabe's Three-Layered Case hypothesis originally proposed in Watanabe (1993a). Koizumi bases his argument on this version rather than the revised one (1996) reviewed in the preceding section. However, the gist of Koizumi's claim is not affected by Watanabe's new case checking mechanism, namely the follow-up case checking described in section 6.2. Koizumi claims that Japanese, lacking overt morphological agreement, has an invisible AgrP, which motivates object raising. He uses as evidence the scope interaction between the delimiter *dake* ('only') and three types of Japanese complex predicates, namely, raising, control,[26] and stative predicates exemplified by the sentences in (130):

(130) a. John wa niku dake o tabe-sugi- ta.
John Top meat only Acc eat- overdo-Past (raising predicate)
'John overdid eating only meat.'

i. only > overdo
('Among many things John ate, it is only meat that he overate.')
ii. overdo > only
(For too long time, John ate nothing but meat.)
(Koizumi 1998: (9))

b. John wa ringo dake o tabe-wasure-ta.
Top apple only Acc eat- forget- Past (control predicate)
'John forgot to eat only apples.'
i. only > forget
('Among many things John was supposed to eat, it is only apples that he forgot to eat.')
ii. *forget > only (It is eat only apples that John forgot to do.)
(Koizumi 1998: (11))

c. John ga migime dake o tumur-e-ru.
Nom right eye only Acc close Pot-Pres (potential with Acc)
'John can close only his right eye.'
i. can > only ('John can wink his right eye.')
ii. ?*only > can (It is only his right eye that he can close.)
(Koizumi 1998: (25a))

d. John ga migime dake ga tumur-e- ru.
Nom right eye only Nom close-Pot-Pres (potential with Nom)
'John can close only right eye.'
i. *can > only
ii. only > can (Koizumi 1998: (25b))

In (130a) with a raising predicate *sugi-* ('over-'), the object in the complement sentence can take both narrow (embedded) and wide (matrix) scopes, which causes the ambiguity shown in the interpretations (i) and (ii), while in (130b) with a control predicate the narrow scope reading of the complement object is disallowed as indicated by the reading (ii) with a star. As for potentials, it was already stated in section 4 ((31) in particular) that the potentials *(r)are*, *(r)e* require matrix and complement subjects in deep structure. In terms of GB theory, potentials theta-mark their external arguments resulting in the requirement of the PRO complement subject. In other words, they are control predicates. (130c) does not conform to the descriptive generalization given above, revealing a scope phenomenon (narrow scope) different from (130b) with a control predicate. However, (130d) with the complement object marked with the nominative *ga* shows that only the wide scope reading is permitted as is the case with control predicates.

The relevant question to ask about the facts given above is: How can we account for (i) the fact that the raising predicate permits narrow and wide scope interpretations for the complement object, (ii) the fact that the control predicate permits only wide scope interpretation, and (iii) the fact that the potential with the *o*-marked complement object does not permit wide scope reading, while the *ga*-marked complement object permits only wide scope reading?

Koizumi (1998) and Watanabe (1996) share the basic mechanism of Case checking, namely, raising both Case bearing heads (V with [Acc] and T with [Nom])

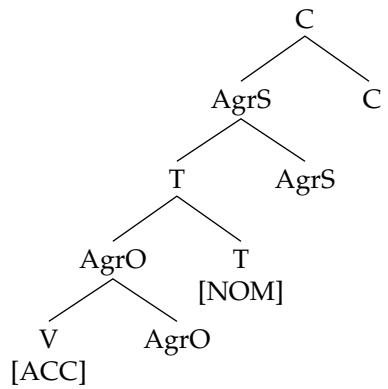
and the case checked DPs to the same checking domains. V and the object DP are raised to the checking domain of Agr-o, whereas T and the Subject DP go to that of Agr-s. The resulting structures are the same as (118a and b) in Watanabe's system. In Watanabe, case checking is transference of the case feature of DP to Agr, while in Koizumi case checking is carried out by copying the case features of DP and V or T to Agr. If the two copied features are of the same type, case checking is successful. Thus, Koizumi's case checking is carried out by case matching. Watanabe motivates follow-up case checking by the obligatory elimination of case features left with the case bearing heads, since case features are uninterpretable. Koizumi motivates the same three-step process by the invisibility of Agr with copied features at the LF interface, where the success of the case matching is checked. Thus, the feature copied on Agr must be copied onto the lexical elements T or C, which have semantic contents and are visible in LF. This corresponds to Watanabe's follow-up checking. The structures for the three-step case checking are the same as Watanabe's structures (119a and b) for follow-up case checking.

On top of this basic mechanism, Koizumi provides the following condition on feature copying:

(131) Features may be copied to an item with an original case feature, but they may not be recopied from that item.

In the partial structure (132), the case features previously copied to AgrO from the object and the verb can be copied to T with the original case feature [NOM], but not to C due to the intervening T with the original case feature.

(132)

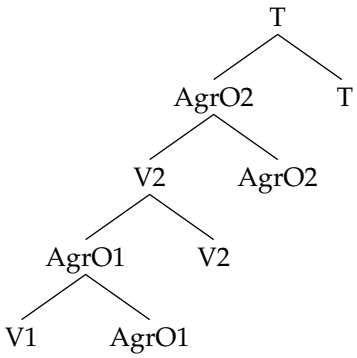


(Koizumi 1998: (31))

Now let us see how the three questions raised in connection with the data given in (130) are answered. The raising verb, V2 in (133) given below, is without the case feature [ACC]. When AgrO1 receives [ACC] from V1 (the embedded verb) and its object, these features can be copied onto T since V2 is without a case feature. This means that feature copying within the domain of AgrO1 licenses the

object, so it takes the narrow scope, i.e., the embedded scope. When V1 is raised to V2 without its case feature copied to AgrO1, the case feature [ACC] is transferred to V2. Now the object of V1 cannot be licensed within the domain of AgrO1. Thus, it has to move to the Spec of AgrO2, where it is licensed and yields the wide scope reading. The raising of an embedded verb to the matrix verb, specified as Restructuring, is optional in the case of raising predicates, which is the source of ambiguity between wide and narrow scope readings.

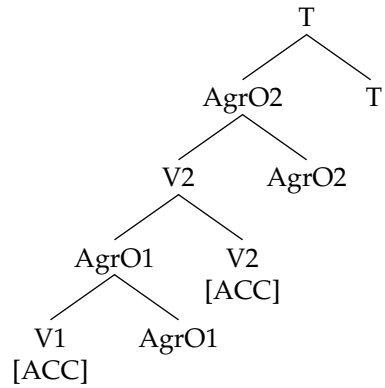
(133) V2 = Raising



(Koizumi 1998: (33))

In the case of control verbs, both V1 and V2 have [ACC], so that [ACC] copied onto AgrO1 cannot be recopied to T due to the presence of V2 with the original case feature [ACC] (Condition (131)). Since the third step, copying the case feature carried by AgrO1 onto T, is imposssible, the complement object must move to the Spec of AgrO2 to get licensed. This is why control predicates permit only the wide scope reading. (134) is the intermediate structure of the control predicates relevant to the feature copying mechanism:

(134) V2 = Control



(Koizumi 1998: (34))

The potentials are control predicates, but without [ACC], so AgrO1 with the Case features copied onto it from V1 and its object can be recopied to T without being blocked by V2. This is the reason for the narrow scope reading. When V1 is raised to V2, its Case feature is tranferred to V2 as in the case of raising predicates. The object with [NOM] must be adjoined to TP to get its case feature checked in the domain of AgrS. The two case features carried by T are recopied onto C. This is the cause of the wide scope reading for the nominative object in (130d).

Koizumi claims that Japanese, without overt morphological agreement, has AgrP, using the scope interactions observed in sentences with complex predicates exemplified by those in (130). To be more specific, unless object movement to AgrP-Spec is assumed, the scope interactions cannot be accounted for, since the differences of interpretations are dependent on the positions of the specifiers of AgrP, either in the embedded or the matrix clause, that moved complement objects occupy.

Koizumi's work is supported by the fact of Scandinavian languages, which are reported to have overt object raising. Thus, this work is interesting in terms of UG.

Now that Agr as a functional head has been discarded, how to account for these facts in the framework of the MP is the problem for all those who have worked on Agr-based case theory. In the appendix to his chapter 1, Watanabe (1996) casts his case checking system in the new framework without Agr, which is given in section 6.4.1.

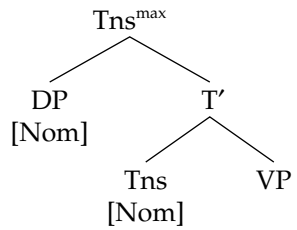
6.4 Ura (1996, 1999, 2000, 2001)

6.4.1 From Agr-based case checking to Agr-less

Ura (1996) gives a solution to the problem as to how to switch from Agr-based case checking to Agr-less case checking. To avoid involvement in too much theory internal discussion, this section concentrates on Ura's proposal relevant to Watanabe's case checking.

In order to capture the essence of his Layered Case Checking hypothesis without the use of Agr, Watanabe gives basic ideas for the modifications of his theory given in section 6.2. First he proposes that nominative and null case checking are carried out in TP, as in (135):

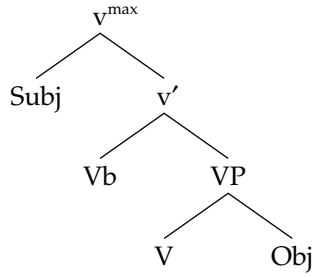
(135)



(Watanabe 1996: (1.28))

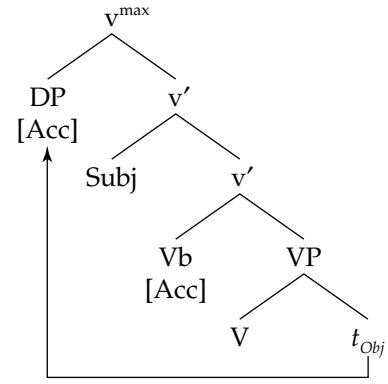
For accusative case checking, Watanabe makes crucial use of the multiple Specifier construction proposed in Chomsky (1995c) and followed by Ura, the gist of which is given below after presenting Watanabe's idea.

(136) a.



(Watanabe 1996: (1.30))

b.

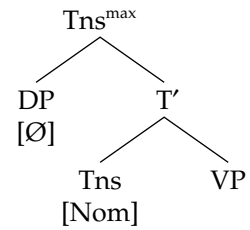


(Watanabe 1996: (1.29))

Vb in (136a, b) is *v* in Ura, which stands for a light verb representing a transitive verb. As is shown by (136a) the Subj is in Vb-Spec as in the standard case, while the moved Obj occupies another Vb-Spec position. This means, according to Ura, that Vb allows multiple spec positions due to its parametric positive value of 'violability of procrastinate'. Procrastinate is an economy condition that forces the choice of movement in LF (covert movement) over that in syntax (overt movement). There is assumed a parametric variation of verbs between those permitting violation of this condition and those disallowing it. Since the violability is optional, i.e., not forced on all the verbs but tolerated by some verbs, it is called by Ura 'an unforced violation of procrastinate'. When the head verb has this property, it projects multiple specifier positions as landing sites of moved elements. Thus, (136b) is a legitimate structure.

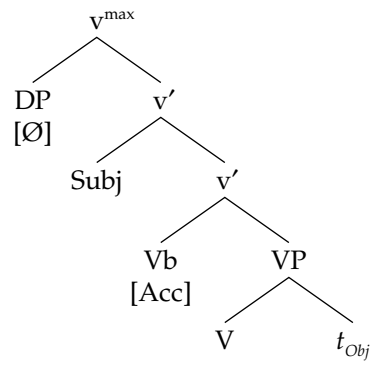
With the structures (136a, b), Watanabe's case checking proceeds as indicated by (137a, b) for [Nom] and [Acc] respectively:

(137) a.



(Watanabe 1996: (1.31a))

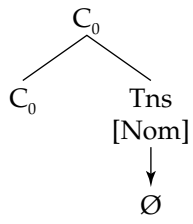
b.



(Watanabe 1996: (1.31b))

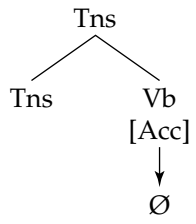
Watanabe's follow-up checking results in the structures (138a, b):

(138) a.



(Watanabe 1996: (1.32a))

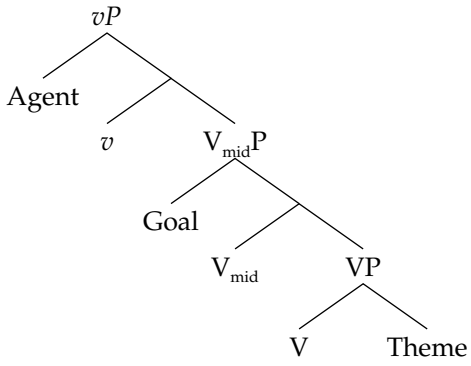
b.



(Watanabe 1996: (1.32b))

The two-layered VP shell, as given in (136b) is proposed by Chomsky (1995c). Ura extends it to a three-layered VP shell by adding $V_{mid}P$, which stands for verbs with the ability of discharging the theta-roles EXPERIENCER, GOAL, or BENEFACTIVE. The underlying structure for verbs like *give* with this ability is (139) given below:

(139)



(*v* = Watanabe's Vb)
(*vP* = Watanabe's Vmax)

(Ura 1996: (2.15))

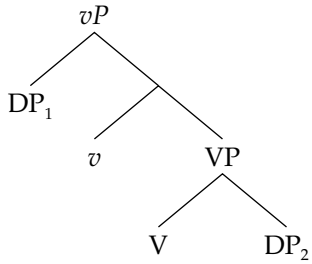
6.4.2 Mutiple feature checking

Ura (1996) is concerned with the explication under the MP of the widely observed facts that grammatical relations (GR), subject, object, and so on, do not always show one-to-one correspondences to grammatical functions (GF) such as playing the role of the antecedent of a reflexive form, the controller of the PRO subject of an adjunct clause,[27] or the trigger of the so-called subject triggered honorification in Japanese. Ura calls the discrepancy between GR and GF Grammatical Function Splitting (GFS). Typical examples of GFS can be drawn from facts about various types of ergative languages (Ura 1996, 2000). GFSs are observed in syntactic, morphological, and mixed ergativity. Take for example the case system of Georgian, which Marantz (1992) describes. In Georgian morphological ergativity is observed in sentences with simple past tense while accusativity shows up in sentences with the other tense forms. Furthermore, the agreement is dependent

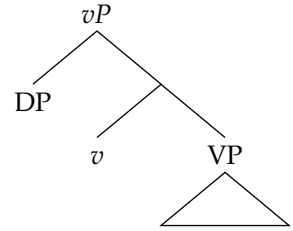
on the accusative case system. Now we can see that case analysis cannot be determined solely in terms of structural configurations. Due to space limitation, it is impossible to summarize Ura's arguments for the necessity of multiple feature checking to deal with such problems. The gist of the multiple feature checking Ura proposes is that multiple functional features borne by a single functional head are permitted to enter into multiple feature checking relations.

Another important proposal of Ura in relation to the idea of multiple feature checking is the 'Theta-Position Checking' parameter (θPC-parameter), which "states that elements can enter into a formal feature-checking relation at their theta-position in a language L only if the value of L's θPC-parameter is set as [+θPC]" (Ura 2000: 206). The base structures for transitive and intransitive (unergative) clauses are assumed as follows:

(140) a. Transitive



b. Intransitive (unergative)

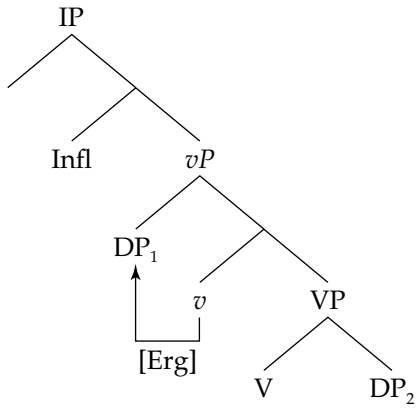


(Ura 2000: 206–207, slightly modified)

Let us see how Ura's multiple feature checking works to account for morphological characteristics of ergative languages with [+θPC]. On the basis of this assumption, DP_1 in (140a) enters into a case checking relation with *v* without moving out of its theta-position, vP-Spec.[28] In this case the case feature [Erg(ative)] is borne by DP_1 and *v*, thus, [Erg] on DP_1 is checked off.

Next, through Merge the finite Infl is introduced to (140), as in (141):

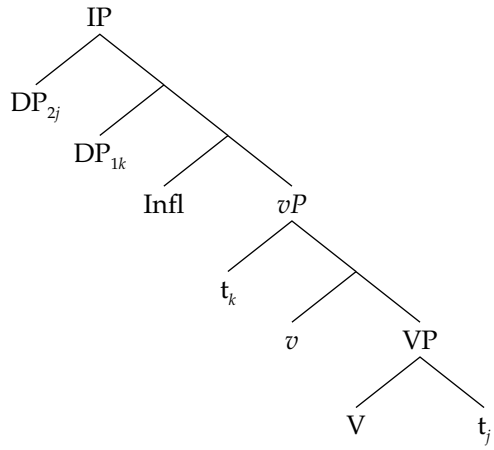
(141)



(Ura 2001: (43))

DP_1 in (141) is closer than DP_2 to the target of movement, IP-Spec. However, DP_1 has already lost its case feature through ergative case feature checking. DP_2 is the only candidate to hold a case checking relation with Infl, so it has to move to IP-Spec. However, DP_1 too has to move to a Spec position, it is assumed, to check off the [EPP] feature. Now the extra Spec position (the outer Spec) is utilized as in (142):

(142)



(Ura 2001: (45))

The checked case is absolutive in this case. Thus, the logical object (not the subject) enters into the case checking relation with Infl.

In a language with [–θPC], DP_1 must move from its theta-position to a position where its case feature can be checked off; namely, to the Spec of IP.

With this brief outline, let us try to account for the case of split ergatives in Georgian. The case feature checking carried out thus far accounts for morphological case distribution. Recall that Georgian follows the accusative pattern in agreement, according to Marantz (section 6.1.1). This means that agreement in Georgian is based on DP_1 in the inner Spec position. As a result, Infl checks off two different features (the EPP feature and the case feature) of two distinct DPs using multiple Spec positions.

To show how this multiple feature checking works with Japanese, the Dative Subject Construction (DSC) is taken up. Sentences with stative psychological predicates and potentials, those with the *ni-ga* case alignment exemplified in (15) and (16), are analyzed together as the DSC. The subjecthood of DPs marked with *ni* and the non-subjecthood of nominative objects in the DSC have already been discussed above. Ura states that "this fact indicates that T's nominative case-feature and its ϕ-feature can be checked independently in Japanese and Korean; for, from its morphological manifestation, it is natural to assume that T's nominative case-feature is checked off by the nominative object, and T's ϕ-feature is checked off by the dative subject" (Ura 1999: 231).

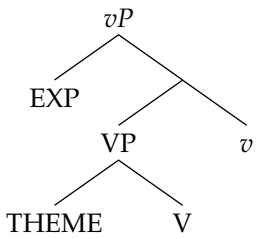
Ura's basic assumptions for the analysis of Japanese and Korean case systems are listed below, in order to see the real nature of the whole case checking system as applied to Japanese.

(143) (i) The EPP-feature of T is strong; (ii) the EXPERIENCER (EXP) of the psych-verbs that can occur in the DSC is generated at the Spec of a kind of light verb, which takes a VP with THEME in its complement position; (iii) the light verb in the two-layered VP shell of the psych-verbs that can occur in the DSC may assign a dative case to EXP as an inherent case, and they are allowed not to have an accusative case feature as a lexical idiosyncracy; (iv) agreement may be independent of nominative case; (v) T's phi-feature is strong, but its nominative feature is weak; (vi) T's nominative feature may enter into multiple feature checking relations.[29]

With these assumptions, Ura (1999) proceeds to show that the DSC provides supporting evidence for the assumption of multiple feature checking. Sentences (15) and (16b) are typical examples of this construction, whose case alignment, *ni-ga*, has been discussed in this paper repeatedly in different theoretical frameworks. Ura gives (144b) as the basic structure of sentences like (15), repeated below as (144a):

(144) a. watasi-tati ni mondai no honsitu ga yoku
we Dat problem Gen real nature Nom well
wakar- u koto
understand-Pres that
'that we can understand well the real nature of the problem'

b.



(Ura 1999: (26))

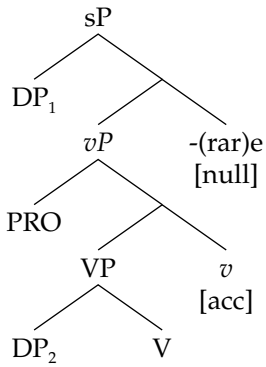
A dative subject, EXP in (144) is merged in the *vP*-Spec position. The dative marker *ni* is an inherent case marker, so it does not enter into a case checking relation with anything, even though it is raised to TP-Spec attracted by the strong EPP feature borne by T. Thus, its D feature is checked off in this checking relation.[30] This accounts for its function as subject, in playing the roles of the antecedent of an anaphora, and the trigger of subject orientated honorification and so on. The case feature [Nom] carried by T attracts DP with [Nom], THEME in

(144), and enters into the case checking relation with it, checking [Nom] off from the THEME DP. Thus two different features, [EPP] and [Nom], borne by T independently enter into different checking relations with different DPs.

Ura's analysis of the DSC provides evidence for his claim that individual features borne by a single head are checked independently, and that a single feature can check the same feature carried by multiple DPs, as in the case of multiple subjects in Japanese.

Ura continues to demonstrate the derivation of the three case arrays of potentials in this framework with quite a few additional assumptions. The structure posited by Ura (1999) is (145):

(145)



(Ura 1999: (38))

In (145) sP stands for the maximal projection of the potential suffix *(r)are* or *(r)e*, which bears the [null] case feature, which is to be checked by PRO. This is the same assumption as Watanabe's. Without case absorption, [acc] borne by *v* is checked off by DP_2, and DP_1 is raised to TP-Spec to check off its weak nominative case feature at LF. The result is *ga-o* case alignment. Due to (143iii) the potential suffix optionally assigns *ni* to DP_1 and absorbs the case feature [acc] of *v*. Now DP_1 is raised to TP-Spec attracted by T's strong features, the EPP and phi-features. When [acc] of *v* is absorbed by the potential affix, DP_2 has to move to another TP-Spec position in LF to check off T's nominative case feature. Thus, T enters into feature checking relations with both DP_1 and DP_2, resulting in *ni-ga* case alignment. When *ni* is not assigned to DP_1 and case absorption is applied, *ga-ga* case alignment emerges.

To summarize, case feature checking theories, either Agr-based or not, aim at (i) accounting for the distribution of DPs on case theoretic grounds, (ii) identifying subjecthood of DPs, (iii) motivating NP movement (A movement) in the MP framework, i.e., in the framework without the notion of government, and (iv) accounting for the distribution of PRO, which is tied to the case system.

In terms of (iii) and (iv), the theories taken up in section 6, together with a fairly large number of works currently going on, may be successful, especially in view of their coverage of quite a number of typologically different languages. As

for (i) and (ii), there is room to reconsider whether there are other means to achieve these aims, especially concerning (i) languages like Japanese with overt case particles and postpositions invite different approaches to this problem. Kuroda (1988) in section 5.4 and Fukui and Takano (1998) in section 6.5 propose alternatives. Concerning (ii), case checking as a means of identifying subjecthood depends on T(ense), with the case feature [Nom] or [Null]. This means that embedded non-finite clauses must be generated as IP or TP. Kuroda (1988), on the other hand, convincingly argues that Japanese is a language with "non-forced agreement," and proposes an alternative, which claims that a subject is generated as the external argument of a verb (Ext (V)). Following this proposal, we can account for the subjecthood borne by both matrix and complement subjects. In fact, as has been repeatedly emphasized in sections 5 and 6, the underlying complement subject marked with *o* in the *o*-causative and those marked with *ni* in the *ni*-causative and the indirect passive have the typical functions of a subject mentioned above. In view of this fact, Kuroda's proposal must be seriously studied together with the function of T(ense) from the point of view of UG.

6.5 Fukui and Takano (1998)

Supporting the claim by the MP that linear ordering does not play a role either in LF or in the computation from numeration to LF and that it is part of the phonological component, Fukui and Takano propose the operation of demerge in the phonological component. Demerge recursively applies to the topmost construct formed by Merge and detaches the maximal projection first and starts the concatenation from the first detached element.[31] (See Fukui and Takano (1998) for a formal and detailed presentation of demerge and concatenate.) The result is Specifier-Complement-Head order, namely head final order. The Spec-Head-Comp order in head initial languages is the result of verb raising triggered by the strong feature of the functional head *v*. The presence or absence of the functional head with the strong feature of attracting a verb to its specifier position accounts for the linear order variation in languages.

According to the above theory, Japanese does not undergo verb raising since its head final order is base generated. As a consequence the standard analysis of accusative case checking based on verb raising is not available for Japanese.[32] This is a desirable consequence in view of the lack of evidence in Japanese for the relevance of the abstract case system. Roughly speaking, Fukui and Takano have come up with a conclusion similar to Kuroda's (1988), that is, in Japanese, subject and object NPs are licensed by *ga* and *o*, not by Case checking. The significance of Fukui and Takano's work lies in the account of the process of uninterpretable feature 'elimination'. The case feature carried by NP and the feature 'Assign the accusative case' ([+Acc]) carried by the transitive verb must be eliminated before the derivation terminates in LF, since they are not interpretable. Fukui and Takano claim that "Case particles make case features visible to Spell-Out," which triggers the elimination of the case feature of an NP because

spell-out takes away visible features relevant to the phonological component. Without the case feature, the NP proceeds to LF and the derivation successfully terminates in the covert component, if the other conditions are met. Fukui and Takano further assume that the accusative case in Japanese is an inherent case and that it is linked to a particular theta-role. This means that [+Acc] on the transitive verb can stay on in the covert component as an interpretable feature.

As for the nominative case, it is assumed that T(ense) in Japanese does not carry the case feature 'Assign the nominative case'. The case particle *ga* makes the case feature of its complement NP visible, which leads to the elimination of this case feature by spell-out. The case particle *ga* licenses the multiple subject NP in the same way.

This is a very rough outline of Fukui and Takano's approach to the Japanese case system within the MP framework. This approach seems to be on the right track, but there are some serious problems yet unsolved. One of them is the question of how to account for interrelationships of structural cases and other distributional facts described in sections 4 and 5.

7 Conclusion

This summary reveals that the distinction was made between structural and inherent cases already in Kuroda's dissertation (1965), written in the framework of the early generative grammatical model. This distinction has been one of the basic points in Japanese generative grammars up to the present time. However, neither this distinction nor case itself had been included in the main research agenda until the emergence of the ideas of principles and parameters in the early part of the 1980s. Chomsky himself admits, "But as far as I can determine, there was never any distinction made between what we now call structural and inherent Case; I don't know the literature well enough to check, but I asked other people like Giuseppe Longobardi, and apparently there is no clear recognition of the distinction . . . As far as I am aware, this split was not noticed until the P&P approach came along" (Chomsky 2002: 112–113). It is surprising how poorly the results of long and continued efforts of Japanese generativists have fared in the generative tradition.

As was pointed out in the introduction, Japanese traditional linguists did not make the distinction, treating all case particles as markers of noun phrases functioning as predicative modifiers. According to Chomsky, the same applies to research on case in the European tradition. Neither Gruber nor Fillmore made this distinction. Kuroda (1965) achieved an integration of various ideas on case into a well-articulated system.

It is interesting to note that there has emerged a move toward disintegration. Kuroda (1988) is one example, treating the structural *o* and inherent *o* together as complements of verbs, structural cases in other words. Inoue (1997a) shows that there is no fast and hard line dividing the structural case particle *o* and inherent *o*, using various structural tests. Fukui and Takano admit only the inherent particle

o, related to various theta *roles*. It is hoped that this kind of trend in Japanese linguistics will give some impact on the refinement of the MP, contrary to the fate of the very early efforts to integrate ideas into a claim for the basic distinction among particles.

In the presence of sentences without nominative subjects, as described in Inoue (1998), Ura's assumption that [EPP] is strong in Japanese cannot be maintained. Instead, we have to assume that there are parametric differences among languages in terms of the requirements of sentencehood. Inoue (1998) contends that some languages require the subject–predicate relation, most typically realized as 'forced agreement' in Kuroda's terms. Others are satisfied with a topic–comment relation. Still others permit both of them. Japanese falls into the third group, with the subject orientated honorifics and the subject antecedent requirement for anaphora depending on the subject–predicate relation, permitting at the same time the topic–comment relation.

The status of *ga* is certainly more complex than the nominative case in English. This summary is an attempt to show various approaches to account for its multiple functions. Saito (1982) and Kuroda (1986) are in sharp contrast with respect to the treatment of *ga* as the subject and focus marker. The former distinguishes them by giving them different syntactic structures, the latter by providing a semantic account for the difference. The multiple subject construction has been approached as well from several theoretical perspectives; Kuno and Kuroda using the subjectivization transformation, Takezawa with the configurational approach utilizing the mechanism of adjunction of a subject to IP, and Ura with the multiple specifier positions for subjects. Finally, the *ga* marking the object of a stative predicate looks like a default case in Marantz's case realization. All these studies show that the presence or absence of the subject–verb agreement is an important factor in deciding typological differences. In this respect, Kuroda (1988) offers an important perspective for future studies.

NOTES

This chapter presents some of the results of my research supported by a Grant-in-Aid for COE Research (08CE1001) from the Japanese Ministry of Education, Science and Culture, granted to Kanda University of International Studies from 1996 to 1999.

Comments by T. Ito and Y. Ueda helped revision of the preliminary version of this chapter. Special thanks are due to B. Horton, who patiently read through the first manuscript and helped editing. Y. Furukawa's comments on Koizumi (1995, 1998) and Ura (1996, 1999) led me to decide the inclusion of these papers in the review given in section 6.

Abbreviations used in this chapter: Adj-aff = adjectival affix, Acc = accusative, Caus = causative, Compl = completive aspect, Cop = copula, Dat = dative, Desid = desiderative, DP = determiner phrase, Foc = focus, Gen = genitive, Hon = honorific, Neg = negative, Nm = nominal marker, Nom = nominative, NP = noun phrase, Pass = passive, Past = past tense, Perf = perfective aspect, Pol = polite form, Pot = potential, Pres = present tense, Presum = presumptive, Prog = progressive aspect, SF Par = sentence final particle, State = stative, Top = topic, VP = verb phrase.

1 Government Binding (GB) Theory is based on the following subsystems:

(i) bounding theory
(ii) government theory
(iii) theta-theory
(iv) binding theory
(v) Case theory
(vi) Control theory

(Chomsky 1981: 5)

All these subsystems are closely tied to each other. With respect to case theory, the abstract Case (nominative and accusative) is assigned to the NPs generated in the positions identified by verbs and verb phrases as theta-positions, that is, theta-role assignable positions. It is further claimed that "a verb with a complement assigns case if and only if it theta-marks its subject" (Chomsky 1986b: 141, (185)). The core of theta-theory is the theta-criterion, which reads as follows: Each argument bears one and only one theta-role, and each theta-role is assigned to one and only one argument (Chomsky 1981: 36). Case theory consists of abstract case assignment to the NPs governed by case assigning heads, Tense and verbs, and the Case filter which requires that every lexical NP must get case assigned to it.

(i) NP* if NP has phonetic content and has no case. (Chomsky 1981: 49)

2 Grammatical functions are basically those functions as subject and object. Especially, the subject plays important functions as the antecedent of anaphora (in Japanese *zibun* ('self') or *otagai* ('each other')), the trigger of the subject orientated honorific expressions, and the controller of the null subject PRO of an embedded adjunct. Some examples follow:

(i) Katoo-san$_i$ ga zibun$_i$ o seme-te i-ru
Katoo Nom self Acc accuse-Prog-Pres
'Mr Kato accuses himself.' (the antecedent of an anaphor)

(ii) sensei ga kono hon o o-kaki ni nat-ta
Nom this book Acc Hon-write-Hon- Past
'The teacher wrote this book.'(the trigger of subject orientated honorification)

(iii) [PRO$_i$ ie o deru mae ni] Katoo-san$_i$ wa hisyo ni denwa si-ta
home Acc leave before Katoo Top secretary to call- Past
'Before leaving home Mr Kato called his secretary.' (the controller of PRO)

3 *Ni* is put within parentheses because linguists like Kuroda and Saito regard all sorts of *ni* as an inherent case marker (postposition).

4 The base form is *nar-re*, from which the first consonant of the affix *re* is deleted because it is attached to the verb with the final consonant *r*. If it is attached to a verb with a final vowel *r* is retained as in (i) below. More is given in note 6.

(i) ne-ru ('sleep'), ne-rare-ru ('can sleep')

5 Agt stands for Agent. Gruber gives a special status to Agent; namely, in his grammar Agent is optionally selected by Event, rather than by VP.

6 The verbal suffixes like *sase* (causative), *rare* (passive), *rare* or *re* (potential) start with consonants, which are deleted when attached to verbs with final consonants to avoid consonant clusters. This is shown by enclosing the initial consonant with parentheses in the exposition as in *(s)ase* and *(r)are*, whereas in example sentences the actual form without a consonant is given. When they are attached to verbs with final vowels the initial consonants of these affixes are retained. The adjectival suffix *tak* (desiderative) loses its final consonant when the present tense morpheme *i* is attached to it. Thus, *tak-i* becomes *ta-i*. In the exposition the form *ta(k)-i* is used, while in examples the actual form *ta-i* is given.

7 The *ga*-marked subject of a sentence with a stative predicate has the sense of 'exhaustive listing', the term used by Kuno (1973c), which means an exclusive selection of an NP from among all the other candidates. In an embedded clause this sense is not kept. Using this fact, *koto* ('that') is added to turn these sentences to embedded clauses and eliminate the sense of 'exhaustive listing' from them.

8 Desideratives do not permit *ni-ga* case alignment. In Inoue (1997b) this type of *ni* is treated as an inherent case marker of the subject selected by stative psychological predicates like *wakar* ('understand') and potentials. The desiderative *ta(k)* does not select *ni* for its subject.

9 (21b) is a non-configurational tree structure following the general acceptance around the end of the 1970s of non-configurationality of languages like Japanese. Kuno (1973c) employs configurational tree structures (with the node VP) for Japanese. The structures like (21b) are used here to simplify arguments involving cyclic case assignments, where the VP node does not play any role.

10 The case alignment (*ga-ni-o*) is not treated as a structural case array by some linguists. The parentheses are meant to show this situation.

11 In Kuroda's system, the NP that is assigned *ni* by subject-*ni* raising is not affected by the structural case assigning rule (23) as shown by (27) and the following discussion. This means that this *ni* is treated by Kuroda as a postposition. An anonymous reviewer pointed out that there are "a number of works to suggest that *ni* is case or postposition." This is exactly what this summary is meant to convey. Kuno, for example, regards the indirect object *ni* as a structural case, and the locative *ni* as a postposition. The test of Q float was used rather frequently around the latter part of the 1970s. However, it did not yield a decisive result. See Inoue (1978a) for details.

12 Kuno follows the ST derivation of direct passives, that is, the subject NP is first postposed and the object NP is moved to fill the vacated subject position.

13 This is the rendition given by Saito (1982) rather than Kuno's. This is used to give a more natural reading.

14 [+Self-controllable] is assumed to be a feature of a predicate that selects an agentive subject.

15 Some nominal clauses other than relative clauses also permit the conversion of *ga* to *no*. Clauses with *no*, *koto* (nominalizers) and lexical NPs like *zizitu* ('fact') and *hookoku* ('report') permit this conversion under certain conditions. We can, therefore, generalize the applicability of this conversion to complex NPs.

16 Exhaustive listing and neutral description are the semantic terms originally used by Kuno. Note 7 above gives the sense of the first. Saito claims that the *ga* marked NPs with the sense of exhaustive listing must be treated as focused elements.

Neutral description can be taken to be a semantic interpretation given to sentences without foci.

17 α governs β iff α m-commands β and there is no γ, γ a barrier for β, such that γ excludes α (Chomsky 1986a: 9, (18)). α excludes β if no segment of α dominates β (p. 9, (17)).

18 α c-commands β iff α does not dominate β and every γ that dominates α dominates β. Where γ is restricted to maximal projections α is said to m-command β (Chomsky 1986a: 8, (13)).

19 Chomsky (1986a) extended the X' scheme to functional categories, I(nflection) and C(omplementizer). IP corresponds to S and CP to S' of the EST framework.

20 The symbol # is added here to show that the structure underlying (103b) is not assumed to underlie (103a). Kuroda assumes that in (103a) *koma* ('top') is adjoined to Max(N), whose head is *iro* ('color'), and Max(N) is assigned *ga* by the predicate *kirei*. Then *ga* is distributed from Max(N) to both *koma* and *iro*.

21 Projection principle: Representations at each syntactic level (i.e., LF, and D- and S-structure) are projected from the lexicon, in that they observe the subcategorization properties of lexical items (Chomsky 1981: 29, (38)). In other words the projection principle requires that complements of heads must be represented at each syntactic level. For example, a verb projects its complements according to its subcategorization property. The projection principle, together with the requirement that every clause must have a subject, constitutes the extended projection principle (EPP). In the GB framework this means that the head of IP must project its specifier position for the subject to occupy, thus leading to the obligatory existence of a subject for each clause. Later in the MP, feature strength (strong or weak) is assumed to decide the movement of feature-bearing items to positions where feature checking can take place. For example, the strong EPP feature triggers the movement of the D feature carried by DPs (determiner phrases) in the specifier position of VP to that of IP resulting in the elimination of the D feature from the subject DPs. (Instead of assuming that the determiner occupies the NP-Specifier position, Abney's (1987) claim is accepted in recent works that the determiner is the head of the determiner phrase which takes NP as its complement.)

22 'Equidistance' is defined as: If α and β are in the same minimal domain, they are equidistant from γ. The minimal domain is: MIN(S), S a set of categories, is the smallest subset K of S such that for any $\gamma \in S$, some $\beta \in K$ reflexively dominate γ (Watanabe 1996: 4–6).

23 The PRO theorem requires that PRO be not governed. In (120a) PRO is not governed by the matrix verb *tried* thanks to the presence of *e* in CP, while in (120b) there is nothing blocking the government of PRO by the matrix verb *believe*.

24 'Mary' in (124b) is the embedded subject binding the anaphor *zibun* in the embedded clause.

25 'Three-layered case checking': Watanabe proposed follow-up case checking in addition to nominative and accusative case checking. These three types of case checking involve three layers of syntactic configuration.

26 Raising verbs like English *seem* and Japanese *sug*i ('overdo') require the movement of the complement subject to the matrix subject position, while one type of control verbs like English *try* and Japanese *wasure* ('forget') require that the PRO complement subject be coreferential with the matrix subject and the other type like English *persuade* and Japanese *tanom* ('ask') requires the PRO complement subject to be coreferential with the matrix direct or indirect object.

27 The adjunct subject PRO is controlled only by the matrix subject unlike the PRO as the complement subject discussed in note 26:

(i) [PRO_i ryokoo ni de-ru mae ni] Katoo-san_i ga tomodati o syootai-si-ta.
trip to go-Pres before Nom friend Acc invite- Past
'Before going on a trip Mr Kato invited his friends.'

28 The specifier of XP is abbreviated as XP-Spec in the following.

29 This assumption accounts for multiple nominative DPs. The early MP assumes that strong features are checked in the overt component (syntax) while the checking of weak ones is carried out in the covert component (LF). Since it is assumed that the nominative feature is weak, the feature checking of multiple nominative DPs are carried out in LF. T's phi-feature is responsible for the functions of subjects. Now in Chomsky (2000, 2001b) the idea of feature strength is discarded together with the distinction of overt and covert components. It is unknown at the present stage what effects will emerge involving all the grammars using these assumptions.

30 D feature is checked off as the result of the EPP feature checking.

31 It is implied that Demerge is an operation undoing the result of Merge and mapping it into an unstructured (linearized) sequence of elements. "Our hypothesis is that human language is designed in such a way that merge and demerge are in a symmetric relation with respect to their applications" (Fukui and Takano 1998: 36).

32 As was explicated in section 6.2.1, using the structure (118), V^0 must be raised and adjoined to Agr-o to carry out accusative feature checking.

6 Conclusion

1 Introduction

In Mandarin Chinese,[1] there is a construction sometimes referred to as simply the *ba* construction: *ba zi ju* (sentence with *ba*). It is one of the most famous constructions in the grammar of Chinese and has attracted the attention of almost every linguist interested in the grammar of Chinese. However, it has also consistently eluded a satisfactory analysis. The construction is complex and seems to be subject to a myriad of difficult-to-characterize, fuzzy constraints. It is generally one of the most difficult constructions for foreign language learners of Chinese. Yet it is an extremely prominent pattern in Chinese, very commonly used in daily speech. In fact, it seems to be gaining even more prominence in so-called Taiwan Mandarin (Mandarin spoken in Taiwan) because of influence from the even more extensively used corresponding *ka* construction in Taiwanese.[2]

It would be impossible, within the limits of this chapter, to do justice to the complexity of this construction and the rich, endless literature on this topic if we aim for a comprehensive presentation of the properties, problems, and past analyses, and also present a detailed and extensive review of published works. In order to at least provide an understanding of the complexities, we will, therefore, devote much space to the properties of each of the components of the structure which must be considered when analyzing this construction. Moreover, with an aim to setting an appropriate direction for a more satisfactory analysis, we will bring more empirical generalizations from a closely related structure, providing a new perspective to this study: a comparative dimension based on contrasts between the *ba* construction in Mandarin and the corresponding *ka* pattern in Taiwanese. Phrase structures for both *ba* and *ka* constructions will be proposed to reflect the similarities and differences between the two constructions. In addition, a substantial part of this chapter will focus on the constraints on the usage of the *ba* construction, the aspect of the construction which has been the most controversial in the literature. We will review the recent, important analyses of the various constraints – approaches from the perspective of event structures, aspectual structures, and pragmatics – and discuss the strengths and weaknesses of each of these analyses. We will show that all these different approaches accommodate the typical or canonical cases of the *ba* construction. However, there are many 'non-canonical' instances of the *ba* construction which elude any precise structural account. More specifically, the accounts based on aspectual structures and event structures are both too weak and too strong empirically. An account based on pragmatic constraints is vague and uncertain. Nonetheless, vagueness and uncertainty are in the nature of the constraints on this construction. There also exist many minimal pairs of sentences which are structurally identical (including identical aspectual and event structure) but differ in acceptability as a *ba* sentence. Accordingly, we suggest that it is important to distinguish form from usage. Form can be represented precisely by syntactic phrase structure. Usage, however, is influenced by pragmatic factors which cannot be accommodated solely by clearly defined grammatical accounts.

We first characterize in section 2 the syntactic properties of the *ba* construction by describing each component of the *ba* construction in turn, including a *ba* sentence and a non-*ba* counterpart, *ba*, the types of NPs which can follow *ba*,[3] and the possible following verbal constituents. We then turn, in section 3, to the *ka* construction in Taiwanese, comparing the similarities and differences between *ba* and *ka* constructions, which leads to the establishment of an analysis of the syntactic structure of both of these constructions in section 4. Section 5 discusses constraints on the usage of the *ba* construction. The main proposals in the literature will be discussed in detail, revealing the strengths and weaknesses of each of them. We show why precise structural accounts cannot capture the complex constraints on the usage of the *ba* construction and why it is important to distinguish form from usage.

2 Properties

Schematically, a *ba* sentence always has the form in (1a–b), disregarding optional elements.[4] That is, a *ba* sentence has a subject (NP* in (1a–b)), followed by *ba* and 'the *ba* NP' (the NP directly following *ba*), followed by a verb and something else before or after the verb, i.e., the X (X is non-null) in (1a–b):

(1) a. NP* + *ba* + NP + V + X
b. NP* + *ba* + NP + X + V

In addition to the uncertainty of whether a *ba* sentence always has a non-*ba* counterpart,[5] controversy exists with respect to the proper description of almost every component of this construction: (i) the categorial status of *ba*; (ii) the types of NPs allowed in this construction; (iii) the types of Vs allowed; and (iv) what the X is. There have also been substantial and endless debates on whether the *ba* construction carries a special interpretation: whether the *ba* construction expresses some notion of 'affectedness' and whether all the constraints on this construction are reducible to this notion. To begin to understand the controversies, we attempt to describe in the following subsections the important syntactic properties of each component of the *ba* construction.

2.1 Ba *sentences and their non-*ba *counterparts*

We begin with the overall pattern. We claim that a *ba* sentence always has a non-*ba* counterpart. The first component of a *ba* sentence is the subject, which is also the subject of the corresponding non-*ba* sentence. The following two examples illustrate some straightforward cases:

(2) a. wo ba ta sha-le
I BA him kill-Le[6]
'I killed him.'
b. wo sha-le ta-le.
I kill-Le him-Le
'I killed him.'

(3) a. wo ba yaoshi wang-le.
I BA key forget-Le
'I forgot the key.'
b. wo wang-le yaoshi-le
I forget-Le key-Le
'I forgot the key.'

These two types of sentences differ only in where the thematic object of the verb occurs: in a non-*ba* sentence, it occurs postverbally, whereas in a *ba* sentence, it occurs between *ba* and V (see note 6).

In less straightforward cases, it is still possible to state that a *ba* sentence has a non-*ba* counterpart with an identical subject. For instance, in a case like (4a), where it is not immediately obvious that the subject 'this bottle of wine' is directly related to the verb *zui-dao* 'be drunk and fall' thematically, there is still a non-*ba* counterpart with the same subject (4b):

(4) a. zhe-ping jiu ba ta zui-dao-le.
this-bottle wine BA him drunk-fall-Le
'This bottle of wine made him very drunk.'
b. zhe-ping jiu zui-dao ta le.
this-bottle wine drunk-fall him Asp
'This bottle of wine made him very drunk.'

Zui-dao is a compound verb used causatively in (4b).[7]

There are also cases where a verb is followed by a complement, such as a resultative complement or a locative complement, initially complicating the assessment of whether or not there is a non-*ba* counterpart. When a resultative or locative complement occurs, it is generally the case that an object cannot occur postverbally because, independently, Chinese restricts the number of elements that can occur postverbally (the postverbal constraint): generally only one constituent is allowed in postverbal position[8] (see, for instance, Chao 1968; Huang 1982a; Koopman 1984; Travis 1984; Li 1985, 1990; Tang 1990; Sybesma 1992).[9] Under such circumstances, a non-*ba* counterpart is generated by placing the *ba* NP in some preverbal position (such as pre-subject as a topic or post-subject as a preposed object). (5a), for instance, has a non-*ba* counterpart in (5b) by topicalization and (5c) by object-preposing. In addition, verb-reduplication, as in (5d), is another mechanism to create a non-*ba* counterpart without violating the general postverbal constraint of only one postverbal constituent:

(5) a. wo ba zhe-shi xiang-de hen ziji.
I BA this-matter think-De very carefully
'I have thought about the matter carefully.'
b. zhe-shi, wo xiang-de hen zixi.
this-matter I think-De very carefully
'The matter, I have thought about carefully.'
c. wo zhe-shi xiang-de hen zixi.
I this-matter think-De very carefully
'I, the matter, have thought about carefully.'
d. wo xiang zhe-shi xiang-de hen ziji.
I think this-matter think-De very carefully
'I have thought about the matter carefully.'

Alternatively, a non-*ba* counterpart may also be generated by placing the *ba* NP counterpart in the subject position of a resultative complement or a locative complement:

(6) a. haizi ba wo ku-de tou-teng.
child BA me cry-De head-ache
'The child cried so much that my head ached.'
b. haizi ku-de wo tou-teng.
child cry-De me head-ache
'The child cried so much that my head ached.'

(7) a. zhe-ping jiu ba ta zui-dao-zai di-shang.
this-bottle wine drunk-De him fall-at ground-on
'This bottle of wine made him drunk and fall on the ground.'
b. zhe-ping jiu zui-de ta dao-zai di-shang.
this-bottle wine drunk-De him fall-at ground-on
'This bottle of wine made him drunk and fall on the ground.'

The examples above show that a *ba* sentence always has a non-*ba* counterpart. They only differ in the presence/absence of the morpheme *ba* and word order: the *ba* NP corresponds to an NP in postverbal position in a non-*ba* counterpart or in some other position when necessary to avoid violating the general constraint on the number of postverbal NPs possible. The subject of a *ba* sentence and its non-*ba* counterpart stays constant.

Following the subject in a *ba* construction is the key word *ba*, which we turn to next.

2.2 *Ba*

Let us begin with some clear facts about the nature of *ba* and then turn to the analyses of *ba* that have been proposed in the literature.

2.2.1 *The categorial status of* ba

Historically, *ba* was a lexical verb meaning 'take, hold, handle' (see L. Wang 1954; H. Wang 1957; Bennett 1981, for instance). It also occurred in the so-called serial verb construction [V1 + NP + V2 + XP],[10] with *ba* as V1 [*ba* + NP + V + XP]. The pattern can mean 'to take NP and do [V XP] (to it)'. Such a historical origin seems to still be detectable in many contemporary *ba* sentences.[11] For instance, the following question-and-answer pairs in modern Chinese look like serial verb constructions:

(8) a. ni ba juzi zenmeyang-le?
you BA orange how-Le
'What did you do to the orange?'
b. wo ba juzi bo-le pi-le.
I BA orange peel-Le skin-Le
'I peeled the skin off the orange.'

(9) a. ni yao ba ta[12] zenmeyang?
you want BA him how?
'What do you want to do to him?'
b. wo yao ba ta da-duan tui.
I want BA him hit-broken-Le leg
'I want to break his leg.'

These sentences bear great similarity in form to the serial verb construction [Subject + V1 + NP + V2 + XP]. They are interpreted as 'Subject takes NP and does [V + XP] to it; what the subject does to NP is [V+XP]': (8b) means what I did to the orange was peel its skin and (9b) means that what I want to do to him is break (his) leg.

Ba in modern Chinese, however, has lost standard verbal properties, according to most of the works on this construction (see Zou 1995 for an extensive review of relevant works). It has become 'grammaticalized'[13] and does not behave like a verb according to traditional verbhood tests: (i) it cannot take an aspect marker (10b); (ii) it cannot form an alternative V-not-V question (10c); and (iii) it cannot serve as a simple answer to a question (10d) (see, e.g., Chao 1968; Li and Thompson 1981):[14]

(10) a. ta ba ni hai-le.
he BA you hurt-Le
'He hurt you.'
b. *ta ba-le ni hai(-le).
he BA-Le you hurt(-Le)
c. *ta ba-mei/bu-ba ni hai(-le).[15]
he BA-not-BA you hurt-Le
d. *(mei/bu-)ba.
(not-)BA

Such morphosyntactic tests, however, are not quite satisfactory. There are a very small number of verbs in Chinese that simply do not behave like standard verbs according to these tests; nonetheless, they are clearly verbs. *Shi* 'make, cause' is such an example. It behaves like *ba* with respect to verbhood tests; yet no linguist has raised doubts as to the verbal status of *shi*:

(11) a. ta shi ni hen kuaile.
he make you very happy
'He made you happy.'
b. *ta shi-le ni hen kuaile.
he make-Le you very happy
c. *ta shi-mei/bu-shi ni hen kuaile.
he make-not-make you very happy
d. *(mei/bu-)shi.
(not-) make

What is clear, however, is that the NP following *ba* (referred to as the *ba* NP henceforth) can simply be the object of the following verb, as in (10a). When the *ba* NP is understood as the object of the following verb (V), the object position of the V must be empty. It cannot be occupied by a pronoun or a reflexive coreferential with the *ba* NP, as in (12a–c). These properties of *ba* and the *ba* NP are not true for any other verbs and their objects:

(12) a. *ta ba Zhangsan$_i$ hai-le ta$_i$.
he BA Zhangsan hurt-Le him
'He hurt Zhangsan.'
b. *ta ba Zhangsan$_i$ hai-le ziji/taziji$_i$.
he BA Zhangsan hurt-Le self/himself
'He hurt Zhangsan.'

(12b) should be contrasted with (12c), which allows *shi* 'make, cause' to be followed by a verb and a reflexive:

(12) c. ta shi Zhangsan$_i$ hai-le ziji/taziji$_i$.
he make you hurt-Le self/himself
'He made Zhangsan hurt himself.'

The contrast between (12a–b) and (12c) shows that *ba* in modern Chinese is different from lexical verbs.

2.2.2 *The analysis of* ba

Although *ba* has become 'grammaticalized' and hence does not behave like a lexical verb, questions arise as to what it means to be grammaticalized. What morphosyntactic properties does the 'grammaticalized' *ba* have? There have been so many proposals that the logical possibilities have almost been exhausted:

(13) a. as a lexical verb (Hashimoto 1971);
b. as a preposition (Li and Liu 1955; Chao 1968; Lü 1980; Travis 1984; Cheng 1986; Li 1990);
c. as a dummy Case assigner (Huang 1982a; Koopman 1984; Goodall 1987a);
d. as a dummy inserted to fill the head of a CAUSE phrase when verb raising does not take place (Sybesma 1999);[16]
e. as the head of a base-generated functional category (Zou 1995).

The lack of lexical verbal properties in modern Chinese makes the first option less attractive. (13b–c) on the one hand and (13d–e) on the other can be distinguished by one major difference: constituency. For a *ba* construction of the form [*ba* NP VP], the analyses in (13b–c) take *ba* and the *ba* NP as a constituent. For a preposition analysis (13b), *ba* should form a constituent with its object, the *ba* NP. As a dummy Case assigner (13c), *ba* should form a constituent with the *ba* NP. That

is, according to (13b) and (13c), the *ba* NP alone (without *ba*) and the VP should not form one constituent. In contrast, according to (13d–e), which view *ba* as the head of a CAUSE Phrase or some other functional projection, the *ba* NP should form one constituent with the VP, not with *ba*. The fact is that the *ba* NP and the VP can form one constituent, as illustrated by the coordination test (see Wu 1982):[17]

(14) ta ba [men xi-hao], [chuanghu ca-ganjing]-le.
he Ba door wash-finish window wipe-clean-Le
'He washed the door and wiped the windows clean.'

This suggests that (13d–e) are more adequate. However, there is a subset of *ba* sentences which indicates that *ba* can form a constituent with the *ba* NP, suggesting the inadequacy of solely relying on the (13d–e) analyses.[18] This subset of sentences is the type of sentence that Sybesma (1999: chapter 6) refers to as "canonical *ba* sentences" (in contrast to his 'causative *ba* sentences') – those sentences whose subject is an animate agent, not an inanimate causer,[19] such as (14). Let us use another simpler example, such as (15a). It allows *ba* and the *ba* NP to be preposed as a unit to the sentence-initial position (15b). That is, such 'canonical *ba* sentences' not only allow the *ba* NP to form a constituent with the following VP but also allow *ba* and the *ba* NP to form a constituent:[20]

(15) a. ni xian ba zhe-kuai rou qie-qie ba!
you first BA this-Cl meat cut-cut Par.
'Cut the meat first.'
b. ba zhe-kuai rou, ni xian qie-qie ba!
BA this-Cl meat you first cut-cut Par.
'Cut the meat first.'

cf.:

c. ni ba [zhe-kuai rou qie-qie], [na-xie cai xixi]-ba!
you Ba this-Cl meat cut-cut that-Cl vegetable wash-Par.
'You cut the meat and wash the vegetable.'

Sentences like (15a–b) show that it is not always sufficient to just take *ba* as the head of a CAUSE phrase or the head of some other functional projection not forming a constituent with the following NP. It is also doubtful that it is adequate to claim that *ba* is an inserted Case assigner. If it were, it is not clear why, for instance, (15b), with *ba*, and (15d), without *ba*, are both acceptable. A case marker should not be able to be inserted optionally:

(15) d. zhe-kuai rou, ni xian qie-qie ba!
this-Cl meat you first cut-cut Par.
'Cut the meat first.'

Summarizing, *ba* in modern Chinese does not behave like a lexical verb. The coordination test illustrated in (14) and (15c) shows that the structure [*ba* NP VP] can be analyzed as [*ba* [NP VP]]. In addition, when a *ba* sentence is of the 'canonical' type, the constituent structure seems to have the possibility of behaving like [[*ba* NP] VP], since *ba* and the *ba* NP can be preposed as a unit (15b). The former observation is in line with the approaches that treat *ba* as the head of a projection, taking [NP VP] as its complement, such as (13d–e). The latter observation goes along with a preposition analysis (13b).

2.3 The ba *NP*[21]

It has been widely noted in the literature that the *ba* NP is sensitive to a myriad of semantic and syntactic restrictions. In this subsection, we focus on the syntactic properties of the *ba* NP and discuss what a *ba* NP is syntactically.

2.3.1 V-object

First of all, it is quite common for a *ba* NP to correspond to the direct object of the verb in its non-*ba* counterpart. That is, a *ba* NP is simply the object of a verb, as illustrated in (2–3). In fact, the *ba* NP in the cases we have seen so far is mostly the (direct) object of the verb. However, it can also be an indirect object:

(16) a. wo ba ta wen-le yi-da-dui hen-nan-de wenti.
I Ba him ask-Le one-big-pile very-difficult-De question
'I asked him many difficult questions.'

cf.:

b. wo wen-le ta yi-da-dui hen-nan-de wenti.
I ask-Le him one-big-pile very-difficult-De question
'I asked him many difficult questions.'

(17) a. wo ba ta fa-le henduo qian.
I Ba him fine-Le much money
'I fined him a lot of money.'

cf.:

b. wo fa-le ta henduo qian.
I fine-Le him much money
'I fined him a lot of money.'

There are also cases which seem to take an instrument or locative NP as a *ba* NP, rather than taking an object. (18a–b) illustrate an instrument as a *ba* NP, and (18c–d) a locative NP:

(18) a. ta yong shou wu-zai erduo-shang.
he use hand cover-at ear-on
'He covered his ears with his hands.'
b. ta ba shou wu-zai erduo-shang.[22]
he Ba hand cover-at ear-on
'He covered his ears with his hands.'
c. ta zai lian-shang tu-(man-)le hui.
he at face-on cover-full-Le ash
'He covered his face with ash.'
d. ta ba lian(-shang)[23] tu-man-le hui.
he Ba face(-on) cover-full-Le ash
'He covered his face with ash.'

These cases, however, may actually be better regarded as a direct object, since an instrument and locative NP can clearly become the object of a verb:

(19) a. ta wu shou wu-zai erduo-shang.
he cover hand cover-at ear-on
'He covered his ears with his hands.'
b. ta tu hui tu-man-le lian.
he cover ash cover-full-Le face
'He covered his face with ash.'

The instrument NP 'hand' functions as the object of the verb 'cover' in (19a), and the locative NP 'face' in (19b) also functions as the object of the verb 'cover-full'. The occurrence of 'full' with 'cover' in (19b) when the locative NP functions as an object can be used as a test showing that the *ba* NP 'face' in (18d) originates as an object: *man* 'full' must occur with the verb in such a *ba* construction, in contrast to the non-*ba* sentence which does not need *man* 'full' (20):

(20) ta zai lian-shang tu-le hui.
he at face-on cover-Le ash
'He covered his face with ash.'

In brief, the *ba* NP can be a direct or indirect object of the verb. The cases that seemingly are non-V-objects such as instruments or locatives can actually be regarded as V-objects.

2.3.2 Non-V-objects

There are cases where the *ba* NP cannot be a direct or indirect object of the V. It can be a possessor of the object NP (21a–b) or in a part–whole relation with the object NP (21c–d):

(21) a. tufei sha-le tade fuqin.
bandit kill-Le his father
'The bandit killed his father.'

b. tufei ba ta sha-le fuqin.
bandit Ba him kill-Le father
'The bandit killed his father.'
c. shuiguo, ta chi-le yi-ban.
fruit he eat-Le one-half
'The fruit, he ate half.'
d. ta ba shuiguo chi-le yi-ban.
he Ba fruit eat-Le one-half
'He ate half of the fruit.'

It can also be the subject of a clause expressing the result of an action (22):

(22) a. ta ku-de women dou fan-si-le.
he cry-De we all annoy-dead-Le
'He cried so much that we were all extremely annoyed.'
b. ta ba women ku-de dou fan-si-le.
he Ba we cry-De all annoy-dead-Le
'He cried so much that we were all extremely annoyed.'

Indeed, Sybesma (1999: chapter 6) claims that a *ba* NP is always the subject of a result clause. He quotes Goodall's (1987a) study and claims that a *ba* NP is derived by NP movement. Because of the locality conditions on NP movement, a *ba* NP must always be the subject of the result clause, not the object (Specified Subject Condition; Chomsky 1977b, 1981). The following examples are from Goodall 1987a: 234 and Sybesma 1999: 157–158):

(23) a. na-ge nuhai ku-de Zhangsan nian-bu-xia na-ben shu.
hat-Cl girl cry-De Zhangsan read-not-on that-Cl book
'That girl cried so that Zhangsan could not continue reading that book.'
b. na-ge nuhai ba Zhangsan ku-de nian-bu-xia na-ben shu.
that-Cl girl Ba Zhangsan cry-De read-not-on that-Cl book
'That girl cried so that Zhangsan could not continue reading that book.'
c. *na-ge nuhai ba na-ben shu ku-de Zhangsan nian-bu-xia.
that-Cl girl Ba that-Cl book cry-De Zhangsan read-not-on
'That girl cried so that Zhangsan could not continue reading that book.'

According to Goodall (1987a: 234), agreed upon by Sybesma (1999: 158), these examples show that it is only possible to raise the subject out of the embedded clause to become the *ba* NP, and not the object, a pattern "typical of movement to an A-position."

We will return to the analysis by Sybesma in section 5.3. For present purposes, we would like to point out that it is not quite true that the *ba* NP cannot be the object of an embedded clause. The *ba* NP in the following instances must be interpreted as the object of the embedded clause:

(24) a. na-ge nuhai ba shoupa ku-de meiren gan mo.
that-Cl girl Ba handkerchief cry-De nobody dare touch
'That girl cried so that nobody dared to touch the handkerchief.'

This sentence is quite acceptable in the contexts where the girl kept crying and using the handkerchief to wipe off her tears. She cried so much that the handkerchief was completely wet and filthy. Even a sentence like (23c) can be made acceptable in appropriate contexts. For instance, the girl kept crying, with tears continuously falling on the pages of the book, to the extent that the pages become illegible. Under such circumstances, the following sentence is quite acceptable:

(24) b. na-ge nuhai ba na-ben shu ku-de meiren neng kan-de-qingchu.
that-Cl girl Ba that-Cl book cry-De nobody can read-able-clear
'That girl cried so that nobody could read that book clearly.'

What is important is that a relation is established between the *ba* NP and the following verb phrase. To put it more concretely, the *ba* NP is an 'outer object' or the object of V' in these cases, related to the subject or object of an embedded clause, as further elaborated on next.

2.3.3 Outer object/V'-object

The *ba* NP in (21–24) can be subsumed under the concept of the so-called V'-object, which is the object of a complex predicate consisting of a verb and its complement (Huang 1982a, 1987, 1988). Alternatively, in the terminology of Thompson (1973), the *ba* NP is an 'outer object' of the verb, in contrast to a V-object which is an 'inner object'.[24] That is, a *ba* NP can either be a V-object (inner object) as shown in section 2.3.1 or a V'-object (outer object) as shown in section 2.3.2.[25] An outer object (V'-object) receives an 'affected' theta-role (V' assigns an 'affected' theta-role to the V'-object, in Huang's terms). The affected object of 'father-killing' is 'him' in (21b); the affected object of 'eating a half' is 'the fruit' (21d); in (22b), 'we' were affected by the crying and got annoyed. Similarly, in (24a–b), the *ba* NP is affected by the crying to such an extent that it cannot be touched or read any more. Some other commonly used examples illustrating an outer object/V'-object are those in (25a–c) below. In (25a), *juzi* 'orange' is the outer object of *bo-pi* 'peel skin'. In (25b), 'the clothes' is the outer object of 'packing into a bundle'; in (25c), 'sadness' is the outer object of 'changing into power':

(25) a. ta ba juzi bo-le pi.
he Ba orange peel-Le skin
'He peeled the skin off the orange.'
b. wo ba yifu bao-le yige xiaobao.
I Ba clothes pack-Le one-Cl bundle
'I packed the clothes into a bundle.'
c. Lisi ba beitong hua-cheng liliang.
Lisi Ba sadness change-become power
'Lisi changed his sadness into power.'

An outer object (V′-object) can become an inner object (V-object) if the V and its complement can be combined (compounded) to become a V (V′ reanalyzed as V; see Huang 1983 for the distinction between phrasal and word categories; also see Larson 1988b for V′-reanalysis):

(26) a. Lisi ku-de shoupa hen shi.
Lisi cry-De handkerchief very wet
'Lisi cried and got the handkerchief wet.'
b. Lisi ba shoupa ku-de hen shi.
Lisi Ba handkerchief cry-De very wet
'Lisi cried and got the handkerchief wet.'
c. Lisi ba shoupa ku-shi-le. (compounding of V-V)
Lisi Ba handkerchief cry-wet-Le
'Lisi cried-wet the handkerchief.'
d. Lisi ku-shi-le shoupa. (compound V + object)
Lisi cry-wet-Le handkerchief
'Lisi cried-wet the handkerchief.'

(27) a. na-ping jiu zui-de Lisi dao-xiaqu-le.
that-bottle wine drunk-De Lisi fall-down-Le
'That bottle of wine made Lisi get drunk and fall.'
b. na-ping jiu ba Lisi zui-de dao-xiaqu-le.
that-bottle wine Ba Lisi drunk-De fall-down-Le
'That bottle of wine made Lisi get drunk and fall.'
c. na-ping jiu ba Lisi zui-dao-le. (compounding of V-V)
that-bottle wine Ba Lisi drunk-fall-Le
'That bottle of wine made Lisi get drunk and fall.'
d. na-ping jiu zui-dao-le Lisi. (compound V + object)
that-bottle wine drunk-fall-Le Lisi
'That bottle of wine made Lisi get drunk and fall.'

(28) a. zhejian shi ku-de Zhangsan lei-le.
this-Cl matter cry-De Zhangsan tired-Le
'This thing got Zhangsan tired from crying.'
b. zhejian shi ba Zhangsan ku-de lei-le.
this-Cl matter Ba Zhangsan cry-De tired-Le
'This thing got Zhangsan tired from crying.'
c. zhejian shi ba Zhangsan ku-lei-le. (compounding)
this-Cl matter Ba Zhangsan cry-tired-Le
'This thing got Zhangsan tired from crying.'
d. zhejian shi ku-lei-le Zhangsan. (compound V + object)
this-Cl case cry-tired-Le Zhangsan
'This thing got Zhangsan tired from crying.'

In brief, the following generalization can be put forward:

(29) A *ba* NP corresponds to a V-object (inner object) or a V'-object (outer object) in its non-*ba* counterpart.

A V-object can be a direct object, an indirect object, an instrument NP, or a locative NP, all occurring in the structure [V___]. A V'-object can be an NP holding a possession or part–whole relation with the V-object or an NP identified with the subject or object of an embedded result clause, which may well be a pro/PRO (see Huang 1982a for conflating pro and PRO in Chinese).[26] According to the works referred to earlier by Huang and Thompson, a V'-object is assigned an 'affected' theta-role by a V' consisting of a V and its complement.

A question arising out of (29) is how the *ba* NP is derived and specifically how and if the *ba* NP is derivationally related to its non-*ba* counterpart. It corresponds to a V-object or V'-object. However, it no longer is in the typical V-object position [V___], although it is likely that a *ba* NP is in the V'-object position (Huang 1982a). We will return to this issue in section 5. For the moment, we simply note that a *ba* NP can form an idiom with the verb, which suggests a movement relation between the non-*ba* V-object position and the *ba* NP position. For instance, the O part of some [V + O] idioms can occur as a *ba* NP: *zhan-pianyi* 'occupy-advantage = take advantage' in (30), *kai-dao* 'open-knife = operate, perform operation' in (31), and *kai-wanxiao* 'open-joke = joke' in (32):

(30) a. ta ba pianyi zhan-jin-le.
he Ba advantage take-exhaust-Le
'He took full advantage.'
b. ta zhan-jin-le pianyi
he take-exhaust-Le advantage
'He took full advantage.'

(31) a. ta ba dao kai-wan-le.
he Ba knife open-finish-Le
'He finished the operation.'
b. ta kai-wan dao-le.
he open-finish knife-Le
'He finished the operation.'

(32) a. ta ba wanxiao kai-de-guohuo-le.
he Ba joke open-De-excessive-Le
'He overdid the joking.'
b. ta kai wanxiao kai-de-guohuo-le.
he open joke open-De-excessive-Le
'He overdid the joking.'

If the components of an idiom ([V + O] in these cases) need to be generated together as a unit, these examples suggest that a *ba* NP can be derived by NP movement.

2.4 The X factor

The examples we have seen so far show the verb following the *ba* NP always occurs with some additional elements. As stated in (1a–b), there is always an X preceding or following the V in a *ba* sentence. A bare verb is not acceptable. The question is why the verb cannot be bare and what additional elements are required; i.e., what the X in (1a–b) is. This topic has been one of the main concerns throughout the literature on the *ba* construction. Various accounts have been provided. Descriptively, Lü's (1948, 1955, 1980) classification of the X into 13 patterns has been the foundation of most of the subsequent works. For instance, Sybesma (1999: 135–139) combined them into 10 classes. Liu (1997: 68–71) listed nine patterns on the basis of Lü's work. In the spirit of these classifications, we discuss in the following subsections important options for such an X.

2.4.1 Result expressions

A typical element for the X in (1) is a resultative complement following V, expressing the result of an activity. Other constructions such as motion-directional complements or certain dative/double object structures may also be regarded as result expressions, as described in the following subsections.

2.4.1.1 Resultative complements

Let us first consider a resultative complement, which may appear as a clause preceded by the marker *de* cliticized to a verb.[27] This is illustrated by the examples in (33a–b), with the resultative complement boldfaced. In these instances, *cai* 'vegetable' is interpreted as the object of the verb *chao* 'stir-fry' and the subject of the resultative clause *hen lan* 'very mushy', as supported by the acceptability of sentences like (33c). Such an NP is a very common type of *ba* NP:

(33) a. ta chao cai chao-**de-hen-lan**.
he stir-fry vegetable stir-fry-De-very-mushy
'He stir-fried the vegetable mushy.'
b. ta ba cai chao-**de-hen-lan**.
he Ba vegetable stir-fry-De-very-mushy
'He stir-fried the vegetable mushy.'
c. cai hen lan.
vegetable very mushy
'The vegetable is mushy.'

The main verb and the verb of the resultative clausal complement can generally be compounded into a single verb: [V + Result] (see (26–28) in the previous section).[28] After compounding, the *ba* NP generally keeps the interpretation of being object of the V and subject of the result V:

(34) a. ta ba cai chao-lan-le.
he Ba vegetable stir-fry-mushy-Le
'He stir-fried the vegetable mushy.'
b. ta bu-gan ba cai chao-lan.
he not-dare Ba vegetable stir-fry-mushy
'He dare not stir-fry the vegetable mushy.'

However, a *ba* NP need not always be an object of the main V (the first part of the compound [V + result] or [V + resultative clause]). The main V can be intransitive, as in (26–28). In these cases, the *ba* NP is a V'-object related to the complement resultative clause (or more precisely, related to the complex predicate consisting of a V and its resultative complement). A *ba* NP need not always be the subject of the resultative clause either. Indeed, although many of the so-called 'aspectual' or 'phrase' expressions attached to a verb (to form a complex verb) were originated as the predicate of the resultative clause and taking a *ba* NP as its subject, they no longer function like a predicate of the resultative clause in modern Mandarin Chinese. We briefly discuss the cases where a *ba* NP is not the subject of a resultative clause below.

The [V + result] compounding process is quite pervasive. Some compounded [V + Result] expressions have been so commonly used that the result part has become a very productive 'suffix-like' element forming a complex verb with a wide range of verbs. For instance, *wan* 'finish' can be combined with any activity verb to mean finish doing something, and a *ba* sentence with V-*wan* is generally acceptable:

(35) rang wo xian ba zhexie dongxi/shiqing zuo/kan/ting/da-**wan**.
let I first Ba these things do/watch/listen/hit-finish
'Let me first finish doing/watching/listening to/typing these things.'

The same is true with *guang* 'empty' used with many activity verbs:

(36) ta hui ba dongxi chi/he/yong/na-**guang**!
he will Ba thing eat/drink/use/take-empty
'He will eat up/drink up/use up/take up all the things.'

Wan 'finish' or *guang* 'empty' in the complex verb [V + *wan/guang*] does not necessarily retain its verbal status. That is, the result part of such [V + Result] compounds has become grammaticalized and reduced to a suffix. After grammaticalization, such a 'suffix-like' expression has become more like an aspect marker than a verb of result. That is, it is not always identical to the verb of a resultative complement clause in the sense that it can take the *ba* NP as its subject, as in (33c). For instance, in contrast to (33c), the sentence in (37) below containing *wan* 'finish' as the main verb is not acceptable (cf. the V-*wan* expressions in (35)). *Wan* in such instances has become more like an aspect marker indicating completion of an activity:

(37) *zhexie dongxi/shiqing wan-le.
these things finish-Le
'These things finished.'

Similarly, *guang* 'empty' in (38a) below expresses the completion of reading, and the corresponding sentence (38b) with *guang* as a main verb is not acceptable, showing that the *ba* NP cannot be the subject of a resultative clause with *guang* as its predicate (the importance of such a generalization will be revisited in section 5.3 concerning an event structural approach to *ba* constructions):

(38) a. ta hui yixiazi jiu ba suoyou-de shu kan-**guang**.
he will a while then Ba all-De book read-empty
'He will read all the books in a short while.'
b. *suoyou-de shu dou guang-le
all-De book all empty-Le
'All the books are empty.'

In such instances, it makes more sense to analyze the *ba* NP as the object of a single verb which is complex morphologically (containing two morphemes, a verb, and a suffix) than to analyze the *ba* NP as the object of the first morpheme and the subject of the second morpheme of a compound verb.

2.4.1.2 Directional complements

Another type of 'result' complement is a directional complement, indicated by the boldfaced expression in the following examples:[29]

(39) a. qing ni na shu **lai/qu**.
please you take book come/go
'Please bring/take the book.'
b. qing ni ba shu na-**lai/qu**.
please you Ba book take-come/go
'Please bring/take the book.'

(40) a. qing ni jiao ta **jin-lai/shang-lai/xia-qu**
please you ask him enter-come/up-come/down-go
'Please ask him to come in/come up/go down.'
b. qing ni ba ta jiao **jin-lai/shang-lai/xia-qu**
please you Ba him ask enter-come/up-come/down-go
'Please ask him to come in/come up/go down.'

Just like the compounding of [V + Result], a motion-directional complement can also be compounded with the V. (39b) and (40b) are examples. That the compounding has taken place can be shown by the fact that the verbal aspect *-le* follows the directional expression, not the V, as would be expected if the V and motion-directional complement were two distinct lexical items:

(41) a. wo ba shu na-**lai/qu**-*le* san-ci-le.
I Ba book take-come/go-Le three-times-Le
'I brought/took the books three times.'
a'. *wo ba shu na-*le*-**lai/qu** san-ci-le.
I Ba book take-Le-come/go three-times-Le
'I brought/took the book three times.'
b. ta yijing ba hua gua-**shang(qu)**/qu-**xia(lai)**-*le* hen-jiu-le.
he already Ba painting hang-up(go)/take-down(come)-Le very-long-Le
'He has already hung up/taken down the painting for a long time.'
b.' *ta yijing ba hua gua-*le*-**shang(qu)/**qu-*le*-**xia(lai)** hen-jiu-le.
he already Ba painting hang-up(go)/take-down(come)-Le very-long-Le
'He has already hung up/taken down the painting for a long time.'

The directional complement/compound has also been extended, has become grammaticalized, and can combine with other non-motion verbs, indicating the success or completion of an action or event, such as the verb *ji* 'memorize' in (42) and *ai* 'love' in (43):

(42) wo dei ba zhexie-shi **ji-xia(lai)**.
I need Ba these-matter memorize-down(come)
'I need to memorize these matters.'

(43) ni qianwan bie ba ta **ai-shang**, ni hui hen tongku-de.
you absolutely don't Ba him love-up you will very painful-De
'You absolutely cannot fall in love with him; you will be in great pain.'

We see then that directional complements can be subsumed under resultative complements, taking directional complements to express the result of a location change. They can also become grammaticalized and simply denote completion of an action or event.

2.4.1.3 Other 'result' expressions

There are other cases which may not have been classified as a resultative complement traditionally but behave like one with respect to interpretation and acceptability of a *ba* NP. These are cases involving verbs subcategorized for more than the direct object, such as dative/double object verbs or placement verbs (*put something somewhere*). One of the objects becomes a *ba* NP and the other stays in the postverbal position. The postverbal complement is very much like a resultative complement. For instance, (44a) below indicates that the book will be at the table upon successful completion of the event; (44b) expresses that the book is given to (*gei*) him:

(44) a. qing ni ba shu fang **zai zhuo-shang**.
please you Ba book put at table-on
'Please put the book on the table.'

b. qing ni ba shu song **(gei) ta**.
please you Ba book give to him
'Please give him the book.'

In addition to dative/double object or placement verbs, certain 'semi-double object structures' behave alike. Such structures refer to sentences like the following, where there seem to exist two object NPs but the verb cannot take both objects in postverbal position. One of the objects is preposed or is a *ba* NP:

(45) a. *ta bao yifu yi-ge xiao-bao.
he pack clothes one-Cl small-bundle
'He packed clothes into a small bundle.'
b. ta yifu bao **yi-ge xiao-bao**.
he clothes pack one-Cl small-bundle
'He packed clothes into a small bundle.'
c. ta ba yifu bao **yige xiao-bao**.
he Ba clothes pack one-Cl small-bundle
'He packed clothes into a small bundle.'

The postverbal complement in (45c), again, looks like a resultative complement: the clothes becomes a small bundle after the (clothes-)packing.

Purposive complements also behave like result expressions. They indicate the purpose of the action, which is similar to a result, and can occur in a *ba* pattern:[30]

(46) a. wo na shu (lai/qu) **gei ta kan**.
I take book come/go for him read
'I brought a book for him to read.'
b. wo ba shu na (lai/qu) **gei ta kan**.
I Ba book take come/go for him read
'I brought a book for him to read.'

(47) a. wo mai shu (lai/qu) **rang ta yong**.
I buy book come/go let him use
'I bought the book for him to use.'
b. wo ba shu mai lai/qu **rang ta yong**.
I Ba book buy come/go let him use
'I bought the book for him to use.'

The discussions so far show that the X in (1a) can be a result or result-like expression in most cases.

2.4.2 Duration/frequency phrases

Another expression that commonly serves as the X in (1a) is a postverbal duration or frequency phrase. (48a–b) are examples of duration phrases, and (48c–d) frequency phrases:

(48) a. ni ba ta da **yi-zheng-tian** ta ye bu-pa.
you Ba him hit one-whole-day he also not-afraid
'You hit him for a whole day and he still will not be intimidated.'
b. qing ni ba ta kan yi-xia.
please you Ba it watch a while
'Please watch it for a while.'
c. ni ba ta da **shi-ci**, ta ye bu-pa.
you Ba him hit ten-times he also not-afraid
'You hit him ten times and he still will not be intimidated.'
d. qing nimen ba zhe-pian kewen xie **san-bian**.
please you Ba this-Cl text write three-times
'Please write this lesson three times.'

2.4.3 V-(yi-)*V*

Quite similar to the cases with a duration phrase, especially the expression *yi-xia* 'a bit, a while' (cf. (48b)), some verbs, especially activity verbs, can occur in the form V-*yi*-V 'V-one-V (V a bit)', creating an acceptable *ba* sentence:[31]

(49) women dei xian ba zhe-wenti **xiang-yi-xiang/kan-yi-kan**.
we should first Ba this-question think-one-think/read-one-read
'We should first think about/read this question a bit.'

Alternatively, the verb can simply be reduplicated to render the 'a bit' reading; that is, *yi* 'one' in the above pattern need not occur:[32]

(50) women dei xian ba zhe-wenti **xiang-xiang/kan-kan**.
we should first Ba this-question think-think/read
'We should first think about/read this question a bit.'

2.4.4 Verbal measurement

Another similar pattern is the use of measure expressions indicating the extent of the action:

(51) a. ta hui ti ni **haoji-jiao**.
he will kick you many-foot
'He will give you many kicks.' (or kick you many times)
b. ta hui ba ni ti **haoji-jiao**.
he will Ba you kick many-foot
'He will kick you many kicks.' (see above)

(52) a. wo bu da ta **liang-quan** bu zou.
I not hit him two-fist not leave
'I won't leave without giving him two punches.'
b. wo bu ba ta da **liang-quan** bu zou.
I not Ba him hit two-fist not leave
'I won't leave without giving him two punches.'

2.4.5 V-object

The postverbal X elements discussed so far, which make an acceptable *ba* sentence, mostly are not subcategorized for by the verb. Instead, the *ba* NP is the subcategorized object of the verb in most cases. However, it is also possible to find a postverbal element X in a *ba* sentence which is simply the direct object of the verb. That is, the X in (1a) can simply be a direct object. As noted in section 2.3.2, a *ba* NP can be an 'outer object', the object of a complex verb consisting of a verb and its complement (inner object). In that section, the examples used all contain an aspect marker suffixed to the (compound) verb (see the next section on an aspect marker alone making a *ba* sentence acceptable; i.e., an aspect marker by itself can be the X in a *ba* pattern). Nonetheless, such an aspect marker is not necessary. A single inner object as the X is sufficient to make a good *ba* sentence:

(53) a. ta zhi ba shuiguo chi yi-ban.
he only Ba fruit eat one-half
'He only ate half of the fruit.'
b. jide ba juzi bo pi.
remember Ba orange peel skin
'Remember to peel the skin off the orange.'

The same generalization is true for double object structures such as those discussed in sections 2.3.2 and 2.4.1.3, where we saw that a direct object can be grouped with a result expression. There are also double object cases occurring in a *ba* pattern whose postverbal object, which cannot be grouped with postverbal result expressions, is simply the direct object of the verb. No aspect markers are necessary, either (see the next section on aspect markers). That is, similar to (16–17) in section 2.3.1, the following cases are acceptable:

(54) a. wo dasuan ba ta wen yi-da-dui hen-nan-de wenti.
I plan Ba him ask one-big-pile very-difficult-De question
'I plan to ask him many difficult questions.'
b. wo hui ba ta fa henduo qian.
I will Ba him fine much money
'I will fine him a lot of money.'

2.4.6 Aspect markers

The cases discussed so far are generally clearly grammatical to native speakers: they generally accept such *ba* sentences more readily. Next, let us consider the less clear cases, i.e., those *ba* sentences whose VPs only require an aspect marker after the verb.

2.4.6.1 *-Zhe*

Among the cases using an aspect marker to fill the role of X in (1a), the durative marker *-zhe* is a common one and quite easily accepted with certain verbs. Some examples are given below:

(55) qing ba ta bao/na/qian/fang/gua-**zhe**.
please Ba it(him) hold/take/hold-in-had/put/hang-Zhe
'Please hold (in hand)/put (it) down/hang it(him).'

(54) should be contrasted with (55), unacceptable as a *ba* sentence:

(56) *qing ba ta da/chang/he/ca/nian/gai-**zhe**.
please Ba it(him) hit/sing/drink/wipe/read/build-Zhe
'Please hit/sing/drink/wipe/read/build it(him).'

Why is there such a contrast? This has to do with the types of verbs used in these examples. The first type involves verbs which have the interpretation of an end-state realized. The clearest example is *gua* 'hang': hanging is hanging up something and then it is hung up there. There is an end-state as a result of the action. The other verbs in the first type have the same interpretation. The first action of *fang* 'put' is putting something at some place and then the result is that this something ends up being at some place. *Qian* 'hold in hand', *na* 'take', and *bao* 'hold' also have the initial action and a result end-state: the first activity is to get something/somebody to be held in the hand and then the something/somebody ends up being in the state of being held by hand. Adopting the insight of Chen (1978a, 1978b), we assume that these verbs contain the notion of 'transition' or 'path' of motion, resulting in an end-state. Let us call this interpretation a resultative interpretation. The 'durative' marker *-zhe* marks an end-state that continues. That is, there is an inception and an end-state that continues. Such a resultative interpretation, however, is not available to (56). The verbs *da/chang/he/ca/nian/gai-zhe* 'hit/sing/drink/wipe/read/build-Zhe' do not have the 'path–end-state' interpretation. They only have the progressive interpretation when suffixed with *-zhe*; *-zhe* in such cases is a progressive marker. The distinction between these two types of verbs can be further illustrated by the following contrasts. One contrast is that the first type of verb can be more easily compounded with a directional complement (the notion of path is relevant) than the second type (lack of path):

(57) a. bao-lai qian-lai fang-xia na-xia gua-shang
hold-come hold-come put-in take-down hang-up
b. *da-shang *he-lai *ca-qu *nian-xia *ting-xia *gai-shang
hit-up drink-come wipe-go read-down listen-down build-up

Another contrast is that the first type of verb, not the second type, can be combined with *zhu* 'stay' to mean that an end-state holds:

(58) a. bao-zhu na-zhu qian-zhu fang-zhu gua-zhu
hold-stay take-stay hold-stay put-stay hang-stay
b. *da-zhu *chang-zhu *he-zhu *ca-zhu *nian-zhu *gai-zhu
hit-stay sing-stay drink-stay wipe-stay read-stay build-stay

In brief, the durative marker *-zhe* generally can be suffixed to the 'path–end-state' type of verb to express that the end-state continues or holds and a *ba* pattern is available. On the other hand, verbs not expressing 'path–end-state' only express progressive actions when suffixed with *-zhe* and a *ba* pattern is not available.[33]

2.4.6.2 *Le*

In addition to *-zhe*, the completive aspect marker *-le* (the verbal *-le*) may also make a *ba* sentence acceptable.[34] The effect of *-le* on the availability of a *ba* pattern, however, is inconsistent. Some predicates are quite ready to occur with *-le* to make a *ba* sentence and others are not. For instance, the sentences in (59) are acceptable but those in (60) are much worse:

(59) a. ta ba Lisi pian-le.
he Ba Lisi cheat-Le
'He cheated Lisi.'
b. ta jingran ba wo da-le.
he unexpectedly Ba I hit-Le
'Unexpectedly, he hit me.'
c. wo ba shu mai-le.
I Ba book sell-Le
'I sold the book.'
d. wo yijing ba men guan-le.
I already Ba door close-Le
'I already closed the door.'

(60) a. *ta ba na-difang likai-le.
he Ba that-place leave-Le
'He left that place.'
b. *ta jingran ba qiu-sai canjia-le
he unexpectedly Ba ball-game participate-Le
'Unexpectedly, he played the ball game.'
c. *ta ba na-ge canting baifang-le.
he Ba that-Cl restaurant visit-Le
'He visited that restaurant.'
d. *ta ba wode mingling fucong-le.
he Ba my order obey
'He obeyed my order.'

Moreover, this seems to be an area where speakers disagree significantly on the judgment. Take the examples in (61–62), for example. Sentences like (61a) and (62a) are more or less acceptable for some speakers but sound terrible to others, who prefer to have the expressions discussed in sections 2.4.1–2.4.4. following the verb: [35]

(61) a. ??wo ba ge ting-le.
I Ba song listen-Le
'I listened to the song.'
b. wo ba ge ting-wan-le.
I Ba song listen-finish-Le
'I finished listening to the song.'

(62) a. ??wo ba ta kuajiang-le.
I Ba him praise
'I praised him.'
b. wo ba ta kuajiang-le ji-bai-bian-le.
I Ba him praise-Le several-hundred-times-Le
'I praised him several hundred times.'

2.4.7 Preverbal modifiers

In addition to the postverbal elements discussed so far, a *ba* sentence can also be made acceptable by the addition of certain preverbal adverbials (the X in (1b)):

(63) a. bie ba ta **luan**-reng.
don't Ba it disorderly-throw
'Don't throw it around.'
b. qing ba zhuozi **wang ta nabiar** tui.
please Ba table towards him there push
'Please push the table towards him.'
c. ba ta **haohaor-de** zhaogu, ta jiu hui zhang-de-hao.
Ba it good-De care it then will grow-De-well
'Take good care of it and it will grow well.'
d. ni bu ba wenti **zixi-de** yanjiu, zen hui zhao-chu daan?
you not Ba problem carefully study how will find-out answer
'If you don't study the problem carefully, how can you find an answer?'
e. ni bu ba zhe-wenzhang **zixi-de** nian, zenme keneng dong-ne?
you not Ba this article carefully read how can understand-Q
'If you don't read the article carefully, how can you understand (it)?'
f. ta ba jiu **bu-ting-de** he. (from Chao 1968: 348)
he Ba wine not-stop-De drink
'He drank without stop.'
g. wo ba ta **yi**-tui, ta jiu dao-le.
I Ba it one-push it then fall-Le
'It fell as soon as I pushed it.'

Note that some such adverbials may be related to the *ba* NP. For instance, *luan* 'disorderly' in (a) may describe the end-state of the stuff that is being thrown as disorderly. However, this is not the case with all such adverbials. For instance, *zixi-de* 'carefully' in (d) and (e) cannot describe the *ba* NP: the problem in (d)

cannot be careful, neither can the article in (e) be careful. It is the studying and the reading that are careful. We will return to such differences in section 5.

2.4.8 Summary

Summarizing the types of X in (1a–b), we note that a very common one is that the X is a result expression (64a). Other possibilities are listed in (64b–h):

(64) a. V + result
b. V + duration/frequency
c. V + (*yi* +) V
d. V + measure phrases
e. V + object
f. V + *le*
g. V + *zhe*
h. Adv + V

(64b–d) are similar because they all contain a number expression [number + classifier + noun]: duration/frequency phrases are expressed by a number expression; *yi* 'one' + V is also a number expression ('one' is a number, the V may be taken as a classifier-like element) and measure phrases are number expressions as well. (64a–h), therefore, may be restated as follows:

(65) a. V + result
b. V + quantified/number expression
c. V + object
d. V + *le*
e. V + *zhe*
f. Adv + V

(65a–e) include almost all types of elements that can occur postverbally in Chinese. The only one that can occur postverbally in this language but does not make a *ba* sentence acceptable is a descriptive complement (a postverbal manner expression modifying the V), illustrated below:

(66) a. ta jintian-de gongke xie-de hen kuai.
he today-De homework write-De very fast
'He wrote today's homework fast.'
b. *ta ba jintian-de gongke xie-de hen kuai.
he BA today homework write-De very fast
'He wrote today's homework fast.'

2.5 Verbs

We have so far discussed almost all the individual components of the *ba* construction listed in (1a–b) except the V. Because the V interacts closely with the

co-occurring preverbal or postverbal X, and because, when types of verbal properties are considered (such as the classification by Vendler 1967a; Dowty 1979; Smith 1991), it is the verb phrase rather than the verb itself that is significant, we therefore will not further elaborate on the properties of Vs alone, except by bringing up the issue of transitivity regarding the types of verbs. A common observation is that a resultative complement can make a *ba* sentence acceptable, regardless of the transitivity of Vs. That is, the V in a *ba* pattern as in (1) can be intransitive as noted in section 2.3.3, in which case the *ba* NP can be interpreted as the subject of a resultative complement. This is illustrated below:

(67) a. ta ku-de women dou bu-gan xiao-le.
he cry-De we all not-dare laugh-Le
'He cried so much that we did not dare to laugh.'
b. ta ba women ku-de dou bu-gan xiao-le.
he Ba we cry-De all not-dare laugh
'He cried so much that we did not dare to laugh.'

(68) a. ta zou-de tui hen suan.
he walk-De leg very sore
'He walked so much that his legs were sore.'
b. ta ba tui zou-de hen suan.
he Ba leg walk-De very sore
'He walked so much that his legs were sore.'

(69) a. tianqi re-de gou dou bu-jiao-le.
weather hot-De dog all not-bark-Le
'The weather is so hot that the dogs are not barking.'
b. tianqi ba gou re-de dou bu-jiao-le.
weather Ba dog hot-De all not-bark-Le
'The weather is so hot that the dogs are not barking.'

(70) a. tianqi leng-de wo zhi duosuo.
weather cold-De I continue shiver
'The weather is so cold that I keep shivering.'
b. tianqi ba wo leng-de zhi duosuo.
weather Ba I cold-De continue shiver
'The weather is so cold that I keep shivering.'

These sentences seem to be good examples demonstrating that an intransitive V with a resultative complement can make an acceptable *ba* sentence, with the *ba* NP interpreted as the subject of the resultative complement. Closer examination of a wider range of data, however, reveals that the generalization may not be quite true. There are many instances where a result expression does not make a *ba* sentence with an intransitive verb acceptable. For instance, the following

sentences contain a resultative complement after an intransitive verb;[36] yet a *ba* sentence is still not acceptable:[37]

(71) a. ta yansu-de women dou bu-gan xiao-le.
he serious-De we all not-dare laugh
'He was so serious that we did not dare to laugh.'
b. *ta ba women yansu-de dou bu-gan xiao-le.
he Ba we serious-De all not-dare laugh
'He was so serious that we did not dare to laugh.'

(72) a. ta-de shengyin xiao-de women dou ting-bu-jian.
he-De voice small-De we all listen-not-receive
'His voice was so soft that we could not hear him.'
b. *ta-de shengyin ba women xiao-de dou ting-bu-jian.
he-De voice Ba we small-De all listen-not-receive
'His voice was so soft that we could not hear him.'

Why does a resultative complement make a *ba* sentence acceptable in cases like (67–70) but fails to do so in cases like (71–72)? This contrast is especially puzzling in light of the fact that, with a lexical causative matrix verb, the two sets of sentences are equally acceptable:

(67) c. ta ku-de shi women dou bu-gan xiao-le.
he cry-De make we all not-dare laugh-Le
'He cried so much that we did not dare to laugh.'

(71) c. ta yansu-de shi women dou bu-gan xiao-le.
he serious-De make us all not-dare laugh-Le
'He was so serious that we did not dare to laugh.'

(72) c. ta-de shengyin xiao-de shi women dou ting-bu-jian.
he-De voice small-De make we all listen-not-receive
'His voice was so soft that we could not hear him.'

(67c), (71c), and (72c) are the lexical causative counterpart of (67b), (71b), and (72b) respectively. While the *ba* sentence in (67b) is acceptable, (71b) and (72b) are not, even though their lexical causative counterparts are equally acceptable. Such contrasts indicate that the unacceptability of (71b) and (72b) cannot be due to some reason of interpretation.[38] Why, then, are they unacceptable? We would like to suggest that a *ba* sentence does not allow a truly intransitive verb. A complement expressing a result is not sufficient to make an acceptable *ba* sentence. The verb of a *ba* sentence must at least be able to be linked to the *ba* NP in the sense that the verb takes the *ba* NP as its semantic object, though not necessarily in typical syntactic object positions. To clarify this point, let us first consider the following contrast and then return to clarify the above remarks:[39]

(73) a. ta ku-zai women shen-shang, rang women sui-xin.
he cry-at we body-on let us broken-heart
'He cried at us, making us broken-hearted.'
b. tianqi leng-zai women shen-shang, rang women zhi duosuo.
weather cold-De we body-on let us still shiver
'The (cold) weather made us cold, giving us continuous shivers.'
c. *ta yansu-zai women shen-shang.
he serious-at we body-on
d. *ta-de shengyin xiao-zai women shen-shang.
he-De voice small-at we body-on

Even though all the relevant verbs (including the adjectival ones) are intransitive, the contrast between (73a–b) and (73c–d) indicates that these verbs differ in the possibility of having a goal/recipient of the action/event. There is a recipient of the crying or the coldness of the weather, as indicated by the acceptability of (73a–b). On the other hand, the seriousness and a small voice do not have a recipient, as indicated by the unacceptability of (73c–d). What the contrast between (73a–b) and (73c–d) shows is that there are 'pseudo-intransitive' verbs, in contrast to 'real intransitive' verbs. (73c–d) contain real intransitive while (73a–b) involve pseudo-intransitive verbs. The latter can take an implicit object (goal/recipient), but not the former. That this distinction may be on the right track can be supported by a minimal contrast between the following sentences:

(74) a. xiaohai wan-de fumu kaixin/shangxin-si-le.
child play-De parents happy/sad-dead-Le
'The children played so much that the parents were extremely happy/sad.'
b. xiaohai bing-de fumu danxin-si-le.
child sick-De parents worried-dead-Le
'The children were so sick that the parents were extremely worried.'

The (b) sentence can have a goal/recipient but not the (a) sentence, as shown by their contrast in the acceptability of a co-occurring location/recipient phrase:

(74) a'. *xiaohai wan-zai fumu xin-shang.
child play-at parents heart-on
b'. xiaohai bing-zai fumu xin-shang.
child sick-at parents heart-on
'The children's sickness is in the parents' hearts.'

Not surprisingly, a contrast exists between these two cases in acceptability as a *ba* sentence, even though both allow a lexical causative:

(74) c. *xiaohai ba fumu wan-de kaixin/shangxin-si-le.[40]
child Ba parents play-De happy-dead-Le
'The children played so much that the parents were extremely happy.'

cf. lexical causative:

c′. xiaohai wan-de shi fumu kaixin/shangxin-si-le.
child play-De make parents happy/sad-dead-Le
'The children played so much that the parents were extremely happy.'
d. xiaohai ba fumu bing-de danxin-si-le.
child Ba parents sick-De worried-dead-Le
'The children were so sick that the parents were extremely worried.'

cf. lexical causative:

d′. xiaohai bing-de shi fumu danxin-si-le.
child sick-De make parents worried-dead-Le
'The children were so sick that the parents were extremely worried.'

In other words, contrary to the claim in the literature, truly intransitive verbs cannot occur in the *ba* pattern. The fact that *ku* 'cry', *leng* 'cold', *bing* 'sick', etc. can appear in the *ba* pattern is due to the fact that these verbs are only 'pseudo-intransitive' or 'quasi-transitive' in the sense that the existence of a goal or recipient argument is implied. The distinction is manifested in the (im)possibility of a postverbal *zai* locative phrase which expresses the goal/recipient of the action/event. We may therefore conclude that a postverbal result expression itself is not sufficient to license a *ba* pattern. The *ba* NP must be related to the verb. Because such a *ba* NP is not a true direct object of the V, it may be subsumed under the notion of an 'affected object' or 'outer object', 'V′-object', along the lines of the observation stated in (29) in section 2.3.3, repeated below, that a *ba* NP always thematically related to the verb:

(29) A *ba* NP corresponds to a V-object (inner object) or a V′-object (outer object) in its non-*ba* counterpart.

Viewing this along the lines of a V′-object, we may clarify the nature of a V′-object: it is not the case that any V′ can take an object. A thematic relation must still exist between such an object and the V. Such a thematic relation requirement distinguishes the acceptable and unacceptable *ba* sentences discussed above. More generally, it may also distinguish cases like the following, which differ only in the use of Vs:

(75) a. tufei ba ta sha-le fuqin.
bandit Ba him kill-Le father
'Bandits killed his father.'
a′. tufei sha-le ta fuqin.
bandit kill-Le he father
'Bandits killed his father.'
b. *tufei ba ta baifang-le fuqin.
bandit Ba him visit-Le father
'Bandits visited his father.'

b′. tufei baifang-le ta fuqin.
bandit visit-Le he father
'Bandits visited his father.'

An outer V′-object may bear a possession relation with an inner V-object, which is true with both (75a) and (75b). Despite the same thematic relation between the two objects, the former, with the verb *sha* 'kill', is acceptable as a *ba* sentence, but not the latter, with the verb *baifang* 'visit'. Were any V′ able to take an outer object, the contrast between (75a) and (75b) would not exist. The minimal difference between the two choices of verbs and the resulting contrast in acceptability as a *ba* sentence, again, points to the close relation between the outer object and the V.

This generalization has important implications for how a *ba* NP is derived. For instance, it has bearings on the debate between Goodall (1989) and Huang (1992a), which was revisited by Sybesma (1999), concerning whether a *ba* NP should be derived by movement or base generation. The crucial data used in these works are instances like (76) where the *ba* NP corresponds to the subject of a resultative complement. The works mentioned debated whether the *ba* sentence in (76a) is derived from (76b) and (76a′) from (76b′) by the raising of the subject of the resultative complement to become the *ba* NP (see Sybesma 1999: 158–159 for relevant examples, and section 2.2.2 for relevant discussions):

(76) a. ta ba tieshu ku-de kai-le hua.
he Ba iron-tree cry-De open-Le flower
'He cried such that the iron trees blossomed (something very unusual happened).'
a′. ta ba huli wen-de luchu-le yiba.
he Ba fox ask-De reveal-Le tail
'He interrogated such that the fox revealed its secrets.'
b. ta ku-de tieshu kai-le hua.
he cry-De iron-tree open-Le flower
'He cried such that the iron trees blossomed (something very unusual happened).'
b′. ta wen-de huli luchu-le yiba.
he ask-De fox reveal-Le tail
'He interrogated such that the fox revealed its secrets.'

The proponents of the raising analysis, such as Goodall and Sybesma, argue for raising on the basis of the fact that *tieshu kai hua* 'iron tree open flower' and *huli luchu yiba* 'fox reveal tail' are idiomatic expressions indicating that a highly unlikely event has happened and that the truth has come out respectively. In contrast, Huang argues that the relevant *ba* sentences involve a control structure and the seemingly idiomatic expressions actually just involve figurative speech, with 'iron tree' possibly referring to an 'iron-hearted father' and 'fox' referring to a sly person.

One needs to be cautious of what conclusion can be drawn from these data. Such data only bear on the issue of whether the *ba* NP can be raised from the subject of a complement clause, rather than a more general issue of whether the *ba* NP can be derived by a raising process. It is quite conceivable that a *ba* NP can be derived by movement, but the data in (76) do not provide any positive or negative evidence, because of the independent consideration of whether a *ba* NP can originate as the subject of a complement clause at all.

Our generalization in (29), in principle, prohibits the derivation of a *ba* NP raised from within a resultative complement, because a *ba* NP must be a V-object or a V'-object. (29), however, does not preclude the possibility of a *ba* NP being derived by a raising process. It is just that the raising must apply to a V-object or a V'-object and not the subject of a resultative complement; otherwise, sentences such as (71b), (72b), and (74c) would be acceptable. The analysis of (76a–b) should, then, not be the one proposed by Goodall, according to which the *ba* NP is raised from the subject of the complement clause. Instead, Huang's analysis is more adequate, according to which the idiom-like expressions are not true idioms but figurative expressions. That this conclusion is correct is supported by the fact that *tieshu* 'iron tree' and *huli* 'fox' can occur independent of their predicate (and retain the figurative interpretation), as in (76c–c'), unlike true idiomatic expressions whose components are not allowed to be generated independently without losing their idiomatic interpretation, such as (76d–d'):

(76) c. ta ba tieshu shuifu-le ma?
he Ba iron-tree persuade Question
'Did he persuade the iron tree (the iron-hearted one)?'

c'. ta ba huli wen-wan-le ma?
he Ba fox ask-finish-Le Question
'Has he finished interrogating the fox (the sly one)?'

cf.:

d. ta xihuan chi doufu.
he like eat tofu
'He likes to flirt.' (idiomatic reading: *chi-doufu* 'eat-tofu = flirt')
'He likes to eat tofu.' (non-idiomatic reading)

d'. ta xihuan doufu.
he like tofu
'He likes tofu.' (non-idiomatic reading only)

On the other hand, the fact that (76a, a') cannot be derived by directly raising the subject of the complement clause to the *ba* NP position does not argue against a general raising analysis, which raises a *ba* NP raised from a V-object or V'-object position. We will show in section 4 that our proposal for the structure of the *ba* construction forces us to allow such a raising process, which will be supported by facts involving true idiomatic expressions of the structure [V + O].

Having discussed the syntactic properties of each of the components of a *ba* construction as in (1a–b), we should be able to establish appropriate syntactic structures for the *ba* construction. Before we proceed, however, we would like to bring in one more set of data – comparisons with the Taiwanese counterpart, the *ka* pattern, which will help with the characterization of the relevant *ba* structure in Mandarin because of their close similarities and important differences.

3 Cross-dialectal comparison with Taiwanese *ka*

A Mandarin *ba* sentence has a counterpart in Taiwanese, with *ba* replaced by *ka*, illustrated by the Mandarin example in (77a) and its counterpart in Taiwanese in (77b):[41]

(77) a. ta ba wo ma san-ci le.
he Ba me scold three-times Le
'He scolded me three times.'

cf.:

b. i ka gua meN saN-pai a.
he Ka me scold three-times Particle
'He scolded me three times.'

The two constructions share the form [Subject + *ba/ka* + NP + VP] and most of the important constraints. A *ba* sentence in Mandarin can always be translated into a *ka* sentence in Taiwanese. However, the reverse is not true. A *ka* sentence is allowed in more contexts than a *ba* sentence.

There are three major differences between the Mandarin *ba* construction and the Taiwanese *ka* construction.[42] The first major difference is that, in contrast to the prohibition against a bare verb in Mandarin *ba* sentences (i.e., the X-factor, a postverbal or preverbal element required to accompany a bare verb, such as those listed in (64–65)), Taiwanese easily allows a bare verb to occur in the *ka* construction when the verb takes an affected object (see section 5.1). The following perfectly acceptable *ka* sentences, for instance, use only a bare verb after the *ka* NP:

(78) i ka gua pha/peN/meN.
I Ka me hit/cheat/scold
'He hit/cheated/scolded me.'

The second difference is that it is not always possible for a *ka* sentence in Taiwanese to have a non-*ka* counterpart, in contrast to Mandarin which always has a non-*ba* counterpart for a *ba* sentence. For instance, the following *ka* sentences do not have a non-*ka* counterpart:

(79) a. li m-hoN ka gua the-tsa ha-ban.
you don't Ka me earlier off work
'Don't get off work earlier (than you should) on me.'
b. li na kaN ka gua tsao, gua teo ho li ho-khuaN.
you if dare Ka me leave I then let you good-look
'If you dare to leave on me, I will show you the consequence.'

In these cases, *ka* is necessary to give an interpretation to the *ka* NP, which is not at all related to the thematic structure of the verb. In other words, one difference between *ka* and *ba* is that the former, but not the latter, can assign a thematic role to the *ka* NP independently.

Finally, in contrast to the possibility in Mandarin of preposing *ba* together with the *ba* NP in some cases, it is clearly unacceptable to prepose *ka* with the *ka* NP in any *ka* sentence in Taiwanese:

(80) *ka tsit-te ba, li siN tshe-tseh-le.
Ka this-Cl meat you first cut-cut-Particle
'Cut the meat first.'

In brief, although the Taiwanese *ka* construction and the Mandarin *ba* construction are quite similar, they do differ significantly in several respects:

(81)

	***ba* structures**	***ka* structures**
a.	Bare verbs are disallowed.	Bare verbs are allowed.
b.	A non-*ba* counterpart is always available.	A non-*ka* counterpart is sometimes unavailable.
c.	A *ba* NP is thematically related to the following V or V′ (a V-object or V′-object).	A *ka* NP need not be thematically related to the following V or V′. *Ka* is sufficient for a *ka* NP to be interpreted.
d.	*Ba* and the *ba* NP are preposable as a unit.	*Ka* and the *ka* NP are not preposable as a unit.

The comparisons between *ba* and *ka* constructions will help us determine appropriate syntactic (phrase) structures for these constructions.

4 Structures

The important syntactic facts that need to be captured by an adequate phrase structure for the *ba* construction are as follows:

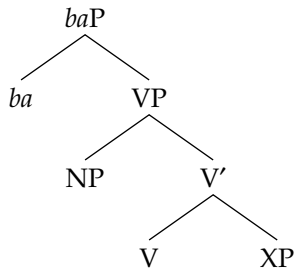
(82) a. A *ba* sentence has a non-*ba* counterpart.
b. *Ba* and the *ba* NP normally do not form a unit syntactically, but they do so in some cases.
c. No element can intervene between *ba* and the *ba* NP.

d. What follows *ba* is a VP that contains an X and a V.
e. A *ba* NP is a V-object or a V′-object.

4.1 A preliminary analysis

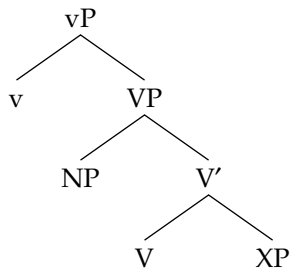
There is evidence that at least, in some cases, *ba* should head its own projection (see the discussions in section 2.2). When *ba* heads its own projection, its complement should be a maximal category (the bare phrase structures in the Minimalist Program; see Chomsky 1995c). (83) is therefore a potential partial structure for a *ba* sentence, where the NP in the Spec of VP is the *ba* NP. It is an object of V′. In the case where the *ba* NP is a V-object, it is raised to the Spec of VP position:

(83)



This structure resembles very much the vP structure discussed extensively in Chomsky (1995c) or the VP-shell structure proposed by Larson (1988b) for double object structures, if *ba* is the head of a higher vP or VP. Indeed, if the label *ba*P is replaced by vP or VP, the structure is a regular verb phrase like Chomsky's vP structures or Larson's VP-shell structures. For simplicity, let us just use Chomsky's vP structures in the representations (if Larson's VP-shell structures are adopted, all vPs will be replaced by VPs and vs by Vs):

(84)



When *ba* appears in the v position, the verb is in the V position and a *ba* sentence is derived:

(85) wo ba beizi na gei-ta.
I Ba cup take to-him
'I gave the cup to him.'

Alternatively, *ba* need not appear in the v position. In that case, the verb moves up to the v position, deriving a non-*ba* sentence:

(86) wo na beizi gei-ta.
I take cup to-him
'I gave the cup to him.'

In other words, *ba* may be taken as the spell-out of a small v in Chomsky's sense (or a higher V in Larsonian VP-shell structures). When v is spelled out as *ba*, V-to-v-raising does not apply, deriving [*ba* NP V XP]. When *ba* does not occur, V-to-v-raising takes place, deriving [V NP XP].

4.2 Revision

The structure in (83) seems to capture the properties in (82). We saw how the *ba* and non-*ba* counterpart are derived. *Ba* heads a projection and nothing can intervene between *ba* and the *ba* NP if *ba* assigns Case to the *ba* NP and Case assignment obeys an adjacency condition (Stowell 1981). However, this structure is not quite adequate. It is especially problematic with respect to the placement of adverbials. Take a manner adverb for illustration. In a *ba* sentence, a manner adverb can occur before or after *ba*:

(87) a. wo xiaoxin-de ba beizi na-gei-ta.
I carefully Ba cup take-to-him
'I gave the cup to him carefully.'
b. wo ba beizi xiaoxin-de na-gei-ta.
I Ba cup carefully take-to-him
'I gave the cup to him carefully.'

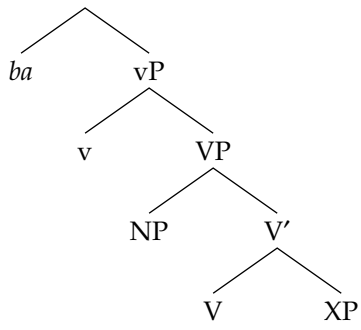
If (83)/(84) is the structure, it means that a manner adverb should be able to adjoin to either V' or some node higher than the *ba*P in (83) or vP in (84). Such adverb placement possibilities predict that the non-*ba* counterpart, after V raised to v, such as (88a–b) below, should be acceptable. However, (88b) is not acceptable.[43] An adverb must precede a verb:

(88) a. wo xiaoxin-de na beizi gei-ta.
I carefully take cup to-him
'I gave the cup to him carefully.'
b. *wo na beizi xiaoxin-de gei-ta.
I take cup carefully to-him
'I gave the cup to him carefully.'

The contrast between (87b) and (88b) casts doubt on the adequacy of a structure like (83)/(84), with v spelled out as *ba* or as the landing site of V-to-v raising.

The distribution of adverbs illustrated in (87) and (88) indicates that *ba* must be higher than the landing site of the raised main verb; i.e., higher than vP in (84):

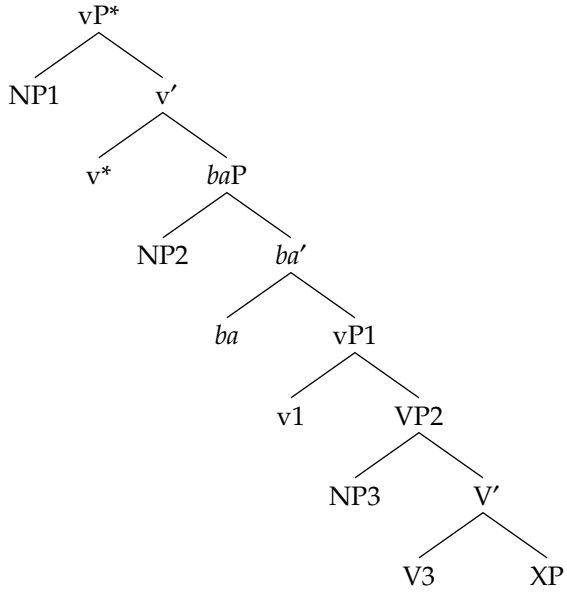
(89)



In such a structure, an adverb is adjoined to vP (or an intermediate projection v′, or some other node higher than vP). For a non-*ba* sentence, an adverb appears on the left of the main verb after the main verb is raised from V to v. For a *ba* sentence, an adverb may appear to the right of *ba* (as well as to the left if the adverb is adjoined to a node higher than the *ba* projection).

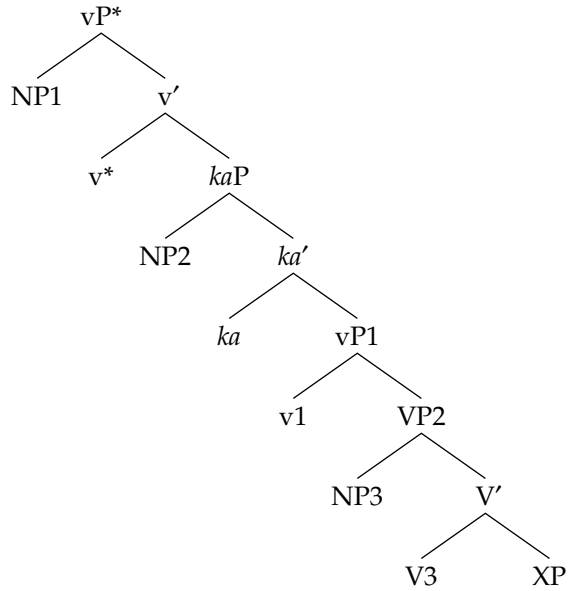
The structure in (89) solves the problem with adverb placement. However, it raises the question of where the *ba* NP must be positioned. It certainly cannot be the NP in (89). The *ba*-NP and *ba* can never be separated by any element. The structure in (89) would wrongly allow the main verb to occur between *ba* and the *ba* NP. There needs to be an NP position above the raised verb to host the *ba* NP. That is, there should be more structures above vP, such as the one below:[44]

(90)



In this structure, vP1 is the verb phrase that follows the *ba* NP; NP2 is the most likely candidate to host a *ba* NP and NP1, the external argument of the sentence. To derive the correct word order, *ba* is raised to v*, V3 is raised to v1. (A non-*ba* sentence only has the projection up to vP1.) This structure spells out the relation between a *ba* construction and its non-*ba* counterpart, their minimal difference being in the projection of a *ba*P shell for a *ba* construction, and accommodates the facts regarding the distribution of adverbials in a *ba* construction and a non-*ba* counterpart. This structure, however, seems to suggest that *ba* is very much like a verb in the sense that both are dominated by a v (v1 for V and v* for *ba* in (90)). On the other hand, we mentioned earlier in section 2.2 that *ba* is not a verb. Do these two facts contradict each other? They do not, when we consider the behavior of *ka* in a *ka* construction, the Taiwanese counterpart of the Mandarin *ba* construction. Recall that, in contrast to a *ba* sentence which always has a non-*ba* counterpart, a *ka* sentence need not have a non-*ka* counterpart. Correspondingly, *ka* can assign a thematic role to a *ka* NP, but a *ba* NP is always related to the following V or V′ thematically. The thematic assigning property of *ka* reflects the origin of the *ba* and *ka* constructions, which were serial verb constructions. The structure in (90) reflects such properties faithfully. (90), thus, should be adopted for the *ka* construction:

(91)



The question is whether this structure still describes the *ba* construction appropriately. Moreover, adopting the same structure for both *ka* and *ba* constructions fails to capture the differences between these two constructions, as listed in (81).

The facts that *ka* can assign an independent theta-role and that a *ka* sentence does not always have a non-*ka* counterpart indicate that *ka* in Taiwanese has a

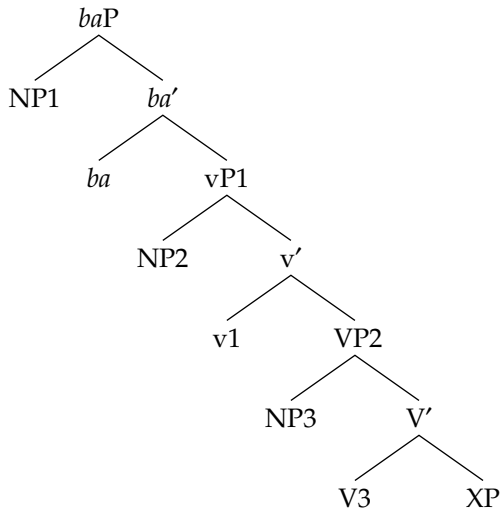
more independent status than *ba* in Mandarin. We suggest that the minimal difference between the two constructions is that *ka* is 'more lexical' than *ba*: *ka* can directly assign a thematic role (an affected theta-role) to the *ka* NP. *Ba*, on the other hand, does not assign a thematic role. A *ka* NP can be base generated but a *ba* NP always originates from within the verb phrase.[45] *Ba* in Mandarin is more 'empty' than *ka* in Taiwanese.

The independent theta-assigning capability of *ka* should predict that the prohibition against the V in a Mandarin *ba* sentence being a true intransitive should not apply to a Taiwanese *ka* sentence (cf. section 2.5). This is correct. The unacceptable cases with true intransitive verbs in the Mandarin *ba* sentences discussed in section 2.5 are acceptable as *ka* sentences, as illustrated below (cf. (71–72)):

(92) li-e syaNim na ka gua se-ka molang thiaN-u, gua e ka li
your voice if Ka me small-extent nobody hear-have I will Ka you
si taolo.
fire job
'If your voice is so small that nobody can hear you (at my cost), I will fire you.'

Such differences between *ka* and *ba* make it possible to surmise that *ba* has lost more lexical properties and is more grammaticalized than *ka*. Structurally, because of the grammaticalization process, v* disappears in (90) and the external argument NP1 occupies the Spec of *ba*P position, with the *ba* NP occupying the Spec of vP1:

(93)



Adverbials are placed at the v level (for instance, adjoined to v'). A *ba* NP (NP2) in this structure is not within the maximal projection of *ba*, and therefore not assigned a thematic role by *ba*. The relation between *ba* and the *ba* NP is not

thematic, but *ba* still assigns Case to the *ba* NP (exceptional Case marking; Chomsky 1981). It is also possible that the weakening of the lexical properties of *ba* (grammaticalization) makes it possible to cliticize *ba* to the *ba* NP, making the two behave as a unit (82b), which, if true, also accounts for why *ka* + NP do not behave as a single unit in Taiwanese (81d).

In brief, the *ba* construction in Mandarin can be viewed as a more grammaticalized version of the *ka* construction in Taiwanese. The two minimally differ in their thematic-assigning capability. This difference is reflected in the presence of a v projection for *ka*, but not for *ba*. The two structures, (91) for *ka* sentences and (93) for *ba* sentences, accommodate the generalizations in (81).

Note that the structure in (93) assumes that the *ba* NP, NP2 in Spec of vP1, can be raised from a lower position. Such a raising analysis is supported, as shown next.

4.3 The ba *NP*

As mentioned, a *ba* sentence always has a non-*ba* counterpart and a *ba* NP is an inner object (object of V) or an outer object (assigned a theta-role by V and its complement). In other words, the *ba* NP is generated in either NP3 (V'-object) or XP (V-object) position in (93). On the surface, a *ba* NP occurs in NP2 position in (93). This indicates that a *ba* NP must be derived by a raising process (see the discussion regarding (76) in section 2.5). The raising, however, can only originate from a V-object or V'-object position; it cannot originate from the subject position of a complement clause. Note that the *ba* NP, NP2, is still within the extended maximal projection of V (vP). That is, it is within the thematic domain of V/V'. Raising the subject of an embedded clause to the *ba* NP position would be like raising an embedded subject to the object position of a higher clause, a process generally possible only if the subject is raised to the Agreement of Object position, not the position within the extended maximal projection of V (see Hornstein 1994).[46]

A raising analysis to derive the *ba* NP is supported by the fact that an object NP of a verb + object [V + NP] idiomatic expression, as in (94a–d), can become a *ba* NP, as in (95a–d):

(94) a. ta zhan-qu-le pianyi.
he take-go-Le advantage
'He took advantage.'

b. ta kai-wan-le dao.
he open-finish-Le knife
'He finished the operation.'

c. bie you-huai-le mo.
don't hu-bad-Le -mor
'Don't humor badly (humorous in the wrong way).'

d. ni gankuai xiao-le bian-ba, buyao zai wan-le.
you hurry small-Le convenience-Par. don't again play-Le
'Hurry up peeing; don't fool around any more.'

(95) a. ta ba pianyi zhan-qu-le.
he Ba advantage take-go-Le
'He took advantage.'
b. ta ba dao kai-wan-le.
he Ba knife open-finish-Le
'He finished the operation.'
c. bie ba mo you-huai-le.
don't Ba -mor hu-bad-Le
'Don't humor badly (humorous in the wrong way).'
d. ni gankuai ba bian xiao-le-ba, buyao zai wan-le.
you hurry Ba convenience small-Le-Par. don't again play-Le
'Hurry up peeing; don't fool around any more.'

4.4 A bare verb?

The proposal discussed so far accounts for almost all the syntactic properties of the *ba* construction in Mandarin, in contrast to the *ka* construction in Taiwanese, as listed in (81). What is left is the contrast between the acceptability of a bare verb for a *ka* sentence and the unacceptability of such a form for a *ba* sentence. Why is it, then, that a *ba* sentence in Mandarin cannot allow a bare verb? It is possible to trace this constraint to a more general phenomenon: in Mandarin, when an object is preposed (i.e., not occurring in the postverbal position), it is generally unacceptable to have a bare verb, as illustrated by the contrast in the following pairs of sentences:

(96) a. *wo zuotian zhe-ge zhuozi ca.
I yesterday this-Cl table wipe
'I, this table, wiped yesterday.'

cf.:

b. wo zuotian zhe-ge zhuozi ca-le.
I yesterday this-Cl table wipe-Le
'I, this table, wiped yesterday.'
c. *zhe-ge zhuozi, wo zuotian ca.
this-Cl table I yesterday wipe
'This table, I wiped yesterday.'

cf.:

d. zhe-ge zhuozi, wo zuotian ca-le.
this-Cl table I yesterday wipe-Le
'This table, I wiped yesterday.'

Why is it, then, that the focus of the literature has been on the unacceptability of a bare verb in a *ba* sentence, and attention has not been paid to the parallelism

between the *ba* sentences and the object-preposing cases? This probably is due to the fact that we do see some object-preposing cases where bare verbs are allowed:

(97) a. wo zhe-ge zhuozi bu-ca.
I this-Cl table not-wipe
'I, this table, won't wipe.'
b. wo zhe-ge zhuozi hui-ca.
I this-Cl table will-wipe
'I, this table, will wipe.'

Crucially, however, the bare verb in these cases occurs with a negation or modal word. Phonologically, they form a unit. In a corresponding *ba* sentence, however, a modal or a negation must occur before *ba.* The inability of a negation or modal word to follow *ba* and directly precede the V makes it impossible to test if, indeed, a *ba* sentence has different constraints than a non-*ba* sentence concerning the acceptability of bare verbs. There is, however, a context where the sharpness of the contrast between a *ba* sentence and a non-*ba* sentence with respect to the acceptability of a bare verb is greatly reduced: the context of listing:

(98) a. ta yi-zheng-ge zaoshang zhe-ge zhuozi ca, na-ge yizi
I one-whole-Cl morning this-Cl table wipe that-Cl chair
mo-de, mang-si-le.
wipe-De busy-dead-Le
'He has been wiping this table, cleaning that chair and what not for the whole morning. He is very busy.'
b. ta yi-zheng-ge zaoshang ba zhe-ge zhuozi ca, (ba) na-ge yizi
I one-whole-Cl morning Ba this-Cl table wipe Ba that-Cl chair
mo-de, mang-si-le.
wipe-De busy-dead-Le
'He has been wiping this table, cleaning that chair and what not for the whole morning. He is very busy.'

Moreover, there are some two-morpheme verbs which are difficult to decompose into an [activity + result] compound but which can occur in a *ba* pattern without an X:

(98) c. ta keneng ba ta fang-qi ma?
he can Ba she abandon-abandon Question
'Was it possible that he abandoned her?'
d. ta shi hui ba taitai hu-lue de ren ma?
he is will Ba wife neglect-omit De person Question
'Is he a person that will neglect his wife?'
e. ta bu ba wo ying-bi cai kuai!
he not Ba me force-force then strange
'It would be strange if he doesn't force me!'

f. wo bu hui ba ta yi-wang de!
I not will Ba it miss-forget De
'I won't forget it!'

Typical [activity + result] compound verbs, including those with the result part grammaticalized to become an aspect-like suffix (cf. section 2.4.1.1), allow a positive potential infix *de* 'able' or a negative potential infix *bu* 'not' [activity + *de/bu* + result]. However, verbs such as *fang-qi* 'abandon-abandon', *hu-lue* 'neglect-omit', *ying-bi* 'force', and *yi-wang* 'forget' in (98c–f) do not allow such an infix. (98c–f) seem to demonstrate that bare verbs can occur in a *ba* pattern, just like (98b).

Despite these examples, it is in general still marginal for a bare verb to appear in a *ba* pattern. In addition, (98b) is not consistently accepted among native speakers, and the verbs in (98c–f) still consist of two morphemes. These considerations are in sharp contrast to Taiwanese, which readily allows a single-syllable bare verb in a *ka* construction. One may propose subsuming the strong tendency to avoid a bare verb in a *ba* pattern to some more general phenomenon, such as certain interactions between prosody and syntax as suggested by Feng (1995), which may be specific to Mandarin but not Taiwanese. We will not speculate further on a solution here for lack of a better understanding of the contrast, except by pointing out that such a contrast cannot be a difference of interpretation: both *ba* and *ka* sentences have an 'affectedness' interpretation (see further discussion in section 5.1).

4.5 Over-generation

The investigation of each of the components of a *ba* sentence (1a–b), coupled with the cross-dialectal comparison between a *ba* sentence in Mandarin and a *ka* sentence in Taiwanese, suggested the structure in (91) and (93). They capture the properties of *ba* sentences as in (82a–d) and the relation between a *ba* sentence and a *ka* sentence, in contrast to their non-*ba*/non-*ka* counterpart, when available, as in (81a–d).

Our proposal provides an answer to the question of what structure adequately represents the *ba* construction. However, it has not addressed the issue that has been the focus of attention of most linguists interested in this construction: the conditions on when a *ba* sentence can be used. Note that the structure proposed in (91) or (93) greatly over-generates. The following are just some of the many unacceptable *ba* sentences that can be generated by the structure proposed:

(99) a. *ta ba dong da-po-le.
he Ba hole hit-break-Le
'He broke the hole.'
b. *Lisi ba ta xihuan-de hen gaoxing.
Lisi Ba he like-De very happy
'Lisi likes him so much that he is very happy.'

c. *ta ba na-difang dao-le.
he Ba that-place arrive-Le
'He arrived at that place.'
d. *wo ba jiu he-zui-le
I Ba alcohol drink-drunk-Le
'I got drunk from drinking.'
e. *ta yijing ba mei-jian-shi dou zhidao-le
he already Ba every-Cl-matter all know-Le
'He already knows everything.'
f. *tufei ba ta baifang-le fuqin.
bandit Ba him visit-Le father
'The bandit visited his father.'

There have been many interesting accounts for the relevant constraints. Proposals have been made from the perspective of information structure (topic-comment, presupposition-focus; see, for instance, Mei 1978; Hsueh 1987; Tsao 1987), interpretation/pragmatics (transitivity, disposal, affectedness; see L. Wang 1945, 1947; H. Wang 1957; Chao 1968; Hashimoto 1971; Thompson 1973; Li 1974; Hopper and Thompson 1980; Li and Thompson 1981; etc.), aspectual structure (Szeto 1988; Yong 1993; Liu 1997), and event structure (Sybesma 1992, 1999). We will show in the next section that, although all these approaches accommodate the core cases of *ba* sentences fairly well, the structurally formulated solutions fail to adequately account for the range of data that contain minimal pairs with identical structures but different acceptability as a *ba* sentence.

5 Constraints

Among the approaches based on information structure, interpretation/pragmatics, and aspectual and event structures, we will concentrate on the last three and show how each of them accounts for the constraints on the core instances of *ba* sentences, but attempts at precise grammatical formulations inevitably fail.[47]

5.1 An interpretation/pragmatic account

5.1.1 The notion of 'affectedness/disposal'

The majority of the literature on the *ba* construction centers on the notion of 'disposal' or 'affectedness'. That is, a *ba* sentence is a construction denoting 'disposal' or 'affectedness'. This special meaning is related to the original lexical meaning of *ba*, 'handle, manipulate'. It is responsible for the many constraints on the choice of verbs, the choice of *ba* NPs, and the use of other postverbal or preverbal elements (the X in (1)) in a *ba* construction. For instance, even though in many cases the *ba* NP is the object of the main verb in preverbal position,[48] as illustrated in (100), the 'special meaning' of the *ba* construction prevents all transitive verbs from preposing their object as a *ba* NP, such as (101):

(100) a. wo ba juzi bo-le.
I Ba orange peel-Le
'I peeled the orange.'

cf.:

b. wo bo-le juzi.
I peel-Le orange
'I peeled the orange.'

(101) a. *wo ba ta xihuan-le.
I Ba him like
'I like him (now, became fond of him).'

cf.:

b. wo xihuan ta-le.
I like him-Le
'I like him (now, became fond of him).'

The intuition regarding the unacceptability of sentences like (101a) is that such sentences do not express the handling or manipulation of something (recall the original meaning of *ba*); 'he' is not manipulated or dealt with by 'my liking him'. The *ba* NP is not affected by 'my liking him'. This contrasts with (100a), which expresses the notion that the *ba* NP 'the orange' was manipulated: it was peeled.

Such an intuition is behind the terms for this construction that have been quite widely used in the literature: the 'disposal' or 'executive' construction (*chuzhi shi*; see Wang 1954). These terms are to capture the intuition that the *ba* construction, ideally, is to describe something being 'disposed of' or some action being taken on the *ba* NP. In Wang's words: "The disposal form states how a person is handled, manipulated, or dealt with; how something is disposed of; or how an affair is conducted" (translated in Li 1974: 200–201). According to Teng (1974b), this interpretation property accounts for why it is most common for the *ba* NP to be a Patient (affected) NP. Frei (1956/1957) and Teng (1974b) refer to this construction as the ergative or accusative construction, to highlight the fact that the 'object' of *ba* generally is a patient (affected). In a word, *ba* is a marker of the thematic role 'patient'. Alternatively, the *ba* construction can be viewed as a 'highly transitive' construction. The construction describes the particular action made upon its object or a high degree of affectedness of the verb exerted upon the object (see, for instance, L. Wang 1954; H. Wang 1957; Chao 1968; Hashimoto 1971; Thompson 1973; Li 1974; Li and Thompson 1981; Tiee 1990; M. Wang 1987; for a recent work, see Li 1995). The 'affectedness' interpretation can be better understood by the contrast between the following two sentences, which have similar argument NPs. Depending on which NP becomes the *ba* NP, the sentences are interpreted differently. They differ in expressing which NP is affected: (102a) expresses that the pot is affected, and (102b) the water:

(102) a. wo ba guozi zhuang-le shui.
I Ba pot fill-Le water
'I filled the pot with water.'
b. wo ba shui zhuang-zai guozi-li.
I Ba water fill-at pot-in
'I filled the water into the pot.'

5.1.2 Extension – non-physical affectedness

However, it is not always easy to understand a *ba* NP as some entity that is 'affected', 'manipulated', or 'dealt with'. Extensions have been made to accommodate more *ba* cases.

It has been suggested that 'affectedness' need not be physical. It can be psychological or even imaginary. For instance, Li and Thompson (1981: 469–470) explain that sentences such as (103–104), which contain emotive or psychological (stative) verbs normally not occurring in a *ba* pattern, are acceptable when the postverbal intensifier is added. The intensity of the emotion can imply disposal. In (103), the presence of the postverbal expression greatly exaggerates the degree of his missing you. "It is as if one cannot help thinking that you are affected in some way when he misses you to such an extent that he can't even eat" (1981: 469). The added expression *yao si* 'want to die' in (104) "hypothetically creates an image that such intense love must have some effect on the 'small cat'. Thus, the disposal idea . . . is implied by the verb together with the added expression. An implication of disposal is, therefore, sufficient to warrant the use of the *ba* construction" (1981: 469):

(103) ta ba ni xiang-de fan dou bu-ken chi.
he Ba him miss-De food even not-willing eat
'He misses you so much that he won't even eat his meals.'

(104) Lisi ba xiao-mao ai-de yao si.
Lisi Ba small cat love-De want die
'Lisi loves the kitten so much that he wants to die.'

Such an image must be in the speaker's mind only, because the *ba* NP, the one that is missed in (103), need not even know that he is missed. Thus, (103) can be followed by (105a). The subject, the one that misses the *ba* NP in (103), need not know the extent, either, as illustrated by the acceptability of (105b):

(105) a. ni keneng bu zhidao-ba!
you probably not know-Par
'Probably you don't know.'
b. ta keneng bu zhidao ta yijing ba ni xiang-de feng-le.
he probably not know-Par he already Ba you miss-De crazy-Le
'Probably he doesn't know that he already missed you so much that he went crazy.'

In brief, among all the different terms to label the *ba* construction, there seems to be an intuition expressed in the majority of works that this construction expresses some loose notion of 'affectedness' – the *ba* NP being affected in some way. The 'affectedness' need not be physical: it can be emotional or simply imaginary.

Such a special meaning is so typical of the *ba* construction that it can make a distinction in interpretation between a *ba* sentence and its non-*ba* counterpart. This can be illustrated by the behavior of idiomatic expressions. The following examples show that an object part of a [V + O] idiomatic expression can become a *ba* NP:

(106) a. ta ba pianyi zhan-qu-le.
he Ba advantage take-go-Le
'He took advantage.'
b. ta ba dao kai-wan-le.
he Ba knife open-finish-Le
'He finished the operation.'
c. bie ba mo you-huai-le.
don't Ba -mor hu-bad-Le
'Don't humor badly.'
d. ta ba wanxiao kai-de-guohuo-le.
he Ba joke open-De-excessive-Le
'He overdid the joking.'
e. ni gankuai ba bian xiao-le-ba, buyao zai wan-le.
you hurry Ba convenience small-Le-Par. don't again play-Le
'Hurry up peeing; don't fool around any more.'

The use of the *ba* construction in these sentences seems to favor an understanding that something is affected or disposed of (in a very loose sense). For instance, (106a) states that the advantage has been taken by him (abstractly). (106b) says that the operation has been performed. In a way, *dao* 'knife' is equated to 'operation' and *kai* 'open' to 'perform (operation)'. In (106c), even though *youmo* is a transliteration of the English word *humor*, it seems possible to understand the sentence as this: the humorous stuff that he will be telling/acting (i.e., the -mor that he hu-ed) goes bad. In (106d), the joke that he made has gone overboard. (106e) can be interpreted as the pee gets peed fast. All of them imply a very loose notion of 'affectedness/disposal'.

In addition to the effect on the general interpretation of this pattern, the notion of 'affectedness/disposal' provides some understanding of the constraints on the types of *ba* NPs and predicates, which include a V and an X in (1a–b).

5.1.3 Constraints on ba *NPs*

Because a *ba* NP is an affected one, it generally should exist before an event occurs in order to be affected (existence condition), it generally cannot be non-specific (specificity condition), and it generally must be something/someone that can be affected by the event (affectedness condition).

5.1.3.1 Existence

There is a strong tendency for the entity denoted by the *ba* NP to exist in the speaker's conceptual world before the activity/event takes place. If it does not exist, generally a *ba* NP is not acceptable. Let us clarify these remarks with the following pairs of examples:

(107) a. *ta ba zhuyi xiang-dao-le.
he Ba idea think-arrive-Le
'He thought of the idea.'
b. ta ba diannao mai-le.
he Ba computer sell-Le
'He sold the computer.'

The contrast between (107a) and (107b) can be accounted for in the following manner: an idea does not exist before it is thought of but a computer must exist before it is sold.

The existence can simply be a conceptual existence, rather than a physical one. For instance, the concept of what a hole should be can exist before the hole is dug and takes the desired shape. In contrast, if one breaks a hole, one normally does not have a preconception of the hole:

(108) a. ta ba dong wa-hao-le.
he Ba hole dig-complete-Le
'He completed digging the hole.'

cf.:

b. *ta ba dong da-po-le.
he Ba hole hit-break-Le
'He broke the hole.'

In the world we know, a hole comes into existence as a result of breaking, which is incompatible with the existence requirement of a *ba* NP. This is especially clear when words expressing the lack of intention, like 'unintentionally, carelessly', are added to (108b).

(108) c. *ta bu-xiaoxin ba dong da-po-le.
he not-careful Ba hole hit-break-Le
'He broke the hole carelessly (unintentionally).'

More generally, no creation verbs are quite compatible with a *ba* NP, unless the *ba* NP expresses a conceptual existence before the event/action takes place. This is why a *ba* sentence is not acceptable with verbs like *faxian* 'discover' or *faming* 'invent':

(109) a. *ta ba jinzi faxian-le.
he Ba gold discover-Le
'He discovered gold.'
b. *ta ba diandeng faming-le.
he Ba light-bulb invent-Le
'He invented light-bulbs.'

Similarly, the unacceptability of sentences like (110a–b) can be attributed to the existence requirement. Generally, the object of seeing or hearing comes into the existence only after the seeing or hearing. A *ba* sentence is not acceptable:

(110) a. *wo ba ta kan-dao-le.
I Ba he see-arrive-Le
'I saw him.'
b. *wo ba ta ting-dao-le.
I Ba he listen-arrive-Le
'I heard him.'

In contrast, if my intention is to touch him (as in a game), the following sentence can be acceptable because the existence of 'him' is in my mind before my touching him:

(110) c. wo ba ta mo-dao-le! wo ying-le!
I Ba he touch-arrive-Le I win-Le
'I touched him! I won!'

5.1.3.2 Specificity

A great majority of the literature on *ba* constructions claims that a *ba* NP must be specific or definite and that it has to do with the meaning of 'disposal' or 'affectedness' – the entity that is dealt with or affected needs to be specific (see the discussions in sections 5.2 and 5.4 on the revision of such a claim). Examples frequently quoted are those *ba* NPs (i) which are a bare NP and cannot be interpreted as indefinite, and (ii) which are a number + classifier expres- sion and cannot be interpreted as indefinite. Bare NPs and number + classifier expressions can be interpreted as indefinite in some other contexts, such as a postverbal object position:

(111) **Bare NP:**
a. qing ni ba bi gei wo.
please you Ba pen give me
'Please give me the pen.' (definite reading)
*'Please give me a pen.' (indefinite reading unavailable)

cf.:

b. qing ni gei wo bi.
please you give me pen
'Please give me the pen.' (definite reading)
'Please give me a pen.' (indefinite reading)

[Number + classifier + noun] expressions generally are interpreted as non-specific and therefore unacceptable as a *ba* NP:

(112) a. *qing ni ba san-zhi bi gei wo.
please you Ba three-Cl pen give me
'Please give me three pens.'

cf.:

b. qing ni gei wo san-zhi bi.
please you give me three-Cl pen
'Please give me three pens.'

(113) a. *ta ba shi-duo-ben shu mai-le.
he Ba ten-more-Cl book buy-Le
'He bought ten-plus books.'
b. ta mai-le shi-duo-ben shu.
he buy-Le ten-more-Cl book
'He bought ten-plus books.'

(112a) and (113a) are not acceptable because 'three pens' and 'ten-plus books' generally cannot be interpreted as specific.

When such expressions are interpreted as specific, as when the universal quantifier *dou* is added, they can serve as a *ba* NP:

(114) qing ni ba san-zhi bi dou gei wo.
please you Ba three-Cl pen all give me
'Please give me all three pens.'

Sybesma (1999: 142) notes that, in the terms of Barwise and Cooper (1981), the *ba*-NP must be strong.[49]

In these two subsections, we stated that 'existence' and 'specificity' are strong tendencies regarding a *ba* NP. They are not exceptionless, as we will see later in the chapter when discussing event and aspectual structural approaches to *ba* constructions. The exceptions may be vaguely related to how the notion of 'affectedness' is understood. We attempt to describe the general applications of 'affectedness' next.

5.1.3.3 Affectedness

The 'disposal' interpretation is also claimed to be responsible for the unacceptability of having a *ba* NP like (115a), in contrast to the one in (115b): a language is not manipulated or dealt with when one reads things in that language. A sentence can be tackled (figuratively) by reading it in its entirety:

(115) a. *wo ba Zhongwen nian-le san-xiaoshi-le.
I Ba Chinese read-Le three-hour-Le
'I read Chinese for three hours.'

cf.:

a'. wo nian Zhongwen nian-le san-xiaoshi-le.
I read Chinese read-Le three-hour-Le
'I read Chinese for three hours.'
b. wo ba zhe-juzi nian-le san-xiaoshi-le.
I Ba this-sentence read-Le three-hour-Le
'I read this sentence for three hours.'

Similarly, it may help capture the contrast between the acceptability of sentences like those in (116a–b) and the unacceptability of those in (116c–e): it is easier to think of 'a key' being affected, because of its displacement by being forgotten, dropped, or lost (116a), and a ball game being claimed by winning (116b). (116b) can be further contrasted with (116c), which it is harder to interpret as "affected" if one simply participates in a ball game. For (116d–e), it is harder to think of a place being affected when one arrives at or leaves the place:

(116) a. wo ba yaoshi wang/diu/yishi-le
I Ba key forget/drop/lose-Le
'I forgot/dropped/lost the key.'
b. wo yiding neng ba qiusai ying-le.
I certainly can Ba ball-game win-Le
'I certainly can win the ball game.'
c. *ta jingran ba qiu-sai canjia-le.
he unexpectedly Ba ball-game participate-Le
'Unexpectedly, he played the ball game.'
d. *ta ba na-difang dao-le.
he Ba that-place arrive-Le
'He arrived at that place.'
e. *ta ba na-difang likai-le henjiu-le.
he Ba that-place leave-Le long time-Le
'He left that place for a long time.'

The 'affectedness' interpretation also helps determine the syntactic position a *ba* NP originates in. It has been suggested that a *ba* NP is an outer object when it is

not an inner object of the verb, as discussed in section 2.3.2. The so-called outer object receives an 'affected' theta-role. The clearer the 'affected' interpretation, the easier it is to make an 'affected NP' and an acceptable *ba* sentence.

In (117a), killing a person's father naturally affects this person (particularly in a patriarchal culture), and therefore a *ba* sentence is quite acceptable. On the other hand, visiting someone's father normally does not affect that person, and a *ba* sentence is not acceptable (117b). (117c) and (117d) illustrate the same contrast in affectedness and acceptability:

(117) a. tufei ba ta sha-le fuqin.
bandit Ba him kill-Le father
'The bandit killed his father (and he was affected).'
b. *tufei ba ta baifang-le fuqin.
bandit Ba him visit-Le father
'The bandit visited his father.'
c. women ba ta guai-zou-le xiaohai.
we Ba him swindle-off-Le child
'We swindled his child (and he was affected).'
d. *women ba ta tanlun-le xiaohai.
we Ba him discuss-Le child
'We discussed his child.'

As mentioned earlier, the contrast between the pairs of sentences above is important in another sense: it shows that bearing some relation, such as a possession relation, to the object of the verb (the inner object) is not sufficient to create an outer object and a *ba* sentence. It must be that the combination of [V + inner object] can take an outer object which is interpreted as 'affected', along the lines of the discussion on the constraints of the thematic relation between a *ba* NP and the V/V' in section 2.5.

For double object structures, the choice of a direct object or an indirect object as the *ba* NP also is related to the notion of affectedness. As a rule of thumb, if a double object verb can be combined with *gei* 'give, to', the direct object can be a *ba* NP; if it cannot be combined with *gei*, the direct object cannot be a *ba* NP. The following minimal contrasts illustrate the relevance of *gei*:

(118) a. wo jiao ta Zhongwen.
I teach him Chinese
'I taught him Chinese.'
b. *wo ba Zhongwen jiao ta.
I Ba Chinese teach him
'I taught him Chinese.'
c. wo jiao-(gei) ta mijue.
I teach-to him secret (of success)
'I taught him the secret of success.'

d. wo ba mijue jiao-(gei) ta.
I Ba secret teach-to him
'I taught him the secret of success.'

Li (1990) argues that the use of *gei* expresses transaction. (118a) does not allow the occurrence of *gei* because a language cannot be transferred to someone. That is, a language cannot be given to someone. On the other hand, the secret of success can be given to someone. The possibility of transaction is expressed by the possibility of using *gei*. This is correlated with the use of *ba*: if something can be transferred, it can be affected in terms of its location being changed.

The same is true with indirect objects: the notion of 'affectedness' also helps determine the acceptability of a *ba* sentence. In the double object structure with *jiao*(*gei*) 'teach (to)', the *ba* NP cannot be the indirect object because it is the direct object that is transferred, not the indirect object, as illustrated by (118c–d). The cases where an indirect object of a double object structure can be a *ba* NP are verbs like *wen* 'ask', *fa* 'fine', *qiang* 'rob', *tou* 'steal', *hua* 'spend, cost'. These are verbs that do not occur with *gei* and the direct object cannot be a *ba* NP. The 'affected' interpretation seems to be the driving force for the use of the indirect object of such verbs as a *ba* NP. The indirect object of *fa*, *qiang*, *tou*, and *hua* expresses someone that is fined, robbed, or has something stolen, or whose money has been spent, all qualified as someone that is affected:[50]

(119) ta ba wo fa/qiang/tou/hua-le shi-kuai qian.
he Ba I fine/rob/steal/cost ten-dollar money
'He fined/robbed/stole/fined/cost me ten dollars/ten dollars from me.'

An indirect object of such double object structures without *gei* cannot always become a *ba* NP, however, if the 'affectedness' interpretation is not present. Take *wen* 'ask', for instance. A *ba* sentence is better only if the indirect object is somehow affected by the asking of questions. For instance, when the indirect object is asked about many difficult questions, as in (120), he may be affected emotionally by being asked so many difficult questions. An 'affectedness' interpretation obtains and a *ba* construction is available:

(120) ta ba wo wen-le yi-da-dui hen-nan-de wenti.
he Ba me ask-Le one-big-pile very-difficult-De question
'He asked me many difficult questions.'

In contrast, the following sentence is much less acceptable, because, generally, it is much less likely that asking for directions would affect the person being asked:

(121) ??ta ba wo wen-le fangxiang.
he Ba I ask-Le directions
'He asked me directions.'

Nonetheless, such a sentence can be made more acceptable if it is made clear that asking for directions affects the one being asked, such as being emotionally disturbed by such questions:

(122) ta mingming zhidao wo bu-qingchu fangxiang, que hai
you obviously know I not-clear direction but still
dang-zhong ba wo wen-le fangxiang rang wo chu-chou!
face-crowd Ba I ask-Le direction let me embarrass
'He obviously knows that I am not clear about the directions; yet he still asked me directions in public, making me embarrassed!'

(123) zhen lan!!! ta (jingran) ba wo wen-le fangxiang!!!
really lousy he surprisingly Ba I ask-Le directions
'A disaster! (How dare) he ask(ed) me directions.'

5.1.4 Constraints on predicates

According to Li and Thompson (1981: 489), the 'disposal' nature of the *ba* construction provides an understanding of

> why some grammarians and textbook writers have thought that the verb in a *ba* sentence cannot stand alone, but must be either preceded by some adverb or followed by some element, such as a perfective, directional, or resultative verb suffix or a complex stative clause. The reason that *ba* sentences always have verbs with those elements preceding or following them is that such sentences serve to elaborate the nature of disposal.

The function of X in (1), then, is to add to the verb the special 'disposal' meaning in order to make an appropriately interpreted *ba* sentence. Different verbs may themselves have different strengths of 'disposal'. It is easier for a verb like *sha* 'kill', *da* 'hit', *pian* 'cheat', etc. to have an interpretation according to which its object is affected by the killing, hitting, and cheating (stronger disposal interpretation). In contrast, for a verb like *xihuan* 'like', *liaojie* 'understand', *renshi* 'know', it is harder to have such an interpretation (much weaker disposal interpretation). The former, those verbs higher in transitivity and disposal interpretation, generally just need a perfective aspect marker *le* to indicate that the action is carried out and the effect is inflicted on its object. That is, these verbs can appear in a *ba* sentence with the simple addition of a perfective aspect marker *le*. The latter, those low in transitivity and weak in disposal interpretation, such as stative verbs, generally are more difficult to make into a *ba* sentence, even with the help of an X factor. For instance, the addition of a resultative complement, number phrases/aspect marker, Adv, etc. does not make a good *ba* sentence with such verbs in the following cases:

(124) **Resultative complement:**
a. *Lisi ba ta xihuan-de hen gaoxing.
Lisi Ba he like-De very happy
'Lisi likes him so much that he is very happy.'

cf.:

b. Lisi xihuan ta shi-de ta hen gaoxing.
Lisi like he made-De he very happy
'Lisi likes him so much that he is very happy.'

(125) **Number phrases/aspect marker:**
a. *ta yijing ba Lisi renshi-le sannian-le.
he already Ba Lisi know-Le three-year-Le.
'He's already known Lisi for three years.'

cf.:

b. Lisi, ta yijing renshi-le sannian-le.
like he already know-De three-year-Le.
'Lisi, he's already known for three years.'

(126) **Adv + V:**
a. *wo ba zhe-shi yi-liaojie, jiu lai-le
I Ba this-matter once-understand then come-Le
'I came as soon as I understood this matter.'

cf.:

b. wo yi-liaojie zhe-shi jiu lai-le
I once-understand this-matter then come-Le
'I came as soon as I understood this matter.'

However, it is not impossible to find instances with the low-transitivity stative verbs making a good *ba* sentence with the help of an appropriate X, such as (69–70) discussed in section 2.5 (the adjectival verbs *re* 'hot', *leng* 'cold', are stative verbs) and the following one from Li and Thompson (1981: 470, example (30)):

(127) ta ba zhe-shi liaojie-de hen touche.
he Ba this-matter understand-De very thorough
'He understands the matter thoroughly.'

The thoroughness of understanding the matter probably entails that the matter is in control, i.e., it fits in a non-physical, imaginary affectedness interpretation.

Such a 'disposal/affectedness' account probably can also accommodate the fact noted in section 2.4.8 that a descriptive phrase is the only type of element that can occur in a postverbal position but does not make a good *ba* sentence. The examples are (66a–b), repeated here:

(66) a. ta jintian-de gongke xie-de hen kuai.
he today-De homework write-De very fast
'He wrote today's homework fast.'

b. *ta ba jintian-de gongke xie-de hen kuai.
he BA today homework write-De very fast
'He wrote today's homework fast.'

The form [V + de + descriptive] is interpreted like a descriptive adjective (stative verb). There have been debates in the literature on whether the verb or the descriptive phrase (the postverbal adjective) is the main verb of the sentence structurally (see C.-T. Huang 1982a, 1988; C. R. Huang 1987; Li 1985, 1990; among others). What we claim here is that, semantically speaking, the adjective determines the situation type of the verb phrase. It makes the situation type like that of an adjectival predicate, rather than an activity denoted by the V. That is, the verb phrase [V + de + descriptive] behaves like a descriptive adjective with respect to situation types. For instance, just as an adjective cannot occur in a command, neither can [V + de + descriptive]:

(128) a. *ni hen kuai!
You very fast
'You be fast!'
b. *ni xie-de hen kuai!
You write-De very fast
'You write fast!'

They cannot occur in the progressive form either:

(129) a. *ta zheng-zai hen kuai.
he right-at very fast
'He is being fast.'
b. *ta zheng-zai xie-de hen kuai!
he right-at write-De very fast
'He is writing fast.'

The form [V + de + descriptive] is not an accomplishment or achievement verb phrase either, because it does not have an end-point and it does not occur in the pattern of completion in a certain amount of time:

(130) *ta zai yi-ge-xiaoshi-nei gongke xie-de hen kuai.
he at one-hour-in homework write-De very fast
'He wrote homework fast in an hour.'

Because [V + de + descriptive] is interpreted like a descriptive adjective (stative verb) with respect to situation types, this pattern tends not to accept a *ba* form, just like other adjectival predicates or stative verbs, as we saw earlier.

In brief, the addition of a postverbal or preverbal element makes the affectedness interpretation more salient and renders a *ba* sentence more acceptable. The

strength of the 'disposal/affectedness' interpretation of verbs interacts with the need of the X factor. For verbs with strong 'disposal/affectedness' interpretation, an aspect marker is sufficient. For verbs with weak or no 'disposal/affectedness' interpretation, an X may not be sufficient to draw out an affectedness interpretation, and a *ba* sentence is still unacceptable. Such a vague notion of 'disposal/affectedness' plays an important role in the acceptability of *ba* sentences. Indeed, the notion of 'disposal/affectedness' has dominated the approaches to the constraints on the *ba* construction. The vagueness of the notion also leads to the claim that the acceptability of a *ba* sentence sometimes is not absolute. It is only better or worse as a *ba* sentence. This conception can be best summarized by Li and Thompson's (1981: 487) conditions on the use of the *ba* construction as a continuum:

(131) *ba* *ba* *ba* *ba*
Impossible Likely Obligatory

Indefinite or non-referential object Definite and highly prominent object
No disposal Strong disposal

A definite and highly prominent object is an object that is "more obvious in the speech context and more immediate to our discussion" (1981: 484). Li and Thompson further provide support for their continuum in (131) on the basis of statistics: the more elements that are added to elaborate the nature of disposal, the more likely are the sentences to appear in the *ba* form. For instance, their data produced 83 *ba* sentences, none of which was a verb that was reduplicated or only followed by *-zhe* (which have little 'disposal' meaning added, according to Li and Thompson). Only 6 or 7 percent of the 83 sentences ended with just V-*le*. Li and Thompson also suggest that the continuum may capture the fact that speakers tend to disagree on the acceptability of certain *ba* sentences, especially those that are less clear on their disposal nature, i.e., those in the middle of the continuum.

In short, although it is doubtful that there are obligatory *ba* sentences (all *ba* sentences can have a non-*ba* counterpart), the continuum in (131) does express explicitly the complexity of *ba* sentences: whereas speakers can agree quite readily on the best examples and the least likely examples for this pattern (the two extremes), the judgment is not clear especially on those cases that fall between the two extremes.

5.1.5 Summary

A great majority of the literature on *ba* constructions focuses on the usage of *ba* sentences by expounding on the notion 'affectedness/disposal', which states that the *ba* NP is the NP that is disposed of, dealt with, manipulated, affected in some way (physical or non-physical imaginary). This notion is responsible for the requirements on the types of *ba* NPs and predicates required in this pattern. As described in this section, such a notion seems to capture the basic intuition about

this construction and the canonical interpretation of a *ba* sentence. In the clearest cases, like *wo ba cai chao-de hen lan* 'I stir-fried the vegetable very mushy', we know that the vegetable is affected by the cooking, the result being mushy. Something is manipulated in a certain way. In cases like *wo ba Li xing le* 'I take the surname Li (my surname is Li)', our intuition tells us that this is an unacceptable use because, in the common world, a surname cannot be affected or manipulated by someone's having that surname. However, when we go beyond the clear cases, the picture becomes fuzzy. As mentioned, the notion of 'affectedness' has to be relaxed to include non-physical or imaginary situations. This creates a great deal of uncertainty. The so-called explanation becomes less comprehensible. For instance, what is the difference between hating someone for life and fearing someone for life that makes one better than the other as a *ba* sentence (132)? What is the difference between missing someone extremely and resembling someone extremely that makes one more affected and acceptable as a *ba* sentence and the other less affected and unacceptable as a *ba* sentence (133)? In both situations, the *ba* NP, the one that is missed or taken after, does not even need to be aware that he or she is missed or taken after:

(132) a. wo hui ba ta hen yi-beizi.
I will Ba him hate one-life
'I will hate him for life.'
b. ??wo hui ba ta pa yi-beizi.
I will Ba him fear one-life
'I will fear him for life.'

(133) a. xiaohai ba ta xiang-de yao si.
child Ba him miss-De want die
'The child misses him extremely.'
b. *xiaohai ba ta xiang-de yao si.
child Ba him resemble-De want die
'The child resembles him extremely.'

cf.:

c. xiaohai xiang ta xiang-de yao si.
child resemble him resemble-De want die
'The child resembles him extremely.'

Of course, one can always create a story to accommodate the difference. For instance, if I am in fear of him (132b), he is always in control and he will not be the affected one even in a non-physical, imaginary sense. Such an 'explanation', however, will always be fuzzy, uncertain, unpredictable, and even circular in some cases. However, this does highlight the fuzziness and uncertainty of some uses of this construction. As mentioned, speakers often disagree on their judgments of *ba* sentences, especially those that fall in between the two extremes in

(131). Moreover, the same speaker may also make very different judgment in different contexts. For instance, although a sentence like (134a) below is judged not quite acceptable normally, it can become acceptable to the same speaker in a context where the *ba* NP 'I' was very much disgusted with 'his asking directions'. 'He' fully knows that 'I' don't know about directions and 'he' is trying to embarrass 'me'. Under such circumstances, (134b) can be uttered with total disgust and disbelief, as noted earlier:

(134) a. ??ta ba wo wen-le fangxiang.
he Ba I ask-Le directions
'He asked me directions.'
b. ta (jingran) ba wo wen-le fangxiang!!!
he surprisingly Ba I ask-Le directions
'(How dare he) He asked me directions.'

The vagueness and uncertainty, in a way, then, seem to be also an advantage: they reflect the uncertainty in speakers' judgments of many such sentences. It gives us a clue as to what the clearest acceptable and unacceptable *ba* cases are and to what would be more unsettling, allowing for more speaker variations and contextual variations. On the other hand, the weakness remains that it is extremely difficult to characterize the properties and claim in precise terms what may a priori be called an acceptable or unacceptable *ba* sentence.

It would therefore be very desirable to clarify and eliminate the fuzziness and uncertainty in characterizing this pattern, if possible. Indeed, there have been proposals claiming that the notion of 'affectedness/disposal' is unnecessary. Within such proposals, the *ba* construction is not unique. It can be subsumed under other, more common structures. Constraints on the *ba* construction can be derived from some better-defined structural or semantic properties. These alternative proposals offer insight into this construction from different perspectives and contribute to our understanding of the complex properties of this pattern. Unfortunately, it is the complexity of this pattern, reflected by the continuum in (131), that makes precise structural accounts for this pattern fall short empirically. Above all, there exist many minimal pairs with identical grammatical structures that exhibit different degrees of acceptability as a *ba* sentence because of the different contextual information involved. It is difficult to make such contextual information precise in grammatical terms. This casts doubt on the adequacy of capturing the usage of this pattern grammatically.

The most interesting attempts to provide a clearer, more precise grammatical account for the properties of the *ba* construction, in place of a vague notion of 'affectedness', are the aspectual approach represented by Liu (1997; also see Szeto 1988 and Yong 1993; cf. Zou 1995 for an aspect phrase selected by *ba*) and a structural approach that links the *ba* construction to accomplishment structures, proposed by Sybesma (1999). We examine these two approaches below, discuss their insights, and evaluate how effectively they tackle the complexity of the *ba* construction.

5.2 An aspectual approach

Assuming with Mei (1978) and Tenny (1987), among others, that affectedness is a property of the verb, Liu (1997: 93) notes that a *ba* sentence "may or may not have the property of affectedness." To support this claim, she gives the following sentence (her 1997: 94, (118)) to show that a *ba* sentence need not have an affectedness interpretation:

(135) ta ba yige dahao jihui cuoguo-le.
he Ba one-Cl big-good opportunity wrong-pass-Le
'He let a great opportunity pass.'

Liu argues, instead, that a *ba* construction is essentially a construction expressing a bounded event, and constraints on the *ba* construction are due to the aspectual properties of this pattern.

5.2.1 The analysis

Liu (1997) argues that a *ba* sentence requires its predicate to denote a bounded event or situation – 'bounded situations' are as defined in (136), which is a revised version of boundedness by Dahl (1981) in (137):

(136) Bounded situations do not have internal stages that are static or stages that can be viewed as such.

(137) **Dahl's definition of boundedness:**
A class of situations or a characterization of a situation (e.g., a sentence) is bounded if and only if it is an essential condition on the members of the class or an essential part of the characterization that a certain limit or end-state is attained.

The constraints on possible types of NPs and VPs of a *ba* sentence are manifestations of obligatorily expressing a bounded event/situation. Using the term 'event' to refer to denotations of predicates, presented in perfective or imperfective aspect, and 'situations' to refer to denotations of uninflected predicates, Liu argues that the notion of boundedness can be expressed in two ways: it can be bounded on the basis of the situation denoted by the uninflected predicate (situation type or situational aspect; see Vendler 1967a; Dowty 1979; Tai 1984; Teng 1986; Chen 1988; Smith 1991; Yong 1993), or it can be bounded when a situation of an appropriate type is presented in a certain aspect (viewpoint aspect). If the terminal point or resultative state is included in the meaning of the uninflected predicate, then the situation alone will guarantee boundedness. If, however, the terminal point or resultative state is included only when the situation is presented in an appropriate aspect, then a bounded event depends on both the situation and the aspect it is presented in. An appropriate aspect is a completive aspect *-le* or a durative aspect *-zhe* (see the discussions in section 2.4.6). According

to Liu, the notion of 'bounded situations/events' captures the fact that *ba* sentences generally take the following forms (Liu 1997: 62, (30a–i)):

(138) a. V + complement
b. V + *de*
c. V + retained object
d. V + perfective marker *le*
e. V + PP (dative or locative)
f. V + quantified phrase
g. V + *yi* + V
h. V + durative marker *zhe*
i. Adv + V

According to Liu, all patterns in (138) except those with aspect markers, i.e., (d) and (h), contain predicates which express bounded situations. Evidence for this claim comes from the fact that none of these patterns can occur with the durative marker *-zhe*, which is a marker that presents a continuous and stable situation without regard to end-points (Smith 1991). It basically marks a situation as stative or resultative (Liu 1997: 66). Some of her examples showing the incompatibility of the durative marker *-zhe* and the predicates in (138a–c, e–g, i) are repeated here (see Liu 1997: 68–69, (52a–g)):

(139) a. *wo ba wenti kan qingchu-zhe.
I Ba question see clear-Zhe
'I'm seeing the question clearly.'
b. *ta ba jia baochi-zhe-de hen ganjing.
he Ba home keep-ZHE-DE very clean
'He keeps his home very clean.'
c. *wo ba damen shang-zhe suo.
I Ba gate put-on-ZHE lock
'I'm locking the gate.'

That such predicates express a bounded situation can be understood along the lines presented in section 2: a result (including resultative complement, directional complement, and PP or object) or a number expression provides an end-point to the event. For instance, in a sentence like *wo bu-hui ba ta ti-tong* 'I will not kick him hurt', the result *tong* 'hurt' provides an end-point to the action of kicking. In *wo ba ta ti sanxia/sanjiao* 'I kicked him three times/three kicks', the number expression 'three times/three kicks' provides a terminal point for the action. An adverbial modifier can also provide an end-point (138i). Liu uses examples such as the following to illustrate this pattern (her 1997: 70–71, (59a–b)):

(140) a. ta zhengzai ba dongxi wang wuli ban.
he in-progress Ba things toward room-in move
'He is in the process of moving things into the room.'

b. ta ba tou yi tai.
he Ba head one raise
'He raised his head up.'

In (140a), the adverbial phrase 'into/toward the room' provides an end-point, and 'one' in (140b) serves the same function. Liu further argues that the constraints on possible *ba* NPs (specificity, existence; see section 5.1.3) can be derived from a dependency relation between the *ba* NP and the predicate:

> there is a dependency between the *ba* NP argument and the predicate, and boundedness and specificity are different manifestations of a property that holds of the dependency. The dependency can be characterized in terms of a very simple notion in semantics. The idea has been explored in Krifka (1989) and Dowty (1991), where the way the aspect of telic predicates depends on their NP arguments is captured in terms of a structure-preserving function – a homomorphism. (1997: 88–89)

Liu suggests taking

> the meaning of a *ba* predicate to be a homomorphism that maps the *ba* argument denotations into the domain of events, and the structure that is preserved in this case is the 'all of' relation. For example, *xiewan* 'write and finish' in *ba zhefengxin xiewan* 'write and finish the letter' maps *zhefengxin* 'this letter' to the event writing and finishing this letter. The 'all of' relation that is preserved in the mapping makes sure that all of the letter – the entire letter – is mapped to all of the event, i.e., finishing the letter. . . . When applied to the predicate, the 'all of' relation characterizes the event as bounded since only events that are bounded can enter into the 'all of' relation. Unbounded events like 'know Japanese' cannot be quantified because such events do not have boundaries – beginning point and terminal point – and it does not make sense to consider an 'entire' event of knowing Japanese. Only events with boundaries (both end points) provide a domain for universal quantification. Similarly, when it comes to NP denotation, the 'all of' relation makes sure that the individuals can be quantified by 'all of'. And only G(eneralized)-specific NPs denote individuals that can be quantified by 'all of'. (1997: 89–90)[51]

The notion of 'G-specific' Liu proposes differs from the notion of 'specific' used in other works. According to Liu (1990), G-specific NPs are the NPs that can be scope-independent in object positions. They can occur with the universal quantifier *dou* 'all' in Chinese. The forms they take are given in (141), in contrast to the non-G-specific NPs in (142) (Liu 1997: 86):

(141)	Definite NPs:	Demonstrative NPs, pronouns, names
	Universally quantified NPs:	*Suoyou de* N 'all of the N'
		Meige N 'every N'
	Most N:	*Daduoshu de* N 'most N'
		Dabufen de N 'most N'
	Some N:	*Mo xie* N 'certain N'
	Bare numeral Det: *two* N:	*Liangge* N 'two N'

(142) Decreasing NPs: *Shige yixia de* N 'fewer than ten N'
Modified numeral Det: *Shilaige* N 'about ten N'
San wu ge N 'three to five N'

According to Liu, the 'all of' relation dictates that only the type of NPs in (141) can be a *ba* NP.

Another important point of this analysis concerns the fact that a bare verb cannot occur in a *ba* sentence. According to Liu, even though 'read that book' and 'sell that car' should be considered a telic predicate (a definite object makes an activity verb telic), they do not denote a bounded situation because they cannot be modified by the duration phrase *zai X nei* 'in (amount of time)', with the interpretation 'complete/finish something in X' (1997: 72):

(143) a. *ni neng zai yige zhongtou-nei kan naben shu-ma?
you can at one-Cl hour-in read that-Cl book-Q
'Can you read that book in an hour?'
b. *wo xiwang zai yige xingqi-nei mai naliang che.
I hope at one-Cl week-in sell that-Cl car.
'I hope to sell that car in a week.'

Moreover, they are compatible with the durative marker *-zhe*. 'Read that book' thus contains internal stages that can be viewed as static and cannot denote a bounded event:

(144) wo zheng kan-zhe naben shu (ne).
I Prog read-Zhe that-Cl book Par.
'I am reading that book.'

Because such a telic predicate does not express a bounded situation, an aspect marker to express the notion of boundedness is necessary in a *ba* structure (to create a bounded event through the presentation of a situation from an approriate viewpoint). This captures the fact that the verb does not occur in the bare form:

(145) a. wo ba na-ben shu kan-*(le).
I Ba that-CL book read-Le
'I read that book.'
b. wo ba naliang che mai-*(le).
I Ba that-Cl car sell-Le
'I sold that car.'

Finally, Liu explains why the durative marker *-zhe*, such as the one in (146) below, can make a *ba* sentence:

(146) qing ni dai-zhe shoutao.
please you wear-Zhe gloves
'Please wear gloves.'

She suggests that this type of *ba*-sentences must be in the irrealis mode so that the sentence can express a bounded event: the inception of an action is included in the meaning of a sentence when it is in the irrealis mode. *-Zhe* provides the meaning of a resultative state: the resultative state holds. The inception and the resultative state combine to make a bounded event.

In brief, the requirement that a *ba* sentence must express a bounded event/situation is responsible for the constraints on possible types of NPs and VPs in the *ba* construction.

5.2.2 The issues

This analysis is very attractive, in that it captures the constraints on *ba* NPs and VPs in *ba* constructions through a simple requirement of 'boundedness'. The term is defined and does not suffer from the fuzziness of the 'affectedness' account.

Unfortunately, it is not clear that the argument given against an 'affectedness' account is convincing or whether such an aspectual account is adequate empirically. The main argument against an 'affectedness' account given by Liu is that a sentence like (135), repeated here, does not have an 'affectedness' interpretation:

(135) ta ba yige dahao jihui cuoguo-le.
he Ba one-Cl big-good opportunity wrong-pass-Le
'He let a great opportunity pass.'

However, given the loose notion of 'affectedness', it is very difficult to make a decisive claim that (135) does or does not have an 'affectedness' interpretation. Recall that a sentence such as *wo ba yaoshi wang le* 'I forgot the key' in (116a) in section 5.1.1.3, for instance, is an acceptable *ba* sentence that was subsumed under the notion of 'affectedness'. 'The key' in this sentence is no more or less 'affected' than 'a great opportunity' in (135). Indeed, Lü (1948: 128) assumes the following sentence, almost identical to (135), to be a disposal (affectedness) sentence as well:

(147) ba jihui cuo-guo-le.
Ba opportunity wrong-pass-Le
'(Subject) missed the opportunity.'

Nonetheless, if an aspectual approach can capture the constraints on *ba* constructions without resorting to the vague notion of 'affectedness', the analysis is much more desirable. We show below, however, that this attractive analysis falls short empirically and that the tests it relies on to determine boundedness are not adequate. We illustrate these problems in the following subsections.

5.2.2.1 Tests for predicates of bounded situations

Recall that in order to account for why an aspect marker *-le* is required in some cases, Liu claims that an activity verb plus a definite NP such as 'that book/car'

does not express a bounded situation in Chinese, even though the verb phrase is telic. The tests used were the (un)acceptability of a co-occurring time expression 'in an X-amount of time' and the compatibility with the durative marker *-zhe* (cf. (143–145)).

Consider the test using the time expression 'in an X-amount of time'. Such a test would lead us to expect that, if the object NP is replaced by some other types of NPs which allow the co-occurrence of 'in an X-amount of time', a *ba* sentence should be acceptable without *le*. However, this is not the case. For instance, (143) can be made acceptable by replacing the definite NP with a quantified or a number phrase:

(148) a. ni neng zai yige zhongtou-nei xiugai quanbu-de wenzhang-ma?
you can at one-Cl hour-in correct all-De article-Q
'Can you correct all the papers in an hour?'
b. wo xiwang zai yi-fengzhong-nei mai yiliang che.
I hope at one-minute-in sell one-Cl car.
'I hope to sell a car in a minute.'

Nevertheless, these expressions still cannot occur in a *ba* sentence with a bare verb. The aspect marker *-le* is still required:

(149) a. *wo ba quanbu-de wenzhang (dou) xiugai.
I Ba all-De article all correct
'I correct all the papers in an hour.'
b. wo ba quanbu-de wenzhang (dou) xiugai-le.
I Ba all-De article all correct-Le
'I correct all the papers in an hour.'

(150) a. *wo ba yiliang che mai.
I Ba one-Cl car sell
'I sold a car.'
b. wo ba yiliang che mai-le.
I Ba one-Cl car sell-Le
'I sold a car.'

One may argue that Liu probably is wrong in stating the requirement of *-le* for instances like (144) (see section 2.5 regarding the occurrence of *-le*) and such instances probably should simply express bounded situations after all, just like their English counterparts. However, this raises the question of what is a valid test to determine if a predicate expresses a bounded situation. Specifically, it is not clear why the contrast between (143) and (148) should exist, if the time phrase 'in an X-amount of time' is taken as a test for bounded situations.

Another test Liu uses to determine if a predicate expresses a bounded situation is compatibility with the durative marker *-zhe*. Specifically, the predicates in (138a–c, d–g, i) cannot occur with *-zhe*; therefore, they express a bounded situation.

Were this test to apply consistently, this approach would be quite precise and clearly defined. However, such a test is not always reliable: incompatibility with *-zhe* does not guarantee a *ba* sentence, and compatibility with *-zhe* does not necessarily brand a *ba* sentence for rejection, either. Liu (1997: 67) quotes Yeh's (1993) observation that *-zhe* marks a contingent state, not an absolute state. In other words, *-zhe* does not occur with individual-level predicates but only with stage-level predicates. It therefore does not occur with verbs like *zhidao* 'know' or *xing* 'be surnamed as'. Although *-zhe* does not occur with an individual-level predicate, such a predicate does not normally occur in a *ba* pattern:

(151) a. *ta xihuan-zhe wo.
he like-ZHE me
'He is liking me.'
b. *ta ba wo xihuan(-zhe).
he Ba me like-ZHE
'He likes/is liking me.'

Note that one cannot simply say that such verbs express an 'absolute state', not a 'contingent state', and this is why *-zhe* cannot occur with them and they are not acceptable in a *ba* sentence independently. To see why, recall the discussion in section 5.1 regarding 'imaginary' or 'emotional' affectedness. For instance, a stative verb like *hen* 'hate' does not occur with *-zhe* and, generally, does not occur in a *ba* sentence. However, strong modification makes a *ba* sentence acceptable:

(152) a. *ta hen-zhe wo.
he hate-ZHE me
'He is hating me.'
b. *ta ba wo hen(-zhe).
he Ba me hate-ZHE
'He hates/is hating me.'

cf.:

c. ta ba wo hen-de ya yang-yang-de.
he Ba me like-De tooth itchy-itchy-De
'He hated me so much that his teeth became itchy.'

Moreover, as noted in section 2.4.8, when a *de* complement (138b) is a descriptive complement, it cannot occur in a *ba* sentence, as illustrated in (66). Such predicates cannot occur with *-zhe* either:

(153) *ta jintian-de gongke xie-zhe-de hen kuai.
he today-De homework write-Zhe-De very fast
'He was writing today's homework fast.'

Finally, it is not quite clear that *-zhe* can make a good *ba* sentence because it is in an irrealis mode. The following examples show that such *ba* sentences can be a complement to *kan* 'see', which does not necessarily include the inception of an action:

(154) wo qu ta-jia shi, kan ta ba haizi bao-zhe, hai ba lanzi
I go he-home when see he Ba child hold-Zhe and Ba basket
na-zhe, haoxiang yao chu-qu-de yangzi.
take-Zhe like will out-go-De appearance
'When I went to his home, I saw him holding the child, holding the basket, as if he was going out.'

In brief, the two tests Liu uses to determine if a predicate expresses a bounded situation, namely incompatibility with *-zhe* and compatibility with the time expression 'in an X-amount of time', do not work adequately. This account, consequently, loses an important foundation: the ability to determine whether a predicate expresses a bounded situation so that the acceptability of a *ba* construction can be determined.

Regardless of the validity of the tests to determine boundedness of a predicate, empirical problems exist.

5.2.2.2 Bounded events/situations not acceptable as *ba* sentences

Liu's main claim is that a *ba* sentence always expresses a bounded event/situation. If a predicate expresses a bounded situation or is presented in the appropriate aspect to express a bounded event, it should be acceptable as a *ba* sentence. However, many instances exist where bounded events/situations are expressed, but they do not make acceptable *ba* sentences.

First, there are predicates that express bounded situations but fail to make an acceptable *ba* sentence. For instance, the most typical bounded predicates (accomplishment verb phrases) are [V + result] expressions (138a); yet they do not always make an acceptable *ba* sentence:

(155) a. ta zhexie wenzhang dou kan-de hen shengqi.
he these article all read-De very angry
'He got angry from reading all these articles.'
b. *ta ba zhexie wenzhang dou kan-de hen shengqi.
he Ba these article all read-De very angry
'He got angry from reading all these articles.'

(156) a. wo zhe-ping-jiu he-zui-le.
I this-Cl-wine drink-drunk-Le
'I have drunk the wine drunk.'
b. *wo ba zhe-ping-jiu he-zui-le.
I Ba this-Cl-wine drink-drunk-Le
'I have drunk the wine drunk.'

Indeed, it seems possible to find counter-examples for all the patterns in (138). We have already discussed cases which illustrate the unacceptability of [V-*de*] (138b) in a *ba* sentence (section 2.8). Let us demonstrate the same point with a few more examples. The pattern (138c), V+ retained object, for instance, is illustrated in (157a–b), which are unacceptable as a *ba* sentence:

(157) a. *tufei ba ta baifang-le fuqin.
bandit Ba him visit-Le father
'The bandit visited his father.'
b. *women ba ta tanlun-le xiaohai.
we Ba him discuss-Le child
'We discussed his child.'

Take (138f) as another instance. For Liu (1997: 56), when a verb occurs with a quantified phrase (number phrase), it expresses a bounded event. A quantified phrase can be a duration or a frequency phrase. That is, if a verb is followed by a duration or frequency phrase, the predicate expresses a bounded situation and is predicted to occur in the *ba* form. However, counter-examples, again, are not difficult to find:

(158) a. wo renshi ta san-nian-le.
I know him three-year-Le
'I have known him for three years.'
b. *wo ba ta renshi san-nian-le.
I Ba him know three-year-Le
'I have known him for three years.'

cf.:

(159) wo ba ta qipian/nuedai san-nian-le.
I Ba him cheat/maltreat three-year-Le
'I have cheated/maltreated him for three years.'

Finally, although *-le* can be used with a predicate which does not express a bounded situation in the appropriate (perfective) aspect in order to establish a bounded event, there are many instances which show that the addition of *-le* still fails to make an acceptable *ba* sentence:

(160) a. *ta ba na-difang likai-le.
he Ba that-place leave-Le
'He left that place.'
b. *ta ba qiu-sai canjia-le.
he Ba ball-game participate-Le
'He participated in the ball game.'

c. *ta ba na-ge canting baifang-le.
he Ba that-Cl restaurant visit-Le
'He visited that restaurant.'
d. *ta ba wode mingling fucong-le.
he Ba my order obey
'He obeyed my order.'
e. *ta yijing ba mei-jian-shi dou zhidao-le.
he already Ba every-Cl-matter all know-Le
'He has already known everything.'
f. *ta ba zhe-zhi-mao zhaogu-le.
he Ba this-Cl-cat care-Le
'He cared for this cat.'

In brief, many instances exist which are not acceptable in the *ba* form, although they conform to the patterns listed in (138) and do express a bounded situation/event.

5.2.2.3 Non-bounded events/situations acceptable as *ba* sentences

On the other hand, there are cases which do not express bounded events/situations, yet are acceptable as a *ba* sentence. This is especially true with the pattern in (137i) [Adv + V]. Recall that a preverbal adverbial may contribute to make a *ba* sentence acceptable. The examples given by Liu are (140a–b). The addition of an appropriate adverbial makes a predicate denote a bounded situation. However, closer examination of the relevant examples shows that such adverbials do not make the predicate a bounded one. Take Liu's example (140a), repeated below, for instance:

(140) a. ta zhengzai ba dongxi wang wuli ban.
he in-progress Ba things toward room-in move
'He is in the process of moving things into the room.'

Although Liu translated the predicate as 'moving things into the room', a more appropriate translation would be 'moving things toward the room'. *Wang* 'toward' simply expresses direction, rather than reaching a destination 'into'. Such a predicate is not compatible with the time expression 'in an X-amount of time' (the test used by Liu to determine if a predicate expresses a bounded situation):

(140') *ta zai yige-zhongtou-nei ba dongxi wang wuli ban.
he at one-hour-in Ba things toward room-in move
'He moved things toward the room in an hour.'

In other words, the adverbial phrase does not make the predicate express a bounded situation. Yet this predicate is acceptable in a *ba* sentence.

There are other adverbial phrases which behave in the same way. Take preverbal manner adverbs, for instance. Such adverbs can help to make a good *ba* sentence but do not make the predicate express a bounded situation. 'Carefully',

for example, can occur preverbally without making the predicate bounded, as illustrated by the acceptability of a progressive marking:

(161) ta zheng-zai zixi-de nian-zhe na-pian wenzhang.
he right-at carefully read-Asp that-Cl article
'He was carefully reading that article.'

It can also occur in a command, in contrast to a postverbal descriptive phrase (see (128a–b) in section 5.1):

(162) zixi-de nian!
carefully read
'Read carefully!'

The time expression 'in an X-amount of time' is incompatible:

(163) *ni zai yige zhongtou-nei zixi-de nian naben shu-ma?
you at one-Cl hour-in carefully read that-Cl book-Q
'Did you read that book carefully in an hour?'

The unacceptability of (163) indicates that *zixi-de nian* 'read carefully' is not an accomplishment predicate. The possibility of a progressive in (161) and the acceptability of a command in (162) indicate that *zixi-de kan* remains an activity verb phrase. However, such an unbounded predicate can occur in the *ba* form:

(164) ni bu ba zhe-wenzhang zixi-de nian, zen hui zhao-chu wenti?
you not Ba this article carefully read how will find-out question
'If you don't read the article carefully, how can you find problems?'

Recall also that the sentence given by Chao (1968: 348) quoted as (63f) also does not contain a bounded predicate:

(63) f. ta ba jiu bu-ting-de he.
he Ba wine not-stop-De drink
'He drank without stop.'

It is even possible for the durative marker *-zhe* to occur with the verb (this example is not in the irrealis mode either):

(165) ta ba jiu bu-ting-de he-zhe.
he Ba wine not-stop-De drink-Zhe
'He was drinking without stop.'

Furthermore, for Liu, the example in (154) discussed earlier, regarding the use of *-zhe* as a durative marker in the past time rather than in the irrealis mode, also presents a problem for the notion of bounded situations/events. This example is repeated below:

(154) wo qu ta-jia shi, kan ta ba haizi bao-zhe, hai ba lanzi
I go he-home when see he Ba child hold-Zhe and Ba basket
na-zhe, haoxiang yao chu-qu-de yangzi.
take-Zhe like will out-go-De appearance
'When I went to his home, I saw him holding the child, holding the basket, as if he was going out.'

Such examples illustrate the empirical problem that expressions which do not express bounded situations/events can still be acceptable as a *ba* construction.

In short, to claim that a bounded event or situation makes an acceptable *ba* sentence is both too weak and too strong empirically. There are cases of bounded events/situations unacceptable as a *ba* sentence and cases of non-bounded events/situations acceptable as a *ba* sentence.

5.2.2.4 The *ba* NP

Recall that Liu further derives the specificity (G-specificity) constraint on *ba* NPs by resorting to an 'all of' homomorphism relation between a bounded predicate and a *ba* NP. She claims that a *ba* NP must participate in all the event from the beginning to the end-point. That is, a *ba* NP must be able to quantified by 'all of'. An important test used is the occurrence of *dou* 'all': only an NP that can occur with *dou* can be a *ba* NP (cf. (141–142). For instance, the *ba* NP in the following sentence is interpreted as specific and is a participant of the event from the beginning to the end. It can co-occur with *dou*:

(166) wo hui ba san-ben shu dou fang-zai zhuo-shang.
I will Ba three-Cl book all put-at table-on
'I will put all three books on the table.'

This captures many interesting constraints, such as the difficulty of a non-G-specific NP serving as a *ba* NP and the difficulty of a *ba* NP occurring with verbs of creation (*manufacture*) or perception verbs (*see*, *hear*). Indeed, this accommodates the generalizations concerning the *ba* NP discussed in section 5.1.

The problem, however, is that the constraints on *ba* NPs are not as rigid as we would wish for. There are many examples which do not fall within the account. For instance, the example (63f) by Chao just quoted above does not seem to require the wine to be presented in an 'all of' relation. Moreover, it is not clear what it means that the *ba* NP must be able to be quantified by 'all of'. When a *ba* NP is a singular NP, is it also quantified by 'all of'? Note that the addition of the universal quantifier *dou* 'all' is not possible when the individual to be quantified over is singular. Independently, a singular NP just cannot be quantified by *dou*:

(167) a. wo ba ta xiang-de yao-si.
I Ba him miss-De want-die
'I missed him so much (that I want to die).'

b. *wo ba ta dou xiang-de yao-si.
I Ba him all miss-De want-die
c. ta (*dou) xiang-de yao-si.
he all miss-De want-die
'He missed so much (that he wants to die).'

(168) a. wo ba zhe-pi-ma qi-le yici.
I Ba this-Cl-horse ride-Le once
'I rode the horse three times.'
b. *wo ba zhe-pi-ma dou qi-le yici.
I Ba this-Cl-horse all ride-Le once
c. zhe-pi-ma (*dou) qi-le yici.
this-Cl-horse all ride-Le once
'This horse was ridden once.'

There are also instances which are clearly listed in Liu's category of non-G-specific NPs (142), not allowing the occurrence of *dou*, but do appear in a *ba* construction. Expressions such as *budao aifen-zhi-yi* 'less than 1 percent' and *san dao wu ge* 'three to five' in the following sentences are such examples:

(169) a. anzhao guiding ni zhi neng ba budao baifenzhiyi-de yingyu
according rule you only can Ba less-than 1 percent-De profit
na-lai gei yuangong feng hong.
take-come to employee distribute bonus
'According to the rules, you can only take less than 1 percent of the profit to distribute to the employees as bonus.'
b. *budao baifenzhiyi-de yingyu dou gei yuangong feng hong-le.
less-than 1 percent-De profit all to employee distribute bonus-Le
'Less than 1 percent of the profit was all distributed as bonus to the employees.'

(170) a. wo zuiduo zhi neng ba san-dao-wu-pian xiugai-hao-de wenzhang
I most only can Ba three-to-five-Cl corrected-De article
na-chulai gei ni kan.
take-out for you read
'I can only bring at most three to five corrected articles for you to read.'
b. *san-dap-wu-pian xiugai-hao-de wenzhang dou gei ni kan.
three-to-five-Cl corrected-De article all for you read
'Three to five corrected articles are for you to read.'

On the other hand, there are also instances allowing the occurrence of *dou* which are not acceptable as a *ba* form. The examples in (155a–b) we saw earlier, for instance, demonstrate the acceptability of *dou* with an NP which cannot be a *ba* NP:

(155) a. ta zhexie wenzhang dou kan-de hen shengqi.
he these article all read-De very angry
'He got angry from reading all these articles.'
b. *ta ba zhexie wenzhang dou kan-de hen shengqi.
he Ba these article all read-De very angry
'He got angry from reading all these articles.'

Summarizing, although Liu's account based on the notion of 'boundedness' is quite attractive, it falls short empirically. It does not account for why some *ba* sentences are acceptable with an unbounded predicate and some other *ba* sentences are unacceptable with a bounded predicate. The derivation of the properties of *ba* NPs from a homomorphism relation with a bounded predicate may capture the core cases (cf. the continuum in (131)); however, the facts are not as clean and clear as the analysis predicts.

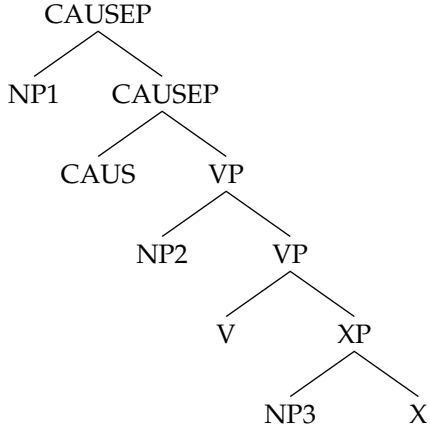
5.3 An event-structural account

Sybesma (1999), revised from his 1992 dissertation, is a very interesting work that incorporates the interpretation of and the semantic (pragmatic) constraints on the *ba* construction into the syntactic structure. This represents the best syntactic structural effort to account for the properties of the *ba* construction. Unfortunately, the complexity of the *ba* construction still evades an adequate structural description.

5.3.1 The analysis

Sybesma proposes that *ba*-sentences are always CAUS-sentences in some abstract sense. The VP (comprising the V after the *ba* NP and the embedded XP) does not have an external argument. The subject of the sentence (NP1 in (171) below) bears the role of the causer; in other words, it bears a semantic relation to the head CAUS (not to the VP):

(171)



In this structure, NP1 is the subject of the sentence. NP2 and NP3 are related by NP-movement, NP3 being the trace. The head of the CAUSP (for CAUS Phrase) is phonologically filled either by way of insertion of *ba* or by movement of the head of VP (Sybesma 1999: 170). The latter derives a non-*ba* sentence with an accomplishment VP. The former derives a *ba* sentence. Because *ba* is only a phonological filler, interpretations are the same for structures derived by verb-raising or *ba*-insertion. That is, a *ba* sentence does not carry a special meaning. It is just like a non-*ba* sentence with an accomplishment predicate. Both express a result or an end-point: the VPs embedded under CAUS must be unaccusatives, which are "characterized by the fact that they involve an end point" (1999: 178). The *ba* NP is the subject of the underlying result small clause (the end-point) and is the theme that undergoes a change of state or location.

This structure, according to Sybesma, can be paraphrased as "the subject causes the *ba*-NP to undergo the event denoted by the VP." Revised slightly to be distinct from the lexical causative cases, such as those with causative verbs *shi* 'make' or *rang* 'let', the structure is interpreted as follows: "the subject of the sentence (the causer) brings about a new state of affairs which results from the event denoted by V" (1999: 178). Importantly, the *ba* NP is not independently mentioned and is only semantically dependent on the embedded predicate. It is part of the resulting state. This is a departure from the 'affected/disposal' tradition: a *ba* sentence is no longer viewed as primarily aimed at disposing of the *ba* NP. The paraphrase applies to all causatives and accomplishments, or simply, all are accomplishments. That is, the structure in (171) is the structure for both *ba* and accomplishment sentences. When verb-raising takes place, it is an accomplishment sentence; when *ba* is inserted, it is a *ba* sentence.

This structure derives the constraints on the *ba* construction, according to Sybesma. The apparent specificity requirement on the *ba* NP (the *ba* NP must be specific) and the 'affectedness' of the *ba* NP follow from the fact that the structure expresses a bounded event. "An event is bounded if it contains an object which is affected and quantificationally closed" (1999: 173). The relevant factor for the 'affectedness' of the *ba* NP is the "change of state" (1999: 175).

Sybesma's contribution is to approach the *ba* construction with its specific interpretation and constraints from a structural perspective. The notion of 'structural dynamism' is central to the analysis: the structure determines the meaning, rather than the theta-theory or thematic structures of individual lexical items. Structures are generated (Generate a) and lexical items are interpreted accordingly. The *ba* construction is simply realization of a CAUS head in the CAUSP of an event structure. The event structure has a CAUS head subcategorized for a VP that is an unaccusative (without a subject, necessarily involving an end-point). When the unaccusative verb is not raised to the CAUS head, it is spelled out as *ba*. The *ba* construction is not unique at all. It is just a variation of a construction with an accomplishment verb phrase, and the verb-raising process is replaced by *ba* insertion. The constraints on possible types of NPs and VPs in a *ba* sentence follow from the event structure (bounded event; cf. Liu's analysis in the previous section).

5.3.2 The issues

Despite its attractiveness in eliminating the vague notion of disposal/affectedness and providing a more concrete structural analysis for the *ba* construction, this analysis still encounters difficulties in face of the complexities of *ba* constructions.

5.3.2.1 A *ba* sentence and the non-*ba* counterpart

The main claim of this approach is that a *ba* sentence and a non-*ba* accomplishment have identical structures, which only differ in whether verb-raising takes place or a dummy *ba* is inserted. It is not clear that *ba* sentences and non-*ba* accomplishments are indeed identical. Liu (1997: 60), while reviewing Sybesma (1992), observes that "this hypothesis runs into difficulty both ways: there are *ba* sentences with non-accomplishments and sentences of accomplishments which nonetheless cannot occur with *ba*, as seen in [172] [173] respectively:"

(172) women dou ba Laowang dangzuo laoshi.
we all Ba Laowang take-as teacher
'We all consider Laoang as our teacher.'

(173) *wo dasuan mingtian ba nei-ben-shu kan.
I plan tomorrow Ba that-Cl-book read
'I plan to read that book tomorrow.'

According to Liu, in (172), *dangzuo laoshi* 'take as teacher' is not an accomplishment but an achievement; on the other hand, in (173), *kan nei-ben-shu* 'read that book' is a typical case of accomplishment, and yet it does not license *ba*. These cases, therefore, suggest that the *ba* predicate cannot be equated with accomplishments.

Liu's reservations concerning equating a *ba* predicate with an accomplishment are legitimate. However, these two cases may not be really serious problems, because Sybesma can try to expand his system to include the achievements that can appear in a *ba* pattern (after all, (172) does involve a result clause *zuo laoshi* 'as a teacher') and because the unacceptability of (173) need not be specific to the *ba* pattern (cf. the discussion in section 3 on the *ka* counterpart in Taiwanese). Nonetheless, these considerations do point out the importance of not equating a *ba* predicate with an accomplishment. These two do not always have the same structures or the same requirements. Otherwise, all *ba* predicates would be accomplishments and all accomplishments would have a *ba* counterpart. The former hypothesis would exclude cases like (172). With respect to the latter, there are many accomplishments that do not allow a *ba* counterpart. Some of such examples are those discussed in the previous section (155–160). In these cases, we see that *kan-de hen shengqi* 'read and get angry' and *he-zui* 'drink-drunk' (accomplishment) can occur in a non-*ba* sentence but not in a *ba* sentence. This contrast is not expected if *ba* and accomplishment sentences have identical structures and interpretations, and *ba* is simply a dummy inserted to the CAUS head position when verb raising does not take place. In other words, if indeed (156a–b), for instance, are derived by the raising of the compound verb *he-zui* 'drink-drunk' and, when this compound verb is not raised, *ba* is inserted, (156b) should be as

acceptable or as unacceptable as (156a). Of course, Sybesma can distinguish non-*ba* accomplishments from *ba* cases by specifying that a *ba* NP is always "the subject of the small clause complement of the verb" (1999: 179). Taking this step, however, would require making a special statement for the *ba* construction, rather than making it a more general claim that the *ba* construction is just an accomplishment and all accomplishments, even all transitives, have the same structure and interpretation (Sybesma 1999: chapter 7).

5.3.2.2 The *ba* NP as subject of the result phrase

Considering the *ba* construction alone, then, one may argue that Sybesma's analysis can be adopted as long as we specify that a *ba* NP must be the subject of the result clause. However, this still faces challenges. There are cases of *ba* sentences that are quite acceptable but where *ba* is not interpreted as the subject of the result clause. In the earlier examples (103–104), quoted from Li and Thompson (1981: 469), for instance, the result clause 'he won't even eat his meals'/'wants to die' does not take the *ba* NP as its subject. Instead, it is interpreted as referring to the subject of the matrix clause:

(103) ta ba ni xiang-de fan dou bu-ken chi.
he Ba him miss-De food even not-willing eat
'He misses you so much that he won't even eat his meals.'

(104) Lisi ba xiao-mao ai-de yao si.
Lisi Ba small cat love-De want die
'Lisi loves the kitten so much that he wants to die.'

Such examples are not isolated ones. They are quite common. (152c), discussed earlier, is another example, where the subject of the result clause is the matrix subject:

(152) c. ta ba wo hen-de ya yang-yang-de.
he Ba me like-De tooth itchy-itchy-Par
'He hated me so much that his teeth became itchy.'

More such examples are illustrated below. In (174a), the result clause has a lexical subject that is the same as the matrix subject. The result expression *hui* in (174b) is interpreted as taking the matrix subject as its subject: *wo hui youyong* 'I am capable of swimming'. In (174c), the result expression *dong* should take the matrix subject as its subject, rather than the *ba* NP; the *ba* NP is the object of the result expression: *ta dong-le wenzhang-le* 'He understood the article'. The result expression *tou* 'thorough' in (174d) is more like a degree modifier of the verb, the hatred being thorough, rather than being a predicate of the *ba* NP. Similarly, the "result" expression *hen zixi* 'very careful' in (174e) modifies the verb, rather than functioning as the predicate of the *ba* NP. If *hen zixi* can have a subject at all, it is the action, not the *ba* NP, that functions as the subject: *ta de kaolu hen zixi* 'his thinking is careful'; cf. **zhe shi hen zixi* 'this thing is careful':

(174) a. wo ba ta ma-de wo-ziji dou shou-bu-liao!
he Ba him scold-De myself all put-not-up
'I scolded him so much that I could not stand it myself.'
b. deng wo xian ba youyong zhende xue-hui yihou zai
wait I first Ba swimming really study-capable after then
gen ni bi.
with you race
'Let me first really learn to swim and then I will race against you.'
c. xian rang ta ba wenzhang nian-dong yihou zai wen
first let him Ba article read-understand after then ask
ta wenti ba!
him question Par.
'Let him first understand the article and then ask him questions.'
d. ta yiding hui ba ni hen-tou-de.
he definitely will Ba you hate-thorough-particle
'He will definitely hate you thoroughly.'
e. wo ba zhe-shi kaolu-de hen zixi.
I Ba this matter think-De very carefully
'I thought about the matter carefully.'

To be noted, however, is that the *ba* NP is still the object of the verb in these cases. All these examples show that it is acceptable for a *ba* NP to be simply the object of the verb without being the subject of the result clause (cf. the generalization in (29) that a *ba* NP is a V-object or a V'-object).

5.3.2.3 Absence of a result clause

The above section shows that, although a *ba* sentence may contain a result/extent expression, such an expression need not interpret the *ba* NP as its subject. This casts doubt on the appropriateness of Sybesma's analysis, outlined in (171). A further problem is that a result expression need not even exist. As shown earlier, there are cases expressing an unbounded event – without an end-point – such as the examples discussed earlier in section 5.2.2.2 concerning unbounded events, as in (164–165) (repeated below) and (63f):

(164) ni bu ba zhe-wenzhang zixi-de nian, zen hui zhao-chu wenti?
you not Ba this article carefully read how will find-out question
'If you don't read the article carefully, how can you find problems?'

(165) ta ba jiu bu-ting-de he-zhe.
he Ba wine not-stop-De drink-Zhe
'He was drinking without stop.'

Other examples, such as (140a) discussed earlier, also denote an unbounded situation/event and do not have a result complement. (Recall that the translation should be 'toward the room' in contrast to Liu's 'into the room'.)

(139) a. ta zhengzai ba dongxi wang wuli ban.
he in-progress Ba things toward room-in move
'He is in the process of moving things [toward] the room.'

5.3.2.4 Placement of adverbials

The fact that a *ba* sentence and its non-*ba* counterpart only differ in whether V is raised to CAUS or whether *ba* spells out CAUS in the structure (171) also faces problems with the placement of adverbials. As mentioned, some adverbials can occur before or after the *ba* NP. However, such adverbials do not occur postverbally (see the discussions in sections 4.1–4.2). If *ba* is only a filler inserted when verb-raising does not take place, it is not clear why the relevant adverbial cannot occur postverbally, when it can occur after *ba*.

5.3.3 Summary

In brief, it is doubtful that a *ba* construction is the same as sentences with accomplishment predicates in sharing the structure in (171), with their only difference being in whether CAUS is filled by a raised V or by an inserted *ba*. There are many accomplishments that do not have a *ba* counterpart, and a *ba* sentence need not be an accomplishment. The two patterns are not always identical in acceptability and interpretation. A *ba* sentence, therefore, needs to be distinguished from simply accomplishments. Moreover, it is not true that a *ba* NP is always the subject of an unaccusative predicate (the result). There are cases where the result clause takes the matrix subject as its subject, and instances which denote unbounded events; i.e., a result clause is not a constituent within the *ba* sentence. Finally, the distribution of adverbials in a *ba* sentence and its non-*ba* counterpart fails to be accounted for.

5.4 Affectedness revisited

We discussed in section 4 the structural properties of the *ba* construction. Structurally, a *ba* NP must be a V-object (inner object) or a V'-object (outer object, assigned an 'affected' theta-role by a complex predicate that consists of V and its object). This over-generates greatly, however. Not all objects can be a *ba* NP. Constraints also exist on the types of Vs or VPs allowed in a *ba* sentence. The issue is how these constraints can be captured. We discussed in sections 5.1–5.3 approaches from different perspectives: (i) an interpretation/pragmatics approach that relies on a vague notion of 'affectedness'; (ii) an aspectual approach that requires a *ba* sentence to express a bounded situation or event; and (iii) an event structure approach that subsumes *ba* sentences under those with accomplishment predicates. All three approaches are completely satisfactory when only the canonical cases of the *ba* construction are considered, i.e., those containing a result expression with a *ba* NP as the subject: *wo ba cai chao-de hen lan* 'I stir-fried the vegetable quite mushy'. These are also the kind of *ba* sentences most frequently used and most readily accepted by speakers. The problem, however, is that the 'non-canonical' cases, those not having the pattern [V + result], are also

widely used. The acceptability of some such sentences is also more heavily subject to individual variations or uncertainty.

The aspectual approach and the event structure approach are both too weak and too strong. Both approaches have the problem of over-generation. They cannot predict why many accomplishments or many sentences of bounded situations/events cannot be acceptable *ba* sentences. At the same time, both approaches fail to generate those *ba* sentences that express unbounded situations/events and those cases where the *ba* NP is not the subject of the result expression. The 'affectedness' approach is harder to evaluate because the notion of 'affectedness' is so vague, especially when imaginary effects are included. This approach, however, does differ from the other two in this respect: while the latter express the constraints on the *ba* pattern in terms of event structures or aspectual structures (explicit linguistic representations), the former expresses the constraints without explicit linguistic representations. They are within the realm of world knowledge, speaker intention, hearer perception, etc. Recall Li and Thompson's explanation of why sentences like (103) and (104), repeated here, are acceptable:

(103) ta ba ni xiang-de fan dou bu-ken chi.
he Ba him miss-De food even not-willing eat
'He misses you so much that he won't even eat his meals.'

(104) Lisi ba xiao-mao ai-de yao si.
Lisi Ba small cat love-De want die
'Lisi loves the kitten so much that he wants to die.'

They stated that the use of the postverbal expression in (103) greatly exaggerates the degree of his missing you. "It is as if one cannot help thinking that you are affected in some way when he misses you to such an extent that he can't even eat" (Li and Thompson 1981: 469). The added expression *yao si* '(he) wants to die' in (104) hypothetically creates an image that such intense love must have some effect on the 'small cat'. Accordingly, the disposal idea is implied by the verb together with the added expression.

Although such explanations are vague and depend greatly on speakers' interpretations, they seem to be the nature of the constraints on the use of *ba* sentences. Again, take variations of (104), for instance. We find the following contrast:

(175) a. Lisi ba xiao-mao ai-de feng-le.
Lisi Ba small cat love-De crazy-Le
'Lisi loves the kitten so much that he is going crazy.'
b. Lisi ai xiao-mao ai-de feng-le.
Lisi love small cat love-De crazy-Le
'Lisi loves the kitten so much that he is going crazy.'

(176) a. *Lisi ba xiao-mao pa-de feng-le.
Lisi Ba small cat fear-De crazy-Le
'Lisi fears the kitten so much that he is getting crazy.'

b. Lisi pa xiao-mao pa-de feng-le.
Lisi fear small cat fear-De crazy-Le
'Lisi fears the kitten so much that he is getting crazy.'

(175a) is much better than (176a) as a *ba* sentence. The two sentences, however, are identical with respect to aspectual structures or event structures. Further note that their non-*ba* counterparts are equally acceptable.

Such instances abound: many sentences are identical with respect to representable linguistic structures and they are equally acceptable as a non-*ba* sentence; yet they, again, differ greatly in acceptability as a *ba* sentence:

(177) a. wo ba ta da-le yixia.
I Ba him hit-Le a bit
'I hit him a bit.'
b. wo da ta da-le yixia.
I hit him hit-Le a bit
'I hit him a bit.'

(178) a. ??wo ba ta zhaogu-le yixia.
I Ba him care-Le a bit
'I took care of him a bit.'
b. wo zhaogu ta zhaogu-le yixia.
I care him care-Le a bit
'I took care of him a bit.'

(179) a. women ba ta shuo-le yici.
we Ba him say-Le once
'We said to him (mildly scolded him) once.'
b. women shuo ta shuo-le yici.
we say him say-Le once
'We said to him (mildly scolded him) once.'

(180) a. *women ba ta taolun-le yici.
we Ba him discuss-Le once
'We discussed him once.'
b. women taolun ta taolun-le yici.
we discuss him discuss-Le once
'We discussed him once.'

The contrast between the pairs of sentences, (177) and (178), (179) and (180), is a puzzle under any structural account, either an aspectual structure or an event structure account. On the other hand, an advocate of the 'affectedness' approach may claim that it is easier to interpret the one being hit in (177) as the one affected than the one being taken care of (178), and that it is easier to interpret the one being (mildly) scolded (179) as the one affected than the one being discussed

(180). Although it is impossible to verify such an account, it, nonetheless, points to the inadequacy of a clearly defined structural account.

More examples illustrate the futility of a clearly defined structural account. The following two sets of sentences only differ in the noun used as a *ba* NP: *zhe-dun-fan* 'this-Cl-meal' vs. *zhe-pan-cai* 'this-Cl-dish':

(181) deng wo ba zhe-dun-fan chi-bao yihou zai chu-qu.
wait I Ba this-Cl-meal eat-full after then out-go
'Wait till I eat-full this meal (I get full from eating this meal), I will go out.'

(182) *deng wo ba zhe-pan-cai chi-bao yihou zai chu-qu.
wait I Ba this-Cl-dish eat-full after then out-go
'Wait till I eat-full this dish (I get full from eating this dish), I will go out.'

The acceptability of (181) is especially surprising. Normally, *ba fan chi bao* 'Ba meal eat-full', along with *ba jiu he zui* 'Ba wine drink-drunk', has been marked unacceptable as a *ba* predicate and has been used as a typical example to support the claim that a *ba* NP must be the subject of a result clause. Indeed, *ba zhe-dun-fan chi-bao* 'Ba this meal eat-full' is not acceptable in all contexts. There seems to be a contrast between the following two sentences:

(183) a. wo hai mei ba zhe-dun-fan chi-bao-ne!
I still not Ba this-Cl-meal eat-full-Par.
'I haven't finished the meal yet!'
b. *wo ba zhe-dun-fan chi-bao-le.
I Ba this-Cl-meal eat-full-Le
'I finished the meal.'

However, it is not clear how these sentences can be distinguished structurally. Equally challenging to a structural account is the fact that (181'), which has the identical pattern to (181) and contains the other famous predicate *ba jiu he zui* 'Ba wine drink-drunk', is still not acceptable as a *ba* sentence:[52]

(181') *deng wo ba zhe-ping-jiu he-zui yihou zai chu-qu.
wait I Ba this-Cl-wine drink-drunk after then out-go
'Wait till I eat-full this meal (I get full from eating this meal), I will go out.'

Structurally, these cases are identical; it is simply not clear how a structural account can accommodate such different acceptability of *ba* sentences.

We also saw earlier, in section 3, examples like the following, which only differ in the *ba* NP used, and were subsumed under the notion of 'affectedness':

(120) ta ba wo wen-le yi-da-dui hen-nan-de wenti.
he Ba me ask-Le one-big-pile very-difficult-De question
'He asked me many difficult questions.'

(121) ??ta ba wo wen-le fangxiang.
he Ba me ask-Le directions
'He asked me directions.'

The following two sentences only differ in the use of the adverb:

(184) ni ruguo bu ba shu zixi-de nian, zenme neng dong-ne?
you if not Ba book carefully read how can understand-Q
'If you don't study the book carefully, how can you understand?'

(185) ??ni ruguo bu ba shu anjing-de nian, zenme neng dong-ne?
you if not Ba book quietly read how can understand-Q
'If you don't study the book quietly, how can you understand?'

It may be easier to understand that, if one reads a book carefully, it is more likely that every word in the book will be read; but this is less likely to be the case when one reads a book quietly. There is more connection with ('effect' on) the book by careful reading than quiet reading. Of course, such 'explanations' cannot be verified. Nonetheless, they also defy the structural accounts proposed.

The following sentences only differ in the duration phrases used: one expresses a stronger degree of hatred (hatred for life) than the other (just temporary hatred):

(186) ta ba wo hen-le yi-beizi.
he Ba me hate-Le one-life
'He hated me for a whole life.'

(187) ??ta ba wo hen-le yi-xiazi.
he Ba me hate-Le one-while
'He hated me for a while.'

The following sentences show the same 'inner object/outer object' structures that differ in acceptability only because different verbs are used:

(188) ta ba wo sha-le fuqin.
he Ba me kill-Le father
'He killed my father.'

(189) *ta ba wo yao-le fuqin.
he Ba me invite-Le father
'He invited my father.'

Many such examples exist, like those discussed in section 5.1, which all point to the same generalization: the constraints on possible *ba* NPs and predicates cannot be easily characterized in clearly defined structural terms.

6 Conclusion

The *ba* construction has been one of the most challenging topics in the literature on Chinese grammar. We have shown that, to understand the difficulties of this construction, we need to separate its form from its usage. Formally, it is clearer what structure a *ba* sentence should take. It has the structure represented in (93) in section 4.2, which places all the constituents of a *ba* construction in appropriate positions and can correspond to a non-*ba* sentence without structural problems. A *ba* NP is always related to the V or V'. When it is a V'-object (outer object, object of a complex predicate), the theta-role it receives is an affected theta-role. The definition of an 'affected' theta-role, however, was not made clear in the literature and was not further elaborated in this chapter either. This is related to the difficult part of this construction: the appropriate usage of a *ba* sentence, which has been most controversial. The usage part has essentially been defined by the constraints on possible *ba* NPs and VPs: what NPs are allowed as a *ba* NP and what components are acceptable or necessary to make a VP in a *ba* sentence. The discussions in section 5.2 and 5.3 show that accounts for such constraints based on bounded events/situations or event structures fail empirically, even though they provide very attractive options.

If the comparison between the Taiwanese *ka* construction and the Mandarin *ba* construction is any indication, it shows that a *ba* sentence carries a special meaning, even though *ba*, unlike *ka*, no longer assigns an 'affected' theta-role independently. Although such a special meaning is clear in the canonical cases ('he stir-fried the vegetable mushy'), it becomes less and less clear as the speakers expand and deviate from the core cases.[53] This probably is what contributes to the uncertainty and variation in speakers' judgment with the more deviant cases, which is also the spirit of the continuum discussed by Li and Thompson, illustrated in (131) in section 5.1. We take this to be an indication that the construction is strongly influenced by discourse, pragmatic, and idiolectal factors and the notion of affectedness is a fuzzy and loose notion which may be interpreted differently by different speakers. Further evidence for the non-grammatical nature of the constraints on the usage of *ba* sentences was supported by minimal pairs like those discussed in section 5.4, where all pairs of sentences share the same grammatical structure, including the same aspectual structure or event structure, and all have equally acceptable non-*ba* counterparts. If we want to capture the fact that all *ba* sentences have a non-*ba* counterpart and that sentences with identical structure can have different acceptability as a *ba* form, we are forced to recognize the effect of world knowledge, speaker intention, etc. on the use of this construction. In other words, we should recognize the existence of different contributing factors characterizing this construction and separate form from usage, distinguish basic structures from the constraints on when the structure is used.

NOTES

1 'Mandarin Chinese', the official Chinese language, will simply be referred to as 'Chinese' in this chapter, unless when contrasted with Taiwanese, a Southern Min dialect of Chinese spoken in Taiwan.

2 The version of Mandarin spoken in Taiwan has been significantly influenced by Taiwanese phonologically and even syntactically to some extent.

3 The distinction between NPs and DPs does not concern us in this chapter and nominal expressions are consistently labeled as NPs (see Abney 1987 for the proposal of DP structures and Li 1998, 1999, for arguments for the existence of DPs in Chinese).

4 In the following discussions, we concentrate on the constituents necessary for a *ba* sentence and disregard the elements that are allowed in a *ba* sentence but are not obligatory, such as sentential adverbials or other modifiers.

5 The usage of 'counterpart' here does not necessarily mean that one is transformationally derived from the other. It only means that for a *ba* sentence, it is always possible to find a non-*ba* sentence which only differs from the one with *ba* in the occurrence of this key word and the corresponding difference in word order.

Also note that there are some isolated *ba* sentences from Mandarin varieties spoken in Northern China that lack non-*ba* counterpart, such as (i):

(i) ba-ge Feng yatou bing-le.
BA-Cl. Feng maid sick-Le
'(Something) got the maid Feng sick.'

(i) might be related to the earlier verbal usage of *ba*. We will disregard such cases as they are not productive patterns in modern Mandarin and they are impossible in Taiwanese (section 3).

6 The morpheme *-le* can be suffixed to a verb (verbal *-le*) or occur at the end of a clause (clause-final *-le*, allowing only a root clause-final particle to follow it). The verbal *-le* has generally been taken as an aspect marker, indicating completion. The clause-final *-le* has generally been analyzed as a 'change of state' marker. A verbal *-le* and a clause-final *-le* can co-occur in a clause. When a clause ends with V-*le*, it is possible that this *-le* is a combination of the verbal *-le* and the clause-final *-le*. There is an immense literature on whether the two *-le*s should be analyzed as one or two different morphemes (see, for instance, Wang 1965; Chao 1968; Rohsenow 1978; Li and Thompson 1981; Mei 1981; Huang and Davis 1989; Lu 1991; Li 1992; Soh 1998; Sybesma 1999; among many others). Because the exact analysis of the two *-le*s is not our concern, we will gloss all occurrences of *-le* simply as 'Le'.

7 Many verbs in Chinese can be used as both an unaccusative and a causative verb without any morphological changes. *Zui-dao* in the following example is unaccusative:

(i) ta zui-dao-le.
he drunk-fall-Le
'He got very drunk.'

8 Some patterns allow more than one constituent in postverbal position, such as double object structures, control structures, and purposive clauses. See Li (1990).

9 It has been suggested that the complexity of postverbal elements and the prohibition against more than one postverbal constituents contribute to the proliferation of *ba* sentences (see, for instance, Hu and Wen 1956: 129).

10 A 'serial verb construction' is not a unified structural notion. It refers to all constructions with the surface form of more than one verb phrase occurring consecutively. Structurally, the series of VPs can be analyzed as different types of coordination or subordination structures. See Li and Thompson (1981: chapter 2), for instance.

11 In modern Shanghai and Wuhan dialects, it is possible in some cases to use *ba* in the pattern [*ba* NP1 V NP2] with NP2 being a pronoun coreferential with NP1 (Bingfu Lu, Yuzhi Shi, p.c.).

12 *Ta* in Chinese is a human and non-human third person pronoun. For simplicity, we will just use one of the many possible translations for each case.

13 Several West African languages, such as Twi and Fong, have similar constructions that involve the grammaticalization of a morpheme like *ba*; see Zou (1995) for some discussions on cross-linguistic comparisons of such structures and the grammaticalization process.

14 There have also been proposals claiming that *ba* is a 'coverb' (see, among others, Wang 1947, 1954; Lü 1948; Li and Thompson 1974, 1981: chapters 9, 15). A coverb is a special category created in Chinese grammatical studies to represent the group of words which were verbs but have gradually lost their verbal properties. They are so labeled because they are no longer verbs and yet they have not become true prepositions, either: they don't fully behave like lexical verbs or typical prepositions.

15 There are speakers who find *ba* in the V-not-V question form acceptable (see, for instance, Wu 1982). Using the V-not-V form as a test for verbhood does not seem to be quite deterministic, even though it is frequently applied in the literature. For some speakers, certain prepositions, adjectives, and adverbs may also occur in the 'V-not-V' form, which should be more correctly labeled as a general A-not-A question form, not just V-not-V.

16 Sybesma (1999) is an extensive revision of Sybesma (1992) and includes many of his other works. We will mainly quote from Sybesma (1999). See Sybesma (1999: 220–221) for many other related references.

17 It is acceptable if *ba* also occurs in the second conjunct, i.e., *ba*, the *ba* NP and the following VP can form one constituent.

18 The preposing is not possible when it is a 'causative' sentence (i.e., the type of sentences whose subject bears a causer thematic role):

(i) a. zhe-ping jiu ba ta zui-dao-le.
this-bottle wine BA him drunk-fall-Le
'This bottle of wine made him very drunk.'
b. *ba ta, zhe-ping jiu zui-dao-le
BA him this-bottle wine drunk-fall-Le

19 Wang (1954) suggests the terms 'disposal' and 'causative', which are Sybesma's 'canonical' and 'causative' respectively.

20 It was observed by Zou (1995), for instance, that *ba* and the *ba* NP cannot form a constituent and be preposed. However, Yafei Li (p.c.) notes that it is not that difficult to prepose the *ba* phrase in some instances. We agree with his judgment, though this pattern occurs only in casual informal speech. It seems that preposing of the *ba* phrase is the best in the contexts where the interpretation of doing something to the *ba* NP

is clearest. A command sentence is a very good example. However, it does not have to be a command:

(i) ba na-dui wenzhang, wo zao jiu gai-hao-le.
BA that-pile article I early then correct-finish-Le
'I corrected that pile of articles long ago.'

21 It should be pointed out that the element following *ba* is not necessarily an NP. A clause is also possible:

(i) wo ba [ta bu-lai] dang-zuo shi hen yanzhong-de shi.
I BA him not-come take-as be very serious-De matter
'I take it as a very serious matter that he does not come.'

This is not common, however. A noun typically co-occurs:

(ii) ta bu-gan ba [ni shengbing]-de shi gaosu dajia.
he not-dare BA you sick-De matter tell everyone
'He dare not tell everyone the matter that you are sick.'

(iii) *ta bu-gan ba [ni shengbing] gaosu dajia.
he not-dare BA you sick tell everyone
'He dare not tell everyone that you are sick.'

22 See Lu and Ma (1985: 200–201) for the instrument and locative examples in (18b) and (18d).

23 When the location marker *zai* is used as in (18c), a localizer such as *shang* 'top' must be used. With *ba*, such a localizer is optional.

24 In light of recent developments in the structure of VPs (Larson's (1988b) VP-shell, for instance) and the almost non-existent status of an intermediate category X' in the Minimalist Program (Chomsky 1991, 1993, 1995c), it is not clear if the term V'-object is appropriate. It nonetheless suffices to express the sister relation between an outer object and a complex predicate consisting of a verb and its complement. We will continue using the term 'V'-object', alongside the term 'outer object', for convenience.

25 More radically, it is possible to suggest that every instance of the *ba* NP is a V'-object (Huang 1982a, 1987, 1988). When it looks like an inner object (V-object), it actually is an outer object identifying an empty category in the V-object position.

26 A pro generally is identified by the first c-commanding NP (Huang 1982a). This means that a pro in an object position generally cannot be identified with an NP outside the clause, due to the intervening subject of the clause. However, it can be topicalized to the peripheral position of the clause first, and then be identified by an NP outside the clause. This is the analysis proposed by Huang (1982a) for cases like (i):

(i) Zhangsan$_i$ [T_i [e_j renshi pro$_i$ de] ren$_j$ hen duo.
Zhangsan know De person very many
'Zhangsan, the people who knew (him) are numerous.'

The pro in the object position of the relative clauses moves to T first in order to be co-indexed with *Zhangsan*.

27 The morpheme *-de* must occur between V and the result expression if the two are not compounded. It was suggested that this morpheme was reduced from the verb *dao* 'arrive' (Chao 1968: 353). This morpheme is to be distinguished from the potential morpheme *-de*, or the manner *-de*, which cannot occur in the *ba* construction:

(i) *ta ba youyong xue-de-hui.
he BA swimming study-De-able
'He can learn swimming.'

(ii) *ta ba gongke xue-de-kuai.
he BA homework write-De-fast
'He wrote the homework fast.'

In some southern dialects of Chinese, such as Taiwanese, the three *de*s are pronounced differently. The resultative *-de* is pronounced like the morpheme for *dao* 'arrive', the potential *-de* is pronounced like the morpheme 'can, able', and the manner *de* is like *zhao* 'hold'.

28 Compounding is subject to syllable structure constraints. See Feng (1995) for a phonological account.

29 The directional expressions *lai* 'come' and *qu* 'go' do not necessarily indicate the action of coming and going. They can simply be the indicators of the direction of motion (to or away from the speaker): *qing ni ba ta na-lai* 'please bring it over'; *qing ni ba ta na-qu* 'please take it'.

30 When the direct object becomes a *ba* NP, the main verb must be able to be compounded with the verb of the purposive clause; otherwise, *qu* 'go' or *lai* 'come' must occur between the two verbs. Thus, (46b) is acceptable with or without *lai/qu* because *na* and *gei* can be compounded. In contrast, (47b) cannot delete *lai/qu*, as indicated by the unacceptability of (i), because *mai* and *rang* cannot be compounded:

(i) *wo ba shu mai rang ta yong.
I BA book buy let him use
'I bought the book for him to use.'

It seems that the following generalization exists in Chinese: when two bare Vs occur next to each other, they must be compounded. If the two cannot be compounded, the sentence becomes unacceptable.

31 Verb reduplication can take the form of V-V or V-*yi*-V 'V-one-V' for those verbs with one syllable. For verbs with two syllables AB, an activity verb is reduplicated as ABaB and a stative verb as AABB (such as *piao-liang* 'pretty'/*piao-piao-liang-liang*, *gan-jing* 'clean'/*gan-gan-jing-jing*). A stative verb generally does not occur in a *ba* sentence; the reduplicated stative verb AABB does not occur in a *ba* sentence either.

32 Verbs that have more than one syllable can only occur in the pattern V-V as in (i), not V-*yi*-V as in (ii):

(i) women dei xian ba zhe-wenti kaolü-kaolü/taolun-taolun.
we should first BA this-question consider-consider/discuss-discuss
'We should first consider/discuss this question a bit.'

(ii) women dei xian ba zhe-wenti kaolü-yi-kaolü/taolun-yi-taolun.
we should first BA this-question consider-one-consider/discuss-one-discuss
'We should first consider/discuss this question a bit.'

33 The non-occurrence of *-zhe* in a *ba* sentence is only true when the verb is bare and *-zhe* plays the role of the X in (1). If there is an additional X, *-zhe* need not play the role of the X and a *ba* sentence is available: We will discuss such examples later in the chapter.

34 The literature generally focuses on the verbal aspect marker *-le* and does not discuss the sentence-final *-le* with respect to the acceptability of a *ba* sentence. It seems that in most cases, a sentence-final *-le* does not make a *ba* sentence available.

A sentence-final *-le* is typically used in the following cases, which express that a new state of affair has just been realized:

(i) wo bu-xihuan ta-le.
I not-like him-Le
'I do not like him (now; it used to be the case that I liked him).'

(ii) ta hui shuo-hua-le.
he can speak-word-Le
'He can speak now (it used to be the case that he could not speak).'

(iii) ta bu-ting zhe-ge-le.
he not-listen this-song-Le
'He does not listen to this song any more (he used to).'

The *ba* counterpart of these sentences seems to be generally less acceptable than those with a verbal *-le*:

(iv) a. ni ba zhe-che xi-le (jici?) (verbal *-le*)
you BA this-car wash-Le how many times
'How many times did you wash the car?'
b. wo bu xi zhe-che-le. (sentence-final *-le*)
I not wash this-car-Le
'I don't wash this car any more.'
c. *wo zai ye bu-ba zhe-che xi-le. (sentence-final *-le*)
I again also not-BA this-car wash-Le
'I will no longer wash this car.'

(v) a. wo ba ta pian-le. (yici). (verbal *-le*)
I BA him cheat-Le one time
'I cheated him (once).'
b. wo zai ye bu-pian ta-le. (sentence-final *-le*)
I again also not-cheat him-Le
'I will no longer cheat him.'
c. ?wo zai ye bu-ba ta pian-le. (sentence-final *-le*)
I again also not-cheat him cheat-Le
'I will no longer cheat him.'

35 The other aspect marker, the experiential marker *-guo*, has not received much attention in the literature regarding its role in a *ba* sentence (cf. Lu and Ma 1985). It seems that it is less acceptable than the verbal *-le* in allowing a *ba* sentence, though it is still quite acceptable in some cases, such as (id). This may be due to the pragmatic factors to be discussed in section 3:

(i) a. ʔta ba na-pi-ma qi-guo-ma?
he BA that-Cl-horse ride-Guo-Q
'Did he ride that horse before?'
b. ʔta ba zhexie-haizi ma-guo.
he BA these-boys scold-Guo
'He has scolded these boys before.'
c. ʔta ba yaoshi wang-guo.
he BA key forget-Guo
'He has forgotten the key before.'
d. ni you-mei-you ba zhongyao-de shiqing wang-guo?
you have-not-have ba important-De thing forget-Guo
'Have you forgotten important matters (before)?'

36 Adjectives in the traditional literature have been grouped with verbs (stative verbs) especially when they occur as the predicate of a clause. We continue to use the term 'verb' to include predicative adjectives.

37 It could be that the result clause is an 'extent' clause in such cases: the extent of seriousness, the extent of smallness, etc. If an extent clause is different from a result clause, we might conclude that a *ba* sentence is acceptable only with a result clause. However, it is not easy to distinguish 'extent' from 'result'. Note that being serious and being small both can yield a result, as illustrated by the acceptability of a lexical causative in (71c) and (72c). Even in the Taiwanese dialect which uses different pronunciations for the various *de*s in different constructions, the same pronunciation is found with both the extent and result *de*. Also see Sybesma (1999), which assumes 'extent' and 'result' to be the same.

38 Sybesma (1999: 178), for instance, argues that both the *ba* construction and the lexical causative construction have the same CAUSE morpheme and only differ in categorial selection: a CAUSE in the *ba* construction selects a VP as its complement, and a CAUSE spelled out as a lexical verb (lexical causative) selects a CP/TP as its complement.

39 *Re* 'hot' in (69) is just like *leng* 'cold' and can occur in the pattern in (73). *Zou* 'walk' seems to be less acceptable in this pattern:

(i) *ta zou-zai tui-shang.
he walk-at leg-on

(ii) a. ni yinggai zou-zou ni-de tui.
you should walk-walk you-De leg
'You should walk your legs (let your legs walk).'
b. ni-de tui neng zou-ma?
you-De leg can walk-Q
'Can your legs walk?'

40 This sentence can be acceptable with the interpretation that the parents are the toys for the children to play with. Both *kaixin* 'happy' and *shangxin* 'sad' are used in this example to show that even an unfortunate event cannot be acceptable as a *ba* sentence here. See Lü (1980) and Wu (1987) for discussions on the *ba* construction expressing unfortunate events.

41 The sound symbol *N* in the Taiwanese examples represents nasalization of the preceding vowel.

42 In addition, *ka* in Taiwanese can be a beneficiary marker, which is not available for *ba*.

43 One may argue that the distribution of adverbs can be captured by an analysis that assumes adverbs must be licensed by a head that is lexically filled. When *ba* occurs, an adverb can be licensed by the main verb occurring in the lower V position or by *ba* in the higher v position. When V-to-v-raising takes place, the lower V is an empty category and cannot license an adverb within the lower VP. Such an approach would require cross-linguistic parameterization, because V-raising does not prevent an adverb from occurring in the lower position, as shown in the study of French by Pollock (1989). Moreover, if the analysis by Huang (1992b), Soh (1998), and Tang (1998) concerning V-raising is correct, an empty verb in Chinese can license a duration/frequency phrase.

44 This is the structure adopted in work in progress by James Huang, Yen-Hui Audrey Li, and Yafei Li.

45 This does not mean that Taiwanese does not have the movement option. A *ba* sentence can always be translated into a *ka* sentence but not vice versa. It is therefore possible to claim that Taiwanese *ka* can allow either a base-generated *ka* NP or a raised *ka* NP, and that Mandarin only allows a raised *ba* NP.

46 Such a prohibition can be phrased as follows: an NP within the thematic domain of a head cannot be raised to a position within the thematic domain of another head.

47 We will not discuss the approach based on information structures because it is hard to find convincing accounts of this type in the literature based on a clearly defined theory of information structures. Moreover, as shown in the text, the choice of the *ba* NP, the choice of verbs, and the type of X in (1a–b) affect the acceptability of a *ba* sentence. It is difficult to see how this can be captured by an account based on notions of topic-comment or presupposition-focus.

48 Chao (1968: 343) sometimes refers to the *ba* sentence as a "Pretransitive" construction. This construction is "a special form of the V-V series [which] has a first verb, the pretransitive, and an object, which ordinarily would be the object of the V-V series. For this reason, this object of the pretransitive is often regarded as a form of the inverted object." This definition of the *ba* construction is closest to the structural description given in (93) and the generalization in (29) (a *ba* NP must be a V or V'-object).

49 Chao (1968: 344) notes that even an indefinite-looking *ba* NP should still not be interpreted as indefinite: "Attention should, however, be drawn to a class of apparent cases of indefinite reference consisting of a pretransitive with *ig* or *g* before the object; here something quite definite is referred to. Thus: *ta ba ge pibao diu le* 'She lost a purse', *ta ba ge zhangfu si le, keshi bujiu you jia le ge zhangfu* 'She lost a husband but she soon re-married' . . . The advanced position of the object, brought about by the pretransitive, has a stronger effect than the presence of the word *g* or *ig* in deciding the definiteness of reference. As Leu Shwushiang (LWjuo. 129–130) [Lü 1948] has noted, there is no reason why forms like *g* or *ig* in Chinese should be limited to indefinite reference because *a* or its equivalent in other Indo-European languages is the indefinite article."

50 Syntactic constraints, however, also play a role in determining which NP can become a *ba* NP. The following sentence, for instance, shows that what is stolen can also be a *ba* NP:

(i) ta jingran ye ba wode pibao tou-le.
he unexpected also Ba my purse steal-Le
'Unexpectedly, he also stole my purse.'

When an indirect NP of the verb *tou* occurs as in (119), however, only the indirect NP can be the *ba* NP, not the direct NP:

(ii) *ta jingran ye ba pibao tou-le wo.
he unexpected also Ba purse steal-Le me

See Li (1990) for the extractability of direct and indirect objects in double object constructions.

51 See Zhang (2000) for a similar observation of the 'all of' interpretation of a *ba* NP.

52 It is possible to speculate that the contrast between (181) and (181') is due to different degrees of lexicalization: *chi-bao* 'eat-full' is more lexicalized and takes *fan* as its object, in contrast to *he-zui* 'drink-drunk', which only originates as a bi-clausal structure. Some analysis along the lines of the generalization in (29) can be explored. However, this still does not explain why *chi-bao* in a *ba* construction is quite limited, as illustrated by the contrast between (183a) and (183b).

53 This is in the spirit of a prototype approach to this construction. See, for instance, Bybee and Moder (1983) and Rosch (1978).

1 The paradigm

1.1 Introduction

Consider the following Spanish sentence:[1,2]

(1) Juana quiere ver**lo**.
Juana want-pres-3sg see+it
'Juana wants (to) see it.'

Here the matrix verb *querer* 'want' is followed by an infinitival complement containing a direct object expressed by the clitic *lo*. Spanish has an alternative for (1), which is presented in (2):

(2) Juana **lo** quiere. ver.
Juana it want-pres-3sg see
'Juana wants (to) see it.'

The sentences in (1) and (2) have the same interpretation, but in (2) the clitic appears attached to the matrix verb.[3] Though this is not a logical necessity, many

linguists assume that (1) and (2) are derivationally related, in the sense that both involve the same D-structure. We will follow this assumption here (but see section 3.2). In the case of the in situ variant (1) the clitic stays in the complement, but in the clitic climbing variant (2) the clitic moves or 'climbs' out of the latter and attaches to a higher host. Clitic climbing (Cl Cl) is known to occur in various languages, such as Spanish, Italian, and Portuguese, Dutch and German, Serbo-Croatian, and the West African Kru languages.[4] Cl Cl constructions are in some sense anomalous: their anomalous nature consists in the fact that the clitics appear in the matrix domain rather than in the complement domain in which they are generated, without there being an obvious trigger that causes them to move to the former. As such, theorizing about these constructions involves an attempt at a deeper and more subtle understanding of the means Universal Grammar has available for the expression of clausal complement relations.

In the discussion that follows we will restrict ourselves to Cl Cl in Romance, about which there exists a considerable amount of literature.[5] In section 1.2 we will present an overview of the main properties of the construction, which we summarize in subsection 1.2.6. This overview will be followed – in section 1.3 – by a sketch of the central issue involved in the research on the Cl Cl construction.

1.2 Properties of the Cl Cl construction

1.2.1 Cl Cl verbs

Cl Cl occurs with a restricted set of matrix verbs and as such constitutes an exception, rather than a rule. The verbs that allow it are mainly modal, aspectual, and movement verbs.[6] Thus, for instance, the modal verb *querer* in the examples in (1) and (2) contrasts with the verb *odiar* in (3), which cannot act as a host for Cl Cl:

(3) a. Juana odia ver**lo**.
Juana hate-pres-3sg see+it
'Juan hates (to) see it.'
b. *Juana **lo** odia ver.

Both *querer* and *odiar* are subject control verbs, selecting a CP (S') complement. Cl Cl also occurs with raising verbs, which select IP (S) complements. An example is *soler* in (4):

(4) a. Juana suele leer**lo** por la mañana.
Juana tend-pres-3sg read+it for the morning
'Juana tends to read it in the morning.'
b. Juana **lo** suele leer por la mañana.

A raising verb that doesn't allow for Cl Cl is the verb *parecer*, as in (5):[7]

(5) a. Juana parece saber**lo**.
Juana seem-pres-3sg know+it
'Juana seems (to) know it.'
b. *Juana **lo** parece saber.

1.2.2 Optionality and clustering

As one can deduce from the examples in (1), (2), and (4), Cl Cl is optional. In other words, there is always a choice between an in situ variant and a Cl Cl variant.[8] However, if the complement contains more than one clitic, as in (6) – where the clitics are *me* and *lo* – and the climbing option is chosen, it must involve all the clitics, as in (7a). Thus, neither (7b), with *me* in situ and *lo* attached to *quiere*, nor (7c), with these options reversed, is grammatical:[9]

(6) Juana no quiere entregár**melo**.
Juana not want-pres-3sg give+me+it
'Juana doesn't want to give it to me.'

(7) a. Juana no **me lo** quiere entregar.
b. *Juana no **me** quiere entregar**lo**.
c. *Juana no **lo** quiere entregar**me**.

1.2.3 Structural relation between host and clitic

A further property of Cl Cl is that it is strongly restricted by structural conditions: the only configuration in which it can apply is the one in (8), where V1 is the semantic head of CP/IP and the clitic is contained in the same minimal CP/IP as V1:

(8) $[_{V'}$ V2 $[_{CP/IP}$ V1 Cl]]

Given this configuration, V1 will normally act as the host in the in situ variant and V2 as the host after Cl Cl. The situation is somewhat more complex when auxiliaries are involved, but here we abstract from those.

As can be deduced from (8), Cl Cl is impossible when the clitic originates in a clause that is not governed by the verbal host, i.e., that is not a complement of this host.[10] As such, Cl Cl respects the general condition which prohibits extraction from subjects and adjuncts, i.e., the Condition on Extraction Domains of Huang (1982a), which shows that it is a normal syntactic process. The pairs of examples in (9) and (10) are meant as an illustration of this point. In both cases the main verb is a Cl Cl verb. The in situ version in (9a) involves a clitic contained in a subject (*leerlo bien*). (9b) is its Cl Cl variant, which is ungrammatical. In (10a) *a comprarlo* is an adjunct phrase; the Cl Cl counterpart (10b) is again ungrammatical:

(9) a. [Leer**lo** bien] debe requerir mucha paciencia.
read+it well must-pres-3sg require much patience
'To read it well must require much patience.'
b. *[Leer bien] **lo** debe requerir mucha paciencia.

(10) a. A qué tienda vas [a comprar**lo**]?
To which shop go-pres-2sg to buy+it
'To which shop do you go in order to buy it?'
b. *A qué tienda **lo** vas [a comprar]?

Another consequence of the fact that the clitic must originate in the clause that is governed by the host is that Cl Cl is locally bounded. Thus, for instance, in (11) where the clause the clitic *lo* belongs to is governed by (non-Cl Cl) *odiar*, but not by the Cl Cl verb *suele*, climbing of *lo* onto this latter verb is excluded (11b):

(11) a. Juana suele [odiar [hacer**lo**]].
Juana tend-pres-3sg hate do+it
'Juana tends (to) hate (to) do it.'
b. *Juana **lo** suele odiar hacer.

There is one apparent exception to this local boundedness: intervening verbs that themselves belong to the Cl Cl class do not prevent climbing onto a higher host. We exemplify this in (12):

(12) a. Juana quisiera poder hacer**lo**.
Juana want-cond-past-3sg can do+it
'Juana would want to be able to do it.'
b. Juana **lo** quisiera poder hacer.

Here the intervening head *poder*, a Cl Cl verb, does not prevent climbing of the clitic *lo* onto the higher verb *quisiera*. We may, however, assume that Cl Cl proceeds recursively, that is, that the in situ variant of (12b) is in fact (13):

(13) Juana quisiera poder**lo** hacer

If, on the other hand, we assume that the clitic climbs directly onto the host *quisiera* we must allow for the semantic head of IP/CP in (8) not only being the in situ host of the clitic, but any potential host.

1.2.4 Two further restrictions

There are two cases in which, even if the structural conditions discussed in the preceding subsection are met and the matrix verb is a Cl Cl verb, Cl Cl is impossible. The first involves finite complements. Such complements, of which *que lo ves* in (14a) is an example, never allow Cl Cl (cf. 14b):

(14) a. Juana quiere que **lo** ves.
Juana want-pres-3sg that it see-pres-2sg
'Juana wants you to see it.'
b. *Juana **lo** quiere que ves.

The second case is that in which the complement contains a negation particle. As illustrated in (15), Cl Cl is blocked by the presence of such a particle:[11]

(15) a. Juana quiere no ver**lo**.
'Juana wants not (to) see it.'
b. *Juana **lo** quiere no ver.

1.2.5 Movement of V and complement

In the examples we have presented so far the the complement is right-adjacent to the matrix verb. At least for Italian, this adjacency is not a necessary requirement, however. In the first place, this language permits VP adverbs to occur between the two constituents, and in the second place, it permits the complement to appear in a left-peripheral position. Below we consider in turn each of these two cases, which, as we will show, occur as the result of movement.

The example in (16), from Cinque (2004), illustrates that the intervention of a VP adverb like *subito* between the matrix verb and the complement is compatible both with clitics in situ and with climbed clitics:

(16) a. Verrò subito a scriver**lo**.
Come-fut-1sg at-once to write+it
'I'll come at once to write it.'
b. **Lo** verrò subito a scrivere.

VP adverbs occur to the left of the VP and serve as a standard diagnostic for verb movement to I, which is a general process in the Romance Cl Cl languages. Example (16b) shows that V-to-I movement is not blocked by Cl Cl in Italian.[12]

In the examples in (17) the complement occurs in the left periphery of the matrix clause:

(17) a. [Legger**lo** a tutti] non potevo.
read+it to all not can-past-1sg
'Read it to everybody, I couldn't.'
b. [Leggere a tutti] non **lo** potevo.

The complement in these cases functions as a topic. Left-peripheral topics are assumed to be preposed by Topicalization. From the grammaticality of the example in (17b) we can conclude that Topicalization of the complement is compatible with Cl Cl.[13]

The above shows that both (Italian) matrix verbs and their complement can be moved from their base position in Cl Cl constructions. However, there is at least

one case in which movement of the complement is incompatible with Cl Cl. This is the one involving clausal pied-piping (chapter 50) in Italian, discussed in Rizzi (1978).[14] Consider (18a), which represents the relevant aspects of the D-structure of a noun phrase containing a non-restrictive relative clause (the part between the outer square brackets). As the verb *posso*, or rather *potere*, 'to be able', is a Cl Cl verb, one expects the clitic *ti* to be able to climb out of its complement (indicated by the inner square brackets), with as a result the structure in (18b):

(18) a. Il Direttore [, per il momento, proprio non posso
the Director for the moment really not can-pres-1sg
[presentar**ti** al quale]].
introduce+you to whom
b. Il Direttore [, per il momento, proprio non **ti** posso [presentare al quale]].

To derive the complete S-structure, the relative constituent *al quale* must be preposed by *wh*-movement to the beginning of the relative clause. Italian can pied-pipe an infinitival clause in this kind of relative; that is, *al quale* when being preposed may take with it the whole complement of *posso* that contains it. For the in situ variant (18a) this gives the result in (19):

(19) Il Direttore, presentarti al quale, per il momento, proprio
the director, introduce+you to whom, for the
non posso.
moment, really not can-pres-1sg
'The Director, to introduce you to whom, for the time being I really cannot.'

The relevant case, however, is the Cl Cl variant (20): preposing the complement here apparently destroys the relation between the Cl Cl host and its complement and leads to an ungrammatical result:

(20) *Il Direttore, presentare al quale, per il momento, propio non **ti** posso.

This concludes our discussion of the main properties of Cl Cl, which we summarize in subsection 1.2.6.

1.2.6 Summary

As shown in subsections 1.2.1–1.2.5, Cl Cl has the following characteristics:

- Cl Cl only applies with a small class of matrix verbs.
- Cl Cl is optional, but doesn't allow for split clitics.
- Cl Cl may only apply out of non-finite complements governed by a Cl Cl verb.
- Cl Cl is incompatible with the presence of a negative particle in the complement.

- Cl Cl hosts may be separated from their complement by V-to-I movement (at least in Italian).
- Cl Cl constructions show restrictions with respect to fronting of the complement.

It is obvious that the theory of grammar must aim at explaining these distinct properties. It is also obvious that the core of this explanation will involve the special nature of Cl Cl verbs. In the following section we will present a first approximation to the line of research required to unveil their exceptional character.

1.3 Clitic Placement and the Clause Mate Condition

The fundamental question about Cl Cl verbs is what exactly allows these verbs to 'attract' clitics from their complement clause, thereby relaxing the usual locality conditions on clitic attachment. This immediately raises an underlying question, which is: what exactly are these conditions? Though there are some specific proposals on this point, we will not discuss these as yet. What we will do here is indicate the direction in which these must be sought.

There is some discussion in the literature as to whether the morphological units formed by clitics and verbs are base-generated or produced derivationally. As virtually all the work on Cl Cl assumes the latter option, we will do the same here.[15] Under this assumption, clitics are generated in XP positions in the base and are attached to the verb by means of a rule of Clitic Placement (Cl Pl).[16] Thus, Cl Pl transforms, for instance, the D-structure in (21a) into the structure in (21b):

(21) a. Juana ve [DP **lo**].
Juana see-pres-3sg it
'Juana sees it.'
b. Juana **lo**+ve **t**.

Even in simplex clauses, however, the host of a clitic is not always the verb responsible for its semantic role. We refer to clauses containing, in addition to the main verb, one or more auxiliaries.[17] Auxiliaries in Romance are perfective, passive, or aspectual. Perfective and passive auxiliaries select VPs headed by past participles and aspectual auxiliaries VPs headed by gerunds.[18] In the case of past participles, clitics always attach to the auxiliary. We exemplify this for a perfective auxiliary (22), a passive auxiliary (23), and a combination of both (24):

(22) a. *Juana ha visto**lo**.
Juana have-pres-3sg seen+it
'Juana has seen it.'
b. Juana **lo** ha visto.

(23) a. *El libro fue entregádo**me**.
The book be-pres-3sg given+me
'The book was given to me.'
b. El libro **me** fue entregado.

(24) a. *El libro ha sido entregádo**me**.
The book have-pres-3g been given+me
'The book has been given to me.'
b. El libro **me** ha sido entregado.

In the case of gerunds, on the other hand, there are two options: the clitic appears either on the gerund or on the auxiliary:

(25) a. Juana estaba cantándo**lo**.
Juana was-past-3sg singing+it
'Juana was singing it.'
b. Juana **lo** estaba cantando.

Thus, in clauses with auxiliaries, Cl Pl obviously must or can target the (highest) auxiliary, instead of the main verb. Notice that this instance of Cl Pl is remarkably similar to Cl Cl: we can say that the clitic 'climbs' out of the VP in order to attach to the auxiliary. In the same vein, but from a different perspective, it is generally assumed that Cl Cl is in fact a case of Cl Pl, comparable to Cl Pl with auxiliaries in the sense that in both cases the host is higher than the verb the clitic 'belongs' to.[19]

Apart from the obligatoriness of 'climbing' in cases such as those in (22–24), there is one other crucial difference between regular Cl Cl verbs and auxiliaries: while the former are exceptions among the class of verbs selecting clausal complements, the latter *all* require or allow climbing. We may deduce from this that Auxiliary Cl Cl (Cl Pl targeting auxiliaries) is unconstrained. Apparently, thus, the constraint that prevents Cl Cl with normal raising or control verbs must be sought in the difference between their type of complement and the complement type of auxiliaries. Consider in this respect the relevant aspects of an auxiliary and a raising construction in, respectively, (26a) and (26b):

(26) a. V $[_{VP}$ V]
b. V $[_{IP}$ subject $[_{I'}$ I $[_{VP}$ V]]]

The raising construction (26b) differs from the auxiliary construction (26a) in that, in addition to the VP, it contains an IP boundary, a subject, an I' projection, and an I-head. It follows that the constraint under consideration must be due to the presence of at least one of these elements. Until section 6 we will not be concerned with a specific proposal. We only establish that for some reason clitics normally cannot cross sentential boundaries (as opposed to VP boundaries). This is sometimes referred to as the Clause Mate Condition, which here is meant to

indicate that a clitic and its trace must occur in the same clause.[20] We will also employ this term, but it must be kept in mind that it is merely descriptive. As the structure of control complements (27) forms an extension of that involving raising complements, we can simply assume that the constraining factor that holds for the latter is present here as well. Of course the term 'Clause Mate Condition' is also applicable in this case:

(27) V $[_{CP}$ $[_{IP}$ $[_{VP}$ V cl]]]

One possible hypothesis about Cl Cl verbs might be that they are 'stronger' than other verbs, in the sense that they have some kind of 'magnetic force' by which they so strongly attract clitics that the constraining factor can simply be ignored. However, there exists clear evidence that matters are more complex. This evidence, which consists of a set of data involving exceptional (applications of) rules in the same circumstances as those holding for Cl Cl, will be discussed in the next section.

2 Corollaries of Cl Cl

2.1 Introduction

In this section we will show that certain locality restrictions on both DP-movement (section 2.2) and *wh*-movement (section 2.3) are relaxed in the case of infinitival complements of Cl Cl verbs. In section 2.4 we will, furthermore, consider an exceptional property of perfect participles of a subset of Cl Cl verbs in Italian, which consists in the fact that the choice of their auxiliary can be determined by the complement verb. For each of the phenomena we discuss we will consider how far it correlates with the Cl Cl variant and/or the in situ variant. In section 2.5 we present a summary.

2.2 Long DP-Movement

Normally DP-Movement involves movement from a position governed by a verb to the subject position of the clause of which the verb is the semantic head. In control Cl Cl constructions, however, a DP governed by the complement verb may move to the subject position of the matrix clause, across the embedded PRO subject. This can only happen, of course, if the matrix subject position – which normally contains the controller – is empty. The situation in which this is so is in passives. Most Cl Cl verbs reject passivization, for independent reasons. However, Italian (control) *cominciare* 'begin' and *continuare* 'continue' form an exception and the phenomenon of Long DP-Movement can be demonstrated for their passive forms, as in the example in (28a), from Burzio (1986). We add the relevant details of the analysis in (28b):

(28) a. Il palazzo fu cominciato a costruire sotto Carlo V.
the palace be-past-3sg begun to build under Charles V
'They began to build the palace under Charles V.'
b. Il palazzo$_i$ fu cominciato [$_{CP}$ a PRO costruire t$_i$].

Apart from the standard passive, Romance has a construction known as 'Reflexive Passive' or 'Middle' which crucially involves the presence of the reflexive clitic *se* (Spanish, Portuguese), *si* (Italian), instead of passive morphology.[21] A simplex case is that in (29):

(29) Las casas$_i$ se vendieron t$_i$.
the houses SE sell-pres-3pl
'The houses were sold.'
'They sold the houses.'

The Reflexive Passive occurs freely with control Cl Cl verbs and, as shown in the following example from Aissen and Perlmutter (1976), involves Long DP-Movement:[22]

(30) a. Estas secciones de la ciudad se quieren eliminar sin
these sections of the city SE want-pres-3pl eliminate without
que nadie lo sepa.
that no one it knows
'They want to eliminate these sections of the city without anyone knowing it.'
b. Estas secciones de la ciudad$_i$ se quieren [$_{CP}$ PRO eliminar t$_i$] . . .

There is a strong correlation between Long DP-Movement and Cl Cl: sentences with Long DP-Movement and complement clitics are grammatical when the latter climb, but not when they remain in situ: see (31), an example from Zubizarreta (1980). In this sense Long DP-Movement can be classified as a true corollary of Cl Cl:[23]

(31) a. *Estas casas se quieren vender**le** a alto precio.
these houses SE want-pres-3pl sell+him for high price
'They want to sell him these houses for a high price.'
b. Estas casas se **le** quieren vender a alto precio.

2.3 Long Null Operator Movement

Long *wh*-movement is quite general in Romance, and hence it cannot tell us anything specific about Cl Cl constructions. There is, however, one process that is standardly assumed to be of the *wh*-type, which in the languages under consideration appears to obey the Clause Mate Condition. We refer to the process

known as Null Operator Movement.[24] It applies in the infinitival complement of certain adjectives (*tough/hard*, *easy*, *impossible*) and, in Italian, in infinitival relatives. As we will see, the Clause Mate Condition on Null Operator Movement can be violated in the case of Cl Cl verbs.

(32a) contains an example of simplex complement governed by the adjective *difícil* 'hard/tough'. (32b) gives the relevant aspects of its S-structure, which has been obtained by moving an empty element (the null operator) from the object position to Comp, where it is in the correct position to be interpreted as coreferent with the matrix subject:

(32) a. Estas radios serán difíciles de componer.
these radios be-fut-3pl hard-pl to fix
'These radios will be hard to fix.'
b. Estas radios$_i$ serán difíciles [OP$_i$ de PRO componer t$_i$]

In (33) we present an analogous Italian pair involving an infinitival relative, where the coreference is with the antecedent:

(33) a. È una persona da ammirare.
be-pres-1sg a person to admire
'He is someone to admire.'
b. È una persona$_i$ [OP$_i$ da PRO ammirare t$_i$].

In the ungrammatical examples in (34) the clauses containing the base position of the empty operator are governed not by the adjective or antecedent, but by, respectively, the verbs *insistir* and *rimpiangere*. Obviously, in such cases the operator cannot reach the higher Comp position in which it must be linked to the adjective (34a) or antecedent (34b). These examples show that Null Operator Movement is subject to the Clause Mate Condition:

(34) a. *Tales cosas son difíciles de insistir en hacer.
such things be-pres-3sg hard-pl to insist on do
'Such things are hard to insist on doing.'
b. *È una persona da rimpiangere di aver ammirato Italian
be-pres-3sg a person to regret to have admired
'He is a person to regret to have admired.'

Consider now the sentences in (35), which structurally have the same properties as those in (34), but differ from them by the fact that the verb governing the complement with the empty object is a Cl Cl verb (*dejar*, *continuare*). Their grammaticality shows that movement of the *wh*-phrase to the front of the clause governed by the adjective or antecedent – i.e., Long Null Operator Movement – is available here. The Clause Mate Condition can apparently be violated in this case:

(35) a. Estas galletas son casi imposibles de dejar de comer.
These cookies be-pres-3pl almost impossible-pl to stop to eat
'These cookies are almost impossible to stop eating.'
b. È un argomento da continuare a studiare. Italian
be-pres-3sg an argument to continue to study
'It is an argument to continue to study.'

The pair of examples in (36) indicates that Long Null Operator Movement and Cl Cl must go together:[25]

(36) a. *Cerco una cartolina da potere spedir**gli**. Italian
look for-pres-1sg a postcard to can send+him
b. Cerco una cartolina da poter**gli** spedire
look for-pres-1sg a postcard to can+him send
'I'm looking for a postcard I can send him.'

2.4 Avere → Essere *Shift*

Unlike Spanish and Portuguese, Italian has two perfective auxiliaries. The first, *avere* 'have', occurs with unergative and transitive participles and the second, *essere* 'be', with unaccusative participles. A specific property of Italian Cl Cl constructions is that when the Cl Cl verb is a participle that normally requires *avere*, it can appear with *essere* if the complement verb is an *essere* verb.[26] Consider the examples in (37). In (37a) the participle of the Cl Cl verb *volere* 'want' combines with its normal auxiliary *avere.* As the complement verb *tornare* 'return' is an unaccusative verb, however, the auxiliary may also take the form *è* (from *essere*), as in (37b):

(37) a. Mario ha voluto tornare a casa.
Mario have-pres-3sg wanted return to house
'Mario has wanted to come back home.'
b. Mario è voluto tornare a casa.

Notice that the shift of auxiliary only involves *avere*-type participles. Cl Cl participles that occur with *essere* continue to require this auxiliary when the complement verb is an *avere* verb, as is *fare* in the following example:[27]

(38) a. Sono stato per fare una sciocchezza.
be-pres-1sg been for to do a foolish thing
'I've been on the point of doing something foolish.'
b. *Ho stato per fare una sciocchezza.
have-pres-1sg been for do a foolish thing

As illustrated by the example in (37) above, the *Avere* → *Essere* Shift is optional. Rather than being a true corollary of Cl Cl it appears to be a condition for it.[28]

That is, Cl Cl requires the shift (in the relevant context) (39a, b, c), but the latter may also apply with clitics in situ (39d):

(39) a. Mario avrebbe proprio voluto andar**ci**.
Mario have-cond-3sg really wanted go there
'Mario would have really wanted to go there.'
b. *Mario **ci** avrebbe proprio voluto andare.
c. Mario **ci** sarebbe proprio voluto andare.
Mario there be-cond-3sg really wanted go
d. Mario sarebbe proprio voluto andar**ci**.

2.5 Summary

The properties of Cl Cl verbs discussed in this section are the following:[29]

- Cl Cl verbs permit Long DP-Movement over a PRO subject.
- Cl Cl verbs allow for Long Null Operator Movement out of their complements.
- Cl Cl participles can undergo *Avere* → *Essere* Shift (in Italian).

In (40) we summarize how the processes under consideration correlate with Cl Cl:

(40)

	Cl Cl	Cl in situ
Long DP-Movement	Yes	No
Long Null Operator Movement	Yes	No
Avere → *Essere* Shift	Yes	Yes
No *Avere* → *Essere* Shift	No	Yes

As we stated earlier, the fact that these phenomena typically occur with Cl Cl verbs indicates that Cl Cl cannot be studied separately from them. We could say that Cl Cl is simply the most salient epiphenomenon demonstrating the special character of the verbs that allow for it.[30] In the next sections we will consider distinct hypotheses that ultimately strive at unveiling this special character.

3 Cl Cl verbs as auxiliaries

3.1 Introduction

The proposal about Cl Cl verbs that circumvents the Clause Mate Condition in the most radical way is the Dual Subcategorization Hypothesis. According to this hypothesis, the verbs are listed in the lexicon as optionally selecting either a CP/IP complement or a VP complement headed by an infinitival.[31] This entails that, contrary to what we have been assuming so far, they would appear in two different D-structures, (41a/b) or (41c):

(41) Dual Subcategorization Hypothesis:
a. V [$_{IP}$] or: c. V [$_{VP}$]
b. V [$_{CP}$]

The IP/CP option implies a structure identical to that of standard raising/control verbs, for which the Clause Mate Condition prevents the application of Cl Cl, so that this option is only compatible with the in situ variant. Likewise, Long DP and Long Null Operator Movement do not occur under this option, nor does *Avere* → *Essere* Shift.

In the case of the VP option, the relevant aspects of the D-structure of, e.g., *Juana lo quiere ver* will be as in (42):

(42) [$_{CP}$ [$_{IP}$ Juana I quiere [$_{VP}$ ver lo]]]

3.2 *Apparent advantages of the Dual Subcategorization Hypothesis*

Within the VP option, Cl Cl verbs actually have the same status as auxiliaries, so that the Clause Mate Condition is irrelevant and clitics can freely climb. What we have been calling Long Movement reduces to normal movement, targeting the only subject or Comp position that is available. The 'complement' verb is the main verb of the clause, so that it doesn't come as a surprise that when in Italian this verb is of the *essere* class it determines the choice of the auxiliary (but notice that we expect the same thing to happen for *avere* verbs, contrary to fact).

Under the VP option, Cl Cl is assumed to be obligatory, just like Cl Cl with perfective and passive auxiliaries. This means that the issue of clitic splitting does not arise.

Implicit in this approach is that infinitivals – like participials and gerunds – do not necessarily require a clausal projection, contrary to what happens with finite verbs. With the latter the VP option is unavailable and Cl Cl will be subject to the Clause Mate Condition.

The fact that Cl Cl is incompatible with the presence of a negative particle in the complement follows from the sentential status of this particle: it occurs in a clausal position (i.e., higher than VP) and such a position is absent by definition in VP complements.

In section 1.2.5 we saw that (Italian) Cl Cl verbs could be separated from their complement by V-to-I movement: as this is the normal situation for auxiliaries, this is what we expect.[32] The Italian example in (43), which is analogous to example (20), with which we illustrated that Cl Cl constructions show restrictions with respect to fronting of the complement, is intended to show that such restrictions also hold for standard VP complements. This entails that the hypothesis under consideration needs no independent explanation for the ungrammaticality of the Cl Cl case:

(43) *Il Direttore, presentato mi figlio al quale, non ho mai.
the director, introduced my son to whom, not have-pres-1sg never

We see, thus, that the Dual Subcategorization Hypothesis, which is attractive in its simplicity, accounts for most of the facts involving the Cl Cl construction. There are, however, a considerable number of facts that seem to indicate that it is on the wrong track. We discuss those in a separate subsection.

3.3 Problems for the Dual Subcategorization Hypothesis

3.3.1 Cl Cl verbs and auxiliaries

Under the VP option of the Dual Subcategorization Hypothesis, Cl Cl verbs are auxiliaries. As we have already mentioned above, this accounts well for the Italian *Avere* → *Essere* Shift, but not for the fact that *essere* Cl Cl participles continue to take this auxiliary when the complement verb is of the *avere* type (as in (38) above). Moreover, the fact that the *Avere* → *Essere* Shift doesn't necessarily imply Cl Cl remains to be explained.

Another unexpected property of Cl Cl verbs as auxiliaries is that in Italian the latter sometimes can be passivized (and then occur with Long DP-Movement, cf. (28)). Passivization, of course, is a property of main verbs and not of auxiliaries.

A third difference between Cl Cl verbs and auxiliaries, mentioned in Goodall (1987b), also concerns Italian. In this language auxiliaries undergo a preposing rule known as Aux-to-C, as in (44a, b), but this doesn't hold true for Cl Cl verbs (44c):

(44) a. Essendo state le mele mangiate . . .
being been the apples eaten
'The apples having been eaten . . .'
b. Essendosi le mele mangiate . . .
being+SI the apples eaten
'The apples having been eaten . . .'
c. *Essendosi potute le mele mangiate . . .
being+SI can.part the apples eaten
'The apples having been able to be eaten . . .'

3.3.2 The structure of Cl Cl complements

Another serious problem for the Dual Subcategorization Hypothesis involves the fact that there are clear indications that Cl Cl complements have more structure than VPs. In the first place, as observed in Rooryck (1994a), the complement verb appears to the left of VP adverbs, which under standard assumptions indicates that it undergoes V-to-I movement, so that I must be present. We reproduce the Italian example Rooryck uses to illustrate this:

(45) Piero ti verrà a (*spesso) parlare (spesso) di parapsicologia.
Piero you come-fut-3sg to (often) speak (often) of parapsychology
'Piero will come to speak to you often about parapsychology.'

Further indication for more structure is presented by the so-called infinitival particles.[33] A number of Cl Cl verbs appear together with particles. Some Spanish

examples are *empezar a* 'start to', *tener que* 'must' (lit.: 'have that'), *acabar de* 'just finish to' (lit.: 'finish of'), and *estar por* 'be about to' (lit.: 'be for'). The particles are typically linked to the presence of an infinitival complement: they are absent with other uses of the same verbs, as illustrated for *empezar a* in (46):

(46) a. Juana empieza a cantarlo.
Juana start-pres-3sg to sing+it
'Juana starts to sing it.'
b. Empezamos la comida con una ensalada.
start-pres-1pl the meal with a salad
'We start the meal with a salad.'

The position in which the particles occur in negative complements indicates that their position is above VP. This is so because they precede the negative particle, which itself occurs higher than VP; cf. (47):

(47) A los dos años los niños empiezan a no querer obedecer a
at the two years the children start-pres-3pl to not want obey to
los padres.
their parents
'At the age of two children start to refuse to obey their parents.'

Now, if the Cl Cl versions of Cl Cl verbs requiring infinitival particles involve VP complements, one expects the particles to be absent in these versions. As can be deduced from the examples in (48) this is not the case, however:[34]

(48) a. Juana **lo** empieza a cantar **t**.
Juana it start-pres-3sg to sing
'Juana starts to sing it.'
b. Juana **lo** tendrá que hacer **t**.
Juana it have-fut-3sg that do
'Juana has to do it.'

A final indication that Cl Cl complements have more structure than VPs comes from sentences containing Italian interrogative *sapere* 'know'. As discussed in Rizzi (1978), this verb marginally admits Cl Cl when its complement contains a fronted *wh*-word, which under standard assumptions must be in spec, CP:[35]

(49) Su questo punto, non **ti** saprei che dire **t**.
On this point, not you know-cond-1sg what tell
'On this point, I wouldn't know what to tell you.'

3.3.3 Control Cl Cl verbs

If Cl Cl verbs are treated as auxiliaries they must necessarily be assumed not to have a subject of their own. However, a subjectless analysis for control verbs

allowing Cl Cl is problematic in light of the fact that, under standard assumptions, these verbs assign a theta-role to the DP in their subject position and exercise selectional restrictions on it, unlike raising verbs. These properties explain, for instance, the grammaticality contrast in (50), where *este hombre* 'this man' can bear the theta-role assigned by *querer* 'want', but *este tipo de película* 'this kind of movie' is incompatible with this role:

(50) a. Este hombre **me** quiere dar escalofríos **t**.
This man me want-pres-3sg give shivers
'This man wants to make me shiver.'
b. Este tipo de película **me** quiere dar escalofríos **t**.
this kind of movie me want-pres-3sg give shivers
'This kind of movie tends to make me shiver.'

The assumption that Cl Cl control verbs assign a theta-role to their subject also explains why, unlike their raising counterparts, these verbs cannot occur with expletive subjects (which are non-overt in the languages under consideration). The Italian examples in (51), from Burzio (1986: 362), are intended to illustrate the raising (51a) vs. control (51b) contrast in Cl Cl constructions:[36]

(51) a. pro **ci** dovrebbe essere **t** molta gente a la festa.
there CI have-cond-3sg be many people at the party
'There would have to be many people at the party.'
b. *pro **ci** vorrebbe essere **t** molta gente a la festa.
there CI want-cond-3sg be many people at the party
'There would want to be many people at the party.'

Facts like those in (50) and (51) indicate in particular that control verbs in Cl Cl constructions cannot be assumed to have lost the property of necessarily co-occurring with a subject of their own.[37]

This is also corroborated by the fact that there is no essential semantic distinction between Cl Cl variants and in situ variants for these verbs.

3.4 Summary

Below we summarize the problems for the VP option of the Dual Subcategorization Hypothesis:

- Some (Italian) Cl Cl participles always determine the form of the perfective auxiliary (*essere*).
- (Italian) Cl Cl verbs do not undergo Aux-to-C.
- Some (Italian) Cl Cl verbs may undergo passive formation.
- Cl Cl complements manifest V-to-I.
- Cl Cl complements may contain infinitival particles, which occur higher than VP.

- Cl Cl complements may marginally contain a fronted *wh*-word.
- Some Cl Cl verbs assign a theta-role to their subject.

4 Restructuring

4.1 Introduction

Cl Cl verbs are sometimes called 'restructuring verbs'. The term 'restructuring' comes from an extremely influential article by Luigi Rizzi on Cl Cl in Italian (Rizzi 1978). The generalization it covers is that the verb of an infinitival complement can lose its independent status during the derivation, with the result that the phrases it semantically heads (VP, IP, CP) become inoperative (that is they can be considered to be absent). Restructuring would be (optionally) triggered by Cl Cl verbs, but not by other infinitival selecting verbs. The process, which we represent schematically in (52), entails a fusion of the complement clause and the matrix clause into one clausal structure:[38]

(52) **Restructuring (optional):**

$[_{VP}\ V\ [_{IP}\ [_{VP}\ V]]]$ → $[_{VP}\ V{+}V]$

$[_{VP}\ V\ [_{CP}\ [_{IP}\ [_{VP}\ V]]]]$ → $[_{VP}\ V{+}V]$

4.2 The verbal complex

As stated above, Restructuring is brought about because the complement verb loses its independent status. How does this happen? The answer is that the matrix verb and the complement verb come to form one 'verbal complex', which as such then functions as the head of the whole clause. Before discussing the status of this complex in the languages we are considering, it is worth noticing that other language groups present more clear-cut evidence for the presence of such a complex in constructions comparable to the Romance Cl Cl ones. Examples are the Dutch and German Verb-Raising constructions (see chapter 75), which arguably involve adjunction of the complement verb to the matrix verb and Verb Incorporation constructions, such as those ocurring in, for instance, the Inuit languages, in which the complement verb is incorporated into the matrix verb. Verb Raising and Verb Incorporation are triggered by roughly the same class of verbs as our Cl Cl verbs, and involve analogous violations of the Clause Mate Condition.

Now, one possible hypothesis about the verbal complex in Romance Cl Cl constructions is that it has essentially the same features as Verb Raising and/or Verb Incorporation complexes. The latter two differ from each other in that verbs triggering Verb Raising are morphologically independent, whereas Incorporation Verbs are affixes, whose morphological requirements are satisfied by the incorporated verb. The morphological independence of Verb Raising verbs manifests itself by the fact that they move out of the verbal complex when further verb

movement is required in the matrix domain. Romance Cl Cl verbs are clearly not affixes and, as we discussed in section 1.2.5, (at least in Italian) they can be separated from the complement verb by adverbials when they undergo V-to-I movement. This means that if the Romance verbal complex is to be equated with the verbal complexes of either Dutch/German or Inuit, it patterns with the former. (53) presents an example of the relevant aspects of a Dutch sentence, before (53a) and after Verb Raising (53b):[39]

(53) a. . . . dat Juana [PRO het lied zingen] wil
. . . that Juana the song sing want-pres-3sg
'. . . that Juana wants to sing the song'
b. . . . dat Juana [PRO het lied] wil+zingen

(54) contains the analogous pair for Spanish, under the same analysis:

(54) a. . . . que Juana quiere [PRO cantar la canción]
. . . that Juana want-pres-3sg sing the song
'. . . that Juana wants (to) sing the song'
b. . . . que Juana quiere+cantar [PRO la canción]

Observe that in the SOV language Dutch the order between the embedded and the matrix verb is inverted, a fact that provides clear evidence for the existence of the creation of the verbal complex.[40] This type of evidence is unavailable in the Romance Cl Cl languages. One might assume that this follows from the SVO nature of these languages and the fact that for some reason the complement verb always surfaces as the right-hand member of the complex (as we have assumed for (54b)). But notice that we know that at least in Italian the matrix verb can undergo V-to-I movement alone, thereby disrupting the putative complex. It might well be the case that this lonesome V-to-I movement is the general picture in Romance Cl Cl languages (recall that in these languages verbs always move to I). If this is so, the (putative) complex will never surface as such and might well have been created by attachment to the left.

Thus, the existence of a complex of the Dutch/German kind is difficult, if not impossible, to provide independent evidence for in Romance. Let us assume, nevertheless, that it is created at some stage. We have to consider, then, what is the right configuration for this to happen. We follow here the current standard assumptions about the formation of head complexes, which is that such complexes are created by adjunction of the lower head to the higher head, as an instance of head movement. A well-known property of head movement is that the target head must govern the maximal projection of the source head, which entails that intervening heads may not be skipped. For IP complements this means that the complement verb first has to move to I – to which it adjoins under standard assumptions – and then adjoins, together with I, to the matrix verb. CP complements require an additional step: V+I has to pass through C. In (55) we

exemplify with the derivation for *Juana quiere cantar la canción* ('Juana wants to sing the song'). For the sake of concreteness we go on assuming that the adjunction to the matrix verb is to the right, but nothing hinges on this:

(55) a. Juana quiere [$_{CP}$ C [$_{IP}$ PRO I [$_{VP}$ cantar la canción]]] →
b. Juana quiere+[cantar+I] [$_{CP}$ t [$_{IP}$ PRO t [$_{VP}$ t la canción]]]

The assumption that Cl Cl necessarily involves the creation of a verbal complex by means of head-movement accounts well for a number of properties of the Cl Cl construction:

(i) In the first place, the complement must be governed by the matrix verb, because otherwise adjunction of the complement verb to the latter is excluded.
(ii) Furthermore, any intervening head that blocks V→I(→C)→V movement will prevent formation of the complex and hence Cl Cl. This holds true, for instance, for the lexical C of finite sentences and also for the negative particle, at least under the assumption that in the relevant languages this particle is a head occurring above I (cf. Zanuttini 1991).[41] Thus the non-applicability of Cl Cl out of finite complements and complements with a negative particle follows automatically.
(iii) Likewise, the impossibility of having an intervening lexical head – as distinct from a Cl Cl verb – insures the local character of Cl Cl. When such a head is a Cl Cl verb complex, verb formation may be assumed to proceed stepwise.
(iv) Another property of Cl Cl complements, discussed in section 1.2.5, was that they show restrictions with respect to fronting of the complement. Such restrictions also seem to follow. Moving the CP/IP prior to complex verb formation will destroy the required government relation between the matrix verb and the complement. After creation of the complex, the embedded verb and the complement are different constituents, so that one doesn't expect them to move together. Notice that cases in which the complement does seem to move (section 1.2.5) might be instances of Remnant VP Movement, applying after Restructuring, movement of the matrix V to I and Cl Cl.

Before going on to the next subsection, in which we will discuss the effects of Restructuring for Cl Cl and its corollaries, we must pay attention to two points that may be problematic for Romance complex verb formation. The first concerns the presence of infinitival particles (cf. (48) above). These particles, which occur between the two verbs, have to be assumed to form part of the verbal complex. The details of this remain to be worked out. The second point concerns the (marginal) possibility of Cl Cl out of complements with *wh*-phrases preceding the complement verb (cf. (49)): this seems to be unaccountable under the hypothesis that Cl Cl always involves the complex under consideration.

In what follows we'll go on assuming that the verbal complex is formed by concrete adjunction, ignoring the problems discussed above. It should be mentioned, however, that these problems have not gone unnoticed, and various alternatives to verbal complex formation in Romance have been proposed in order to deal with them. According to Rizzi (1978), in fact, the verbal complex is formed as a consequence of reanalysis of linearly adjacent lexical elements in the terminal string. More specifically, given the string *V (C) Subj V*, where C is empty/absent and Subj is PRO or trace, the latter are ignored and the two verbs come to form one complex, by rebracketing: $[_{VComplex}$ *V (C) Subj V]*. Rizzi explicitly allows infinitival particles and *wh*-elements to form part of the complex, and also adverbials (the fact that the order V–Adv–V was produced by V-movement to I was not known at the time). More recent proposals involve, for instance, *reindexing* (Zubizarreta 1980) or *covert incorporation* (Baker 1988a). Roberts (1997b) develops the interesting hypothesis that the effect of adjunction is invisible because the adjoined verb is spelled out in the position of its trace.

4.3 Restructuring and (the corollaries of) Cl Cl

Let us now consider how the Restructuring Hypothesis accounts for Cl Cl and its corollaries.

As mentioned earlier, the effect of complex verb formation is that the complement and matrix clause restructure to one simplex clause. The semantic head of this clause is the verbal complex. The matrix subject now acts as the structural subject of this complex, and the same holds true, mutatis mutandis, of the objects and adjuncts of the (original) complement verb. This, obviously, raises questions about the semantic relations in the restructured clause as well as about the status of the original complement subject. We will return to those in section 3.3.2. The structures in (56) illustrate the effect of Restructuring for a Raising (56a) and Control (56b) verb with a transitive complement. In the restructured versions we put the complement subject between brackets, in line with Rizzi's assumption that it is irrelevant for the other structural relations in the clause:

(56) a. $[_{CP}\ [_{IP}$ DP $[_{VP}$V $[_{IP}$ t $[_{VP}$ V DP]]]]] → $[_{CP}\ [_{IP}$ DP $[_{VP}$V+V (t) DP]]]
b. $[_{CP}\ [_{IP}$ DP $[_{VP}$V $[_{CP}\ [_{IP}$ PRO$[_{VP}$ V DP]]]]]] → $[_{CP}\ [_{IP}$ DP $[_{VP}$V+V (PRO) DP]]]

Let us suppose (as did Rizzi at the time) that the factors that constrain Cl Pl, DP-Movement, and Null Operator Movement, and account for the lack of Cl Cl, Long DP-Movement, and Long Null Operator Movement with standard verbs, are constraints on the application of rules. If this is so, the assumption that the rules under consideration – when targeting a position in the (original) matrix clause – apply after Restructuring leads to the required results: as the rules apply freely within simplex clauses and as the effect of Restructuring is precisely that of producing a simplex clause, the constraints must have been neutralized at that point.

An alternative view, which produces the same result, is that the relevant constraints are conditions on S-structures. In this view, the moment of application of Restructuring is irrelevant. Cl Pl, DP-Movement, and Null Operator Movement can apply in such a way that they target the matrix clause, without Restructuring having yet taken place. The result, of course, will only be grammatical at S-structure if Restructuring does subsequently occur.

Under Restructuring the Italian *Avere* → *Essere* Shift can be equated to Auxiliary Choice in simplex clauses, along the lines presented in Burzio (1986). According to Burzio, the choice of *avere* vs. *essere* is not directly dependent on the type of the main verb, but on the structural relations within the clause. In particular, *essere* is required in the 'ergative' S-structure configuration in (57), where the subject binds its trace in direct object position, and *avere* otherwise:

(57) $[DP_i$ Aux $[_{VP}$ Part $t_i]]$

Consider now the derivation of (37b), repeated here as (58a), which constitutes the prototypical example of *Avere* → *Essere* Shift. From its D-structure in (58b) we derive the structure in (58c), by moving the complement direct object (PRO) to the subject position of the complement. As the structure is one of subject control, the index of the chain PRO–trace is the same as that of the matrix subject. Restructuring now produces the simplex (58d), in which the relation between the subject DP *Mario* and the trace is structurally identical to the relation between the subject and its trace in (57). Given this, the required auxiliary is *essere*:[42]

(58) a. Mario è voluto tornare a casa.
Mario be-pres-3sg wanted come back to house
'Mario has wanted to come back home.'

b. [Mario Aux $[_{VP}$ voluto $[_{CP}$ $[_{IP}$ ec $[_{VP}$ tornare PRO a casa]]]]]

c. $[Mario_i$ Aux $[_{VP}$ voluto $[_{CP}$ $[_{IP}$ PRO_i $[_{VP}$ tornare t_i a casa]]]]]

d. $[Mario_i$ Aux $[_{VP}$ voluto+tornare (PRO_i) t_i a casa]]

Two questions that remain to be considered here are:

- Can the Restructuring Hypothesis account for the fact that Cl Cl doesn't permit clitic splitting (cf. section 1.2.2)?
- Can this hypothesis account for the (lack of) correlation between Cl Cl and its 'corollaries', as summarized in section 2.5?

As we will see below, these questions, which are closely related, have as yet not been answered in a satisfactory way.

One possible view on Cl Pl is that it necessarily applies after Restructuring (or that it targets the highest possible position allowed by S-structure constraints). In cases with more than one clitic in the complement, this would automatically involve climbing of all clitics, so that clitic splitting would not occur. It would

also explain why there is a correlation between Long DP-Movement and Long Operator Movement (which are dependent on Restructuring) and Cl Cl.

Paradoxically, however, the fact that a 'Restructuring phenomenon' such as the *Avere* → *Essere* Shift co-occurs with clitics in situ suggests that restructuring does not automatically imply Cl Cl, that is, that Cl Pl in Restructuring constructions has the choice of targeting either the complement verb or the matrix verb. If this is so, there must be independent explanations for the correlations mentioned in the preceding paragraph. We are forced to conclude that further research is required on this point.

4.4 Restructuring and the T-model of grammar

The Restructuring Hypothesis accounts for many of the characteristics of Cl Cl constructions. The problems it meets with respect to infinitival particles are presumably not unsolvable, and the same holds true for the (lack of) correlation with other Restructuring phenomena and the prohibition against split clitics. The construction with fronted *wh*-phrases occurring between the verbs involved seems to remain a problem, but its marginality may indicate that it does not pertain to the core case of Cl Cl and that perhaps there is another explanation for it (in which case, of course, it also would no longer constitute a counter-example to the Dual Subcategorization Hypothesis). There remains, however, a serious conceptual problem, which we'll now proceed to discuss.

The problem under consideration arose as a consequence of a shift in ideas about the organization of grammar that occurred after Rizzi wrote his article. The current model of that time was the so-called Extended Standard Theory, in which, crucially, D-structure formed the input to semantic interpretation. Within this model, Restructuring affects the syntactic structure, but doesn't have any semantic consequences. Later developments led to the 'T-model' of grammar, in which semantics was considered to be dependent on S-structure. It is easy to see that Restructuring, as proposed by Rizzi, is problematic within this model.

Consider once more the Restucturing derivations in (56), repeated here as (59):

(59) a. $[_{CP}\ [_{IP}$ DP $[_{VP}$V $[_{IP}$ t $[_{VP}$ V DP]]]]] → $[_{CP}\ [_{IP}$ DP $[_{VP}$V+V (t) DP]]]
b. $[_{CP}\ [_{IP}$ DP $[_{VP}$V $[_{CP}\ [_{IP}$ PRO$[_{VP}$ V DP]]]]]] → $[_{CP}\ [_{IP}$ DP $[_{VP}$V+V (PRO) DP]]]

In the T-model the derived structures at the right-hand side form the input to the semantic component. However, we know that Restructuring is optional and that non-restructured clauses have the same interpretation as their restructured counterparts. This entails that semantically the derived structures must be interpreted as identical to their basic structures at the left-hand side. But how can that be achieved? For instance, the IP/CP complement, categorially and semantically required by the matrix verb, has disappeared altogether (observe that this also raises the question as to what happens with the functional heads (I,C) of the complement). Moreover, the structural relations between the two verbs and their

arguments are not the ones from which one normally deduces the type of thematic relations they hold. Thus, the DP object isn't contained in the VP uniquely headed by the V of which it is the internal argument and, similarly, the subject DP bearing the external argument of the (original) matrix verb (in the control construction) isn't governed by the VP of which this verb is the sole head. Another point concerns the status of the complement subjects. We have seen that the latter play no active syntactic role in the restructured clause, which might indicate that they are actually absent. But if this is so, how can the presence of the thematic roles they transmit (59a) or bear (59b) be accounted for? If they are present, on the other hand, their interpretation poses problems analogous to that of the other DPs.

We cannot but conclude that, given the T-model (or any model in which interpretation is dependent on the output of transformations), Restructuring, as proposed by Rizzi, too strongly affects the structure of complex clauses.

5 Less radical forms of Dual Subcategorization and Restructuring

5.1 Introduction

We know at this point that the VP option of the Dual Subcategorization Hypothesis is empirically problematic and that Restructuring in the sense proposed by Rizzi is too strong in the light of later developments of the theory of grammar. This seems to indicate that the attempts to reduce Cl Cl constructions to one single clause don't lead to the required result. On the other hand, it would be implausible to assume that the intuitions behind this line of research – which was extremely strong from the middle of the 1970s to the beginning of the 1980s – are totally unfounded. What seems to be the case is that the implementation of these intuitions has led to results that involve the absence or elimination of too much structure. An obvious step then is to investigate whether more subtle approaches, which still maintain the hypothesis that Cl Cl and its corollaries follow from the fact that the complement lacks certain clausal properties at the relevant level of representation, fare better. Actually, since the early 1980s, various linguists have developed hypotheses along these lines, thereby often using far more intricate theoretical tools than were available earlier on, but clearly not neglecting the considerable number of insights that were attained before. Below we briefly present some main aspects of these later developments.

5.2 Weak variants of the Dual Subcategorization Hypothesis

According to the canonical version of the Dual Subcategorization Hypothesis, Cl Cl verbs select two types of complements: normal CP/IP complements and 'poorer' VP complements. The optionality of Cl Cl follows from the fact that only

in the latter case do clitics attach to the higher verb. The two hypotheses to be discussed below are also based on the idea that besides normal complements – which don't allow for Cl Cl – Cl Cl verbs may take impoverished (infinitival) complements – which require Cl Cl.

5.2.1 Cl Cl complements without theta-roles

The idea that is pursued in Roberts (1997b) is that complements of Cl Cl verbs are always structurally complete, but may be semantically defective. He claims, more specifically, that such verbs can behave 'auxiliary-like' in the sense that they may fail to assign a theta-role to their infinitival complement. The lack of this role has as a consequence that syntactic rules don't interpret this complement as a clause.[43] In other words, processes relating positions in the complement to positions in the matrix clause will not violate the Clause Mate Condition. In (60) we present a schematic representation of this approach: (60a) is the normal case for infinitival complements, including the non-Cl Cl variant of Cl Cl verbs, while (60b) is the option that allows for Cl Cl and its corollaries:

(60) a. [V [$_{CP/IP}$]]

theta
domain of Clause
Mate Condition

b. [$V_{aux\text{-}like}$ [$_{CP/IP}$]]

domain of Clause Mate Condition

Notice that this analysis eliminates all the problems resulting from the lack of clausal structure under the VP option of the Dual Subcategorization Hypothesis (sections 3.3.2, 3.3.3). However, the assumption that Cl Cl verbs may behave 'auxiliary-like' seems to be somewhat stipulative, in particular in light of the fact that (non-raising) Cl Cl verbs remain able to theta-mark their own subject, or, in the case of unaccusatives (cf. note 10), object.

5.2.2 Cl Cl complements with impoverished I

Another alternative to the canonical Dual Subcategorization Hypothesis is one in which Cl Cl climbing complements optionally lack some structure, but not as much as is assumed under the VP option. This possibility is opened up by certain new insights into the structure of the clause in general.

We have hitherto been assuming that, in addition to V, clauses contain at most two other heads, I and C. The latter are called functional heads. Since the early 1990s there has been a strongly growing insight that I and C are not sufficient to account for the empirical complexity of clauses. As a consequence, I is now assumed to split up in several distinct functional heads (with their concomitant projections). This assumption is known as the Split Infl Hypothesis. We must mention that there is as yet no clear agreement as to the number of these heads,

or as to their precise status, This is the reason why in (61), which represents a normal clause, we simply reproduce them as I_1, I_2 . . . I_n:

(61) $[_{CP}\ C\ [_{IP1}\ I_1\ [_{IP2}\ I_2 \ldots [_{IPn}\ I_n\ [_{VP}\ V]]]]]$

It may be the case now that, in addition to a complete CP/IP_1 complement, Cl Cl verbs may select an infinitival complement in which some (or only one) of the I_x heads and their projections are absent and that this is precisely what allows for Cl Cl. This idea, to which we'll briefly return in section 6.3.2, is explored in Martins (2000).

5.3 Intermezzo: Cl Cl verbs as functional categories

The introduction of the Split Infl Hypothesis mentioned above has opened the possibility that Cl Cl verbs themselves function as functional heads; that is, that they are lexicalizations of notions (such as aspect and modality) that belong to the functional domain (i.e., the domain above VP in (61) of the clause). This position is defended extensively in Cinque (2000b). It should be mentioned here that Emonds (1999) also classifies Cl Cl verbs as functional categories. In his approach, this term stands for closed classes of categories that lack purely semantic features and behave or may behave distinctly from their lexical counterparts (i.e., from non-Cl Cl verbs in the case under consideration). Both in Cinque's and in Emond's proposal, Cl Cl constructions are simplex clauses and as such pose at least a number of the problems summarized in section 3.4. Especially in Cinque (2000b), some of these are adressed explicitly.

5.4 Weak Restructuring

One effect of canonical Restructuring is that it crucially alters the relations between constituents in the clause. Various researchers have claimed that such an alteration can be obtained without the elimination of structure assumed by Rizzi (1978).[44] Most of them do assume some form of complex verb formation. Perhaps the most articulate proposal along these lines is the one formulated in Baker (1988a: 64), under the name of the Government Transparency Corollary.[45] In (62) we reproduce this principle:

(62) **The Government Transparency Corollary (GTC):**
A lexical category which has an item incorporated into it governs everything which the incorporated item governed in its original structural position.

Baker's original proposal was formulated for incorporating languages, in which verbal complexes are headed by affixes. However, there is no bar to extending it to verbal complexes in other languages, as Baker himself does for Romance. For this purpose "incorporated (into)" can be interpreted as 'adjoined (to)'. In order

to discuss the effect of the GTC, we'll consider the example in (63), which was presented above as (55b):

(63) Juana quiere+ [cantar+I] [$_{CP}$ t [$_{IP}$ PRO t [$_{VP}$ t la canción]]].
Juana want-pres-3sg sing the song
'Juana wants to sing the song.'

As the reader may recall, this example represents the hypothesis that the complement verb of Cl Cl verbs adjoins to the matrix verb, after having passed through I and (in control cases) C of the complement. The result is a complex verb. Given the GTC, now, the matrix verb *quiere* in (63) governs not only the complement CP itself, but also the object of the adjoined verb (*cantar*), i.e., *la canción*. The latter government relation thus abstracts from the presence of the intervening CP, IP, and VP nodes. These nodes, however, remain present, as do the PRO subject and the traces of the complement verb.

In (64) we present the main aspects of this analysis, using boldface to indicate the 'restructured' government relation between the matrix verb and the embedded object. We also add the matrix VP node, which is the minimal domain in which this relation is established:

(64) . . . **[$_{VP}$ V**+[V+I] [$_{CP}$ t [$_{IP}$ PRO t [$_{VP}$ t **DP]]]]**

Normally VP constituents are free to move out of the minimal VP in which they are governed. The assumption is that this is also the case in structures like (64). It follows that if the object of the complement is a clitic, there is no bar to moving it out of the matrix VP (where it adjoins to the verb, which has moved to matrix I). Similarly, there are no obstructions to Long DP-Movement and Long Operator Movement.

One final remark here is that the proposal hinges crucially on the original government relation between the complement verb and the DP. Extension to other clitics requires proof that the latter are likewise governed by this verb in their base position.

6 The constraining factor for Cl Cl in non-Cl Cl contexts

6.1 Introduction

Until this point we have been employing the term 'Clause Mate Condition' to express the idea that the rules involved in Cl Cl and its corollaries (Cl Pl, DP-movement, Null Operator Movement, and *Avere* → *Essere* Shift) must normally apply within a minimal CP or IP. As indicated in section 1.3, this term is merely descriptive. As such, it abstracts away from the specific factors that are responsible for the fact that 'long' applications of these rules are only allowed in the

case of Cl Cl complements. In the present section we'll discuss a number of hypotheses as to what the Clause Mate Condition really stands for. As we have been doing all along, we will concentrate primarily on Cl Cl. In this case, that means that our central question will be: what is the factor that constrains Long Cl Pl (Cl Cl) in normal cases and how come this factor is inoperative in Cl Cl contexts? As for the corollaries of Cl Cl, we'll only consider what the possible answers to this question imply for them.

As discussed in section 1.3, the minimal domain in which the constraint on Cl Cl must be sought is the domain above the VP in the complement of non-Cl Cl raising verbs. The elements that make up this domain are the IP boundary, the I' projection, the head I, and the DP subject. This means that the constraint must involve at least one of these elements, i.e., that at least one of the situations in (65) holds true for normal Cl Pl (the exclamation mark indicates the factor involved in the constraint):

(65) 1a. $[_{IP}!$ $[_{VP}$ **Cl**]]

1b. $[_{IP}$ $[_{I'}!$ $[_{VP}$ **Cl**]]]

2. $[_{IP}$ I! $[_{VP}$ **Cl**]]

3. $[_{IP}$ DP! $[_{VP}$ **Cl**]]

Below we consider each of these hypotheses in turn. When relevant, we will also examine how the constraint under consideration can be obviated in Cl Cl cases. In doing so, we will no longer take into consideration the standard Dual Subcategorization and Restructuring Hypotheses, which we have rejected as too strong. (Notice, incidentally, that according to these hypotheses all factors in (65) are absent or inoperative; the same holds true for Cinque's and Emonds's approaches, mentioned in section 5.3, which we will also disregard below.)[46]

6.2 Hypothesis 1: IP, I'

It is not very plausible that IP or I' functions as a constraining factor, at least not on its own. Raising constructions such as the one in (66a) (with the non-Cl Cl clitic verb *parecer* 'seem') show that I' and IP don't block DP-movement. Likewise, they don't block *wh*-movement (cf. (66b)), or V-movement into C. The latter is attested, for instance, in the Italian Aux-to-C construction in (66c):

(66) a. Juan$_i$ $[_{I'}$ parece $[_{IP}$ t_i haber trabajado mucho]]].
Juan seem-pres-3sg have worked a lot
'Juan seems to have worked a lot.'

b. No sé $[_{CP}$ a quién$_i$ $[_{IP}$ $[_{I'}$ contestar primero t_i]]].
not know-pres-1sg to whom answer first
'I don't know whom to answer first.'

c. [$_{CP}$ Essendosi$_i$ [$_{IP}$ le mele [$_{I'}$ t$_i$ mangiate]]]
being+SI the apples eaten
'The apples having been eaten . . .'

If the IP (alone) or I' (alone) were to block Cl Cl, the latter process would be very exceptional. Moreover, it would be difficult to explain why blocking of Cl Cl goes together with blocking of Long DP-Movement and Long Null Operator Movement, which are, respectively, DP-movement and movement to the same position as *wh*-phrases. We therefore reject the hypothesis that either I' or IP is the sole constraining factor.[47]

6.3 Hypothesis 2: I

The choice between I and the subject as the constraining factor for Cl Cl depends crucially on the exact details of Cl Pl in simplex clauses. As we'll see, the standard assumption about this process favors the assumption that this factor is I, but requires the additional assumption that Cl Cl constructions involve some form of complex verb formation. We will discuss this option first.

6.3.1 I and Weak Restructuring

The standard assumption about Cl Pl is the one in (67):

(67) **Cl Pl (standard):**
Clitics attach directly to the first available (non-participial) verbal host, after V-movement.

Notice that the alternative, in which the clitic attaches to V before V-movement and V+cl undergo V-movement together, runs into problems in Cl Cl contexts: it predicts that the complement V and its clitics will always surface together, i.e., it only permits an in situ analysis. In short, the existence of Cl Cl forces Cl Pl to be postcyclic, at least under the standard assumption that clitics attach directly to the first available host.[48]

Given (67), I functions as the 'constraining factor' for Cl Cl out of normal infinitivals. This is so because in the languages under consideration infinitival verbs move to I. This is illustrated in (68a), where the fact that V-to-I movement has applied is corroborated by the presence of the adverb *inmediatamente* 'immediately' between the verb and the object. Given (67), Cl Pl will attach the clitic *le* to V in I. The result is represented in (68b):

(68) a. Juan promete dar**le** inmediatamente el libro.
Juan promise-pres-3sg give him immediately the book
'Juan promises to give him the book immediately.'
b. Juan promete [$_{CP}$ [$_{IP}$ PRO dar+I+**le** inmediatamente [$_{VP}$ t el libro **t**]]]

As (68) implies that the 'first available host', i.e., V+I, may not be skipped, clitics cannot end up in a position higher than I.

As for Cl Cl contexts, one must assume here that the complement verb is not an 'available host'. The hypothesis that Cl Cl constructions involve verbal complex formation (sections 4.2, 5.4) in fact predicts this. This is so because, under standard assumptions, the head of such a complex is the matrix verb. As only heads of complex lexical units are visible for outside rules (cf. Williams 1981b), the complement verb becomes 'invisible' and hence unavailable as a host for Cl Pl. It follows that Cl Pl must look higher for the first available host, which is the matrix verb.

Let us illustrate the foregoing with the Cl Cl example in (69a). In (69b) we present its D-structure. (69c) is the structure after V-movement (we assume that the matrix verb moves to matrix I) but before Cl Pl:

(69) a. Juana **lo** quiere ver.
Juana it want-pres-3sg see
'Juana wants to see it.'
b. Juana I [$_{VP}$ quiere [$_{CP}$ [$_{IP}$ PRO I [$_{VP}$ ver **lo**]]]]
c. Juana quiere$_i$+I [$_{VP}$ t$_i$+ver$_j$+I [$_{CP}$ t$_j$ [$_{IP}$ PRO t$_j$ [$_{VP}$ t$_j$ **lo**]]]]

(67) now forces the clitic *lo* to look for the first available verbal host. Given the fact that *ver* is a non-head in the complex *t+ver+I*, it is unavailable. Thus, the clitic attaches to the higher *quiere+I*.

Under the assumption that verbal complex formation triggers some form of (weak) Restructuring (section 5.4), the violation of the Clause Mate Condition for the corollaries of Cl Cl involves the same considerations as those discussed before in sections 4.3 and 5.4.

6.3.2 I and the target of V-movement

An influential alternative to the standard view on Cl Pl, first proposed in Kayne (1989b), makes a crucial distinction between preverbal clitics (proclisis) and postverbal clitics (enclisis):

(70) **Cl Pl (alternative 1):**
proclisis: Clitics attach to the first available verbal host.
enclisis: Clitics attach to the first designated inflectional head.

One important extra element of this proposal is that in the case of enclisis the target of verb movement is not the head to which the clitic attaches, but the position to the immediate left of this head.

In Romance Cl Cl languages, where infinitivals require enclisis, infinitival I functions as a designated host for Cl Pl. This entails that clitics move to I and that the verb surfaces to the immediate left of I (it adjoins to I' in Kayne's proposal). This gives the following analysis for, e.g., (68):

(71) Juan promete [$_{CP}$ [$_{IP}$ PRO dar [$_{I}$ **le**+I inmediatamente [$_{VP}$ t el libro **t**]]]]

Under this analysis, infinitival I acts as the constraining factor for Cl Cl out of normal infinitival complements because it is the first designated host for Cl Pl and as such may not be skipped.

Notice that, given the fact that the verb and the clitic form separate constituents in this proposal, it becomes possible that the clitic (+I) moves to a higher position on its own. This is precisely what happens in Cl Cl cases, according to Kayne. In his view, Cl Cl verbs are special in that they allow for the I head of their complement to be extracted. When this head contains one or more clitics, extraction will automatically lead to Cl Cl. In (72) we reproduce the result of this analysis for *Juana lo quiere ver* (= 69a). We assume, with Kayne, that *lo+I* moves through C and adjoins to the I of the matrix clause, after movement of the finite matrix verb to this position:

(72) Juana [**lo**+I]$_j$+[quiere$_i$+I] [$_{VP}$ t_i [$_{CP}$ t_j [$_{IP}$ PRO ver [$_{I'}$ t_j VP]]]]

Though Kayne doesn't discuss this, it is possible that the extraction of the I head leads to some form of restructuring, which in turn may provide an explanation for the corollaries of Cl Cl.

Variants based on Kayne's analysis of Cl Pl in infinitivals involve elimination or absence of the constraining inflectional head in Cl Cl complements. For instance, Bok-Bennema and Kampers-Manhe (1994) argue that I adjoins alone to the matrix verb, before Cl Pl. Another example is Martins (2000), who, as mentioned in section 5.2.2, makes use of the Split Infl Hypothesis. As discussed, she proposes that certain of the 'atoms' of I (I_x heads) are absent in Cl Cl cases. These include the one that is the designated target of Cl Pl in normal infinitivals.

6.3.3 Summary

The two versions of Cl Pl discussed above are the following:

(73) **Cl Pl (standard):**
Clitics attach directly to the first available (non-participial) verbal host, after V-movement.

Cl Pl (alternative 1):
proclisis: Clitics attach to the first available verbal host.
enclisis (the relevant case for infinitivals in Cl Cl languages): Clitics attach to the first designated inflectional head. V-movement is to the immediate left of this head.

Each of these entails that I normally functions as the 'constraining factor' on Cl Cl, but in different ways. Obviation of the factor in Cl Cl contexts also proceeds differently. In both cases the obviation might trigger Weak Restructuring, which in turn may provide an explanation for the occurrence of the corollaries of Cl Cl.[49] (74) presents a summary of the differences and similarities of the two approaches:

(74) **Cl Pl (standard):**

Constraining factor (CF) Cl Cl:	$[_{IP}$ I! $[_{VP}$ V **Cl**]]
Reason CF:	V → I before Cl → V+I
Obviation CF in Cl Cl complements:	V +I → (C) → V_{matrix}
Obviation CF corollaries:	Weak Restructuring (?)

Cl Pl (alternative 1):

Constraining factor (CF) Cl Cl:	$[_{IP}$ I! $[_{VP}$ V **Cl**]
Reason CF:	Cl → I
Obviation CF in Cl Cl complements:	Cl+I → (C) → I_{matrix} (for variants see end of section 6.3.2)
Obviation CF corollaries:	Weak Restructuring?

6.4 Hypothesis 3: the subject

6.4.1 Introduction

Over the years the idea that the presence of the subject of infinitival complements normally prevents clitics leaving these complements has been extremely pervasive. Indeed, most of the proponents of the standard Dual Subcategorization and Restructuring Hypotheses have followed it. Of interest here, in addition, is one analysis we have not discussed so far, which is the one presented in Burzio (1986), as a version of restructuring (cf. note 44). Burzio boldly extracts the VP of the complement over the subject, thereby placing it outside the domain of the latter and obviating the constraint imposed by it, so that any Cl within this VP is free to move to a higher position. In (75) we present a schematic representation of Burzio's VP-Preposing Rule (notice that at that time Romance IPs were assumed to consist solely of a subject and an IP):

(75) **Burzio's VP-Preposing Rule:**

The reason for the idea that the presence of the subject blocks Cl Cl is to a great extent historical: at the time these hypotheses were developed, extraction from non-finite clauses was generally be assumed to be constrained by the Specified Subject Condition (SSC) of Chomsky (1973), which prohibited relating positions within a clause to positions outside it over a subject DP. Cl Cl, thus, was seen as unexceptional, that is, as obeying the general constraint on extraction rules.

Within the Government and Binding approach (Chomsky 1981), the SSC was replaced by Binding Condition A, which as far as extractions are concerned is only relevant for extractions of DPs. This aspect of Binding Condition A was later subsumed under Rizzi's (1990b) Relativized Minimality requirement, which

prohibits (among other things) A-movement from crossing intervening XPs in A-positions, such as subject DPs.

Given these developments, the idea that Cl Cl with non-Cl Cl verbs is constrained by the presence of the complement's subject only seems to be feasible if Cl Cl involves A-movement. That this may be possible is discussed below.

6.4.2 Cl Cl and A-movement

At least for direct object clitics, there is empirical evidence that Cl Pl requires intermediate A-movement (this was first observed in Kayne 1989a). Consider in this respect first the Italian example in (76):

(76) Gianni **li** ha mangiati **t**. Italian
Gianni them-masc have-pres-3sg eaten-masc-pl
'Gianni has eaten them.'

Crucial here is the agreement between the clitic and the past participle (see chapter 48). Under the standard assumptions that agreement relations are instances of Specifier–Head agreement, we also have to assume that the participle has a specifier (an A-position) and that before cliticizing the clitic passes through its specifier position. In other words, the clitic first undergoes A-movement, or more precisely DP-movement, and is only subsequently cliticized. Thus, instead of (76) we have in fact (77), with two traces:

(77) Gianni **li** ha [**t** mangiati **t**].

If we now look at cases with Cl Cl of an object and a participle in the matrix clause, we see that they also manifest agreement (78a). This entails that we have to assume that the clitic passes through the specifier of the matrix participle (cf. (78b)), and that at least in this case we have a specific instance of Long DP-Movement, which apparently ignores the presence of the subject of the complement:

(78) a. Gianni **li** ha voluti mangiare.
Gianni them-masc have-pres-3sg wanted-masc-pl eat
'Gianni has wanted to eat them.'
b. Gianni **li** ha [**t** voluti [PRO mangiare **t**]].

An obvious extension of this analysis entails the assumption the relevant specifier position doesn't only occur with agreeing participles, but that all direct object clitics pass through it. Cliticization of such clitics can then be considered to be cliticization from this specifier onto V in I, with as a consequence that Cl Cl of direct object clitics always involves Long DP-Movement.

Notice that in order to extend this analysis to other clitics, it has to be assumed Cl Pl always entails intermediate A-movement to a specifier position; that is, that Cl Pl should be formulated as follows:[50]

(79) **Cl Pl (alternative 2):**[51]
step 1: Clitics move to a designated specifier position. (XP-movement)
step 2: Clitics attach to the first available verbal host. (proper Cl Pl)

Given (79) all Cl Cl entails 'long A-movement', or, as we will call it, Long XP-Movement.

6.4.3 Circumventing the complement's subject

Suppose that Cl Cl indeed involves Long XP-Movement. As discussed in section 6.3.1, this type of movement is normally excluded because it crosses the clausal subject and as such gives rise to a violation of Relativized Minimality. Then we need an account of why this violation doesn't occur in Cl Cl constructions. There are two possibilities: either the subject of Cl Cl complements doesn't count for Relativized Minimality, or there is some way in which XP-movement can circumvent the presence of the subject in such complements. We will consider each of these in turn.

First, it is possible that Relativized Minimality is not exceptionless. In fact, it cannot be so under the assumption that Cl Pl involves intermediate XP-movement. Consider, in this respect, the example in (80a). Here the movement of the indirect object clitic *le* to the intermediate XP must have crossed the direct object DP (cf. (80b)). As the latter occurs in an A-position, a strict application of Relativized Minimality predicts that the sentence will be ungrammatical, contrary to fact:

(80) a. Juana **le** da el libro.
Juana him give-pres-3sg the book
'Juana gives him the book.'
Juana **le t** [$_{VP}$ da el libro **t**].

On the basis of similar considerations, Roberts (1997b) claims that Relativized Minimality doesn't hold for A-movement (= XP-movement) in simplex clauses. This means that he in fact reduces Relativized Minimality to the Clause Mate Condition (for A-movement). If we assume that this is correct, any of the analyses of Cl Cl that allow for the apparent violation of the Clause Mate Condition will account for the fact that intermediate XP-movement of clitics can cross the DP-subject of these complements. One such analysis is that in which the complement is semantically defective, under the version proposed by Roberts himself (section 5.2.1). Another one is Baker's version of Weak Restructuring discussed in section 5.4.

The alternative way to circumvent the role of the subject in Cl Cl complements has already been mentioned in section 6.4.1. We refer to Burzio's VP-Preposing Rule. Notice, however, that given later insights, it cannot be solely the VP that preposes. This is so because the complement's V undergoes V-movement to I (section 3.3.2), and preposing the VP before this movement takes place would make it impossible for this rule to apply. Preposing it after V-movement, on the

other hand, makes wrong predictions with respect to word order: DP complements of the verb would surface to its left, contrary to fact; cf. (81):

(81) a. *Juana **te** quiere el libro mostrar.
Juana you want-pres-3sg the book (to) show
b. Juana te quiere t_i [$_{VP}$ t_j el libro t_i]$_k$ [PRO mostrar$_j$+I t_k].

An adaptation of Burzio's rule to a more actual framework is presented in Haverkort (1993), who makes use of the Split Infl Hypothesis (section 5.2.2) and places the first IP_x which follows the subject out of the domain of the latter. For Haverkort, who claims that all infinitivals have a complementizer, the target position of IP_x is the specifier of C. In (82) we present the essential aspects of Haverkort's rule, before (82a) and after (82b) preposing of the post-subject constituent (IP_2), to the specifier position of I_1. (We abstract from the V-movement within IP_2.)[52]

(82) a. . . . [$_{CP}$ C [$_{IP1}$ subject I_1 [$_{IP2}$ I_2 [$_{VP}$ V XP]]]]
b. . . . [$_{CP}$ [$_{IP2}$ I_2 [$_{VP}$ V XP]]$_i$ C [$_{IP1}$ subject I_1 t_i]]

The effect of preposing IP_2 is in essence the same as that of Burzio's VP preposing. In (82a) the presence of the subject blocks XP-movement out of the complement. In (82b) this is no longer the case and Long XP-Movement may freely apply. Within this analysis, Cl Cl verbs are special in that they allow for preposing of the constituent which follows the subject (IP_2) to the first position of their complement. It should be observed that the analysis can of course only be valid if the preposing rule itself is not sensitive to the presence of the subject.

One remaining question is whether these types of accounts may also hold for the corolloraries of Cl Cl. For Long DP-Movement this goes without saying, simply because it is an instance of Long XP-Movement. As for Long Null Operator Movement and *Avere* → *Essere* Shift, we must consider to what extent it is plausible that they are normally prohibited because of the fact that the presence of the subject of the complement induces a Relativized Minimality Violation. As for Long Null Operator Movement, it is possible that this rule, which always consists of movement of an object DP, involves the same intermediate XP-movement we are assuming for Cl Pl. If this is so, it will indeed be subject to the same constraint. As for the *Avere* → *Essere* Shift, recall that it requires the subject of the matrix clause to be related to the trace of PRO in the object position of the complement clause (section 4.3). Though this remains to be worked out, it isn't impossible that it is indeed Relativized Minimality that normally prevents this relation from being established over the (PRO) subject of the complement.

6.4.4 Summary

In (83) we repeat the version of Cl Cl presented in (79):

(83) **Cl Pl (alternative 2):**
step 1: Clitics move a designated specifier position. (XP-movement)
step 2: Clitics attach to the first available verbal host. (proper Cl Pl)

This version entails that the subject functions as the 'constraining factor' for Cl Cl in normal cases. There are at least three kinds of possible explanation for the fact that this factor is obviated (or is inoperative) in Cl Cl complements. It is possible that these account at the same time for the occurrence of the corollaries of Cl Cl. Below we summarize our findings:

(84) **Cl Pl (alternative 2):**

Constraining factor (CF) Cl Cl:	$[_{IP}$ DP! $[_{VP}$ V **Cl**]]
Reason CF:	Relativized Minimality
Obviation CF in Cl Cl complements:	a. defectiveness IP (CP)
	b. Weak Restructuring
	c. I_xP preposing
Obviation CF corollaries:	same as for Cl Cl (??)

6.5 Conclusion

The central question we have been considering in this section is: what is the factor that constrains Long Cl Pl (Cl Cl) in normal cases and how come this factor is inoperative in Cl Cl contexts? As possible factors we have considered the complement's IP, I', I, and the complement's subject. We have seen that the first two are not plausible candidates (section 6.2). The choice between the remaining two is to be strictly linked to the question of what is the exact nature of Cl Pl. Under the hypothesis that the factor is I, this question also plays a crucial role in the determination of what causes its inoperativeness in Cl Cl contexts. Answers to this latter question, however, provide no direct explanation for the corollaries of Cl Cl. Under the hypothesis that the factor is the subject, on the other hand, its inoperativeness (possibly) does entail such an explanation. The explanation of inoperativeness itself, however, is independent from the nature of Cl Pl and must be sought in a different direction. Albeit in updated versions, the hypotheses formulated in the earlier years of Generative Grammar remain relevant for this search. They also continue to play a role under the hypothesis that the factor is I, in particular in the investigation of the reason of the existence of the corollaries of Cl Cl.

Appendix 1 Italian examples

Standard example of in situ–Cl Cl alternation:

(1) a. Mario vuole leggerlo.
Mario want-pres-3sg read+it
'Mario wants (to) read it.'
b. Mario **lo** vuole leggere.

Cl Cl with raising verb:

(2) a. Giovanni dovrebbe prender**lo**.
Giovanni must-cond-3sg fetch+it
'Giovanni would-have to fetch it.'
b. Giovanni **lo** dovrebbe prendere.

Ungrammaticality Cl Cl with regular subject control verb:

(3) a. Mario odia legger**lo**.
Mario hate-pres-3sg read+it
'Mario hates to read it.'
b. *Mario **lo** odia leggere.

Ungrammaticality Cl Cl with regular subject-raising verb:

(4) a. Angela pareva aver**lo** accompagnato a casa.
Angela seem-past-3sg have+him taken to house
'Angela seemed to have taken him home.'
b. *Angela **lo** pareva avere accompagnato a casa.

((4b) is marginally accepted by some speakers.)

Impossibility of 'clitic splitting':

(5) a. Gianni **vi** **li** vuole mostrare.
Gianni you-pl them want-pres-3sg show
'Gianni wants to show them to you.'
b. *Gianni **vi** vuole mostrar**li**.
c. *Gianni **li** vuole mostrar**vi**.

Cl Cl over sequence of Cl Cl verbs:

(6) a. Maria vuole andare a prender**li** lei stessa.
Maria want-pres-3sg go to fetch+them her self
'Maria wants go to fetch them herself.'
b. Maria **li** vuole andare a prendere lei stessa.

Impossibility of Cl Cl out of finite complement:

(7) a. Gianni vuole che Maria **li** veda.
Gianni want-pres-3sg that Maria them see-subj-pres-3sg
'Gianni wants for Maria to see them.'
b. *Gianni **li** vuole che Maria veda.

Ungrammaticality of Cl Cl out of complement with negative particle:

(8) a. A Mario, potete non parlar**gli**, se preferite.
To Mario, can-pres-2pl not speak+him-dat if prefer-pres2pl
'To Mario you (pl) don't have to speak, if you prefer to.'
b. *A Mario, **gli** potete non parlare, se preferite.

(The example above is from Fresina 1982.)

Appendix 2 Portuguese examples

The examples in this appendix are from Martins (2000), and concern European Portuguese (EP). Notice that in EP clitics are always enclitic on infinitivals and normally enclitic on finite verbs.

Cl Cl with subject control verb:

(1) a. Quero fazê-**lo**.
want-pres-1sg do-it
'I want to do it.'
b. Quero-**o** fazer.

Cl Cl with subject raising verb:

(2) O polícia pode-**me** multar por excesso de velocidade.
the cop can-pres-3sg-me fine for excess of velocity
'The cop can fine me for breaking the speed limit.'

(Martins classifies this case as subject control.)

Ungrammaticality Cl Cl with regular subject control verb:

(3) a. O Pedro crê tê-**los** convencido.
the Peter believe-pres-3sg have-them convinced
'Peter believes to have convinced them.'
b. *O Pedro crê-**os** ter convencido.

Ungrammaticality Cl Cl with regular subject raising verb:

(4) *Ele parece-**o** odiar.
He seem-pres-3sg-him hate
'He seems to hate him.'

Appendix 3 List of Spanish Cl Cl verbs

This appendix contains an overview of the Cl Cl verbs in Spanish. It should be borne in mind, however, that there is considerable variation and hesitancy among speakers as to which verbs belong to this class.

Modals:

deber	'can' 'be able' 'may'
poder	'must' 'should'
querer	'want'
saber	'can' 'be able to' 'know how'
tener que	'have to'

Aspectuals (motion):
The verbs presented here are basically movement verbs. When they occur with non-finite complements their meaning becomes aspectual, though their basic meaning usually still transpires.

ir a	'go to' 'will'
llegar a	'arrive at'
venir a	'come to'
volver a	'come back to' 'begin anew'

Aspectuals (others):

acabar de	'just finish'
continuar a	'keep on'
dejar de	'refrain from'
empezar a	'begin'
estar por	'be about to'
soler	'normally do'
terminar de	'finish'

Indirect object control:
The class of indirect object control verbs is exceptional in that it permits Cl Cl, but only for clitics that refer to non-humans. The list – taken from Luján (1980) – is not exhaustive. Cl Cl with indirect object control verbs is not discussed in the text. We refer the reader to Luján (1980) and Bok-Bennema (1981) for further details and references.

aconsejar	'allow'
indicar	'indicate'
mandar	'order'
ordenar	'order'
permitir	'allow'
prohibir	'prohibit'
recordar	'remind'

Others:
The following verbs are sometimes mentioned as Cl Cl verbs. According to Zubizaretta (1982a) they only classify as such "by analogy." Observe that they are all subject control verbs.

aprender a	'learn to'
desear	'desire'
pensar	'think' 'plan'
preferir	'prefer'
tratar de	'try'

Non Cl Cl verbs:
We add a list containing some of the verbs that take infinitival complements, but normally reject Cl Cl.

afirmar	'affirm'
convenir	'be convenient'
creer	'believe'
decidirse a	'decide to'
decir	'say'
descubrir	'discover'
dudar	'doubt'
evitar	'avoid'
haber que	'be necessary'
insistir en	'insist'
invitar a	'invite to'
lamentar	'regret'
morir por	'be dying to'
negar	'deny'
odiar	'hate'
prometer	'promise'
renunciar a	'give up trying'
sentir	'be sorry'
soñar con	'dream about'
sugerir	'suggest'

Appendix 4 List of Italian Cl Cl verbs

This appendix contains an overview of the core class of Cl Cl verbs in Italian. It should be borne in mind, however, that even for this core class there are speakers who do not accept Cl Cl with all of them (cf. Rizzi 1982a: 41, fn. 6). For more extensive sets of verbs that (sometimes) allow Cl Cl, see Napoli (1981) and Fresina (1982).

Modals:

dovere	'have to'
potere	'be able'
sapere	'can' 'know how'
sembrare	'seem'
volere	'want'

Motion verbs:

andare a	'go to'
tornare a	'come back to'
venire a	'come to'

Aspectuals:

cominciare a	'begin to'
continuare a	'continue to'
finire di	'finish to'
stare per	'be about to'

Non-Cl Cl verbs:

Here we present a small set of examples of verbs that take infinitival complements, but generally reject Cl Cl.

affermare	'state'
bisognare	'be necessary'
credere	'believe'
odiare	'hate'
parere	'seem'
scendere a	'go down to'
sembrare di	'seem that'

NOTES

1 Unless indicated otherwise, the examples will be presented in Spanish. However, there are two appendices at the end of this chapter containing examples equivalent to those in section 1 from Italian and, as far as they are available, Portuguese.

2 In Spanish clitics are enclitic (i.e., follow the verb) when they combine with non-finite verb forms and proclitic (i.e., precede the verb) with finite forms. The same situation holds in Italian. (European) Portuguese has enclisis on non-finite verbs, and – under normal circumstances – also on finite verbs. Proclisis on finite verbs occurs in the presence of certain operators (e.g., negation). Orthographically, proclitics are reproduced as separate units and enclitics as part of the verb.

3 Napoli (1981), Rochette (1988), and Rosen (1990) claim that variants like those in (2) differ from those exemplified in (1) in that they represent a single temporal/event structure. For criticism on this claim, see Wurmbrand (2001: 146–156).

4 Modern French also has Cl Cl, but only in the so-called Causative Construction (chapter 6), whose properties differ from the construction type we will be considering here. For clitic climbing in Old French see Roberts (1997b) and the references given there.

5 See chapter 75 for Cl Cl in Dutch and German, Browne (1966) and Ross (1986) for Cl Cl in Serbo-Croatian, and Koopman (1984), Sportiche (1983), and Haverkort (1993: 96ff.) for Cl Cl in Kru.

6 At the end of this chapter the reader can find two appendices listing Cl Cl verbs in Spanish and Italian. The Spanish data come from Aissen and Perlmutter (1976), Luján (1980), and Zubizarreta (1982a). The Italian are from Rizzi (1982a) and Burzio (1986).

7 In fact the set of Cl Cl verbs subsumes most of the raising verbs. However, the Romance counterpart of the prototypical raising verb 'seem' – *parecer* (Spanish/Portuguese), *parere* (Italian) – is standardly not considered a Cl Cl verb (though we must mention that there are some speakers that accept it as such). Italian in addition can translate 'seem' as *sembrare.* According to Napoli (1981) speakers strongly disagree as to whether this verb should be classified as belonging to the Cl Cl class or not.

8 Martins (2000) discusses the fact that in older versions of Romance Cl Cl was obligatory. According to Roberts (1997b) this still holds true in Sardinian for certain Cl Cl verbs. In addition, Fresina (1982) mentions that in Italian *avere da* 'have to' forms an exception in that it requires obligatory climbing.

9 Kayne (1989b: 248) mentions that there are certain dialects that allow for "clitic splitting." According to him, these are dialects that have procliticization on infinitivals, instead of encliticization.

10 As first observed in Burzio (1986: 324ff.), Cl Cl verbs such as Italian *andare* 'go' and *venire* 'come' are unaccusative. This entails that apart from an infinitival complement, they have a DP complement, which moves to subject position for reasons of Case. For such verbs the configuration in (8) in the text is present if one adopts the ideas about double object constructions presented in Larson (1988b) (and see chapter 21). The relevant analysis of the whole VP then is the one in (i), where the configuration under consideration is reproduced in bold and where V3 indicates an empty verb position to which V2 will move:

(i) $[_{VP}\ [_{V'}\ V3\ [_{VP}\ DP\ \mathbf{[}_{V'}\ \mathbf{V2}\ \mathbf{[}_{CP/IP}\ \mathbf{V1\ Cl]]]]]}$

11 It should be observed here that Napoli (1981) presents a number of Italian Cl Cl cases with negative particles in the complement, of which she mentions that her informants find them perfectly acceptable. Cinque (2004) presents a similar claim: according to him, a restricted set of Italian Cl Cl verbs allows Cl Cl over a negative particle in the complement. We reproduce one of Napoli's examples in (i):

(i) L**o** continua a non capire.
it continue-pres-3sg to not understand
'He continues to not understand it.'

12 Data pertaining to matrix V-to-I movement in Spanish and Portuguese Cl Cl constructions remain to be investigated systematically. For Spanish some data are available. Most authors mention that the Cl Cl verb and the complement (or the complement verb) have to be adjacent. The examples they present to illustrate this, however, do not involve VP adverbs. An exception is Lois (1989), according to whom Spanish Cl Cl cases in which the matrix and complement verb are separated by an adverb ending in *-mente* are degraded, while separation by the adverb *apenas* 'hardly' is fully grammatical: cf. (i):

(i) a. ??**Me lo** querían inmediatamente/rápidamente enviar.
me it want-past-3sg immediately/quickly send
'They wanted to send it to me immediately/quickly.'
b. (El problema) **se lo** quería apenas mencionar.
the problem to+him it want-past-3sg hardly mention
'(The problem,) he hardly wanted to mention it to him.'

Another exception is Zagona (1988b), but this work only considers gerundial complements of auxiliary verbs. As shown in the example in (ii), in such cases disruption by V-to-I over adverbs is incompatible with Cl Cl:

(ii) **Lo** eslá (*todavía) legendo
it be-pres-3sg still reading
'She is (still) reading it.'

An interesting example is the Mexican Spanish one in (iii), from LaPolla (1988: 220), where the matrix subject occurs between the Cl Cl verb and the complement. If the subject is assumed to be generated inside VP and to remain there, this constitutes another case of V-to-I movement with Cl Cl:

(iii) **Lo** quiere Maria tomar **t**.
it want-pres-3sg Maria take-inf
'Maria wants to take it.'

13 The example in (16b) is from Cinque (2004). Cinque shows that Cl Cl is also compatible with Focus-fronting.

14 In addition to clausal pied-piping, Rizzi (1978) discusses complements that are Clefted (chapter 25), Right Node Raised, and Complex NP Shifted. None of these cases allows Cl Cl. Given current knowledge it is not sure that they all involve *movement*. It should be mentioned here that Zubizarreta (1980: 150) states that Cl Cl out of Right Node Raised complements is acceptable in Spanish. She observes that Right Node Raising might be a discourse rule and as such not relevant to syntax.

15 Cl Cl approaches based on the idea that clitics – or feature bundles spelled out as clitics – are base-generated in clitic positions are, e.g., Strozer (1976), LaPolla (1988), and, more recently, Miller and Sag (1997) and Emonds (1999). One specific view on the base generation of clitics is the one presented in Sportiche (1996b): see note 51.

16 Notice that this implies that when we speak of clitics in situ – as opposed to climbed clitics – we do not refer to their base position, but to the position they move to within their own (minimal) clause.

17 It should be mentioned here that there are in fact more cases in which the verbal host is not responsible for the semantic role expressed by the clitic: as discussed extensively in Emonds (1999), Romance clitics can also be semantically dependent on adjectival predicates, quantifiers or nouns, as in (i–iii), respectively:

(i) Eso **me** resulta difícil.
this me result-pres-3sg difficult
'This is difficult for me.'

(ii) **Ne** arrivano molti. Italian
of-them arrive-past-3pl many
'Many of them arrived.'

(iii) **Ne** conosco l'autore. Italian
of-it know-pres-1sg the author
'I know the author of that.'

The point made below in the text, which is that Clitic Placement is normally restricted to clauses (CP/IP), also holds in these cases.

18 For aspectual auxiliaries we take over the analysis presented in Zagona (1988b).

19 Though some authors assume that Cl Cl takes place after intraclausal Cl Pl. Examples are Kayne (1989b) and Rooryck (1994a). See also section 6.3.2.

20 The term "Clause Mate Condition" is originally due to Ross (1986).

21 For details see Cinque (1988). See also chapter 42.

22 Raising Cl Cl verbs allow similar reflexive passives, as, e.g., in (i):

(i) Los plátanos **se** suelen comer con las manos.
The bananas SE tend-pres-3pl eat with the hands
'Bananas are usually eaten with your hands.'

In this case, however, we have to do with passivization in the complement clause and subsequent raising of the complement subject DP, as well as Cl Cl of *se*.

23 However, Rooryck (1994a) mentions that with the Italian verbs *cercare di* 'try to' and *provare a* 'try to', which allow Cl Cl for some speakers, Long DP-Movement is excluded. Moreover, there are Spanish speakers who exclude it with *querer* 'want'. For a possible explanation of this latter fact see Bok-Bennema and Kampers-Manhe (1994).

24 Null Operator Movement in Romance is much more restricted than, e.g., in English. In fact it only involves direct objects. Kayne (1989b) suggests that the Romance null operator undergoes Cl Pl (prior to movement to C). This might be interpreted as meaning that this operator is a covert accusative [+wh] clitic.

25 According to Zubizarretta (1980), in certain Spanish and Italian dialects sentences such as the one in (i), with clitics in situ, are grammatical. If this is so, the correlation between Cl Cl and Long Null Operator Movement is not absolute for all speakers:

(i) Esta mesa será difícil de poder vender**te**.
this table be-fut-3sg hard to can sell+you
'This table will be hard to be able to sell you.'

26 As raising verbs are *essere* verbs, the relevant Cl Cl verbs here are the control verbs, with the exception of *andare* and *venire*, which – in addition to being control verbs – are unaccusative and hence require *essere*.

27 For further details, see Burzio (1986: 364ff.).

28 Burzio (1986: 381) mentions one clear exception: Cl Cl verbs which require the infinitival particle *di*, such as *finire di* 'finish to', systematically exclude the *Avere* → *Essere* Shift. Boysen (1977) states that the shift for *sapere* (a Cl Cl verb) was not found in a large corpus of written Italian prose. Cf. also Kayne (1989b: 253).

29 Another Italian corollary of Cl Cl, presented in Rizzi (1978), is Long Dative *'Loro'* Placement. Apart from the discussion in Rizzi (1978), it is usually not considered in studies on Cl Cl, due to the fact that – as Rizzi puts it – dative *loro* belongs to "rather stiff style . . . on which many speakers of Italian do not have intuitions at all" (Rizzi 1978: fn. 29).

30 This is disputed by Kayne (1989b) and by Rooryck (1994a), on the basis of facts such as those mentioned in notes 23, 25, and 28.

31 The claim that the Cl Cl variant of Cl Cl verbs selects a VP complement is defended in Strozer (1976), Napoli (1981), Fresina (1982), Picallo (1985, 1990), Di Sciullo and Williams (1987), Rochette (1988), and Rosen (1990), among others.

32 Rizzi (1978) was the first to observe the parallelism between Aux–Adv–V sequences and Cl Cl verb–Adv–V sequences.

33 For details on these particles see Rizzi (1982a: chapter 3), Kayne (1984a: chapter 5), Haverkort (1993) and the references cited there.

34 The Italian examples in (i), from Fresina (1982), illustrate the order infinitival particle–negative particle for this language. The examples in (ii) are added to illustrate the Cl Cl nature of the verbs (+particles) involved:

(i) a. Sono riuscito a non leggerlo, quel romanzo pornografico.
be-pres-3pl succeeded to not read+it, that novel pornographic
'They succeeded in not reading it, that pornographic novel.'
b. La verità, Gianni stava per non dirla, allorché . . .
the truth, Gianni be-past-3sg for not to tell it, then . . .
'The truth, Gianni was in favor of not telling it, then . . .'

(ii) a. **Le** sono riuscito a parlare **t**.
him be-pres-3pl succeeded to speak
'They succeeded in speaking to him.'
b. La verità, Gianni **la** stava per tacere **t**, allorché . . .
the truth, Gianni it be-past-3sg for conceal, then . . .
'The truth, Gianni was in favor of concealing it, then . . .'

35 As discussed in Rooryck (1994a), similar examples with *wh*-words other than *che* are excluded by Italian informants (though they marginally allow these when the climbed clitic refers to a left-dislocated phrase). According to Rooryck the relevant distinction between *che* and other *wh*-words, such as *a chi* 'to whom' or *come* 'how', is that the former is clitical in nature. It should be mentioned here also that according to LaPolla (1988) examples analogous to (49) in the text are perfect in Mexican Spanish. LaPolla only considers cases with *qué* (=*che*).

36 For arguments that *ci* undergoes Cl Cl and doesn't itself function as the expletive, but is linked to it, see Burzio (1986: 126ff.).

37 As discussed in Burzio (1986: 389, fn. 36), the grammaticality of (i) is surprising, in particular when compared to (51b) in the text. *Molti* must be assumed to occupy the embedded object position, because *ne* can only originate from within objects. Nevertheless *molti-ne* 'many of them' is interpreted as also bearing the subject role assigned by *vorrebbero*. For possible solutions see the aforementioned footnote in Burzio (1986) as well as Zubizarreta (1982a) and Cinque (2004):

(i) **Ne** vorrebbero venire molti **t**.
of+them want-cond-3pl come many
'Many of them would want to come.'

38 Restructuring is also known as 'pruning' or 'clause union'. These terms are due to, respectively, Ross (1986) and Aissen and Perlmutter (1976).

39 Dutch main clauses require V-movement to second position. To abstract from this movement we follow the standard convention by presenting these type of examples in the form of a subordinate clause.

40 The SOV character of Dutch is not undisputed. Zwart (1993) was the first to propose that Dutch is in fact an SVO language.

41 While *non sapere* (Italian) marginally permits Cl Cl over *che* in the specifier of C (49), Cl Cl over the interrogative complementizer *se* is excluded. Cf. Kayne (1989b), Rooryck (1994a). This of course is also explained here.

42 This analysis correctly excludes *Essere* → *Avere* Shift with *andare* and *venire*. As discussed in note 10, the subject of these verbs originates as an object DP in the matrix clause. Restructuring will not affect the trace of this DP. As for the exclusion of this shift in the case of raising verbs, it must be assumed that the trace of the raised subject remains visible for auxiliary selection. See Burzio (1986: chapter 5) for further details.

43 Roberts doesn't use the notion 'clause'. Instead he makes use of the concept of 'Extended Projection', introduced by Grimshaw (1991).

44 Among these are Manzini (1983b) and Goodall (1987b), who claim that both the simplex and the complex structure are present at the same time (Coanalysis). Another example is Zubizarreta (1980), who argues for 'Thematic Restructuring'; that is, Restructuring at the level of LF. Burzio (1986) presents a special form of Restructuring, in which the VP of the complement is attached under the matrix VP, by means of a rule of VP preposing. We will return to this rule in section 6.4.3.

45 A precursor of the Government Transparency Corollary is the Head Condition, introduced by Zwarts (1975) to account for the transparency of Dutch Verb-Raising complements. Bok-Bennema (1981) applies this condition to Spanish Cl Cl complements.

46 In order to concentrate on the main points, we won't evaluate the specific analyses presented below (in sections 6.3, 6.4) with respect to all characteristics of Cl Cl listed in section 1.2.6. We leave such an evaluation to the reader.

47 There are at least two analyses that claim that IP normally functions as a barrier to Cl Cl. However, these analyses assume that the IP under consideration is the complement of an empty C. The most radical of them is Haverkort (1993), in which all infinitival complements (including raising ones) are CPs. In Haverkort's analysis the barrierhood of IP may be obviated by movement of the I_x projection (cf. section 5.2.2) – which includes the clitic and the verb, but not the subject – into the specifier of C. The central characteristic of Cl Cl verbs is that the C of their complements allows this movement. Ouhalla (1989) claims that Cl Cl is made possible by V-movement to C, which obviates the barrierhood of IP. He only considers control complements. It should be mentioned, in addition, that Kayne (1989b) proposes that Cl Cl has to proceed through C if the latter is present. Here again the reason is obviation of the barrierhood of IP.

48 The postcyclicity of Cl Pl is extensively defended in Kayne (1975). Notice, however, that it is incompatible with the idea, mentioned briefly in section 4.2, that cases such as (17b), repeated here as (i), involve remnant VP-movement: to account for the position of the clitic *lo*, the latter has to be attached to the verb *potevo* in I before movement of the remnant:

(i) [Leggere a tutti] non **lo** potevo.
read to all not it can-past-1sg
'Read it to everybody, I couldn't.'

Alternatives that don't require postcyclic Cl Pl will be discussed in sections 6.3.2 and 6.4.2.

49 In fact, Kayne disputes the fact that what we are calling corollaries do have this status: see note 30. Bok-Bennema and Kampers-Manhe (1994) (see below in the text), on the other hand, claim that the corollaries do indeed follow from Weak Restructuring. They argue that this process also applies in French.

50 This is compatible with the idea defended in Koopman and Szabolcsi (2000) that all XP constituents originated in the VP must move to higher Checking Positions.

51 One interesting alternative dispenses with Cl Pl altogether and equates Cl Cl with Long XP-Movement. This is proposed in Sportiche (1996b) and followed up in Roberts (1997b). Under this view, clitics are base-generated in their surface position, as heads with an empty specifier position (Voice heads). The thematic or adjunct position to which the clitic is related contains an empty XP, which must move to the specifier position of the clitic, which in Cl Cl cases is of course a matrix clause position.

52 For more specific details of Haverkort's analysis, see note 47.

1 Introduction

1.1 The phenomenon

Clitic doubling is a construction in which a clitic co-occurs with a full DP in argument position forming a discontinuous constituent with it, as is illustrated in (1) with an example from Spanish (Jaeggli 1986b: 32):

(1) Lo vimos a Juan. Rioplatense Spanish
Him we-saw *a* Juan
'We saw Juan.'

Clitic doubling has been claimed to exist in Romance, Semitic, Slavic, Albanian, and Greek (see, among others, Strozer 1976; Rivas 1977; Aoun 1981, 1999; Jaeggli 1982, 1986b; Drachman 1983; Borer 1984a; Suñer 1988; Philippaki-Warburton 1987; Fykias 1988; Dobrovie-Sorin 1990; Sportiche 1996b, 1998; Massey 1992; Anagnostopoulou 1994, 2003; Uriagereka 1988, 1995a; Torrego 1998; Bleam 1999; Petkova Schick 2000; Kallulli 1999). Doubling has also been claimed to exist in Pirahã, a member of the Mura language family spoken in the Maici river in Amazonas, Brazil (Everett 1987).

Clitic doubling displays intriguing cross-linguistic variation which has been widely discussed in the literature. In particular, while some languages (e.g., Spanish and Romanian) have clitic doubling of objects, others (e.g., French and Italian) lack this type of construction (data from Jaeggli 1982: 12–13; see later sections for discussion of further cross-linguistic differences). This difference is illustrated in (2) with an indirect object clitic doubling example from Spanish and in (3) with its ungrammatical counterpart from French:

(2) Miguelito (le) regaló un caramelo a Mafalda. All dialects of Spanish
Miguelito Cl-dat gave a candy a Mafalda
'Miguelito gave Mafalda a piece of candy.'

(3) Jean (*lui) a donné des bonbons à Marie. French
John Cl-dat has given the candies to Mary
'John gave candies to Mary.'

The study of clitic doubling has always enjoyed a privileged position among investigations of cliticization, which center on the question of whether clitics move

to their surface position from an argument position or whether they are base-generated in their surface position, functioning as agreement markers of sorts. The movement view of cliticization is pursued in a number of analyses which belong to a tradition initiated by Kayne's (1975) seminal work on French, which lacks clitic doubling of objects. A major argument for the base-generation alternative analysis is the existence of clitic doubling phenomena, which were first observed and discussed in Strozer (1976) and Rivas (1977) for Spanish.

1.2 Overview of the history

The history of the study of clitic doubling can be divided into the following periods, which coincide with different stages of the Principles and Parameters theory:

(i) Early Government and Binding (GB) studies (e.g., Jaeggli 1982, 1986b; Borer 1984a) take clitic doubling as an argument for a base-generation analysis of clitics and the movement-properties of cliticization as properties of Chains rather than actual Movement. In their attempt to isolate the factor underlying the Clitic Doubling Parameter, i.e., the property that permits formation of clitic–argument pairs in some languages (Spanish, Romanian) but not in others (French, Italian), these accounts capitalize on Romance and Semitic clitic doubling, which is limited to DPs that are preceded by special prepositions (*a* in Spanish, *pe* in Romanian, *šel* in Hebrew). Example (4) attests to the availability of clitic doubling with direct objects preceded by *a* in Rioplatense Spanish.

(4) La oían a la niña. Rioplatense Spanish
ACC listened-3pl a the girl-ACC
'They listened to the girl.'

The fact that doubling clitics co-occur with arguments preceded by special prepositions is known in the literature as Kayne's Generalization (attributed to Kayne in Jaeggli 1982: 20). Within the literature of this period, Kayne's Generalization is assumed by most researchers to provide the key to the Clitic Doubling Parameter. The parameter regulating the cross-linguistic distribution of clitic doubling is claimed to be Case-theoretic. Specifically it is proposed that clitics absorb Case and, accordingly, clitic doubling is only possible in languages with special prepositions which can license Case on the doubled object.

(ii) Late GB studies maintain the base-generation syntax of clitics and concentrate on certain interpretive effects associated with direct object clitic doubling, which will be referred to by the term 'specificity' (see Enç 1991 and Diesing 1992b for discussion and references). This change of perspective is initiated by Suñer (1988), who argues on the basis of data from Argentinean Spanish that direct object clitic doubling does not rely on the presence of special prepositions, contrary to what had been previously thought. Suñer argues that special prepositions are markers for animacy, while clitic doubling is related to partitiveness

and specificity, in the sense of being licensed only when the doubled argument is partitive or discourse-specific. A similar point is made by Dobrovie-Sorin (1990) on the basis of Romanian direct object doubling. The shift of focus from the phrase structure of doubling clitics to their interpretational effects sheds new light on potential factors underlying the Clitic Doubling Parameter. Clitic doubling is linked to a number of constructions where different semantico-pragmatic properties of direct objects are systematically encoded through morphosyntactic differences, such as scrambling in Dutch and German (De Hoop 1992; Diesing 1992b), participle agreement in French (Adger 1993; Obenauer 1994) and Hindi (Mahajan 1990) and morphological accusative case in Turkish (Enç 1991). The view that doubling and scrambling have the same underlying syntax is first suggested in Sportiche (1996b, original manuscript 1993; see below) and is further defended in Anagnostopoulou (1994), on the basis of interpretational similarities between the two constructions, and in Alexiadou and Anagnostopoulou (1997b), on the basis of evidence from binding (Weak Crossover and Principle C).

(iii) In the early 1990s, new analytic options arise for cliticization and clitic doubling due to a number of major developments in the syntactic formalism. Among them, I note the following: (a) the proliferation of functional projections (Ouhalla 1988; Pollock 1989); (b) the investigation of the conditions on Head Movement (see, e.g., Koopman 1984; Travis 1984; Baker 1988a); (c) the typology of A- and A'-positions, which became particularly important to the understanding of the various types of scrambling (short-distance, medium-distance, and long-distance; see, among others, Déprez 1989; Webelhuth 1989, 1992; Mahajan 1990; Saito 1992) and the locality conditions on Chains (Rizzi 1990b; Cinque 1990c); (d) the extensive postulation of covert movement operations to the functional domain (see, e.g., Chomsky 1991 for head movement and Chomsky 1993 for argument movement); (e) the view that movement is triggered by morphosyntactic features filtering out improper representations where a functional head and an XP do not enter spec–head agreement (Rizzi 1991b for *wh*-movement and all Minimalism, up to Chomsky 2000). These developments lead to a reconciliation of the base-generation and movement approaches to cliticization. It becomes possible to maintain that there is both a movement and a base-generation component in the syntax of cliticization and clitic doubling. Two influential proposals which combine movement with base generation in different ways are developed in an unpublished 1993 paper by Sportiche (versions of this paper were later published as Sportiche 1996b, 1998) and in Uriagereka (1988, 1995a), who bases himself on unpublished work by Torrego (1988). Sportiche (1996b) argues that clitics are heads in the extended projection of V, i.e., they are parts of the V-inflectional system. On the other hand, Uriagereka (1988, 1995a) treats clitics as determiners, i.e., as heads in the extended projection of N. Sportiche proposes that the doubled DP is generated in an argument VP-internal position and undergoes movement to or through the clitic position at some stage in the derivation (overtly or covertly). The availability of clitic doubling depends on whether a clitic can co-occur with an overt DP. A filter similar to the Doubly Filled Comp filter determines whether doubling is possible in a designated language.

Uriagereka suggests that the doubled DP is in the Spec,DP position of a complex DP headed by the doubling clitic which undergoes movement to its surface site. Drawing on evidence from Romance, Uriagereka argues that in some languages, determiners are strong enough to head such complex DPs and in others not: this determines availability of clitic doubling.

(iv) The research summarized so far is placed within an influential tradition that treats clitic constructions as being uniform. In such a conception, variation in the types of clitic chains encountered cross-linguistically is traceable to a single difference between, e.g., Spanish and French – what has been referred to as the 'Clitic Doubling Parameter'. Against this tradition, there is a current trend for fragmentation: clitics are argued to have a different syntax across languages and constructions. One such proposal is developed by Bleam (1999), who argues that accusative clitics are determiners and dative clitics are inflections. Another proposal that takes the uniformity of clitics to be epiphenomenal is put forth in Anagnostopoulou (2003). Dative clitics relating to the double object construction are argued to have a different syntax in Greek and, e.g., the Bantu language Sesotho. Note, finally, that there is a change at the data level. The GB view that clitic doubling is absolutely impossible in certain clitic languages like Italian and French is no longer valid. Kayne (2000) argues that clitic doubling of strong pronouns is possible – in fact, obligatory – in French.

1.3 Organization of the discussion

Having outlined the main theoretical issues arising in connection with clitic doubling, I now turn to a more detailed presentation of the issues surrounding this phenomenon. The discussion is organized as follows. In section 2, I discuss two related clitic constructions, namely Clitic Left Dislocation (CLLD) and right dislocation, addressing the question of how these relate to clitic doubling. In section 3, I present the history of the research on clitic doubling within the tradition that treats clitic constructions as being uniform. A central question within this line of approach has to do with the nature of the Clitic Doubling Parameter. In section 4, a number of proposals are presented that take the syntax of clitics as differing across languages and constructions.

2 Clitic doubling and related constructions

Clitic doubling should be, at least descriptively, distinguished from two constructions that look very similar to it, namely Clitic Left Dislocation (CLLD) and right dislocation.

2.1 Clitic doubling vs. CLLD

CLLD is a construction in which a clitic co-occurs with an XP to its left. An example of CLLD is provided in (5) from Italian (Cinque 1990c: 71):

(5) Gianni, lo vedrò domani. Italian
Gianni him will-see-I tomorrow
'I will see Gianni tomorrow.'

CLLD is an unbounded dependency that is selectively sensitive to islands and shows connectedness effects (see Cinque 1990c; Iatridou 1994; Anagnostopoulou 1994; and the various contributions to Anagnostopoulou et al. 1997).

Given the similarity between CLLD of objects in (5) and clitic doubling, a natural question that arises is whether CLLD results from fronting of a clitic doubled DP to a position in the left periphery of the clause. Agouraki (1993), Kayne (1994), Sportiche (1996b), and Grohmann (2003), among others, argue in favor of analyses along these lines, which straightforwardly explain the connectedness properties of CLLD. On the other hand, Cinque (1990c), Iatridou (1994), and Anagnostopoulou (1994) point out that the two constructions show a number of systematic differences, which are summarized below (see Anagnostopoulou 1994: 151–158 for an overview):

(i) There are languages that have CLLD but not clitic doubling. Italian presents such a case. While CLLD is grammatical in Italian, as shown in (5), doubling is not, as shown in (6):

(6) *Lo vedrò domani Gianni. Italian
Him will-see-I tomorrow Gianni

(ii) There are languages in which doubling is subject to Kayne's Generalization while CLLD is not. Rioplatense Spanish presents such a case:

(7) a. Lo vimos a Juan. Rioplatense Spanish
Him saw-we a Juan
'We saw Juan.'
b. *Lo compramos el/al libro.
It bought-we the book
'We bought the book.'

(8) a. A Juan, lo vimos ayer.
A Juan him saw-we yesterday
'We saw Juan yesterday.'
b. El libro, lo compramos ayer.
The book it bought-we yesterday
'We bought the book yesterday.'

(iii) While the cases of doubling reported in the literature are limited to (doubling of) DPs, the dislocated constituent in CLLD can be any maximal phrase. The Italian data in (9) (Cinque 1990c: 58) exemplify CLLD of PPs and APs:

(9) a. A casa, non ci sono stato ancora. Italian
To home, not there am been yet
'I haven't been home yet.'
b. Di questa faccenda, non ne voglio più parlare.
Of this matter, not of-it want anymore talk
'I don't want to talk about this matter anymore.'
c. Bella, pare che non lo sia mai stata.
Beautiful, seems that not it is ever been
'It doesn't seem that she has ever been beautiful.'

(iv) There are semantic classes of noun phrases that can undergo CLLD but resist clitic doubling, as illustrated in (10) with examples from Greek:

(10) a. Tria provlimata mono o Kostas ta elise. Greek
Three problems only the Kostas them solved
'Only Kostas solved three problems.'
b. ?*Mono o Kostas ta elise tria provlimata.
only the Kostas them solved three problem

These differences are unexpected if CLLD is the movement counterpart of doubling, arguing against the reduction of CLLD to an underlying clitic doubling source. For this reason, Cinque (1990c), Iatridou (1994), and Anagnostopoulou (1994) propose that in CLLD the left-dislocated phrase is base-generated in a left-peripheral adjunct position. The main problem for base-generation analyses of CLLD is that they have to appeal to special mechanisms in order to derive the connectivity property of CLLD (on selective island sensitivity, see Iatridou 1994 and Demirdache 1991).

2.2 *Clitic doubling vs. right dislocation*

Right dislocation is a construction in which a clitic co-occurs with a phrase to its right as illustrated in (11) with an example from French (from Jaeggli 1986b: 33):

(11) Je l' ai vu, l' assassin. French
I him have seen, the murderer
'I saw him, the murderer.'

Right dislocation of subjects and objects has been discussed by, among others, Antinucci and Cinque (1977), Jaeggli (1986b), Calabrese (1992b), Vallduví (1992), Bonet (1991), and Zubizarreta (1994, 1998). Given the similarity between right dislocation of objects and clitic doubling, the question once again arises whether the two constructions have the same or a different structural analysis. In the literature, both positions have been entertained. According to one view (Aoun 1981; Hurtado 1984; Philippaki-Warburton 1987; and much later literature), there

is no formal difference between clitic doubling and right dislocation. In both constructions, the phrase associated with the clitic is an adjunct. According to another view (Strozer 1976; Rivas 1997; Jaeggli 1982, 1986b; Borer 1984a), the object is generated as a complement of the verb in clitic doubling constructions, while it is an adjunct (to VP or IP) in right dislocations. In the present discussion, the latter approach will be adopted because, as will be demonstrated in this section, there are strong arguments against unifying them structurally.

Jaeggli (1986b: 32–35) argues against the adjunct analysis of clitic doubling on the basis of the following systematic differences between right dislocation and clitic doubling:

(i) In right dislocation, the dislocated phrase is set off from the rest of the sentence with a sharp intonational break, as illustrated in (12), while no such break is required before the object in clitic doubling, as illustrated in (13):

(12) Parece que tuvieron que llevarla de urgencia a los Estados Unidos la hija de Coronel Martínez. Rioplatense Spanish
'It seems that they had to take her urgently to the United States the daughter of Coronel Martinez.'

(13) Parece que tuvieron que llevarla a la hija de Coronel Martinez de urgencia a los Estados Unidos.
'It seems that they had to take her the daughter of Coronel Martinez urgently to the United States.'

The difference in intonation between (12) and (13) correlates with a difference in word order. In (12) the direct object occurs at the very end of the sentence, following all other phrases. On the other hand, in (13) the direct object is followed by the string *de urgencia a los Estados Unidos.* According to Jaeggli, these two differences would be mysterious if clitic doubling and right dislocation have the same structural analysis, while they naturally follow from the proposal that doubling is a chain consisting of a clitic and an argument while, in right dislocation, the right-dislocated phrase occurs in a peripheral right-adjoined position.

(ii) Right dislocation is not subject to Kayne's Generalization, as illustrated in (12), while clitic doubling requires the presence of the preposition *a* preceding the doubled phrase, as illustrated in (13).

(iii) There are languages that have right dislocation but disallow clitic doubling. French presents such a case. This language freely allows right dislocation, as was illustrated in (11), while lacking clitic doubling, as was shown in (3).[1]

In later literature, the properties of right dislocation have been investigated in more detail. More specifically, Vallduví (1992) and Zubizarreta (1994, 1998) focus on an intonational property of right dislocation not discussed in Jaeggli (1986b). While for Jaeggli (1986b) the salient property of right dislocation is a pause separating it from the rest of the clause, for Vallduví (1992) and Zubizarreta (1994, 1998) the crucial

property is that the intonation peak of the sentence falls on some element preceding the right-dislocated phrase. Right dislocation is found in all clitic languages and can be easily mistaken for doubling because it is productive and the presence of a pause is not its most prominent feature. In fact, as will be pointed out below, a pause doesn't have to be present at all. It is therefore necessary to present here a more complete picture of right dislocation, as opposed to clitic doubling.

According to Vallduví, the main informational task of right dislocation is to focus V^0 or a projection of V^0. The intonation peak of the sentence falls on V^0 to which the clitic (and the negation, if present) attaches. The example in (14) is an instance of this construction in Catalan (from Vallduví 1992: 102):

(14) La vaig VEURE la baralla. Catalan
It 1-sg-past-see the fight
'I SAW the fight (I did see the fight).'

Evidence from word order supports the view that in right dislocation the DP "doubled" by the clitic is an adjunct. In Catalan locative constructions, the order of the verbal complements is fixed. The direct object must precede the locative phrase carrying the main stress of the sentence, as illustrated in (15a). A stressed object is not allowed to follow the locative phrase, as illustrated in (15b) (from Vallduví 1992: 96, 98):

(15) a. Fiquem el ganivet al calaix. Catalan
Put-we the knife in-the drawer
'We put the knife in the drawer.'
b. *Fiquem al calaix el ganivet.
Put-we in-the drawer the knife
'We put the knife in the drawer.'

When a clitic is present, signaling right dislocation, word order and intonation must be as in (16b), i.e., the direct object must follow the locative phrase, which carries the main sentence stress. As (16a) shows, the right-dislocated object is not allowed to precede the locative phrase:

(16) a. *El fiquem el ganivet al calaix. Catalan
it put-we the knife in-the drawer
'We put the knife in the drawer.'
b. El fiquem AL CALAIX el ganivet.
it put-we in-the drawer the knife
'We put the knife in the drawer.'

Vallduví's discussion of right-dislocated objects in Catalan creates the impression that their crucial property is that they be de-accented while the intonation peak of the sentence falls on some preceding material, the V-cluster in (14) and the locative phrase in (16b). However, even this picture is not refined enough.

In her discussion of right dislocation of objects in Standard Spanish, Zubizarreta (1998: 151–158) draws a further distinction between right-dislocated objects and de-accented in situ objects. The former co-occur with a clitic and follow a subject bearing Nuclear Stress, as illustrated in (17). The latter do not co-occur with a clitic and follow a subject bearing Contrastive Stress, as illustrated in (18):

(17) La lavó mamá, la mamadera. Standard Spanish
Cl-Acc washed Mother the milk bottle
'Mother washed the milk-bottle.'

(18) Lavó mamÁ, la mamadera.
washed mother the milk bottle
'Mother washed the milk bottle.'

Zubizarreta points out that there is no prosodic boundary between in situ de-accented objects and the nuclear pitch-accented words preceding them in examples like (18). On the other hand, the prosodic status of right-dislocated objects in (17) is comparable to some extent to that of English tags. Like tags, right-dislocated objects constitute a distinct prosodic phrase from the preceding material and they bear their own nuclear pitch accent. Similarly to tags, right-dislocated objects are perceived as less prominent than the preceding nuclear pitch-accented word. Unlike tags, however, right-dislocated phrases may be preceded by a salient pause. Thus, a pause may be present in right dislocation, as observed by Jaeggli (1986b), but doesn't have to be present, contrary to what Jaeggli (1986b) thought. Concerning the phrase structure asymmetries between right-dislocated constituents and in situ de-accented constituents, Zubizarreta points out that there are two systematic differences between them. First, as seen in (17) and (18), in situ de-accented objects do not co-exist with clitics, while with right-dislocated objects the presence of a clitic is obligatory. Second, in locative structures the order among dislocated constituents is free, as illustrated in (19) (the hash mark indicates the prosodic boundary preceding a right dislocated phrase), while the order among in situ de-accented objects is fixed, as shown in (20):

(19) a. Escondió el libro #el niño #debajo de la cama. Standard Spanish
Hid the book #the boy #under the bed
b. Escondió el libro #debajo de la cama #el niño.
'The boy hid the book under the bed.'

(20) a. Escondió el niño el libro debajo de la cama.
Hid the boy the book under the bed
b. *Escondió el niño debajo de la cama el libro.
'The boy hid the book under the bed.'

The structural properties Zubizarreta (1998) isolates as being typical of right dislocation coincide with those identified by Vallduví (1992): (i) obligatory presence of a clitic and (ii) freedom of word order in locative constructions where order is otherwise rigid.

Even though a clitic co-occurs with an object to its right in both clitic doubling and right dislocation, the two constructions can be easily distinguished in Spanish and Catalan. Clitic doubling is subject to Kayne's Generalization (i.e., it takes place with pronouns or DPs preceded by the preposition *a* associated with animacy), while right dislocation takes place with DP objects of any kind, as illustrated in, e.g., (14), (16b), and (17), where a clitic co-occurs with an inanimate object not preceded by *a*. This difference in form correlates with the intonational and positional differences discussed above. Objects undergoing clitic doubling can be accented and precede elements with nuclear stress, unlike right-dislocated objects. Thus, in Standard Spanish, where indirect objects and direct object pronouns are allowed to (or must; see section 3.1 below) undergo clitic doubling, a doubled indirect object may carry nuclear stress, as shown in (21a) (from Zubizarreta 1998: 198, (iv)), and a doubled direct object pronoun may precede a non-right-dislocated focused subject receiving nuclear stress, as shown in (21b) (from Zubizarreta 1998: 186, (vi)):

(21) a. Se lo envió a <u>mamá</u> #María #el regalo. Standard Spanish
Cl-Dat Cl-Acc sent to mother #Mary #the present
'Mary sent the present to Mother.'

b. Esta mañana lo castigó a él [$_{F}$la madre de <u>Juan</u>].
This morning Cl-Acc punished him the mother of Juan
'This morning, Juan's mother punished him.'

Thus, doubled objects have the intonation and distribution of arguments, while right-dislocated objects have the intonation and distribution of peripheral elements. These differences can be straightforwardly expressed in an analysis according to which the former occupy argument slots and the latter are right-adjoined elements, as proposed by Jaeggli (1986b) and Vallduví (1992).

The analysis of right dislocation in terms of right-adjunction must be reformulated in antisymmetry proposals, which reject right-adjunction. To this end, both Kayne (1994) and Zubizarreta (1998) relate right dislocation to CLLD. Kayne (1994: 82–83) proposes that in both clitic doubling and right dislocation, the DP doubled by the clitic is base generated in an argument position, thus unifying structurally clitic doubling with right dislocation. To express the intonational and interpretational differences between right dislocation and doubling, Kayne suggests that the former construction is an instance of CLLD at LF, i.e., the right-dislocated phrase undergoes LF-movement of the CLLD type. Covert CLLD is triggered by a feature having the effect of a particular intonation contour at PF. No such feature is present in clitic doubling. Alternatively, Zubizarreta (1998: 198, fn. 57) suggests that right dislocation involves clitic left dislocation followed by leftward movement of the TP across the left-dislocated constituent. Given the

distributional differences between right dislocation and clitic doubling mentioned above, the latter approach is descriptively more adequate, as it captures the fact that right-dislocated elements occupy a peripheral position in the sentence, unlike doubled elements. In Kayne's proposal, this difference is not explained.

3 Unification views: a historical perspective

Having clarified the relations between CLLD, right dislocation, and clitic doubling, I am now in a position to turn to the core issues arising in connection with clitic doubling, defined as a construction in which a clitic forms a chain with a phrase in argument position. This definition puts me in agreement with certain theoretical proposals and not with others. In particular, I will not discuss here the theories developed in Aoun (1981), Hurtado (1984), Philippaki-Warburton (1987), and others, which take the doubled DP to be an adjunct.

3.1 Early GB approaches: a parameter relating to Kayne's Generalization

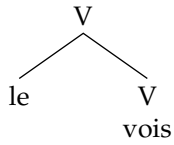
3.1.1 Movement vs. base generation

Consider the French examples in (22):

(22) a. Je le vois. French
I him see
'I see him.'
b. *Je le vois Jean.
I him see John
'I see John.'

In (22a), *le* appears as a morpheme bound to the verb on the basis of a number of tests. For example, it cannot appear in isolation, it cannot be stressed or coordinated, nothing can interrupt the cl–V sequence etc. (see, among others, Kayne 1975: 82–87). This leads to a representation as in (23), where the clitic and the inflected verb form a morphological unit:

(23)



A central issue in the study of clitics is whether the complex [le–vois] in (22a) is directly inserted from the lexicon (the base-generation/lexicalist approach) or the clitic moves to its host from the postverbal complement position of the verb (the movement/syntactic approach).

In Kayne (1975) it is argued that the movement analysis correctly accounts for the fact that clitics and full DP objects are in complementary distribution, as is evidenced by the ungrammaticality of (22b) in French. It is furthermore pointed out that in causative constructions, a dative clitic cannot appear in the main clause in the presence of a subject in the embedded clause, a Specified Subject Condition (SSC) effect providing corroborating evidence for a syntactic approach to clitic placement:

(24) a. Jean a laissé Pierre parler à Marie. French
John has let Peter speak to Mary
'John has let Peter speak to Mary.'
b. Jean l' a laissé parler à Marie.
John him has let speak to Mary
'John has let him speak to Mary.'
c. *Jean lui a laissé Pierre parler.
John to her has let Peter speak
'John has let Peter to speak to her.'

(25) $X_{lui} \ldots {}_S[\ldots Z_{Piene} \ldots W\ Y_{source\ of\ lui} \ldots]$

(25) is the representation of (24c), where X is the surface position of *lui*, Z is the position of the embedded subject Pierre, and Y is the source position of *lui*. This configuration violates the SSC, as stated in (26), which Chomsky (1973) views as a condition on transformations:

(26) No rule can involve X, Y in the structure . . . X . . . $_s$[. . . Z . . . -WYV . . .] where Z is the subject of WYV.

The postulation of a Clitic-Placement transformation (as opposed to inserting clitics in the clitic position via Phrase Structure Rules) correctly predicts the fact that it is subject to the SSC. The movement view was adopted by Quicoli (1980) and others.

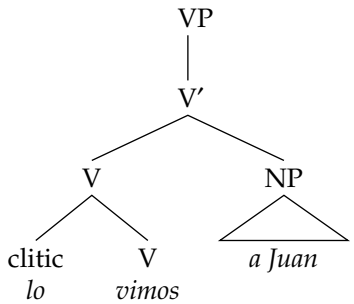
Kayne's major argument for a movement approach to cliticization, namely the complementarity between clitics and full NPs, has been challenged on the basis of clitic doubling in a number of languages with pronominal clitics, such as Spanish, Romanian, and Hebrew, which are exemplified in (27) (see Jaeggli 1982: 15–19 for critical discussion; in Aoun 1981 and Hurtado 1984 the movement view is maintained by analyzing doubled DPs as adjuncts):

(27) a. Lo vimos a Juan. Rioplatense Spanish
him saw-we a John
'We saw John.'
b. L-am văzut pe Popescu. Romanian
him-have-I seen pe Popescu
'I have seen Popescu.'

c. Beit-o šel ha-more 'omed 'al ha-giv'a. Modern Hebrew
house-his šel the-teacher stands on the-hill
'The teacher's house stands on the hill.'

These examples show that there are languages in which clitics and argument NPs are not in complementary distribution. For, e.g., (27a) a representation along the lines of (28) is needed (Borer 1984a and Jaeggli 1986b argue that clitics are parts of the head, as opposed to the earlier proposal in Rivas 1977 and Jaeggli 1982: 98, fn. 10, that they are sisters of V immediately dominated by V'):

(28)



Since the complement position of the verb is occupied by *a Juan*, it is hard to maintain a movement analysis for clitic doubling, as there is no source position available for the clitic. This leads to the view that *lo* in (28) is directly inserted under V. Ethical datives constitute a further argument for base generation. In Spanish, ethical datives are obligatorily realized as clitics, a fact suggesting that the thematic role assigned to the dative clitic is never assigned to an NP in argument position (data first discussed in Perlmutter 1971):

(29) a. Me le arruinaron la vida a mi hijo. All dialects of Spanish
Cl-Dat cl-Dat destroyed the life to my son
b. *Le arruinaron la vida a mi hijo a mí.
Cl-Dat destroyed the life to my son to me
'They ruined my son's life.'

In Jaeggli (1982: 18–19) it is argued that ethical dative clitics are base generated in the clitic position since they do not alternate with phrases in the canonical argument position.

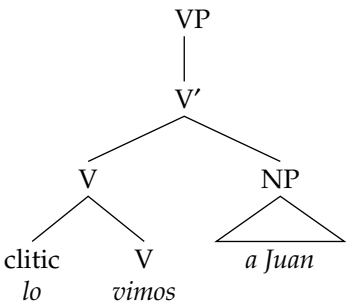
The view that (i) clitics are inserted from the lexicon in clitic doubling and ethical dative constructions and (ii) all clitics share the same syntax leads to a base-generation analysis of non-doubling clitic constructions, such as the Spanish example (30) and its French counterpart *je le vois* (see (22a)):

(30) Lo veo. Standard Spanish
Cl-ACC see-I
'I see him/it.'

Under the 'uniformity' view, clitics are base generated in their surface position even in languages like French where clitic doubling is disallowed.

Base-generation analyses of clitics are developed in Bouchard (1984), Jaeggli (1982, 1986b), Borer (1984a), and Burzio (1986), among many others. According to these proposals, the only difference between (30) and (27) is that in (30) the clitic is associated with an empty category in complement position, as illustrated in (31):

(31)



In a base-generation analysis, SSC effects of the type illustrated in (24) do not constrain movement per se, but rather the relationship between the clitic and the base-generated empty category in the complement position of V:

(32) $X_{\text{lui}} \ldots {}_{S}[\ldots Z_{\text{Pierre}} \ldots W\ Y_{\text{source of lui}} \ldots]$

This is compatible with Chomsky's (1981) position that the SSC is part of the Binding Theory, which applies equally to Movement Chains and Base-Generated Chains (see Sportiche 1996b, 1998 and Van Riemsdijk 1999 for an overview). See Borer (1984a) for extensive argumentation that the clitic in (28) and (31) governs and c-commands the co-indexed NP position (see also Jaeggli 1986b). As stressed by Borer (1984a: 35), an analysis along these lines treats clitic constructions without doubling as being formally similar to the output of movement rules. Since the base-generated clitic is co-indexed with the empty category it c-commands, base-generated constructions of this type are identical in representational terms to movement dependencies.

Base-generated chains consisting of a clitic and an (overt or covert) NP pose a number of questions, widely discussed in the early GB literature (see Jaeggli 1986b for an overview).

(i) What is the role (argument–non-argument) and position (A, A') of the clitic?
(ii) What is the relation between the verb and the clitic, on the one hand, and the verb and the NP, on the other, in terms of thematic roles and Case?
(iii) What is the relation between the clitic and the NP (what type of Chain do they form)?

(iv) How does the base-generated empty category in (31) fit Chomsky's (1981, 1982) typology of empty categories (is it PRO, pro, or a different type of category)?
(v) What explains the difference between languages like French, where the complement position of the verb is obligatorily empty in the presence of the clitic, and languages like Spanish, where the two are allowed to co-occur?

Due to space limitations, it is impossible to present an exhaustive list of all answers to these questions suggested in the early GB literature. I focus here on the fifth question, namely the Clitic Doubling Parameter, which, as will become evident, presupposes a particular view on clitic chains, highlighting some of the positions taken by individual researchers with respect to the other questions. In the next subsection, I present two representative proposals on the Clitic Doubling Parameter developed in the framework of Chomsky (1981), namely Jaeggli (1982) and Borer (1984a). The facts they discuss compose an intriguing picture of variation within and across languages. Before proceeding, I would like to point out that these researchers (as well as Steriade 1980; Dobrovie-Sorin 1990; Suñer 1991) extensively discuss the behavior of clitic doubling in *wh*-constructions. This issue is disregarded here.

3.1.2 Kayne's Generalization and the Clitic Doubling Parameter

The main insight expressed in Jaeggli's (1982) theory of cliticization is that clitic doubling is a marked phenomenon (see Jaeggli 1982: 20 for theoretical discussion): within Romance, clitic doubling is found to varying extents in Spanish and Romanian, while it is totally absent in French and Italian (as already mentioned, later research has shown that clitic doubling is not totally absent from French and Italian; see, e.g., Kayne 2000 on French). It is pointed out that within Romance, the property that appears to regulate the cross-linguistic distribution of doubling is Kayne's Generalization: an object NP may be doubled only if it is preceded by a special preposition. It is therefore concluded that the theory of cliticization must be flexible enough to allow for the clitic doubling option but restrictive enough to treat doubling as a specific option limited to Kayne's Generalization environments. To this end, it is proposed that clitics are generated in the clitic position and they absorb government of the verb (a special kind of government called 'subcategorization government'), due to a uniqueness condition on government. (Recall that Jaeggli did not assume that the clitic is part of V but rather analyzed it as a sister of V dominated by V'.) As a result of government-absorption, the empty NP in complement position in (31) is PRO, which is ungoverned. (The view that clitics absorb government and that the complement position of the verb is ungoverned was argued against in Borer 1984a and was also dropped in Jaeggli 1986b. According to Borer 1984a, the empty position is undefined in terms of Chomsky's system; according to Jaeggli 1986b, it is pro.) When an overt NP occurs in object position, it cannot receive Case, which must be assigned under government. Therefore, clitic doubling is ruled out as a Case Filter violation (Vergnaud cited in Chomsky 1981), unless a special preposition is present, which can assign Case to the NP. Kayne's Generalization is thus linked to Case theory.

In Jaeggli's (1982) theory, the cross-linguistic differences in the distribution of clitic doubling in Romance are accounted for as follows (see Jaeggli 1982 for details and Jaeggli 1986b for some revisions):

(i) **Direct Object Doubling: presence vs. absence of *a*; *a* is not always a Case-assigner.**
Direct Object Doubling is allowed in Rioplatense Spanish with animate, specific objects, which are introduced by the special preposition *a* (33a). It is disallowed in Rioplatense Spanish when the object is inanimate and a preposition in front of it is impossible (33b). Doubling is ruled out in French and Italian, where the option of inserting *a* is unavailable, as illustrated in (34) for French. Finally, in Standard Spanish direct object doubling is ruled out, even though animate, specific objects are introduced by *a* (35):

(33) a. Lo vimos a Guille. — Rioplatense Spanish
Cl-acc saw-we a Guille
'We saw Guille.'
b. *La vimos la casa de Mafalda.
Cl-acc saw-we the house of Mafalda
'We saw the house of Mafalda.'

(34) a. *Je le vois Jean. — French
I him see John
'I am seeing John.'
b. Je vois Jean.
I see John
c. *Je vois à John

(35) a. *Lo vimos a Guille. — Standard Spanish
Cl-acc saw-we a Guille
'We saw Guille.'
b. Vimos a Guille.
Saw-we a Guille

The contrasts between (33a) and (33b) in Rioplatense Spanish, on the one hand, and (33a) in Rioplatense Spanish and (34a) in French (and Italian), on the other, are linked to the presence vs. absence of *a*. When *a* is present, as in (33a), Case can be assigned to the NP complement of V. In the absence of *a*, the NP cannot be assigned Case, violating the Case Filter. In order to account for the contrast between Rioplatense Spanish (33a) and Standard Spanish (35a), it is stipulated that *a* cannot assign Case to direct objects in Standard Spanish.

(ii) **Indirect Object Doubling: *a* is a preposition or a Case marker.**
Indirect object doubling is permitted in all dialects of Spanish and is disallowed in French and Italian. The relevant examples are repeated from above, for Spanish and French respectively:

(2) Miguelito (le) regaló un caramelo a Mafalda. All dialects of Spanish
Miguelito Cl-dat gave a candy a Mafalda
'Miguelito gave Mafalda a piece of candy.'

(3) Jean (*lui) a donné des bonbons à Marie. French
John Cl-dat has given the candies to Mary.
'John gave candies to Mary.'

The problem posed by this contrast is that in both Spanish and French/Italian, indirect objects must be preceded by *a*, and yet doubling is ruled out in the latter group of languages, as illustrated in (3). To account for this, Jaeggli suggested that *à* is a Case marker in French, i.e., it realizes dative Case rather than assigning it. He presents two pieces of evidence that *à* is not a preposition in French, which are based on coordination (Vergnaud 1974). First, contrary to coordinated PPs in (36a), coordinated indirect objects introduced by *à* in French can serve as antecedents of a relative clause (37a), behaving like NPs. Moreover, while the complement of a preposition can be a conjunction of noun phrases as in (36b), this is not allowed with the complement of *à*, as shown in (37b). Instead, two *à*-phrases must be coordinated, as shown in (37c):

(36) a. *Il a compté sur l'homme et sur la femme qui French
He has counted on the man and on the woman who
se sont recontrés hier.
refl are met yesterday
'He counted on the man and the woman who met yesterday.'
b. Ils se sont assis sur la table et les chaises.
They refl are sat on the table and the chairs
'They sat on the table and the chairs.'

(37) a. Il a parlé à l'homme et à la femme qui se sont
He has spoke to the man and to the woman who refl are
recontrés hier.
met yesterday
'He spoke to the man and the woman who met yesterday.'
b. *Ils ont parlé à Marie et le directeur.
'They talked to Mary and the director.'
c. Ils ont parlé à Marie et au directeur.
'They talked to Mary and to the director.'

The differences in (36) and (37) present evidence that *à* is not a preposition. It is proposed that, not being a preposition, *à* cannot assign Case, and doubling violates the Case Filter. By contrast, Spanish *a* qualifies as a preposition on the basis of Vergnaud's second test (Jaeggli 1982: 32):

(38) a. Les compraron una casa a Maria — All dialects of Spanish
They bought. a house for Maria
y el director.
and the director
'They bought a house for Maria and the director.'
b. Les mandaron cartas a los padres y los abuelos del interesado.
'They sent letters to the parents and the grandparents of the interested party.'

Being a preposition, *a* assigns Case to the object when a clitic is present, and, therefore, clitic doubling is permitted in Spanish.

(iii) **Whenever clitics are obligatory in Spanish, cliticization is obligatory in French.**

In Jaeggli (1982) a number of environments are discussed where clitic doubling or simple cliticization is obligatory in Spanish. It is furthermore pointed out that in all cases where the presence of a clitic is obligatory in Spanish, cliticization is obligatory in French as well. The environments in question are inalienable possession constructions and constructions with strong object pronouns:

(a) **Inalienable possession constructions:**

(39) a. Le lavaron los manos a Luis. — All dialects of Spanish
Cl-dat washed the hands a Luis
'They washed Luis's hands.'
b. Le lavaron los manos.
c. *Lavaron los manos a Luis.

(40) a. *Elle lui cassera Jean le gueule. — French
She Cl-dat will break John the face
'She will break John's face.'
b. Elle lui cassera la gueule.
she Cl-dat will break the face
'She will break his face.'
c. *Elle cassera Jean le gueule.

(b) **Pronouns:**

(41) a. *Vimos a él. — All dialects of Spanish
Saw-we a him
'We saw him.'
b. Lo vimos.
Cl-acc saw-we
c. Lo vimos a él.
Cl-acc saw-we a him
'We saw him.'

(42) a. *Jean voit moi/toi/lui/elle/nous . . . French
b. Jean me/te/le/la/nous . . . voit.

The obligatoriness of clitics in inalienable possession is accounted for in terms of theta-theory. It is hypothesized that certain theta-roles, such as inalienable possessor, are obligatorily assigned to clitics and are transmitted to argument NP positions. The obligatoriness of clitic doubling with strong pronouns is accounted for in terms of a version of the Avoid Pronoun Principle. The difference between Spanish and French illustrated in (39–42), namely that clitic doubling is ruled out in French but not in Spanish, falls out from the fact that French lacks clitic doubling altogether and, therefore, only the simple cliticization option is available. In Spanish, doubling and simple cliticization are equally possible (though see Kayne 2000 for an argument that strong pronouns can be doubled in French).

Having summarized Jaeggli's (1982) theory and the main facts derived by it, I now turn to Borer (1984a), who builds on the view that clitic doubling is tightly linked to Kayne's Generalization and widens the empirical coverage of the Case-theoretic interpretation of Kayne's Generalization by extending it to the domain of nouns and prepositions. Similarly to Jaeggli (1982), who explained cross-linguistic differences in terms of variation in the properties of *a* (see above), Borer (1984a) accounts for parametric differences between Hebrew and Romanian in terms of the specific properties of *šel* and *pe*. At a theoretical level, Borer (1984a) clarifies a number of issues pertaining to the nature of clitics and the formal relations displayed in clitic doubling chains. The latter topic has already been mentioned in section 3.1.1. Concerning the nature of clitics, Borer proposes that they are parts of the heads to which they attach; in particular, they are inflectional elements spelling out (and absorbing) the Case features of the heads. In this sense, Borer is the first to suggest that clitics are (special kinds of) agreement markers. Her treatment of clitics is embedded within a theory of inflection according to which inflectional rules can apply at any level and are allowed to change relational configurations, provided that the lexical specifications remain unchanged. According to Borer, clitics are affixes which are

> the output of an inflectional rule which inserts number, gender and person features and associates them with an already existing Case feature on a lexical head. Clitics are a spell-out of Case features in the sense that once the Case feature is associated with the inserted number, gender and person features, it is given an independent phonological representation and can no longer be transferred to a complement of the head. (Borer 1984a: 41)

Borer's inflectional rule of clitic spell-out is given in (43):

(43) **Clitic Spell-Out (Borer 1984a: 37):**
$[_X$ X, α Case$] \rightarrow [_X$ X [α Case, β gender, γ number, δ person]
X = [+V] in Romance
X = V, P, N in Semitic

Borer's (1984a) analysis is embedded within a discussion of the structure and the Case properties of Hebrew nominals and, in particular, the Construct State construction. On the basis of the Construct State, she argues that noun heads assign structural Case in Hebrew under certain conditions, and establishes that *šel* is present whenever the noun is not in the right configuration to assign structural Case. She furthermore points out that *šel* is obligatory in clitic doubling (Borer 1984a: 49) in nominals, leading to the conclusion that doubling is another configuration in which the Case-assigning capacity of nouns is suppressed. Consider the contrast in (44):

(44) a. beit-a šel ha-mora — Modern Hebrew
house-her of the teacher
'the teacher's house'
b. *beit-a ha-mora
house-her the-teacher

Thus, doubling in Hebrew nominals takes place under exactly the same conditions as doubling in Rioplatense Spanish. It is permitted only in the presence of a special preposition assigning Case to the complement of the noun, in accordance with Jaeggli's (1982) interpretation of Kayne's Generalization.

Nevertheless, a property of *šel* is noted that appears to differentiate it from Spanish *a*. The NP *šel* introduces can serve as an antecedent for a lexical anaphor, as illustrated in (45a), contrary to real prepositions, which block binding, as shown in (45b) (Borer 1984a: 56):

(45) a. re'iyat 'acma šel ha mora — Modern Hebrew
view herself of the teacher
'the teacher's view of herself'
b. *xaśîvat 'acma 'al ha mora
thinking herself about the teacher

On the basis of (45), Borer concludes that *šel*-phrases are not PPs but rather NPs. In view of Jaeggli's discussion of Spanish *a* as opposed to French *à* discussed above, this appears to create an analytic problem. Recall that in order to account for the difference between Spanish, which allows clitic doubling of indirect objects, and French and Italian, which do not, it was crucial for Jaeggli (1982) to argue that French (and Italian) *à* is not a preposition, contrary to Spanish *a*. Now we see that clitic doubling in Hebrew relies on *šel* and falls under Kayne's Generalization. Everything else being equal, *šel* is expected to qualify as a preposition. And yet, there is evidence that it is not.

Even though Borer (1984a) does not explicitly address this problem, she makes a proposal that resolves it, which is motivated by independent considerations.[2] In particular, she draws a distinction between *šel,* which is a contentless, dummy element, and *pe* and *a* in Romanian and Spanish respectively, which are contentful prepositions. Borer (1984a) points out that the range of environments where

šel is found in Hebrew coincide exactly with those in which structural Case cannot be assigned, doubling being one of them. By contrast, *pe* in Romanian is found quite independently of the unavailability of Case assignment. In particular, *pe* is found in the presence of the lexico-semantic features [+human], [+pronominal], while doubling is found only when the object is, in addition, [+specific], i.e., it is limited to a subset of the environments in which *pe* is available (similar considerations apply to *a* in Spanish, according to Jaeggli's 1982 description; see also Borer 1984a). The complex distribution of *pe* and clitic doubling in Romanian is illustrated below (Borer 1984a: 128 drawing on Steriade 1980; see also Dobrovie-Sorin 1990 for discussion of the semantic properties of direct object doubling in Romanian):

(i) ***Pe* obligatory, doubling obligatory**

(46) [+specific, +definite, +human, +pronominal]
   a. Am văzut-o pe ea. Romanian
      have-I seen-Cl pe her
      'I have seen her.'
   b. *am văzut-o ea
   c. *am văzut pe ea

(47) [+specific, +definite, +human, –pronominal]
   a. L-am văzut pe Popescu.
      Cl-have-I seen pe Popescu
      'I have seen Popescu.'
   b. *L-am văzut Popescu.
   c. *Am văzut pe Popescu.

(48) [+specific, –definite, +human, –pronominal]
   a. o caut pe o fată de la noi din sat.
      Cl- I-am looking for pe a girl from the our village
   b. *o caut o fată de la noi din sat
   c. *caut pe o fată de la noi din sat
      (on the specific interpretation)

(ii) ***Pe* obligatory, doubling impossible**

(49) [–specific, –definite, +human, +pronominal]
   a. Am văzut pe altcineva.
      have-I seen pe somebody else
      'I have seen somebody else.'
   b. *am văzut altcineva
      have-I seen somebody else
   c. *l-am văzut pe altcineva

(iii) ***Pe* impossible, doubling impossible**

(50) [−specific, −definite, +human, −pronominal]
a. Am văzut un bucătar.
have-I seen a cook
'I have seen a cook.'
b. *am văzut pe un bucătar
c. *l-am văzut pe un bucătar

(51) [+specific, +definite, −human, −pronominal]
a. Am văzut cînele lui Popescu.
have-I seen the-dog of Popescu
'I have seen the dog of Popescu.'
b. *am văzut pe cînele lui Popescu
c. *l-am văzut pe cînele lui Popescu

(52) [−specific, −definite, −human, +pronominal]
a. Am văzut altceva.
have-I seen something else
'I have seen something else.'
b. *am văzut pe altceva
have-I seen pe something else
c. *l-am văzut pe altceva

On the basis of the fact that there are environments in Romanian where *pe* is obligatory and doubling is ruled out, Borer argues that the presence of *pe* is required by lexico-semantic factors, and therefore, it must be present at D-structure. Its presence facilitates doubling in the sense that *pe* assigns Case to the direct object. But the purpose of inserting *pe* is not simply to rescue the structure. On the other hand, the sole purpose of inserting *šel* is to assign genitive Case in contexts where the noun cannot do so. Borer proposes that the rule of *šel*-insertion is an inflectional rule operating in the phonological component (she argues that the environment of insertion is dependent upon string adjacency). In this analysis, *šel* is not present at S-structure where Binding Conditions apply, explaining the status of examples like (45a) where the presence of *šel* does not affect binding.

I conclude this part of the discussion by summarizing how inter- and intra-linguistic variation is accounted for in the two works presented so far which capitalize on Kayne's Generalization to account for the Clitic Doubling Parameter:

(i) **Kayne's Generalization: A preposition-like element must be present. Case-interpretation: To assign the Case absorbed by the Clitic.** This explains Spanish and Romanian direct object clitic doubling as opposed to French and Italian. It also explains Hebrew doubling in nominals.

(ii) **Auxiliary assumption 1: When a preposition-like element is a preposition, doubling is possible, otherwise not.** This explains why indirect object doubling is well-formed in Spanish but not in French and Italian.

(iii) **Auxiliary assumption 2: When a preposition-like element is a preposition that can assign Case, doubling is possible, otherwise not.** This explains why direct object doubling is well-formed in Rioplatense Spanish but not in Standard Spanish.

(iv) **Auxiliary assumption 3: When a preposition-like element rescues a clitic doubling construction without providing evidence that it is a preposition, then it is inserted at PF.** This explains differences in extraction from doubling in Hebrew and Romanian. The claimed difference between D-structure insertion and PF insertion correlates with the fact that prepositions belonging to the first group are contentful and prepositions belonging to the second group are dummy elements.

3.2 Late GB: specificity, animacy, and rejection of Case-theoretic approaches

Suñer (1988) builds on Borer's (1984a) insight that clitics are similar to agreement markers and focuses on the fact that direct object doubling in Spanish is limited to specific NPs. In addition, she argues against an important assumption made in early approaches toward clitic doubling, namely that clitics absorb Case. By doing so, she initiates an altogether different way of thinking about clitic doubling constructions and the Clitic Doubling Parameter. Finally, she points out that direct object doubling and indirect object doubling differ with respect to specificity.

More specifically: first, she points out that while specific animate DPs can be doubled by accusative clitics (53a, b), non-specific animate DPs cannot undergo clitic doubling (53c, d) (Suñer 1988: 396):

(53) a. [+anim, +spec, +def] (Rioplatense Spanish)
La oían a Paca/ à la niña/ à la gata.
her listened-3pl to Paca/ to the girl/ to the cat
'They listened to Paca/the girl/the cat.'

b. [+anim, +spec, –def]
Diariamente, la escuchaba a una mujer que cantaba tangos.
daily, her listened-3sg to a woman who sang tangos
'He listened daily to a woman who sang tangos.'

c. [+anim, –spec, +def]
*Lo alabarán al niño que termine primero.
him will praise-3pl the boy who finishes first
'They will praise the boy who finishes first.

d. [+anim, –spec, –def]
*No lo oyeron a ningún ladrón.
not him heard-3pl to any thief
'They didn't hear any thieves.'

This is similar to the point Borer (1984a) made for Romanian (see above; see also Dobrovie-Sorin 1990 for Romanian), i.e., that doubling takes place only with a subset of direct objects introduced by a special preposition.

Second, Suñer argues against the view that in Spanish, the preposition *a* is a Case marker licensing clitic doubling. She provides data from Porteño/Rioplatense Spanish, where direct object clitic doubling is possible in the absence of *a* (Suñer 1988: 399–400):

(54) a. Yo la tenía prevista esta muerte. Rioplatense Spanish
I had foreseen (it) this death

b. ¿Así que el tarambana de Octavio la liquidó su fortuna?
Isn't it true that the empty-headed Octavio squandered (it) his fortune? (Kany 1969: 149)

c. Lo último que escuché, claro que la encontré pesada la audición, fue el reportaje.
'The last thing I listened to, of course I found (it) boring the radio-program, was the interview.' (Barrenechea and Orecchia 1979)

d. Ahora tiene que seguir usándolo el apellido. (Barrenechea and Orecchia 1979)
'Now s/he has to go on using (it) the surname.'

e. Yo lo voy a comprar el diario justo antes de subir
I it am going to buy the newspaper just before coming up

Suñer argues that these examples are not right dislocations because they are uttered with the same unbroken intonation curve they would have without the clitic, and they occur in embedded or parenthetical clauses as in (54c), as well as in non-peripheral positions as in (54e). She concludes that *a* is not a Case marker but rather a marker of animacy or 'distinctiveness' (Ramsey 1956), and that the presence of *a* is not a necessary condition for clitic doubling in Argentinean Spanish, contrary to what is widely assumed in the literature. According to Suñer, the existence of examples like (54) show that although direct object clitic doubling of inanimates in Spanish is less general than doubling of animates, neither animacy nor the presence of *a* is required for clitic doubling.

Note, as an aside, that there is minimal variation in the 'distinctiveness' features associated with *pe* and *a* in Romanian and Spanish respectively. The presence of *pe* in Romanian is sensitive to the feature [+human], as was evidenced by the ungrammaticality of (51b) presented in the preceding subsection, while *a* in Spanish is sensitive to the feature [+animate], as shown in (53a) where *la gata* is preceded by *a.* Minimal variation of this kind is expected by 'markedness theories' of the type postulated in the typological literature (see Silverstein 1976 and Dixon 1994 among others; see Anagnostopoulou 1994 for an informal proposal to link phenomena of the Spanish and Romanian type to 'markedness' theories of this kind, and Alexiadou and Anagnostopoulou 2000 for a proposal). Assume, in the spirit of such theories, that *a* and *pe* are ways to mark by special morphology objects that are less likely to be in the O/P (object of transitive clause)

function according to the Nominal hierarchy in (55). In such a view, object marking with *a* and *pe* is the counterpart of subject marking of NPs that are less likely to occur in the A (subject of transitive clause) function with ergative case morphology (as opposed to unmarked nominative) in languages with ergative splits conditioned by the semantic properties of NPs (see Dixon 1994 for details):

(55)

				Common nouns		
1st person pronouns	2nd person pronouns	3rd person pronouns, demonstratives	Proper names	Human	Animate	Inanimate

more likely to be in A than O function

Like ergative languages that sometimes group together 1st and 2nd person, treating both as unmarked, and sometimes treat 1st person as being less marked than 2nd, languages with a special preposition for direct objects sometimes treat as unmarked non-human animates along with inanimates (Romanian), and sometimes treat non-human animates as being more marked than inanimates (Spanish).

Returning now to Suñer's (1988) third point: she notes that indirect object/dative clitic doubling differs from direct object/accusative clitic doubling in not being subject to specificity (Suñer 1988: 394–395). The data in (56) show that any indirect object can undergo doubling in Spanish, unlike direct objects, which must be specific, as was demonstrated in (53):

(56) a. [+human, +spec, ±def]
Le ofrecí ayuda à la niña/a una estudiante. Rioplatense
her offered-1sg to help to the girl/ to a student Spanish
'I offered help to the girl/to a student.'

b. [+human, –spec, –def]
Les ofrecieron queso y leche a familias de pocos medios.
them offered-3pl cheese and milk to families of little means
'They offered cheese and milk to low-income families.'

c. [+human, –spec, +def]
Les dejarı todo mi dinero a los pobres.
them will leave-1sg all my money to the poor
'I will leave all my money to the poor.'

To account for the facts presented above, Suñer (1988) proposes that clitics are inflections, generated as part of the V. They are listed in the lexicon, which permits their features to be specified there. Indirect object clitics and direct object clitics are defined by assigning values to the features [specific], [animate], [gender], [number], and [person], the crucial difference between the two being that direct object clitics are inherently [+specific]. Being agreement affixes, clitics must agree in features with the constituent they form a chain with (Matching Principle). This explains the specificity requirement on direct object clitic doubling. A chain

is well-formed only when there is no clash of features, and a non-specific NP cannot form a chain with a [+specific] clitic, because this would lead to such a clash.

Suñer's (1988) contribution to the study of clitic doubling can be summarized as follows:

(i) She is the first one to systematically discuss the interpretive effects of direct object clitics. After the relevance of these effects was discovered, most accounts of direct object clitic doubling focused on them.

(ii) It has always been known that the conditions under which indirect object clitic doubling takes place are different from the conditions of direct object doubling (see, e.g., Jaeggli's 1982 discussion presented above, as well as Jaeggli 1986b, which proposed that indirect object clitics are optional Case absorbers, unlike direct object clitics, which absorb Case obligatorily). Suñer (1988) points out an additional major difference between the two instances of doubling, namely specificity.

(iii) The fact that Kayne's Generalization has counter-examples was known in the 1980s. Greek was mentioned as being one such language. Spanish, however, was considered to be 'well-behaved' in this respect. Suñer (1988) argues that this is not the case. If doubling clitics do not absorb Case, then they behave similarly to agreement markers, which are usually not assumed to absorb Case (though see Baker 1996 for a generalized view of agreement markers as 'Case absorbers' leading to non-configurationality in polysynthetic languages; his proposal is inspired by clitic doubling and the Case-theoretic interpretation of Kayne's Generalization in the early GB literature).

As already mentioned, Dobrovie-Sorin (1990) reports similar findings for Romanian. Unlike Suñer, Dobrovie-Sorin does not challenge the view that the presence of a special preposition (*pe* for direct objects, the dative morphology for indirect objects in Romanian) is a prerequisite for object clitic doubling. She argues, though, that (i) in Romanian there are many restrictions on direct object clitic doubling which have to do with the interpretation of NPs, and (ii) indirect object clitic doubling differs from direct object clitic doubling with respect to sensitivity to the semantics of NPs.

Having discussed Spanish as being a potential counter-example to Kayne's Generalization, it is time to turn to languages that present straightforward counter-examples to Kayne's Generalization. All Balkan languages that have been claimed to have clitic doubling (e.g., Bulgarian, Albanian, and Greek) fall into this group. Greek will be discussed here in some detail.

In Greek, indirect objects bearing genitive case and direct objects bearing accusative can be doubled:

(57) (Tu) (to) edhosa tu Jani to vivlio. Greek
Cl-gen Cl-acc gave-1sg the John-gen the book-acc
'I gave John the book.'

Greek instantiates a third pattern, apart from that of Spanish and Romanian, which possess clitic doubling and (by and large) observe Kayne's Generalization, and that of Italian and French, which lack clitic doubling. As shown in (57), clitic doubling does not take place in the presence of a preposition. In fact, clitic doubling in Greek is blocked when the indirect object is a PP (see Dimitriadis 1999 for discussion):

(58) a. *Tu edhosa to vivlio s-ton Jani. Greek
Cl-gen gave-1sg the book-acc to-the John
'I gave the book to John.'
b. *Tu pira to vivlio apo ton Jani.
Cl-gen took-1sg the book-acc from the John
'I took the book from John.'

As shown by the contrast between (57) and (58), Greek looks like the reverse of Spanish and Romanian: doubling is actually not allowed in the presence of a preposition. This cross-linguistic difference between Romance and Greek raises the question of whether Greek indeed possesses genuine clitic doubling of DPs. Alternatively, one might argue that what superficially resembles clitic doubling in fact manifests a case of right dislocation, which is found in all clitic languages, regardless of whether they have doubling, and which is not subject to Kayne's Generalization (see section 2.2 above). Greek definitely has right dislocation, i.e., a natural way of uttering (57) is with the intonation peak falling on the verb cluster, resulting in an emphatic interpretation of the verb, as illustrated in (57'):

(57') Tu to edhosa #tu Jani #to vivlio. Greek
Cl-gen Cl-acc gave-1sg the John-gen the book-acc
'I GAVE John the book (I did give John the book).'

If (56') is compared to the Catalan example of right dislocation (14) in section 2.2, discussed in Vallduví (1992), it becomes evident that the two constructions have exactly the same intonation and interpretation.

In previous work (Anagnostopoulou 1994, 1999a, 2003), I have extensively argued that Greek productively employs clitic doubling. Here I limit myself to presenting one set of data in support of this claim, which relates to the evidence from intonation and word order presented in section 2.2 (see Anagnostopoulou 2003). In Greek, objects can be doubled in environments in which the object precedes the subject, as in (59b) and (60b):

(59) a. Pjos tin efage tin turta? Greek
Who Cl-acc ate-3sg the cake-acc?
'Who ate the cake?'
b. Tin efage tin turta o Janis.
Cl-acc ate-3sg the cake-acc the John-nom
'John ate the cake.'

(60) a. O Petros agorase ena vivlio.
The Petros-nom bought-3sg a book-acc.
'Peter bought a book.'
b. Ke tin ali mera, to katestrepse to vivlio enas
And the other day Cl-acc destroyed the book-acc a
mathitis tu.
student-nom his
'And the next day, a student of his destroyed this book.'

In both cases, the object is de-accented and the subject bears main sentence stress. The context furthermore ensures that the subjects are not presupposed. Moreover, it can be shown that subjects in strings with the order Cl–VOS reside in situ. From this it follows that the object associated with the clitic cannot be right dislocated. Hence, it can be concluded that Greek possesses genuine clitic doubling.

Evidence for the assumption that the subjects in (59b) and (60b) remain in situ comes from the observation, made by Zubizarreta (1994) for Romance and by Alexiadou (1999a) for Greek, that in VOS strings, the subject necessarily bears main sentence accent. Following Cinque (1993), Zubizarreta and Alexiadou take this to indicate that the subject is the most deeply embedded argument, which remains in its VP-internal base position. Furthermore, they point out that objects may bind subjects to their right, as schematized in (61a) and illustrated in (61c):

(61) a. $[OBJ_i \ldots [[_{SUB}\, pron_i\,] [t_i \ldots]]$ Greek
b. Pjos sinodhepse to kathe pedhi?
Who-nom accompanied the every child?
'Who accompanied every child?'
c. Sinodhepse to kathe $pedhi_i$ i mitera tu_i.
Accompanied the every child the mother his
'His mother accompanied every child.'

Thus, the object in (61) must have reached its surface location by overt leftward A-movement to a position above the subject. Versions of this analysis for VOS orders are widely adopted in the literature (see Zubizarreta 1994, 1998, for Spanish; Ordóñez 1994, 1997, for Spanish and Catalan; Cardinaletti 1997 for Italian; Alexiadou 1999a for Greek). Crucially for present purposes, the subject also bears main stress when the object is doubled as in (59b), (60b). This entails that objects in Cl–VOS configurations are not right dislocated. But from this it also follows that Greek qualifies as a genuine clitic doubling language.

Cross-linguistic evidence that the facts in (59) and (60) indeed constitute an argument that Greek has clitic doubling comes from languages that have limited clitic doubling of direct objects, such as Standard Spanish and Catalan. In Standard Spanish and Catalan, doubling of objects preceding postverbal subjects carrying main sentence stress is permitted with indirect objects (Ordóñez 1997), and with pronominal direct objects (Zubizarreta 1998: 185, fn. 16: see (21b) above), as illustrated in (62) (see also the discussion in section 2.2):

(62) a. Se lo dio a Juan Maria, el libro. Standard Spanish
Cl-dat Cl-acc gave to John Mary-nom, the book
'Mary gave to John the book.'
b. Lo castigó a él la madre de Juan.
Cl-acc punished a him the mother of John
'John's mother punished him.'

In these languages, clitic doubling of direct object DPs is ruled out. Accordingly, doubling of *a la professora* in a position preceding the subject is ruled out in (63) (Josep Quer, p.c.):

(63) *La saludó a la profesora Juan. Standard Spanish
Cl-acc greeted a the professor John-nom
'John greeted the professor.'

Note that in (62) the direct object *el libro* is 'doubled' by a clitic but, crucially, it occurs in a position after the subject, i.e., in a right-dislocated position.

To sum up, VOS configurations in which the subject bears main stress provide diagnostic environments for clitic doubling as opposed to right dislocation. On the basis of this test, it can be concluded that Greek has clitic doubling.

Similarly to Romanian and Spanish, clitic doubling in Greek has interpretive effects as well (see Anagnostopoulou 1994). In Greek, clitic doubling is mainly found with definites, which cannot be understood as novel in the presence of doubling. Consider the following examples (constructed on the basis of Heim's 1982 discussion of pronouns):

(64) O Jannis diavase [ena vivlio jia ton Arthur Miller$_i$]$_j$, enthusiastike, ke thelise na gnorisi ton sigrafea$_k$ apo konta.
John read [a book about Arthur Miller$_i$]$_j$, he got very enthusiastic, and he wanted to get to know the author$_k$.
the author: (i) Arthur Miller himself (k = i) or (ii) the author of the book (k related to j by 'accommodation').

(65) O Jannis diavase [ena vivlio jia ton Arthur Miller$_i$]$_j$, enthusiastike, ke thelise na ton$_i$ gnorisi ton sigrafea$_i$ apo konta.
John read [a book about Arthur Miller$_i$]$_j$, he got enthusiastic, and he wanted to get to know the author$_i$.
the author: necessarily the already established member of discourse (i.e., the doubled DP cannot be 'novel').

In (64), the undoubled definite *ton sigrafea* (the author) is ambiguous: under a familiar reading, its referent is already present in the context of discourse (k = i); under an 'associative anaphoric use' (Heim 1982 building on Hawkins 1978), it introduces a novel referent, namely *the author of the book about Arthur Miller that John read* (*k* is linked by cross-references to the already present discourse referent *j*).

The presence of the doubling clitic in (65) suppresses the second option: the doubled DP is necessarily linked to the previously mentioned proper name, thus being strictly construed as anaphoric.

3.3 *Inflections vs. determiners*

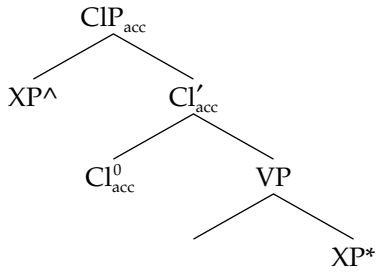
In the preceding subsection, two significant developments in the research on clitic doubling have been noted: (i) emphasis on the sensitivity of direct object doubling to the semantico-pragmatic properties of DPs (specificity, prominence, etc.) along with the fact that (ii) the validity of Kayne's Generalization has been questioned. A third significant development that will be presented in this subsection concerns the movement vs. base generation debate. Due to the expansion of the analytic tools of the theory, it becomes possible to combine movement with base generation.

3.3.1 *Clitics as inflections*

An influential theory reconciling movement with base generation is advanced in Sportiche (1996b, 1998). According to Sportiche, clitics are functional heads heading their own projections in the domain of Infl. These are referred to by the term 'Clitic Voices' and it is suggested that they license a particular property on an agreeing argument: the doubled DP in clitic doubling, an object pro in simple cliticization.

Sportiche argues that clitic constructions show properties of XP-movement (see section 3.3.2) and claims that it would be the null hypothesis to postulate that clitic constructions are identical to all other types of movement configurations, which, in Checking theory (Chomsky 1993, 1995c), involve movement demanded by specifier–head licensing. The structure Sportiche proposes for accusative clitics is illustrated in (66):

(66)



In (66), the (overt or covert) XP* related to the clitic moves to the XP^ position at some point in the derivation (overt syntax or LF).[3] In this way, agreement between Cl and XP* is sanctioned. The agreement relation between the clitic and the XP* is derived as a spec–head relation, and the locality between the clitic and the corresponding XP* follows from the movement relationship between the XP* and the XP^. Clitic doubling minimally differs from non-doubling in that the

XP* is overt in the former and covert in the latter. This way, the syntax of clitics is fully assimilated to that of other functional heads.

The obvious question to ask is the trigger of movement of the double. Sportiche answers this question by pushing the parallelism between the syntax of clitics and that of other kinds of movement. Under the assumption that *wh*-movement is motivated by the *Wh*-Criterion (Rizzi 1991b), he attributes the XP*-to-XP^ movement to the Clitic Criterion in (67), which, in turn, is subsumed under the Generalized Licensing Criterion in (68):

(67) **Clitic Criterion:**
At LF:
a. A clitic must be in a spec–head relationship with a [+F] XP.
b. A [+F] XP must be in a spec–head relationship with a clitic.

(68) **Generalized Licensing Criterion (Sportiche 1996b: 68):**
At LF:
a. A [+F] head must be in a spec–head relationship with a [+F] XP.
b. A [+F] XP must be in a spec–head relationship with a [+F] head.

In (68), [+F] stands for a set of properties such as Wh, Neg, Focus, etc. which trigger movement. For direct object clitic constructions, it is proposed that the clitic licenses Specificity on its associate. Indirect object clitic heads are treated as indirect object agreement markers since they do not yield specificity effects (cf. Suñer's 1988 discussion presented above). The general schema in (66) makes a number of further options available:

(69) **Clitic Constructions Parameters (Sportiche 1996b: 32):**
Movement of XP* to XP^ occurs overtly or covertly.
Head is overt or covert.
XP* is overt or covert.

By (69) the following cases are predicted:

(i) Undoubled clitic constructions as in French and Italian arise when a covert XP* moves overtly or covertly to XP^ with H overt.
(ii) Clitic doubling constructions as in Spanish and Romanian arise when an overt XP* moves covertly with H overt.
(iii) Scrambling constructions as in Dutch and German arise when an overt XP* moves overtly with H covert.

Note that Sportiche unifies the syntax of cliticization/clitic doubling with the syntax of scrambling, which has also been claimed to display interpretational effects (see the references to Diesing 1992b and De Hoop 1992 above). This idea is further explored in Anagnostopoulou (1994) and Alexiadou and Anagnostopoulou (1997b).

Finally, Sportiche proposes that the Clitic Doubling Parameter should be attributed to a filter similar to the doubly filled COMP filter (see Cheng 1997 for cross-linguistic discussion):

(70) **Doubly Filled Voice Filter (Sportiche 1996b: 28):**
*[$_{HP}$ XP [H . . .]]
where H is a functional head licensing some property P
and both XP and H overtly encode P.

Assuming (70) to hold universally, Sportiche speculates that clitic doubling arises in a language precisely when XP* movement may be delayed until LF, since this is the only way of preventing a violation of (70) with an overt XP* in the presence of an overt clitic.

Sportiche's intuition concerning the nature of clitics is similar to the one expressed in Suñer (1988). Both researchers view clitics as agreements and assume that the syntax of indirect object and direct object clitics minimally differ in that the former are pure agreement markers while the latter encode specificity. While for Suñer, direct object clitics are lexically specified as [+specific] and, therefore, can only form a chain with a DP that has compatible feature specification, Sportiche assimilates accusative clitics to heads encoding features like [+Wh], [+Neg], etc.

3.3.2 Clitic constructions in a movement typology: XP-movement vs. head-movement

Sportiche's theory predicts that clitic constructions will show properties of XP-movement because the element undergoing movement is the overt or covert DP-associate of the clitic. On the other hand, for theories of cliticization like the one put forth in Kayne (1989b, 1991) and related work, clitic constructions should display X^0-movement properties, since clitics are analyzed as heads undergoing X^0 movement. As a matter of fact, clitic constructions support both claims, i.e., they present evidence for both XP-movement and head-movement. In what follows, I will briefly summarize some of the evidence presented in the literature.

3.3.2.1 Arguments that clitic dependencies display XP-movement properties

SSC effects of the type illustrated in (24c), repeated here, constitute an argument that clitic constructions involve phrasal movement if the SSC is assumed to fall under Relativized Minimality (Rizzi 1990b). The ungrammaticality of (24c) shows that cliticization is sensitive to the presence of an intervening DP, namely the embedded subject *Pierre*:

(24) a. Jean a laissé Pierre parler à Marie. French
John has let Peter speak to Mary
'John has let Peter speak to Mary.'

b. Jean l' a laissé parler à Marie.
John him has let speak to Mary
'John has let him speak to Mary.'
c. *Jean lui a laissé Pierre parler.
John to her has let Peter speak
'John has let Peter to speak to her.'

If clitic constructions displayed head-movement, then X^0 elements would count as interveners (Head Movement Constraint) and XP elements would not.

Participle agreement (Kayne 1989a) in French and Italian presents further evidence that clitics move as XPs. As shown in (71c), participles may agree with clitics, similarly to elements undergoing *wh*-movement (71b) and unlike in situ objects (71a):

(71) a. Jean a peint(*e) la porte French
John has painted(*fem) the door
'John painted the door.'
b. la porte$_i$ que Jean a peint(e) t$_i$
The door that John has painted(fem)
'the door that John painted.'
c. Jean l' a peint(e).
John Cl has painted(fem)
'John painted it.'

If, as suggested in Kayne (1989a), agreement on the participle is a reflex of a spec–head relation between the participle-head and the object XP undergoing overt movement through its specifier, then the clitic in (71c) – or its covert associate – undergoes phrasal movement.

3.3.2.2 An argument for X^0 movement that has been reanalyzed as an argument for XP-movement

In Kayne (1989b), it is argued that clitic climbing in restructuring contexts provides evidence that clitic placement is X^0 movement, because it is not sensitive to the presence of an intervening *wh*-phrase while it is sensitive to the presence of an intervening *wh*-complementizer, as illustrated in (72):

(72) a. ?Mario, non lo$_i$ saprei [a chi affidare t$_i$]. Italian
Mario, not Cl-acc I-would-know to whom entrust
'Mario, I wouldn't know to whom to entrust him.'
b. *Su questo problema, non lo$_i$ saprei [se consigliare t$_i$].
On this problem, not him I-would-know whether advise
'On this problem I wouldn't know whether to advise him.'

The *wh*-phrase *a chi* does not interfere with clitic climbing while the *wh*-complementizer *se* does. Kayne argues that this contrast is expected if clitic climbing

is head-movement, which is sensitive to intervening heads like the C^0 element *se* and insensitive to intervening phrases like the *wh*-phrase *a chi* in Spec,CP.

Sportiche (1996b), however, points out that Long Object Preposing, which also takes place in restructuring contexts (Burzio 1986), patterns with clitic climbing in being permitted in the presence of a *wh*-phrase but not in the presence of a complementizer (Rizzi 1982a):

(73) a. ?Certe riposte non si sanno mai come dare. Italian
Certain answers not si know never how give
'One never knows how to give certain answers.'
b. *Certe riposte non si sanno mai se dare.
Certain answers not si know never whether give
'One never knows whether to give certain answers.'

Since long object preposing is phrasal movement, the contrast in (73) cannot be explained as a locality effect. In a locality account, the presence of an intervening complementizer is not expected to block phrasal movement and the presence of an intervening phrase is expected to do so, contrary to facts. To account for (73), Sportiche (1996b) suggests, alternatively, that the presence of an intervening complementizer in (73b) blocks incorporation of a head from the lower clause (V or Infl) into a head of the higher clause (V or Infl) leading to restructuring. Thus, long object preposing, which is contingent on restructuring, fails to apply in (73b). Since there is no intervening head blocking restructuring in (73a), long object preposing may apply. This explanation is further extended to (72). The complementizer in (72b) does not directly affect movement of the clitic to the higher clause but rather blocks incorporation/restructuring, which determines the availability of clitic climbing. Sportiche points out that clitics trigger participle agreement on the higher clause in environments like (72a), providing evidence that they undergo phrasal movement at least as high as the specifier position of the participle in the higher clause, as illustrated in (74):

(74) Non li_i avrei $[e_i]_{XP^*}$?saputi /*saputo a chi dare $[e_i]_{XP^*}$ Italian
Not them I-would-have known-pl /*known-sg to whom give
'I would not have known to whom to give them.'

3.3.2.3 Arguments that clitic dependencies display X^0 properties

The most interesting arguments for X^0 movement come from accounts of clitic placement in proposals according to which clitics left-adjoin to T or one or more inflectional heads in the domain of INFL. The left-adjunction to a functional head line of analysis, which presupposes that clitics move as heads since their landing site is a head position, syntactically accounts for the position and order of clitics, the environments in which proclisis and enclisis occur, as well as the complex interaction between the syntax of clitics, the syntax of heads in the I and C domains, such as negation, mood, complementizers, and the placement of finite verb forms as opposed to infinitives, gerunds, and imperatives (see Kayne 1991,

1994; Zanuttini 1991, 1997; Rivero 1994; Rivero and Terzi 1995; among many others).

To briefly illustrate, consider clitic placement in Greek.[4] In Standard Greek, clitics precede the finite verb forms but are enclitics on (non-finite) gerunds and imperatives (similarly to Spanish, Italian, French, and Catalan):

(75) a. To vlepo. Greek
it see-1sg
'I see it.'
b. Dhjavase to.
read-2sg it
'Read it!'
c. dhjavazondas to
reading cl-acc

The relative order of the preverbal clitics is strictly indirect object > direct object, while there is no strict order among enclitics:

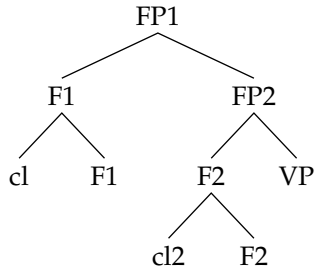
(76) a. Mu to edhose. Greek
Cl-gen Cl-acc gave-3sg
'He/she gave it to me.'
b. dhose mu to
give-2sg Cl-gen Cl-acc
c. dhose to mu
give-2sg Cl-acc Cl-gen

Terzi (1992) and Rivero (1994) argue that in finite clauses clitics left-adjoin to the inflectional head to which the verb raises, in finite environments T or AgrS (Kayne 1989b, 1991). Rivero (1994) develops an interesting analysis for the distribution of clitics in Imperatives, which is based on the view that the verb undergoes head movement to C of the A' type which is triggered by illocutionary features in C (see also Rivero and Terzi 1995). It is proposed that this movement is blocked by Negation, which is assumed to be an operator head under a version of Relativized Minimality (Rizzi 1990b) on head movement which is relativized to the A- vs. A'-status of intervening heads. This analysis captures the correlation between enclisis and absence of negation in imperatives. For gerunds, Rivero (1994) argues that they move to Mood, which is higher than T, in order to pick up the gerundive affix resulting in enclisis, but they can co-occur with negation, which is higher than Mood.

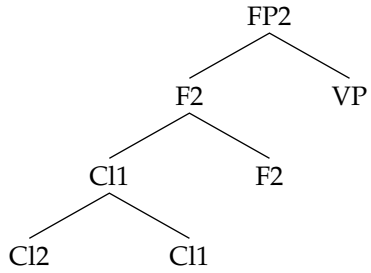
Terzi (1996b) investigates the properties of the functional head to which clitics adjoin from the point of view of Kayne's (1994) antisymmetry framework: she argues that clitics adjoin to T and/or a functional head F, which is a featureless functional head in finite clauses while it is T in gerunds and imperatives. Terzi (1999) explores a Linear Correspondence Axiom line of analysis to account for the puzzle concerning the rigid vs. free ordering of clitics in proclisis and enclisis respectively. She points out that the LCA makes two options available for the

manner in which more than one clitic adjoins in the clausal structure: either (i) each clitic adjoins to a different functional head (77), or (ii) one clitic adjoins to the other (78):

(77)



(78)



In (77) FP1 is an empty functional head, a place holder for clitics, while FP2 is T. In (78), on the other hand, FP2 is T. Terzi proposes that Greek double object clitics instantiate both the first and the second options, while in Romance only the second option is possible, i.e., clitics cluster under the same head T. In contexts of enclisis, the accusative > dative order results from a derivation in which the verb incorporates the accusative clitic in (77), and the two move as a complex higher up, while the dative > accusative order results from a configuration in which Cl1 adjoins to F2 in (77) and the whole complex moves higher up. Assuming that in Romance only option (78) is available for clitic clusters, the order of clitics is not altered in contexts of enclisis.

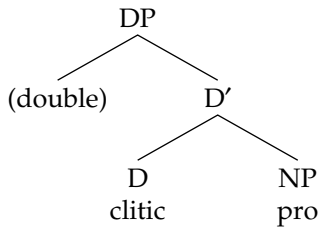
Note, as an aside, that the proposal that clitics adjoin to one another in Romance could, perhaps, be linked to the fact that in the morphological component, Romance clitics are arranged in a template according to person features overriding syntactic ordering (Bonet 1991). One could suggest, for example, that when clitic clusters have the representation (78) forming a syntactic unit, they are spelled out according to their feature specifications and not in a way that reflects hierarchical relations among the corresponding argument positions.

3.3.3 Clitics as determiners

Uriagereka (1988, 1995a) develops an analysis that reconciles the view that clitics move with the view that doubled DPs are in argument position. Following Postal

(1969) and Torrego (1988), Uriagereka argues that third person clitics are determiners, and analyzes them as in (79):

(79)



This proposal makes three claims: (i) D^0s may select for null NP-complements; (ii) doubled DPs are specifiers in complex DPs consisting of D and a null complement; and (iii) clitics are determiners (with null NP-complements). In what follows, I will present the motivation/evidence Uriagereka presents for these claims.

Concerning claim (i), Uriagereka (1988: 402, 1995a: 37) points out that determiners take null pro complements in strings corresponding to the English sequences *the one he came*, *the one from France.* More specifically, in a subset of Romance languages, these have the form illustrated by the Spanish examples in (80). The determiner licenses a pro-NP modified by the relative clause or the PP instead of the pro-form 'one':

(80) a. el/la que vino — Spanish
the who came
'the one who came'
b. el/la de Francia
the from France
'the one from France'

Languages permitting the strings in (80) provide straightforward evidence for the structure in (79). Uriagereka proposes that the only difference between (80) and constructions with cliticization is that the determiner remains in situ in the former while it undergoes movement to the functional domain in the latter.

Concerning claim (ii), Uriagereka argues that doubling is systematically attested in languages allowing for determiners in situ to select zero complements. He points out that in Romance, clitic doubling correlates with both the availability of the structures in (80) and the unavailability of ne-/en-cliticization. Those of the Romance languages that have (80) possess clitic doubling and lack ne-/en-cliticization. Those that do not have (80) lack doubling and show ne-/en-cliticization. On the basis of this correlation, Uriagareka suggests that the Clitic Doubling Parameter in Romance depends on the strength of determiners. He proposes that the Romance languages permitting the structures in (80) have 'strong' determiners, while the ones that resist them have 'weak' determiners.

In languages with strong determiners, a double can be licensed inside the complex DP of the form (79), leading to clitic doubling. In languages with weak determiners, a double cannot be licensed in (79), and clitic doubling is ruled out.

Concerning claim (iii), namely that third person clitics are determiners, Uriagereka (1988, 1995a) provides a number of arguments in support of it. First, he points out that third person clitics and determiners in Romance diachronically derive from the same source, namely Latin demonstratives, i.e., *illum*, *illam*, etc. (Wanner 1987). Second, from a synchronic point of view, clitics have a similar or identical form to determiners. In Galician, for example, the forms are identical, as illustrated in (81):[5]

(81) Galician

	Clitic		Determiner	
	Singular	Plural	Singular	Plural
Masculine	(l)o	(l)os	(l)o	(l)os
Feminine	(l)a	(l)as	(l)a	(l)as

The morphological identity of the forms in (81) can be straightforwardly accounted for if clitics and determiners instantiate one and the same lexical item projecting onto two different syntactic structures. Bleam (1999: 18–20) extends this argument to Spanish, where masculine clitic forms (82a) are not identical to masculine determiner forms (82b). She points out that masculine clitic forms are used as determiners in the absence of an NP-complement (82c):

(82) Spanish

a. Lo/*el vi.
Cl-masc I-saw
'I saw him.'

b. Vi el/*lo libro.
Saw-I the-masc book
'I saw the book.'

c. Vi lo que hiciste.
Saw-I the that you-did
'I saw what you did.'

The third argument comes from the phenomenon of determiner cliticization in Galician. Uriagereka (1988) argues that in Galician, determiners introducing an overt NP undergo optional syntactic cliticization onto the verb, as illustrated in (83):

(83) Galician

a. Comemos o caldo.
Ate-we the soup
'We ate the soup.'

b. Comemo-lo caldo.
Ate-we-the soup
'We ate the soup.'

(83b) provides evidence that determiners may undergo movement out of the DP onto the verb, similarly to clitics.

In an analysis that treats clitics as determiners, the movement properties of clitic constructions are derived from the assumption that clitics uniformly vacate their VP-internal position and undergo movement to the functional domain. Uriagereka (1995a) argues that cliticization is a complex phenomenon which does not obey a single principle and must be parametrized in order to derive placement possibilities arising in various languages. Accusative clitics in all languages undergo movement to the functional domain and are necessarily specific. These properties are derived from the assumption that clitics are referential elements which must move to a VP-external site in order to identify pro. Being VP-external at LF, clitics fall under the Mapping Hypothesis, according to which all specific elements must be assigned VP-external scope at LF. Clitic placement possibilities depend on the site to which clitics move and the mode of movement and attachment to a functional head. It is proposed that in languages like Galician, clitics move to F, a site where point of view is encoded, to license their associated pro. Languages like French, on the other hand, do not have an active F, and pro is licensed through affixation of the clitic to AgrO. In the preceding subsection we saw that clitic placement can be given a description without resorting to language-specific rules in systems that assume that cliticization involves head-movement and head-adjunction. It is therefore not surprising that Uriagereka (1995a), who is mainly concerned with clitic placement, capitalizes on head-movement to account for cross-linguistic variation. We also saw, though, that cliticization provides strong evidence for phrasal movement. As Uriagereka himself points out, it is necessary to incorporate an XP-movement-step into a movement analysis of clitics in order to derive properties of phrasal movement. Thus, in an analysis where clitics are determiners, head-movement must be local, following a phrasal-movement step of the DP containing the clitic, which must be assumed to move overtly at least as high as the site hosting agreeing participles.

4 Fragmentation views

In the course of the discussion, it has become evident that indirect object and direct object clitic doubling are subject to different restrictions across and within languages. So far, the two types of doubling have been shown to differ in two respects. First, there are dialects/languages (e.g., Standard Spanish, Catalan) in which direct object doubling of DPs is ruled out while indirect object doubling is permitted (see the discussion in section 3.1). Second, while direct object doubling is limited to specific DPs, doubling of non-specific indirect objects is licit (see the discussion in section 3.2). We have seen that the differences between the two types of doubling have led to a relaxation of the view that clitic constructions are uniform. For example, Sportiche (1996b) proposes to analyze direct object clitics as markers for specificity, while he treats indirect object clitics as agreement

markers. In this section, I will concentrate on indirect object doubling and its relation to the double object construction. The link between indirect object doubling and the double object construction will lead to a new typology of clitic doubling.

4.1 Indirect object doubling is a double object construction in Spanish

Demonte (1995) investigates Spanish ditransitives and argues that the alternation between the construction exhibiting dative doubling and its counterpart without doubling shows systematic syntactic and semantic properties very similar to those exhibited by the members of the English dative alternation (see also Stowell 1981). The two construction types are illustrated in (84) and (85) (see also Strozer 1976: 557, examples 7a, b):

(84) a. Le entregué las llaves al conserje. Standard Spanish
Cl-dat gave-I the keys to-the janitor
'I gave the keys to the janitor.'
b. Le cociné el pollo a Mario.
Cl-dat cooked-I the chicken to Mario
'I cooked the chicken for Mario.'

(85) a. Entregué las llaves al conserje. Standard Spanish
Gave-I the keys to-the janitor
'I gave the keys to the janitor.'
b. Cociné el pollo para Mario.
Cooked-I the chicken to Mario
'I cooked the chicken for Mario.'

Demonte (1995) argues that the ditransitives in (84) where the goal and benefactive arguments undergo clitic doubling share relevant syntactic and semantic properties with the double object construction in English. The sentences in (85) without clitic doubling show properties of prepositional ditransitives. Some of the evidence for these points is summarized below (Demonte 1995: 9–13).

4.1.1 C-command

In the absence of a dative clitic, a direct object can bind a reflexive indirect object, while the reverse is not possible, as shown in (86). As indicated by the translations, the same contrast is found in the prepositional dative construction in English:

(86) a. El tratamiento psicoanalítico reintegró a María a sí misma.
the therapy psychoanalytic gave-back to Mary-DO to herself-IO
'The psychoanalytic therapy gave back Mary to herself.'

b. *El tratamiento psicoanalítico reintegró/devolvió (a) sí misma
The therapy psychoanalytic gave-back (to) herself-DO
a Maria.
to Mary-IO
'*The psychoanalytic therapy gave back herself to Mary.'

When a dative clitic is present, the indirect object can bind into the direct object, while the reverse is impossible, as shown in (87). This is reminiscent of c-command asymmetries found in the double object construction in English (Barss and Lasnik 1986; Larson 1988b):

(87) a. *El tratamiento psichoanalítico le devolvió a María a la
the therapy psychoanalytic Cl-dat gave-back to Mary-DO to the
estima de sí misma.
esteem of herself-IO
'The psychoanalytic therapy gave back her self-esteem to Mary.'
b. El tratamiento psichoanalítico le devolvió la estima de
the therapy psychoanalytic Cl-dat gave-back the esteem of
sí misma a María.
herself-DO to Mary-IO
'The psychoanalytic therapy gave back Mary her self-esteem.'

In Spanish, the doubled indirect object counts as being higher even though it linearly follows the direct object. In this respect, Spanish differs from English, where, as is well known, precedence and c-command match (see Alexiadou and Anagnostopoulou 1997b, 1999, for discussion of related binding facts with clitic doubled direct objects which can bind into the subject even though they follow the subject).

4.1.2 Passivization

Passivization of the theme in the presence of a clitic doubled benefactor is ill-formed in Spanish, as shown by (88), similarly to English (89), where theme-passivization in the presence of a dative shifted benefactor is ruled out:

(88) *La case le fue pintada a Juan ayer. Standard Spanish
The house Cl-dat was painted to Juan yesterday
'The house was painted for Juan yesterday.'

(89) *The sandwich was fixed Mary English

4.1.3 Possession/theme part of goal

The clitic can double a dative only when the dative is construed as a 'possessor' of the theme. In (90a) *el mantel* can be construed as a part of *a la mesa*, and doubling is licit, while in (90b) *los platos* cannot be construed as a part of *a la mesa*, and doubling is ruled out:

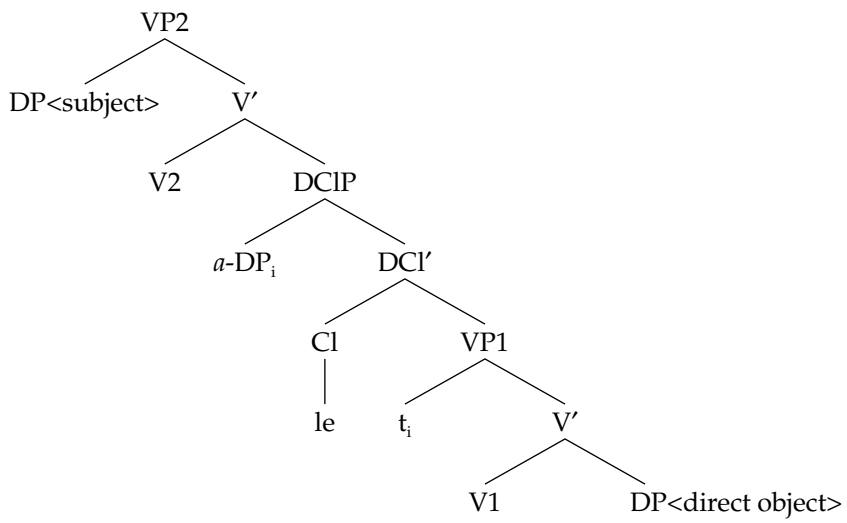
(90) a. Le puse el mantel a la mesa. Standard Spanish
Cl-dat put-I the tablecloth to the table
'I put the tablecloth on the table.'
b. *Le puse los platos a la mesa.
Cl-dat put-I the dishes to the table
'I put the dishes on the table.'

Demonte (1995) argues that this restriction is similar to the one found in English where the double object construction is licensed only when the indirect object can be understood as a possessor of the direct object (Oehrle 1976; den Dikken 1995c; Pesetsky 1995; and others):

(91) a. *Mary sent France a parcel.
b. The revolution gave France democracy.

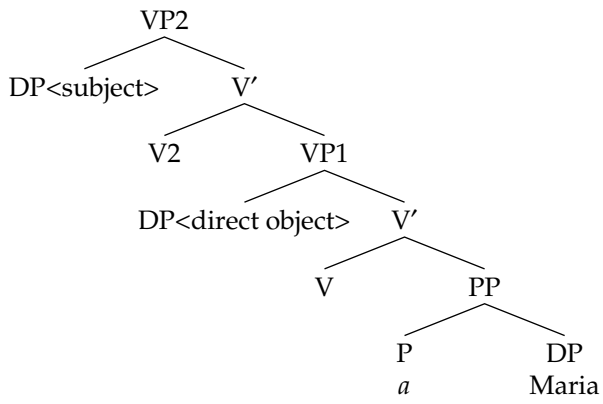
To account for the differences between the constructions with dative doubling and the ones without, Demonte (1995: 17) proposes that the former are double object constructions, represented as in (92):

(92)



The clitic is the head of a dative Clitic Phrase (corresponding to Marantz's 1993 VP headed by an applicative V head; see Demonte 1995: 7, fn. 6), to the specifier of which the indirect object raises from a base position higher than the theme in the lowest VP-shell (or in a DP containing the indirect object and the theme; see Demonte 1995: 25–28; in the latter alternative the indirect object undergoes possessor-raising). On the other hand, the construction without doubling has the Larsonian representation in (93), i.e., the *a*-phrase is a PP, the counterpart of to-PPs in English (Larson 1988b):

(93)



Demonte's (1995) analysis of dative clitics in Spanish as heads of a Dative Clitic Phrase is similar to Sportiche's (1996b) treatment of the dative Clitic Voice as a dative-agreement head (as opposed to the accusative Clitic Voice, which is a specificity head). In addition, Demonte reduces the presence of a dative clitic to the syntax of the double object construction and assimilates the clitic to the overt or covert applicative head present in applicative and double object constructions (Baker 1988a; Marantz 1993). By doing so, Demonte draws an even sharper distinction between the syntax of dative doubling and the syntax of accusative doubling. Since direct objects do not undergo alternations comparable to the dative-shift alternation, the syntax of dative doubling proposed by Demonte is difficult to extend to the syntax of accusative doubling.

4.2 Dative clitics as inflections and accusative clitics as determiners

An explicit proposal according to which dative and accusative clitics have different analyses is developed in Bleam (1999; she builds on Uriagereka 1988), who investigates micro-variation among dialects of Spanish. Bleam argues that dative clitics are agreement markers *a la* Sportiche (1996b) and Demonte (1995), while accusative clitics are determiners, as proposed by Torrego (1988) and Uriagereka (1988, 1995a).

Bleam focuses on Leísta Spanish, a dialect spoken in the north of Spain, which she compares to varieties of Argentinean Spanish, such as Rioplatense Spanish, and Cordoba Spanish, and to Standard Spanish. These dialects show variation with respect to three factors: (i) the form of direct object clitics; (ii) the availability of direct object doubling; and (iii) animacy restrictions on direct object doubling. In what follows, I summarize some of the facts Bleam discusses.

4.2.1 The form of direct object clitics

In Leísta Spanish the dative clitic form *le* is used as a direct object clitic, when the referent is animate (and in many subdialects, masculine), as illustrated in (94) (Bleam 1999: 1):

(94) Le vi. Leísta Spanish
Cl-dat saw-I
'I saw him/her.'

This contrasts with Standard and Argentinean Spanish, where the accusative forms *lo* and *la* are employed for direct objects, as illustrated by (95), and *le* is limited to indirect objects, as exemplified by (96) (similarly to Standard and Argentinean Spanish, *le* is used for indirect objects in Leísta Spanish):

(95) Lo vi. Standard/Argentinean Spanish
Cl-acc-masc saw-I
'I saw him.'

(96) Le di el libro. All dialects of Spanish
Cl-dat gave-I the book
'I gave him/her the book.'

4.2.2 Availability of direct object doubling

As has been shown in section 3, clitic doubling of direct object pronouns is obligatory in all dialects of Spanish. Clitic doubling of direct object DPs, however, is more limited. In Standard Spanish, it is ungrammatical, while in Rioplatense Spanish, it is grammatical in Kayne's Generalization environments mainly. Bleam points out that direct object doubling is found in two more varieties of Spanish, namely some subdialects of Leísta, as illustrated in (97) (Bleam 1999: 2), and Cordoba Spanish, as shown in (98) (Bleam 1999: 135). The latter dialect is spoken in central Argentina (see Schmitt 1996):

(97) Le vi a Juan. Doubling dialects of Leísta
Cl-dat saw-I a Juan
'I saw Juan.'

(98) La toqué a la sonata. Cordoba Spanish
Cl-acc played-I a the sonata
'I played the sonata.'

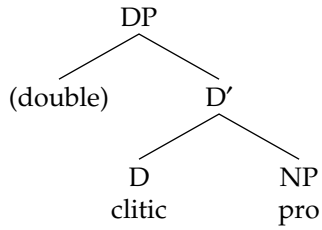
As shown in (97), direct object doubling clitics in Leísta Spanish have a dative form. This property is due to the fact that in these dialects doubling is limited to animate DPs: recall that animate direct object clitics are dative in Leísta.

4.2.3 Doubling of inanimate direct objects

While direct object clitic doubling in most varieties of Spanish is limited to animate DPs, in Cordoba Spanish it is also found with inanimates, as illustrated in (98).

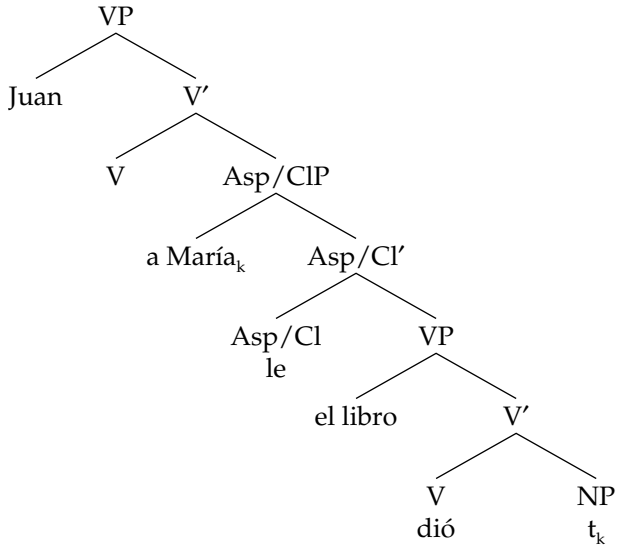
For accusative clitics Bleam adopts Uriagereka's (1988, 1995a) syntax, presented in section 3. They are determiners heading a complex DP as illustrated in (79), repeated here:

(79)



Bleam (1999: 35) points out that dative clitics in Spanish, unlike accusative clitics, do not resemble determiners morphologically. She views the lack of resemblance as evidence that dative clitics do not have the same syntax as accusative clitics. Building on Uriagereka (1988, 1995a), who attributes the specificity effects of accusative clitics to their status as determiners, Bleam furthermore argues that the lack of specificity effects of dative clitics in ditransitives (cf. Suñer's discussion in section 3.2 above) is due to the fact that they are not determiners but rather agreement markers of the kind suggested in Sportiche (1996b). Following Demonte (1995) and Ormazabal and Romero (1999), Bleam (1999) maintains that dative doubling in Spanish is an instance of dative shift. Following Baker (1996), she assumes that in the double object construction, the goal moves past the theme to the specifier of an internal aspect projection (Travis 1991) which dominates the inner VP shell (Larson 1988b). She furthermore proposes that in Spanish the clitic *le* is generated in this Asp head and the indirect object moves to its specifier, as illustrated in (99) (Bleam 1999: 40):

(99)

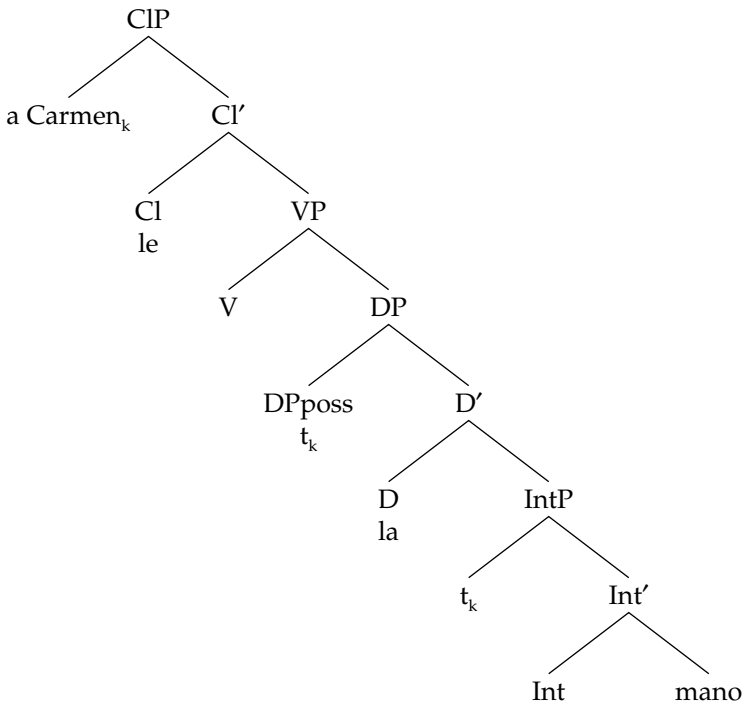


This syntax is very similar to the one proposed in Demonte (1995; see above).

For possessor raising constructions of the type illustrated in (100) Bleam (1999: chapter 3) argues for the structure in (101):

(100) Le vi la mano a Carmen. All Spanish
Cl-dat saw-I the hand to Carmen
'I saw Carmen's hand.'

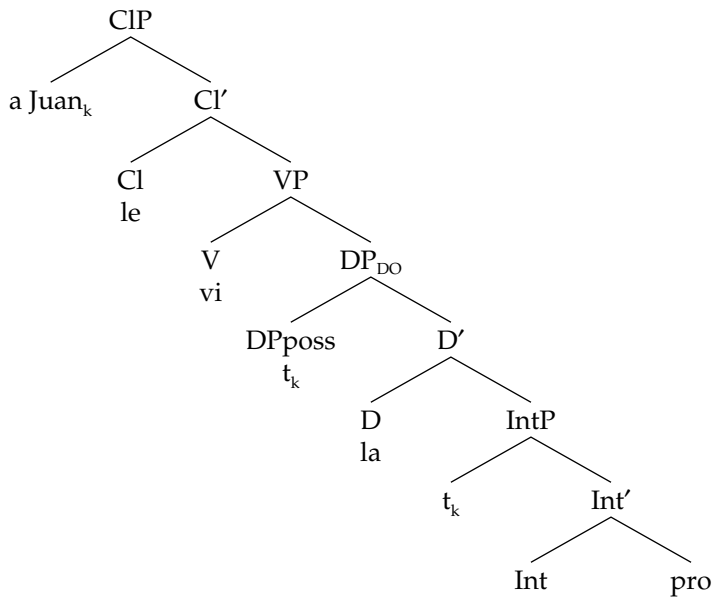
(101)



The possessor originates as the DP-internal subject of an integral (IntP) relation (Hornstein et al. 1994). It moves to the spec,DP, where it is associated with dative marking. From there, it moves to the specifier of the dative clitic, where it checks dative Case and the feature [+A] associated with animacy and affectedness, a feature that all indirect objects in the double object construction have.

Finally, Bleam (1999) extends the possessor-raising analysis of the type illustrated in (101) to direct object clitic doubling in Leísta Spanish. She argues that clitic doubling in this dialect is an instance of an integral relation. The double is a subconstituent of the direct object which escapes the DP and becomes a dative argument of the verb, thus accounting for the use of the dative clitic form with the direct object. This derivation is illustrated in (102) (Bleam 1999: 129):

(102)



In this representation, the overt double is the 'possessor' and pro is the possessed element. The possessor moves through spec,DP to the specifier of the *le*-phrase acquiring properties of an indirect object.

4.3 The Greek type of indirect object clitic doubling

Unlike Spanish, where the presence of a dative doubling clitic signifies a double object construction, in Greek indirect object doubling is just a variant of the double object construction. In active sentences, doubling optionally takes place with genitive indirect object DPs, which alternate with PPs in a manner reminiscent of the dative shift alternation in English. These facts are discussed at length in Anagnostopoulou (1999a, 2003) and will be briefly summarized here.

Greek possesses a variety of ditransitive constructions, in which indirect objects are realized as PPs, as DPs with morphological genitive case, or as DPs with morphological accusative case (see Philippaki-Warburton 1977; Mackridge 1985; Tzartzanos 1989; Holton et al. 1997; among others). The first construction consists of an accusative DP denoting a theme and a goal PP introduced by the preposition *s(e)* 'to'. The DP is assigned morphological accusative case by the preposition, as shown in (103). Similarly to English *to*, Greek *s(e)* is also used as a locative preposition, as in (104):

(103) O Janis estile to grama s-tin Maria. Greek
The John-nom sent the letter-acc to-the Mary-acc
'John sent the letter to Mary.'

(104) O Janis pige stin Olandia.
The John-nom went to-the Holland-acc
'John went to Holland.'

The second construction combines two non-prepositional DPs, a goal and a theme. The goal bears morphological genitive case, while the theme surfaces with morphological accusative:

(105) O Janis estile tis Marias to grama. Greek
The John-nom sent the Mary-gen the letter-acc
'John sent Mary the letter.'

Greek has lost the morphological distinction between genitive and dative case and has generalized the use of genitive. Finally, with a limited set of verbs, the goal can either be introduced by a PP headed by *s(e)* or be projected into a structure in which both the indirect object and the direct object surface with morphological accusative case. This construction will not be discussed here (see Anagnostopoulou 2001, 2003, for details).

The Greek alternation between a PP and an undoubled genitive DP shares many characteristics typical of the dative shift alternation in English. For one, the genitive construction in Greek is mainly tolerated with animate goals, like the double object construction in English (it is also possible with inanimate possessors, as in English):

(106) a. I Ilektra estile ena dhema s-tin Galia. Greek
The Ilektra-nom sent a parcel-acc to-the France
'Ilektra sent a parcel to France.'
b. *I Ilektra estile tis Galias ena dhema.
The Ilektra-nom sent the France-gen a parcel-acc
'*Ilektra sent France a parcel.'

Moreover, in English, there are verb classes that allow the genitive construction and others which don't (Oehrle 1976; Gropen et al. 1989: 243ff.; Pinker 1989; Pesetsky 1995: 141). The same observation holds for Greek (see Anagnostopoulou 2003 for details). Finally, in the genitive construction the genitive goal asymmetrically c-commands the theme, like the double object construction in English. This is illustrated here with the *each . . . the other* test (see Barss and Lasnik 1986; Larson 1988b; see Anagnostopoulou 1999a, 2003, for extensive discussion of word order and c-command in Greek ditransitives):

(107) a. Estila tis mias miteras to pedhi tis alis.
Sent-1sg the one mother-gen the child-acc the other-gen
'I sent each mother the other's child.'
b. *Estila tis miteras tu alu to ena pedhi.
Sent-1sg the mother-gen the other-gen the one child-acc
'*I sent the other's mother each child.'

Unlike Spanish, where *a*-phrases appear to be ambiguous between PPs and dative-shifted DPs, Greek genitives are unambiguously dative-shifted DPs and *se*-DPs qualify as PPs (at least in goal constructions; for benefactive *se*-phrases, see Anagnostopoulou 2005).

As has been seen in (57) and (58) in section 3, indirect objects bearing genitive case may optionally undergo doubling in active ditransitives, similarly to direct objects bearing accusative, and clitic doubling is blocked when the indirect object is a PP. These examples are repeated here:

(57) (Tu) (to) edhosa tu Jani to vivlio. Greek
Cl-gen Cl-acc gave-1sg the John-gen the book-acc
'I gave John the book.'

(58) a. *Tu edhosa to vivlio s-ton Jani. Greek
Cl-gen gave-1sg the book-acc to-the John
'I gave the book to John.'
b. *Tu pira to vivlio apo ton Jani.
Cl-gen took-1sg the book-acc from the John
'I took the book from John.'

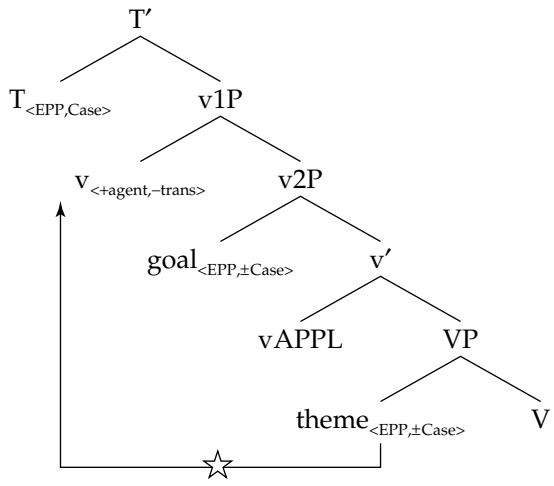
While a clitic is obligatory in the double object construction in Spanish, in Greek it is optional, as is illustrated in (57). This suggests that genitive clitics in Greek do not qualify as dative agreement/applicative-like heads of the type illustrated in, e.g., the structure (92) proposed by Demonte (1995) and the structure (99) proposed by Bleam (1999). In turn, this entails that Spanish and Greek indirect object doubling constructions have a different syntax.

While clitic doubling of genitives in Greek is optional in active sentences, genitives must undergo doubling obligatorily in constructions where the theme undergoes NP-movement. Doubling of a goal or experiencer is obligatory in passives, unaccusatives, and raising constructions, as illustrated in (108) with a passive example (see Anagnostopoulou 1999a, 2003, for details):

(108) a. ?*To vivlio charistike tis Marias apo ton Petro.
The book-nom award-Nact the Mary-gen from the Peter
'?*The book was awarded Mary by Peter.'
b. To vivlio tis charistike (tis Marias) apo ton Petro.
The book-nom Cl-gen award-Nact the Mary-gen from the Peter
'?*The book was awarded Mary by Peter.'

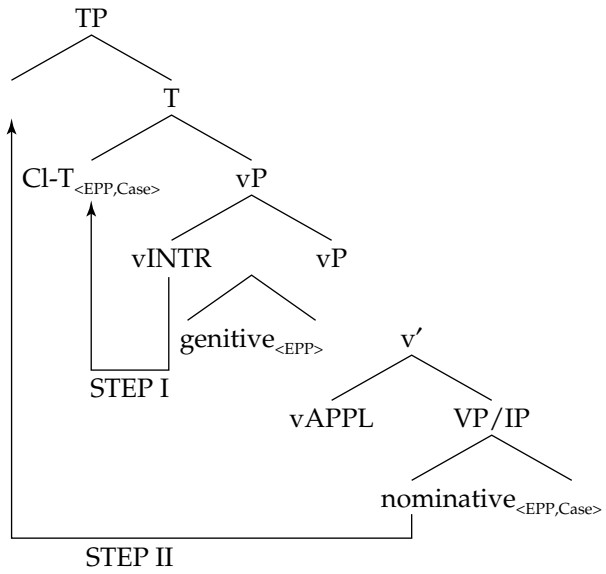
In Anagnostopoulou (1999a, 2003), I argue that (108a) is ungrammatical because the theme cannot undergo NP-movement to T. In the genitive construction, indirect objects are introduced by a higher zero applicative v (Marantz 1993) blocking NP movement of the lower direct object to T, as shown in (109):

(109)



I further argue that in clitic constructions, the intervening formal D-features of the genitive move to T before the nominative and are spelled out as a clitic, as illustrated in (110). In this derivation, locality is respected (Chomsky 1995c; Richards 1997) and, therefore, (108b) is grammatical:

(110)



According to the analysis in (110), genitive doubling clitics in Greek spell out formal nominal features that undergo overt EPP-triggered movement to the functional domain, leaving the genitive phrase behind. Morphological evidence that indirect object clitics are D-elements in Greek comes from the observation that

their forms are identical to determiners, as illustrated in (111) and (112). In this respect, they pattern with accusative clitics:

(111) **Determiners**

	Masculine	Feminine	Neuter
Singular			
Nominative	o	I	to
Genitive	tu	tis	tu
Accusative	ton	tin	to
Plural			
Nominative	i	i	ta
Genitive	ton	ton	ton
Accusative	tus	tis	ta

(112) **Clitics**

	Masculine	Feminine	Neuter
Singular			
Genitive	tu	tis	tu
Accusative	ton	tin	to
Plural			
Genitive	tus	tus	tus
Accusative	tus	tis	ta

Recall that in Spanish, dative clitics do not have the same form as determiners, unlike accusative clitics (see section 4.2 above).

Summarizing, in the preceding sections I have reviewed some proposals according to which indirect object clitics in Spanish are inflections; they head the projection hosting the indirect object in the double object construction, unlike accusative clitics, which have the semantics and morphology of determiners. I have then proceeded to examine Greek, where the double object construction is formed quite independently of the presence of a genitive clitic. On the basis of the optionality of genitive doubling in active sentences, I have suggested that the (applicative/aspectual) head forming the double object construction is zero in Greek, as in English and not as in Spanish. I have furthermore pointed out that genitive clitics in Greek are obligatory in NP-movement constructions and I have attributed their obligatoriness to their status as D-features of DPs, which undergo movement to the functional domain and, therefore, provide an escape hatch to locality violations. The comparison of the properties of the double object construction in the two languages leads to a novel typology of indirect object clitics. In Spanish, they are inflections; in Greek, they are D-features of DPs.

4.4 Aspectual factors and accusative clitics in Spanish

I will close my review of the literature on clitic doubling by presenting an analysis of accusative clitics in Spanish advanced by Torrego (1998). Torrego links

the presence of accusative clitics in Spanish to transitive v (Kratzer 1994; Chomsky 1995c) and proposes that they signal/host/provide the 'active' D-feature of that v (Torrego 1998: 14, 51, 58–72).

More specifically, Torrego (1998) investigates the conditions under which objects of transitive accusative verbs occur with the dative preposition *a* in Spanish, and formulates six generalizations characterizing Spanish accusative/direct objects marked by the dative preposition. These are summarized here (see Torrego 1998: 14–34 for details):

(i) The first generalization is **Kayne's Generalization**. In the dialects of Spanish permitting clitic doubling of direct objects, doubling is limited to direct objects preceded by *a* (see section 3 above).

(ii) The second generalization is that accusatives marked with *a* are **specific** in Spanish (compare this claim, however, to sections 3 and 4.2 above, where it is claimed that *a*-phrases are not always specific; those undergoing doubling are).

(iii) The third generalization is that **telicity** governs the distribution of *a* in Spanish (see, in particular, Schmitt's 1996 discussion of aspectual effects in Spanish; see also Bleam 1999). Torrego points out that (indefinite) objects of verbs that are inherently specified as accomplishments must be preceded by *a* when they are animate, as illustrated in (113):

(113) La policía encarceló *(a) varios ladrones.
The police jailed *a* several thieves
'The police jailed several thieves.'

With other aspectual classes, *a* is optional, as illustrated in (114):

(114) Escondieron (a) varios prisoneros.
Hide-they *a* several prisoners
'They hide several prisoners.'

Torrego argues that when *a* is present the predicate is telic and when it is absent the predicate is atelic.

(iv) The fourth generalization has to do with **agentivity/causation/eventiveness**. With predicates that are inherently agentive or causative, *a* (on indefinite animate objects) is required, regardless of whether the subject is animate or inanimate, as illustrated in (115):

(115) a. El soldado emborrachó *(a) varios colegas.
The soldier made-drunk *a* several friends
'The soldier got several friends drunk.'
b. El vino emborrachó *(a) varios invitados.
The wine made-drunk *a* several guests
'The wine made several guests drunk.'

With eventive transitive predicates that permit non-animate subjects, *a* on the object is possible only when the subject is animate, as illustrated in (116):

(116) a. El herido exigía (a) un médico.
the injured required *a* a doctor
'The injured required for a doctor.'
b. La situación exigía (*a) un médico
the situation required *a* a doctor
'The situation required for a doctor.'

Stative predicates require *a* (on indefinite animate objects) when they express 'active emotions' (Pesetsky 1995):

(117) Caín odiaba *(a) un hermano.
Cain hated *a* a brother
'Cain hated a brother.'

With other stative verbs, when the subject is animate, *a* is permitted (on indefinite animate objects), and when the subject is inanimate, *a* is disallowed:

(118) a. Inés conoce (a) un médico.
Inés knows *a* a doctor
'Inés knows a doctor.'
b. La ópera conoce (*a) muchos aficionados.
Opera knows *a* many fans
'Opera knows many fans.'

In examples like (118a), the presence vs. absence of *a* correlates with eventiveness vs. stativity. When *a* is present, the predicate qualifies as eventive by, e.g., the progressive test (Dowty 1979). When *a* is absent, the predicate is stative and the progressive is disallowed:

(119) a. Estoy conociendo a un vecino.
Am-I knowing *a* a neighbor
'I am getting to know a neighbor.'
b. *Estoy conociendo un vecino.
Am-I knowing a neighbor
*'I am knowing a neighbor.'

(v) The fifth generalization has to do with **animacy**. As already mentioned, the preposition *a* occurs mainly with animates (Torrego 1998: 55 points out that *a* can also occur on metals or proper names referring to anything, from a boat to a magazine).

(vi) The sixth generalization has to do with **affectedness**. Affected (indefinite animate) objects require *a*, unlike unaffected ones, where *a* is optional:

(120) a. El guardia vió (a) un prisoniero.
The guard saw *a* a prisoner
'The guard saw a prisoner.'
b. El guardia golpeó *(a) un prisoniero.
The guard beat *a* a prisoner
'The guard beat a prisoner.'

Note that generalizations (iii), (iv), and (vi) hold of indefinite animate objects. Definites must always be marked by *a* (see Torrego 1998: 66).

To provide a very brief and oversimplified overview of what Torrego (1998) proposes: she argues that non-affected morphologically marked accusatives have structural Case while affected marked accusatives have quirky Case. She furthermore hypothesizes that the mechanism responsible for the properties of marked accusatives listed above is overt raising of the object to spec,vP triggered by a D-feature of v, i.e., a kind of object shift. Among other things, she links object shift to the proposal that (i) affectedness is associated with a specifier position within the layered VP-domain (spec,vP for direct objects, the specifier of a lower functional head for dative shifted indirect objects), and (ii) quirky Case (assigned to the object when the subject is agentive/causative/eventive) is licensed by V in conjunction with v (Torrego 1998: 36). Specificity of marked accusatives is linked to overt raising to spec,vP; she points out that the D-feature of v has been linked to specificity in the case of, e.g., Icelandic object shift (see, in particular, Chomsky 1995c, 2000, 2001b, who proposes that the assignment of an EPP feature to the vP phase has interpretive effects). As for the fact that doubling is limited to marked accusatives in Spanish, Torrego (1998: 56) argues that accusative clitics are Ds overtly encoding the categorial feature D of v (and agreement features), which triggers raising of accusatives marked by *a*. (Torrego furthermore argues that the dative preposition introducing the indirect object in ditransitives is a functional head p, the counterpart of v, which is merged below v and that the dative clitic *le* is to p what the accusative *lo* is to v; she argues that doubled indirect objects do not raise outside VP, unlike direct objects.)

4.5 *Putting (some) pieces together*

In this section, I have presented the most recent literature on clitic doubling, concentrating on the differences within and across languages, which have led to non-uniform analyses (Spanish indirect objects vs. direct objects; Spanish vs. Greek indirect objects; Leísta vs. Argentinean vs. Standard Spanish direct objects). I will close the discussion with some thoughts on how to partially unify Greek indirect object doubling and Spanish direct object doubling.

It has been demonstrated that Greek doubling differs from its Spanish counterpart with respect to two properties. First, indirect object doubling in Greek is just a variant of the double object construction; in Spanish, it signifies the double object construction. Put differently, in the Greek double object construction, doubling of the indirect object is optional; in the Spanish double object construction,

doubling is obligatory. Second, direct object doubling in Greek optionally takes place with any accusative object of the appropriate semantic type (definites; for some speakers also specific indefinites); in Spanish it is limited to what Torrego calls 'marked accusatives', i.e., direct objects marked by the dative preposition *a*.

Interestingly, if Greek indirect object doubling is compared to Spanish direct object doubling as described by Torrego, it turns out that the two are descriptively rather similar. In both, clitics optionally co-occur with objects that have been characterized in the literature as 'affected', are usually animate, and alternate morphologically and syntactically with non-affected, non-animate objects. More specifically, in section 4.3, I have presented evidence that the Greek genitive construction is a double object construction. Genitive objects are usually animate (or inanimates in a possessor/part–whole relation with the theme); they are construed as affected (Marantz 1993); and they alternate with goal PPs, similarly to 'dative-shifted' objects in English. Torrego's (1998) description of *a* marked accusatives in Spanish, presented in section 4.4, reveals a number of related properties: they are usually animate; they are affected (as Torrego stresses, it is not a coincidence that they surface with the dative marking *a*); and they alternate with unmarked accusatives. One difference between genitive goals and marked accusatives is that, to the extent that I have been able to determine, realization of goals as genitive does not depend on properties of the external argument but rather on properties of the internal argument (the goal is affected by the event affecting the theme; the goal must be a possessor of the theme). On the other hand, according to Torrego, realization of direct objects as DPs preceded by *a* depends on whether the subject can be construed as an agent/causer.

It is rather standard to assume that the special semantic properties of indirect objects in the double object construction are located on a functional (applicative) head introducing the indirect object (or checking features of the indirect object in transformational analyses of dative shift) which is merged above the V introducing the theme (Marantz 1993). It is also widely assumed in the literature that 'dative-shifted' objects enter Agree/Move relations with (causative) v or T, unlike prepositional indirect objects (this intuition is expressed in various forms in Larson 1988b; Baker 1988a, 1996; Pesetsky 1995; McGinnis 1998; Anagnostopoulou 1999a, 2003, to mention some analyses). Genitive doubling can be viewed as the overt realization of the Move/Agree relation between v or T and the indirect object (see the discussion in section 4.3). Suppose we extend this line of analysis to Spanish marked accusatives. One possible implementation would be to suggest that the special semantic properties of marked accusatives in Spanish are also hosted on a functional head, presumably the agentive/causative/telic v introducing the subject (see Alexiadou and Anagnostopoulou 2000). It could be suggested that Spanish has two types of a transitive v: one with agentive/causative features for subjects and marked accusative case for animate objects, and one with non-agentive features for subjects and unmarked accusative case for animate objects. Doubling of marked accusatives in Spanish would accordingly be the overt realization of a Move/Agree relation between (agentive) v and the direct object it licenses, similarly to doubling of genitives in Greek.

NOTES

1 Jaeggli (1986b) actually proposed four arguments in favor of his position, but only three of them are mentioned here. Jaeggli's fourth argument relies on a difference between right dislocation and left dislocation in Spanish with respect to Subjacency, namely that right dislocation is subject to Subjacency while left dislocation is not. On the basis of this, Jaeggli proposed that right dislocation is a construction involving movement of the dislocated phrase from a clitic doubling position, and left dislocation is a base-generated dependency not showing island sensitivity. However, later research has shown that in Italian and Greek, there are actually two instances of left dislocation, one showing properties of base generation in not being subject to Subjacency (Hanging Topic Left Dislocation) and one showing properties of movement (CLLD) in being selectively sensitive to islands. Given this complication as well as the fact that right-peripheral constructions are not subject to the same type of locality conditions as left-peripheral ones, this argument is either not valid or requires further refinement.

2 Borer's proposal is the result of an attempt to explain certain properties of extraction from clitic doubling configurations in Hebrew free relatives and questions, as opposed to Romanian (Steriade 1980).

3 In this account, the formal relation between clitics and argument DPs is comparable, to some extent, to the relation between expletives and associates in expletive–associate chains in the framework of Chomsky (1995c). Similarly to associates that move to the expletive position at LF, doubled DPs move to the clitic position overtly (in CLLD and scrambling) or covertly (in clitic doubling; see Sportiche 1996b). It is easy to see that in the framework of Chomsky (2000, 2001b), movement of the associate to the clitic can be restated as an Agree relation between the clitic and the doubled phrase (or T and the doubled phrase; in the latter case, the clitic can be viewed as an overt signal of *Agree* between T and the object). Such an analysis dispenses with actual movement but maintains the locality characteristic of movement (for discussion, see Anagnostopoulou 2003).

4 The summary of clitic placement facts in Greek and of the analyses proposed for them is taken from Alexiadou and Anagnostopoulou (2000: 179–181).

5 In (81), the *l* indicates the form used when the clitic or the determiner is enclitic.

1 Introduction: missing elements in clausal comparatives

One of the earliest observations made in the research on comparatives was that in a comparative construction like (1) an element in the comparative clause (i.e., the clause introduced by *than*) is missing (Lees 1961; Hale 1970; Bresnan 1972, 1973b):[1]

(1) John met more linguists than I met.

Although the direct object of the comparative clause is absent phonetically, there are reasons for assuming that it is present syntactically. One of the most obvious reasons is the fact that in a declarative clause like (2) the direct object simply cannot be missing:

(2) *John believed that I met.

The ill-formedness of (2) is caused by the fact that the lexical restriction that the verb *meet* combines with a noun phrase complement (a subcategorization or thematic requirement) is not satisfied in the syntactic structure. The well-formedness of (1) suggests that this lexical restriction is somehow met in the comparative clause (i.e., the clausal complement of *than*). This is done by assuming the presence of a phonetically empty noun phrase (*e*) in the direct object position:

(3) John met more linguists than I met *e*.

This empty constituent represents the compared element of the comparative clause. It is compared with the head of the comparative clause, *more linguists*. In view of the interpretation of the entire comparative construction (in informal terms: 'the *number* of linguists John met exceeds the *number* of linguists I met'), the compared element of the comparative clause receives the interpretation of a quantified noun phrase, say: *x-many linguists*, where *x-many* forms a Q(uantifier) P(hrase) and *x* is a designated degree element specifiying the QP (Bresnan 1973b).[2,3] Given this interpretation, it has been proposed by Bresnan in a series of papers (Bresnan 1975, 1976a, 1976c, 1977) that a representation like (3), in which the compared direct object is phonetically empty, is derived from a structure like (4), in which the compared material is lexically present, via a transformational operation called Comparative Deletion. This operation deletes lexical material in the comparative clause under identity with material in the compared constituent of the matrix clause.[4] As indicated, it is assumed that the comparative form *more* (as in (3)) derives from the sequence *-er many*:[5]

(4) John met *[[-er many] linguists]* than I met *[[x-many] linguists]*.

In (3), the compared direct object has been removed in its entirety. On the basis of such examples as (5) it was concluded, however, that also a *sub*part of the compared constituent in the comparative clause could be omitted. Given the fact that in (5) the comparison is between the *number* of linguists John met and the *number* of biologists I met, it seems quite natural to analyze the amount indicating QP *x-many* as the deleted part (Bresnan 1973b). Thus, (5) derives from (6) by omitting the amount term *x-many* in the comparative clause. The operation that deletes the amount term (*x-many*) of the comparative clause is called Comparative Subdeletion (henceforth: Subdeletion):

(5) John met more linguists than I met biologists.

(6) John met [*[-er many]* linguists] than I met [*[x-many]* biologists].

As exemplified in (7) and (8), respectively, the processes of Comparative Deletion and Subdeletion apply not only to direct object noun phrases but also to those having a different grammatical function:

(7) a. More women stayed at home than I believed *e* went to the beach. (SU)
b. John sent more girls a postcard than he had given *e* a bunch of flowers. (IO)
c. He uttered more homilies than I'd ever listened to *e* in one sitting. (object of P)

(8) a. More women stayed at home than [*e* men] went to the beach. (SU)
b. John sent more boys a postcard than he had given [*e* girls] a bunch of flowers. (IO)
c. He uttered more homilies than I'd ever listened to [*e* prayers] in one sitting. (object of P)

The examples in (9) and (10) furthermore show that these phenomena are not restricted to noun phrases; the compared phrases can also be adjectival or adverbial:[6]

(9) a. She seems as happy now as she seemed *e* before.
b. My sister drives as carefully as I drive *e*.

(10) a. She seems as happy now as she seemed [*e* sad] before.
b. My sister drives as carefully as I drive [*e* carelessly].

A central question in the study of the syntax of Comparative Deletion and Subdeletion constructions has been: do these comparatives have essentially the same syntax or not? That is, should they receive a uniform syntactic analysis or are there reasons for assigning them different syntactic analyses? Another (related) important question concerns the nature of the computational rule(s) that is/are responsible for the missing compared element in the comparative clause. More in particular: is it a deletion rule, a displacement operation, or maybe some interpretive rule governing empty pronominals that is responsible for the missing element? It is the aim of this chapter to give insight into the linguistic discussions on these and other issues related to the syntax of Comparative Deletion and Subdeletion.

The chapter is organized as follows: section 2 provides a detailed discussion of certain properties of the Subdeletion construction. A central question that will be addressed is what evidence there is for the presence of an empty element within the subcompared constituent of the comparative clause. Although the presence

of an empty element is rather straightforward in the case of a Comparative Deletion construction like (1), it seems less so in the case of a Subdeletion construction like (5). After evidence for the presence of a missing element in Subdeletion contexts has been presented in section 2, section 3 addresses the question of what computational rule(s) is/are at the basis of the two types of comparative constructions. More in particular: what kind of computational operation is 'responsible' for the missing compared element in the comparative clause? Is it unbounded Deletion (Bresnan's approach) or is it *wh*-movement (Chomsky's approach)? Various arguments will be discussed that have been presented as evidence in support of or against one or the other analysis. Section 4 considers an alternative approach (proposed by Pinkham) toward Comparative Deletion and Subdeletion, viz., one according to which the missing element is a base-generated empty pronominal which is licensed by means of an interpretive rule. After the discussion in sections 3 and 4 about the nature of the computational process that applies within the comparative clause, section 5 considers the nature of the relationship between the comparative clause and the matrix clause. An important question that will be addressed concerns the nature of the comparative conjunction in the two types of comparative constructions: does it act as a truly subordinating conjunction or does it act as a coordinating conjunction? And related to that: does the comparative clause in the two types of comparative constructions display the same syntactic (i.e., subordinating/coordinating) behavior? Section 6 discusses the phenomenon of multiple Comparative Subdeletion, i.e., the presence of more than one missing compared element within the comparative clause. In sections 2 through 6, various grammatical properties of Comparative Deletion and Subdeletion will have passed in review. In section 7, these properties will be considered again by raising the important question of whether Comparative Deletion and Subdeleletion should be treated as a single, unified phenomenon or not. That is, do the two types of comparatives involve a single rule of comparative formation, or are they derived in fundamentally different ways? Section 8 is the conclusion.

It should be noted that many aspects of the syntax of comparative constructions will not be dealt with in this study; notably, the syntax of reduced comparatives and the syntax of phrasal comparatives (cf. Lechner 1999, 2001, for recent discussion). The former relates to the derivation of comparative constructions in which, besides the missing element in the compared constituent, there is additional material missing from the comparative clause, as in (11b–e); the latter concerns those comparative structures in which the lexical items *than* and *as* are followed immediately by a non-clausal constituent (as, for example, in *A person taller than Bill entered the room*; *Mary sings more loudly than beautifully*).[7] Some examples of the reduced comparative structures are given in (11b–e), in which, besides the subdeleted subject noun phrase, some other element seems to have been removed from the subcomparative clause:

(11) a. More women bought these apples than [*e* men] bought these pears.
b. More women bought these apples than [*e* men] did these pears.

c. More women bought these apples than [*e* men] these pears.
d. More women bought these apples than [*e* men] did.
e. More women bought these apples than [*e* men].

In (11a), only Subdeletion has operated. In (11b–e), a number of additional processes have been said to apply: pseudogapping (11b), gapping (11c), VP-deletion (11d), comparative ellipsis (11e). As regards this last comparative construction type, there has been discussion about the question of whether to interpret the constituent following *than* (or *as*) as a reduced (i.e., ellipted) clause (cf. Hankamer 1971; Bresnan 1973b; Pinkham 1982; McCawley 1988; Bierwisch 1989; Lechner 2001) or as a base-generated noun phrase (cf. Pinkham 1982; Brame 1983; Hoeksema 1983; Napoli 1983).

2 On the presence of QP

This section addresses the question of whether there is any evidence for a (subdeleted) QP within the subcompared phrase. Section 2.1 presents some of the arguments that have been adduced in favor of this hypothesis. Section 2.2 discusses what might be neutrally called *of*-comparatives (as in *John knows more of these linguists than I know [– of these biologists]*). Section 2.3 discusses an analysis which, like Bresnan's, assumes the presence of a QP within the comparative clause, but, contrary to Bresnan's analysis, locates this QP in a position external to the compared phrase.

2.1 Evidence for a missing element in Subdeletion constructions

Although for Comparative Deletion constructions it is quite clear that some element has been removed from the comparative clause, this is less so for comparative constructions involving Subdeletion. The comparative clause in (12), for example, superficially looks the same as the embedded declarative clause in (13) (modulo the clause-introducing element: *than* vs. *that*); there is no overt difference between compared adjective phrase *wide* in (12) and (absolute) adjective phrase *wide* in (13):

(12) The desk was longer than the table was wide.

(13) John said that the table was wide.

Semantically, however, there is a clear contrast between the two clauses. The declarative clause expresses that *the table* has the property of being wide. The comparative clause, on the other hand, expresses that it is wide *to a certain extent*. This extent of width is compared with the extent to which the desk is long. As is

clear from the compared element *longer* in the matrix clause, the length of the desk surpasses its width.

Thus, although superficially the same, the clause *the table was wide* has a different meaning in (12) and (13): a property reading vs. an extent or degree reading. This latter reading might be syntactically expressed by the presence of a quantifier-like element within the compared adjective phrase.

Besides this interpretive argument in support of the presence of an underlying QP within the subcompared phrase, Bresnan provided a number of other arguments for it. The strongest argument, one of complementary distribution, is the impossibility of having overt quantifiers in the position of the missing quantifier (Bresnan 1975):

(14) a. The desk was longer than the table was *too/*that wide.
b. John met more linguists than I met *many/*three/*most/*a few biologists at the party.

Another argument Bresnan presents in support of a missing quantifier within the subcompared phrase is based on the examples in (15–16):[8,9]

(15) a. *This mouse weighs ounces.
b. This mouse weighs six/that many ounces.

(16) a. John weighs more pounds than this mouse weighs ounces.
b. *John weighs more pounds than this mouse weighs six/that many ounces.

These examples feature a measure verb which selects a nominal measure phrase as its complement. As indicated by the ungrammaticality of (15a), the measure noun phrase cannot consist of a bare measure unit noun; the measure phrase must contain a cardinal (*six*) or a quantifier (*many*) specifying the measure, as in (15b). Knowing this, sentence (16a) is no exception to the required presence of a measure-indicating element within the measure phrase, if one assumes that there is an underlying QP in the specifier position of the measure noun phrase (say: *x-many*). Note that the ill-formedness of (16b) corroborates the presence of an underlying QP within the measure noun phrase; *six/that many* is not allowed to occur within the noun phrase, since they are in complementary distribution with the underlying QP.

A phonological indication for the presence of an empty QP comes from the phenomenon of tensed auxiliary contraction (King 1970; Bresnan 1971a). Bresnan (1973b) argues that this phenomenon, which is known to block directly before a deletion site, is inhibited directly before the Subdeletion site. As indicated by the b-examples (with the * representing Bresnan's judgments), Subcomparative formation can apply if the tense auxiliary has not been contracted:

(17) a. I am cleverer than you are [*e* prudent].
b. *I'm cleverer than you're [*e* prudent].

(18) a. It was as much trouble then as it is [*e* fun] now.
b. *It was as much trouble then as it's [*e* fun] now.

The strength of this phonological argument is disputed by Grimshaw (1987). She argues that the effects depicted in the b-examples are quite weak. Although it is true that contraction directly before a Subdeletion site yields a less than perfect result, contraction before a Subdeletion site turns out to be much better than contraction before a gap created by Comparative Deletion:

(19) a. I'm cleverer than you are *e*.
b. *I'm cleverer than you're *e*.

(20) a. It was as much trouble then as it is *e* now.
b. *It was as much trouble then as it's *e* now.

Also from other languages, empirical evidence has been adduced in support of the presence of a missing QP within the subcompared phrase. Bennis (1977), for example, points out for Dutch that, besides comparative clauses like (21a), in which the entire compared constituent has been deleted, we find comparative clauses like (21b) containing a clitic-like pronoun *er* (of-them/it), which replaces the N'-part of the compared noun phrase in the comparative clause (see also Bennis 1978 and den Besten 1978 for discussion of this point):

(21) a. Ik ken meer taalkundigen dan jij ontmoet hebt.
I know more linguists than you met have
'I know more linguists than you have met.'
b. Ik ken meer taalkundigen dan jij er ontmoet hebt.
I know more linguists than you CL met have
'I know more linguists than you have met.'

This clitic displays the syntactic behavior characteristic of so-called quantitative *er*, i.e., the clitic *er* which pronominalizes part of a quantified noun phrase (viz., N'), as in (22).[10] As illustrated in (23), quantitative *er* can substitute for a (plural) count noun like *boterhammen* but not, for example, for a mass noun like *brood*; it cannot replace part of a noun phrase which is modified by an attributive AP (24); it can replace part of a noun phrase leaving the associated relative clause unaffected (25):

(22) Ik geloof dat Jan *er* toen [veel/drie –] ontmoet heeft.
I believe that John CL then many/three met has
'I believe John met many/three of those.'

(23) a. Jan at gisteren weinig boterhammen. Vandaag eet hij er veel.
John ate yesterday few sandwiches. Today eats he CL many
'John ate few sandwiches yesterday. Today he eats many.'

b. Jan at gisteren weinig brood. *Vandaag eet hij er veel.
John ate yesterday little bread. Today eats he CL much
'John ate little bread yesterday. Today he eats a lot of bread.'

(24) Jan ontmoette er gisteren [drie (*Japanse) –].
John met CL yesterday [three (Japanese) –]
'John met three (Japanese) linguists yesterday.'

(25) Jan ontmoette er gisteren drie die uit Japan kwamen.
John met CL yesterday three who from Japan came
'John met three linguists who came from Japan.'

As illustrated in (26–28), these syntactic properties of quantitative *er* are also found with the item *er* appearing in comparative clauses. This suggests that this item is in fact quantitative *er*:

(26) a. Jan at gisteren meer boterhammen dan hij er vandaag heeft
John ate yesterday more sandwiches than he CL today has
gegeten.
eaten
'John ate more sandwiches yesterday than he has eaten today.'
b. *Jan at gisteren meer brood dan hij er vandaag heeft gegeten.
John ate yesterday more bread than he CL today has eaten
'John ate more bread yesterday than he has eaten today.'

(27) Jan heeft meer Chinese taalkundigen ontmoet dan jij er (*Japanse)
John has more Chinese linguists met than you CL (*Japanese)
ontmoet hebt.
met have
'John met more Chinese linguists than you met Japanese linguists.'

(28) Jan kent meer taalkundigen die uit China komen dan ik er ken
John knows more linguists that from China come than I CL know
die uit Japan komen.
who from Japan come.
'John knows more linguists who come from China than I know linguists who come from Japan.'

Given the fact that quantitative *er* typically replaces the N'-part of a quantified noun phrase (i.e., a noun phrase containing a QP) leaving the QP unaffected (as in (22)), the conclusion seems inescapable that the same holds for quantitative *er* appearing in comparative clauses (e.g., (21b)). The fact that the quantifier of the quantified noun phrase is absent must be due to some independent operation which is active in the comparative clause: Subdeletion. Notice also here that the correctness of assuming an underlying QP is corroborated by the fact that it is

impossible to have a quantifying element (e.g., *drie*) in the specifier position of the compared noun phrase (the argument of complementary distribution):

(29) *Ik ken meer taalkundigen dan jij er drie ontmoet hebt.
I know more linguists than you CL three met have
'I know more linguists than you met.'

French provides evidence for a missing QP roughly along the same lines as Dutch. As noted in Milner (1978a) and Pinkham (1982), comparative clauses in French feature the quantitative clitic *en* (of-it) when the compared element in the comparative clause is interpreted as identical to that of the matrix clause:

(30) J'ai plus de livres que Paul n'en a
I have more of books than Paul NEG CL has
'I have more books than Paul has.'

Just as in Dutch, this quantitative clitic typically combines with a quantifier in non-comparative contexts:

(31) Paul en a beaucoup/trois
Paul CL has many/three
'Paul has many/three books.'

Given this co-occurrence restriction, it seem plausible to assume that there is an underlying QP within the comparative clause containing *en* as well. The only difference is that in comparative clauses the quantifier is non-overt.[11]

2.2 Of-*comparatives*

Part of Bresnan's (1975, 1976a) argumentation in support of an underlying QP within the compared noun phrase is based on what may be neutrally called '*of*-comparatives'. These are comparative constructions in which the compared constituent of the comparative clause contains a lexical *of*-phrase as a residue; that is, the only part that is removed from the compared constituent is a QP. The minimal pair in (32) nicely compares this kind of comparative with the already familar Subdeletion construction:

(32) a. John met more linguists than I met biologists.
b. John met more of the linguists than I met of the biologists.

Bresnan argues that *of*-comparatives also instantiate Subcomparative formation; that is, they are derived by removing a quantifier phrase (QP) from the compared noun phrase. Thus, application of Subdeletion to the structure in (33a) gives us the derived structure in (33b):

(33) a. . . . than I met [*x-many* of the biologists]
b. . . . than I met [*e* of the biologists]

The fact that the *of*-comparative construction becomes ungrammatical when the compared phrase contains a lexicalized QP, as in (34), is again suggestive of the presence of an underlying (phonetically empty) QP within the compared phrase:

(34) *John met more of the linguists than I met three/many of the biologists.

Bresnan further observes that the presence of a QP in subcomparatives seems to be detectable through its local syntactic effects. When quantifiers such as *many* and *more* are followed by indefinite nouns, *of* cannot appear (see (35a)), but if they are followed by definites, *of* is obligatory (see (35b)):

(35) a. many (*of) linguists, more (*of) linguists
b. many *(of) those linguists, more *(of) those linguists

Bresnan notes that the same distribution holds in subcomparatives. This is exemplified in (36). If these examples involve an underlying QP that is removed, then the parallelism depicted in (35) and (36) can be explained, provided that the posited QP has the properties of *many* and *more*:

(36) a. We met more linguists than we met *e* biologists.
b. *We met more linguists than we met *e* (*of) of biologists.
c. We met more of the linguists than we met *e* of the biologists.
d. *We met more of the linguists than we met *e* *(of) the biologists.

Given the above considerations, Bresnan analyzes *of*-comparatives as instances of Subdeletion, in which a subpart of a compared noun phrase has been removed.

Grimshaw (1987) opposes Bresnan's view and takes the position that they should be treated in analogy with Comparative Deletion constructions; that is, 'deletion' involves removal – in her terms, following Chomsky (1977b), movement to Comp (i.e., [Spec, CP]) and subsequent local deletion of the entire compared phrase (see section 3.3). As far as removal is concerned, an *of*-comparative like (32b) would be treated analogously to a comparative construction like (37), which instantiates Comparative Deletion. That is, in both comparative constructions the entire compared constituent of the comparative clause is removed:

(37) John met more of the linguists than they met *e*.

But how can the *of*-phrase (a PP) in (32b) survive if Comparative Deletion (i.e., complete removal of the compared phrase) is involved? Along the lines of an analysis proposed in Taraldsen (1978) for Norwegian *of*-comparatives, Grimshaw proposes that removal of the entire noun phrase (i.e., in her analysis, movement of the compared noun phrase to [Spec, CP]) takes place after the PP has been

extraposed or reanalyzed from within the NP, leaving only the QP remaining inside. This way we get the superficial effect of QP-removal.

Why should an *of*-comparative like (32b) be treated differently from a subcomparative construction like (32a)? The answer lies in their different syntactic distribution. Whereas a subcompared noun phrase can occupy 'clause-internal', i.e., non-final positions within the clause (e.g., the subject position of the clause or a small clause), a compared noun phrase containing an *of*-phrase is blocked from those positions; it can only appear in a position at the end of VP.[12] These distributional facts are illustrated in (38–40):[13]

(38) a. I met more linguists than you met biologists. (final)
b. I met more of the linguists than you met of the biologists.

(39) a. I found more linguists dull than I found biologists interesting. (non-final)
b. *I found more of the linguists dull than I found of the biologists interesting.

(40) a. More linguists were dull than biologists were interesting. (non-final)
b. *More of the linguists were dull than of the biologists were interesting.

Grimshaw points out that the distributional behavior of the *of*-phrase is similar to that of *of*-phrases that combine with fronted *wh*-expressions: here too the residual PP is permitted only in VP-final position and not in internal positions. Compare, for example, the following sentences:

(41) a. How many did you meet – of the linguists?
b. *How many do you think – of the linguists were dull?
c. *How many do you find – of the linguists dull?

The contrast (38b) vs. (39b, 40b) and the contrast (41a) vs. (41b, c) can be explained now as follows: in (38b) and (41a), the PP can be extraposed out of the noun phrase, and therefore Comparative formation (i.e., *wh*-movement, according to Grimshaw) and Question formation (also *wh*-movement) can apply to the entire noun phrase. In the ill-formed examples, extraposition (see chapter 42) of PP has not taken place; witness their clause-internal placement. Consequently, Comparative formation and Question formation would have to apply to a subpart of the noun phrase. This, however, is not permitted, possibly because of the Subjacency Condition.

Returning now to the contrast in grammaticality of the a-examples and b-examples in (39–40), the different distribution of the subcompared noun phrase and the compared noun phrase combining with the *of*-phrase obviously raises a problem for a uniform treatment of the two types of compared constituents. Whatever process one considers responsible for Subdeletion, a unified treatment of the two types of compared noun phrases would predict a uniform behavior of the two elements. However, it is clear that they do not behave uniformly.

In view of the above considerations, Grimshaw concludes that *of*-comparatives do not instantiate Subdeletion.

2.3 Subcompared phrases as 'bare' noun/adjective phrases

If *of*-comparatives do not feature subremoval from the compared noun phrase, then we are left with such comparatives as (5) (i.e., *John met more linguists than I met biologists*) as instances of Subdeletion. However, even for those constructions, it has been argued (contra Bresnan) that no subremoval of a quantifying expression (QP) from the compared noun phrase is involved. Two variants of this hypothesis that there is no empty QP within the specifier position of the compared phrase can be distinguished in the literature. The first variant, hinted at in Taraldsen (1978), takes (42) to be the underlying representation for a Subdeletion construction like (5). No syntactic rule affects the compared phrase, and its comparative interpretation is realized by its being linked to its antecedent in the semantics only. Taraldsen further relates the well-formedness of the comparative clause to the grammaticality of the independent clause *I met biologists*. Note that in this latter sequence, *biologists* acts as a bare plural. Interestingly, Carlson (1977b) has proposed that even though a bare plural like *biologists* is interpreted as (narrow scope) 'some biologists', the indefinite interpretation is not syntactically represented by the presence of some empty element within the noun phrase (see chapter 4). The indefinite interpretation of the noun phrase is only represented in the semantics. Thus, Taraldsen's analysis is quite in line with Carlson's treatment of bare plural noun phrases:[14]

(42) John met [$_{NP}$[$_{QP}$ more linguists]] than I met [$_{NP}$ biologists].

The second variant, suggested in Grimshaw (1987), also interprets the compared noun phrase as a 'bare' (i.e., QP-less) noun phrase. However, as opposed to Taraldsen's analysis, the amount/extent interpretation of the comparative clause (say, *I met x-many biologists*; but see below) is syntactically represented. Following a suggestion by Roger Higgins, Grimshaw hypothesizes that the subcomparative clause contains a phonologically null Adverb Phrase which has an 'extent'-interpretation (i.e., 'to a certain/great extent'). Sentences like (5) and (12) would then receive structures like (43a) and (43b), respectively[15] (see also Izvorski 1995):

(43) a. I met more linguists than you met biologists [$_{AdvP}$ *e*].
<Extent>

b. The desk was longer than the table was wide [$_{AdvP}$ *e*].
<Extent>

The ill-formedness of such sentences as (44a) and (44b) may then be due to the fact that the empty adverbial modifier quantifies vacuously; it does not play any role in the semantic interpretation of the clause:

(44) a. *I met more linguists than you met three biologists.
b. *This table is longer than it is too wide.

In line with this adverbial analysis of Subcomparative Deletion, Ishii (1991) argues that the semantic content of a subdeletion comparative is a comparison between the events described by the comparative clause and the matrix clause, rather than between the individuals satisfying the comparative NP and its correlate. Thus, a sentence like (5) does not compare the number of biologists John met to the number of biologists I met; it rather compares the number of events at which John met linguists to the number of events at which I met biologists.[16]

This 'adverbial' analysis of Comparative Subdeletion was first defended in Pinkham (1982), though for a more restricted set of subcomparative constructions. Although she follows Bresnan in assuming that constructions like (5) and (12) involve 'Subdeletion' of a quantifier from the compared noun/adjective phrase, she rejects Bresnan's proposal that the constructions in (45) involve 'Subdeletion' of an attributive AP:

(45) a. He makes a better soufflé than he does [an – omelette].
b. They make better police dogs than they do pets.

Pinkham points out that Bresnan's claim that attributive APs can be 'subdeleted' is too strong; there are comparative environments in which subremoval of the attributive AP yields an ill-formed sentence:[17]

(46) a. *Mary has a better ear than she has [a – voice].
b. *She bought a prettier dress than she bought [a – shirt].
c. *John met taller linguists than I met [– biologists].
d. *John was a more famous linguist than Bill was [a – biologist].

Pinkham argues that the contrast between (45) and (46) relates to the semantics of the comparison: in the grammatical examples in (45), the comparison is understood as being adverbial, whereas in the ungrammatical examples, no such adverbial interpretation is possible. The adverbial meaning of (45) is clear from the paraphrases in (47). As shown in (48), such 'adverbial' paraphrases are impossible with the examples in (46):[18]

(47) a. He makes a soufflé better than he does an omelette.
b. They make police dogs better than they make pets.

(48) a. #Mary has an ear better than she has a voice.
b. #She bought a dress more prettily than she bought a shirt.

Thus, the generalization to be captured is that Subdeletion of an AP modifying an NP syntactically is permitted only if the comparison is adverbial semantically.

For example, 'to make good omelettes' is equated with 'to make omelettes well'. According to Pinkham, this adverbial interpretation of the AP is realized in the grammar by means of a semantic restructuring rule which modifies the semantic structure of the comparative clause in such a way that an AP which structurally modifies an NP is reanalyzed as a VP-modifier, i.e., a modifier of the predicate.[19] Thus, in (45a) the attributive AP can be semantically reinterpreted as modifier of the predicate *does an omelette*.

Clearly, Pinkham's 'adverbial' analysis of comparative clauses differs from the one defended in Grimshaw (1987) and Ishii (1991). Whereas the latter two start out from a syntactic structure in which the modifying element is a VP-modifier, Pinkham's analysis leaves the modifying element NP-internal at the level of syntactic representation (say, D-structure and S-structure) and assigns it a VP-modifying status at the level of semantic representation.

Summarizing, section 2 addressed the question of whether there is any evidence for the presence of an underlying quantifier (QP) within the compared constituent of the (sub)comparative clause. Bresnan (and other linguists) have tried to provide a variety of empirical arguments for the presence of an understood quantifier within the subcompared phrase of constructions like (5). A number of linguists (e.g., Grimshaw) have argued that there is indeed an amount-extent-designating phrase present in the subcomparative clause, but according to them this phrase is always represented as an adverbial phrase within the subcomparative clause. Taraldsen, finally, assumes that the amount/extent interpretation associated with the subcomparative clause is not syntactically represented by means of some syntactic phrase. The 'subcompared' noun phrase in a sentence like (5) is a bare NP and the amount interpretation is purely a matter of semantics.

3 Bounded vs. unbounded transformations

A common characteristic of Comparative Deletion constructions and Subdeletion constructions is that they both require some element to be omitted from the comparative clause (see Taraldsen's 1978 bare NP-analysis, though; section 2.3). As was shown in section 1, the presence of an 'understood' compared phrase in the comparative clause of a Comparative Deletion construction like (1) was rather straightforward. In section 2, arguments were presented in support of the presence of an empty compared constituent within the comparative clause of a Subdeletion construction like (5). A question which has received much attention in the generative literature concerns the nature of this missing (i.e., empty) constituent. More in particular, what syntactic process 'removes' the (sub)compared phrase in the comparative clause? This question has figured prominently in the controversy between Bresnan (Bresnan 1975, 1976a, 1976c, 1977) and Chomsky (Chomsky 1973, 1977b) about the proper description of unbounded syntactic relations (i.e., the question of whether or not syntactic theory should allow for unbounded transformations).

As shown in (49), the compared constituent in the comparative clause can be construed at a distance from the head of the comparative clause in Comparative Deletion constructions (Ross 1986):

(49) a. John met more linguists than you met –
b. John met more linguists than we thought you said Bill believed Sue met –

Bresnan describes this unbounded dependency between the two compared constituents by means of a transformation termed 'Comparative Deletion'. This rule deletes the compared constituent of the comparative clause under identity with the head of the comparative clause and can apply over an unbounded domain. Thus, the process of comparative formation defines a relationship between syntactic positions that can – modulo island constraints – be arbitrarily distant from each other. Schematically:

(50) . . . *more linguists* [than we thought [you said [(. . .) [Sue met *x-many linguists*]]]]
↓
ø

Chomsky rejects the existence of unbounded transformational rules and proposes that all syntactic transformations are subject to a bounding condition known as the Subjacency Condition. In line with this condition, the unbounded dependency between the two compared constituents in (50) is the result of successive-cyclic application of a bounded movement rule to the second compared constituent, with the result that the moved compared constituent ends up in a position close enough to the head of the comparative clause for the moved element to be locally deleted. Schematically:

(51) . . . *more linguists* than [*wh-many linguists*
↓
ø
we thought [*e* you said [(*e* . . .) [*e* Sue met *e*]]]]

In what follows, the two analyses will be discussed in more detail. As will become clear, the syntax of Subdeletion plays an important role in the debate.

3.1 'Comparative (Sub)deletion' as an unbounded deletion rule

Bresnan argues that unbounded dependencies exist not only between compared phrases in Comparative Deletion constructions but also between subcompared phrases in Subdeletion constructions:

(52) John met
  a. . . . more linguists than you met – biologists.
  b. . . . more linguists than we thought you met – biologists.
  c. . . . more linguists than we thought you said you met – biologists.

She admits, though, that the acceptability of the examples decays more rapidly than with Comparative Deletion constructions as the compared constituent is separated from the head of the comparative clause by more intervening clausal boundaries.

Under the assumption that Subdeletion constructions can involve an unbounded dependency between the two compared constituents, Bresnan claims that an analysis of such a dependency in terms of iterative-cyclic application of bounded movement cannot work, for the simple reason that normally left-branch-modifying elements cannot be moved away from the constituent they modify (cf. Ross's 1986 Left Branch Condition; see chapter 66). Thus, although it is possible to subdelete a QP in Subdeletion constructions (see (5) and (12)), it is impossible to move away the same type of phrase from the constituent it modifies in interrogative constructions:

(53) a. *How many did you meet [– biologists]?
  b. *How was the table [– wide]?

Left-branch adjectival modifiers display the same contrast: Subdeletion can remove the left-branch modifier, but movement cannot:

(54) Maggie is as fine a doctor as her sister is [– a lawyer].

(55) *So fine her sister is [– a lawyer], that they call her Portia.

In short, Subdeletion can remove a variety of modifying constituents which cannot be moved by movement rules. If there is a generalization over English movement rules, according to which certain left-branch modifiers are 'immovable' from certain constructions, then Subdeletion cannot be an exponent of such a rule. Furthermore, as Subdeletion constructions do not involve movement, the unbounded dependencies in (52) cannot be the result of iterative-cyclic application of bounded movement and subsequent local deletion of the *wh*-phrase, but rather should be analyzed in terms of an unbounded deletion rule which deletes part of the compared constituent.

The next question is: how much is deleted from the compared constituent in the comparative clause by the rule of Comparative Deletion? Bresnan argues that only as much is deleted from the compared constituent by the rule of Comparative Deletion as is maximally recoverable from the head of the comparative clause. Or, in somewhat more explicit terms, only the maximal subphrase of the compared constituent identical to a corresponding subphrase of the head undergoes Comparative Deletion. This generalization on the deleted part follows from

Bresnan's Relativized A-over-A Condition (RAOAC) (Bresnan 1975, 1976a, 1976c). This condition on the applicability of transformational rules states that a phrase of type A (= the target predicate), which a transformation affects, must be maximal with respect to the values assigned to the elements in the structural description of the transformational rules that are the context predicates (i.e., the constant factors not operated on by the rule). Maximalization is a function of the syntactic features (+/−N, +/−V) that are mentioned in the structural description.

Consider now Bresnan's (1975) rule of Comparative Deletion:

(56) $[_{Y'''}\ X'''\ W_1]\ [_{S'''}\ W_2\ [_{Y'''}\ X'''\ W_3]\ W_4]\ \ 4 \leq 1$
1 2 3 4 5 6 →
1 2 3 ø 5 6

The Y‴ and X‴-constituents in the Structural Description represent (material inside) the compared elements; the X and Y 'barred' variables are restricted to measure-phrase constituents: N‴, A‴, Q‴. W is a variable over labeled bracketings. The Y‴-constituent contained within the comparative clause (S‴) is the target predicate, i.e., the constant factor operated on by the deletion rule. The leftmost Y‴, the head of the comparative construction, functions as the context predicate. When W_1 and W_3 are null (which amounts to a situation in which X‴ = Y‴), the deletion rule removes the entire compared constituent within the comparative clause; this instantiates Comparative Deletion. When W_1 and W_3 are non-null, the deletion removes only part of the compared constituent, viz., the left-branch modifier; this instantiates Subdeletion. In line with the maximalization requirement on the target predicate, that part of Y‴ must be deleted which is maximally identical to the context predicate:

(57)

a. She has $[_{NP}\ [[_{QP}$ as many] friends] $[_{S'}$ as I had $[_{NP}\ [_{QP}$ x-many] friends]]]
1 2 3 4 5 (6 is null) →
1 2 3 ø 5 6
She has as many friends as I had –

b. She has $[_{NP}\ [[_{QP}$ as many] friends] $[_{S'}$ I had $[_{NP}\ [_{QP}$ x-many] enemies]]]
1 2 3 4 5 6 →
1 2 3 ø 5 6
She has as many friends as I had – enemies

Thus, depending on the value of W_1 and W_2, the deletion rule in (56) yields a Subdeletion construction (57b) or a Comparative Deletion construction (57a) as its output.

An important conclusion we can draw from this discussion is that Bresnan proposes a unified analysis of Comparative Deletion constructions and Subdeletion constructions. She thus considers these constructions to be instantiations of one and the same phenomenon, best analyzed in terms of a rule deleting a

constituent 'across a variable' that is under identity to a constituent which may be arbitrarily far from the deletion site.

Having shown on the basis of Subdeletion constructions that movement cannot be involved (see (53)) and having proposed a unified description of the two types of comparative constructions, Bresnan reaches the conclusion (contra Chomsky 1977b) that many of the grammatical constraints that are used as diagnostics for movement rules cannot be treated as such; the phenomenon of Comparative Deletion, which, according to Bresnan, must be described in terms of a deletion rule, is sensitive to the same constraints as a movement rule like Question Movement.

Let us consider this sensitivity to so-called 'movement constraints' somewhat more closely. First of all, both Comparative Deletion (58) and Subdeletion (59) are sensitive to Ross's island constraints (Ross 1986; see also Grosu 1972a): the Complex Noun Phrase Constraint, the Coordinate Structure Constraint, the Sentential Subject Constraint, the *Wh*-Island Constraint, and the Adjunct Condition; obviously, (most of) these island constraints fall under the unifying Subjacency Condition. Since Subdeletion cannot possibly involve movement (because of the left-branch effect) but nevertheless displays island behavior, Bresnan concludes that island sensitivity should not be interpreted as diagnostic for the presence of a movement process in a grammatical construction. It rather shows that not only movement operations (e.g., Question Formation) but also deletion operations are subject to island constraints:

(58) a. *John bought more oranges than we had discussed [a plan to buy –]]. (CNPC)
b. *John bought more oranges than we had bought [apples and –]. (CSC)
c. *John bought more oranges than [that he had sold –] was generally believed. (SSC)
d. *John bought more oranges than Sue wondered [whether to buy –]. (*Wh*-Island)
e. *John bought more oranges than Bill slept [after he had sold –]. (Adjunct C.)

(59) a. *John bought more oranges than we had discussed [a plan to buy [– apples]]. (CNPC)
b. *John bought more oranges than we had bought [three pears and – apples]. (CSC)
c. *John bought more oranges than [that he had sold [– apples]] was generally believed. (SSC)
d. *John bought more oranges than Sue wondered [whether to buy [– apples]]. (*Wh*-Island)
e. *John bought more oranges than Bill slept [after he had sold [– apples]]. (Adjunct C.)

Bresnan further observes that both Comparative Deletion and Subdeletion display Subjacency effects. The (sub)compared noun phrase in the comparative clause cannot be the complement to a noun which heads a noun phrase that is in turn complement to a higher noun (i.e., stacked picture noun phrase envrionments):[20]

(60) a. The official didn't confess to as many crimes as we had [$_{NP}$ evidence of –].
b. *The official didn't confess to as many crimes as we had [$_{NP}$ information about [$_{NP}$ evidence of –]].

(61) a. The official didn't confess to as many petty crimes as we had [$_{NP}$ evidence of [$_{NP}$ – grave ones]].
b. *The official didn't confess to as many petty crimes as we had [$_{NP}$ information about [$_{NP}$ evidence of [– grave ones]]].

Third, both Comparative Deletion and Subdeletion display Crossover effects. Although in (62a) and (63a), the compared phrase of the comparative clause can function as an antecedent for the pronoun, this is impossible in (62b) and (63b). In those 'crossover' contexts, the pronoun cannot be interpreted as a variable bound by the compared (i.e., quantified) phrase:

(62) a. More students flunked than $-_i$ thought they$_i$ would (flunk).
b. *More students flunked than they$_i$ thought $-_i$ would (flunk).

(63) a. As many new students flunked as [– old students]$_i$ imagined they$_i$ would (flunk).
b. *As many new students flunked as they$_i$ imagined [– old students]$_i$ would (flunk).

Since Comparative Subdeletion cannot involve movement (that is, it involves deletion), Bresnan concludes that crossover effects are not a diagnostic for movement.

In summary, Bresnan argues that the rule of Comparative Deletion (cf. (56)) obeys Ross's island constraints, the Subjacency Condition, and the Crossover Constraint. She concludes that these constraints cannot be used to determine whether or not movement has occurred in a derivation. Furthermore, she emphasizes that since Subdeletion displays the same locality effects as a movement rule like Question Formation, locality properties cannot be explained in terms of a theory of successive cyclicity.

3.2 Some problems for Comparative (Sub)deletion as an unbounded deletion rule

Besides various points of criticism which have been raised against Bresnan's argumentation for the presence of a missing QP within the subcompared phrase

(see section 2), two major problems have been pointed out in the literature for Bresnan's analysis of Subdeletion. The first problem concerns the generalization on the deleted part of the compared phrase, i.e., that part of the compared phrase is deleted which is maximally identical to that of the matrix compared phrase. This issue will be dealt with in section 3.2.1. The second problem, dealt with in section 3.2.2, concerns the placement of the comparative clause: Subdeletion turns out to be restricted to sentence-final comparative ('extraposed') clauses, whereas Comparative Deletion is permitted in both sentence-internal (non-extraposed) and sentence-final comparative clauses.

3.2.1 What does Subdeletion delete?

Bresnan's RAOAC essentially states that that part of the compared phrase within the *than*-clause must be deleted which is maximally identical to the compared phrase within the matrix clause. In a sense, this maximalization requirement on the deleted part seems to be both too strong and too weak; that is, it excludes certain grammatical sentences and fails to exclude certain ungrammatical ones. Let us first consider those cases in which it is too strong.

Chomsky (1977b) discusses the example in (64), where in speaker B's utterance the compared adjective phrase is not totally deleted:

(64) Speaker A: This desk is higher than that one is wide.
Speaker B: This desk is higher than that one is high.

He points out that the sentence is grammatical with emphatic stress on *high*, and argues that its grammaticality is unexpected under Bresnan's RAOAC, since the Comparative (Sub)deletion rule has not deleted the maximal phrase (X″) that is recoverable from the head of the comparative clause (i.e., the antecedent compared phrase). Under maximal deletion, it should have been only possible to delete the entire compared phrase (i.e., *x-much high*).[21]

As noted in Partee (1977), a rebuttal to Chomsky's argument would require showing that the second *high* in speaker B's utterance is not in fact identical to the first adjective phrase *high*. Partee hints at two possibilities. First, one might propose that the emphatic adjective phrase contains an abstract emphatic morpheme *EMPH*, which blocks identity with the antecedent adjective phrase (i.e., *[[-er much] high* versus *[[x-much] EMPH high*). A second way to implement non-identity would be to start out from an underlying structure in which the two compared adjective phrases are headed by differently indexed variables (say, *this desk is [[-er much] A_1] than that one is [[x-much] A_2]*), which are lexicalized by *high* later in the derivation.

Let us now turn to the second problem, viz., that the RAOAC is too weak, in the sense that it incorrectly permits certain subdeletion patterns. As we have just seen, a maximal phrase deletes relative to the context predicate, i.e., the head of the comparative clause. Thus far, we have mainly considered examples in which either the entire compared phrase is deleted (Comparative Deletion), or a QP (*x-much/x-many*) contained within a compared phrase which fulfills a

grammatical function at the clausal level (e.g., subject, object, predicate nominal, VP-adjunct) is deleted. The question arises whether Subdeletion can delete a constituent larger than *x-much/x-many* but smaller than the entire compared constituent.

In her articles, Bresnan provides a number of cases:

(65) a. There isn't *as large a number* of women as there was [– of men]. NP-deletion
b. They make *better* police dogs than they make [– pets]. AP-deletion

However, each of these has something special to it and therefore might be put aside. (65a) has been argued to be a structure in which removal, whatever syntactic operation instantiates it, applies after the PP has been reanalyzed out of the direct object; see section 2.2. Adopting that line of approach, (65a) might instantiate complete removal rather than subremoval. Subdeletion of the attributive AP in (65b) has been argued by Pinkham (1982) to be possible only with those APs which can be semantically restructured as VP-modifiers ('they are better at making police dogs than they are at making pets').[22]

Pinkham (1982) points out the examples in (66) and (67), showing that Bresnan's RAOAC is too weak:

(66) *John has a longer desk than Sue has [a [– wide] table].

(67) *John has [a [longer] desk] than Sue has [a – table].

In (66), the quantifier of an attributive adjective phrase has been deleted under identity with that of the matrix compared phrase; in (67), an attributive AP has been removed under identity with a modifying AP within the antecedent compared phrase. There is nothing in Bresnan's analysis which excludes the application of Subdeletion in these environments. What is more, removal of the entire compared element (i.e., the direct object noun phrase) is permitted:

(68) John has a longer desk than Sue has –.

As Pinkham notes, the contrast between (66–67), on the one hand, and (68), on the other, casts serious doubt on the idea that removal of a part of the compared element and removal of the entire compared element are achieved by a single rule (i.e., the rule of Subdeletion as stated in (56)).

3.2.2 Sentence-internal total 'deletion' vs. sentence-internal non-total 'deletion'

Another problem for Bresnan's rule of Subdeletion, which unifies the phenomena of Comparative Deletion and Comparative Subdeletion, comes from the following

set of facts, discussed in Pinkham (1982), which illustrate a clear asymmetry between the phenomenon of Comparative Deletion and that of Subdeletion (see also Huang 1977; Hendrick 1978):[23]

(69) a. More men than the company was willing to hire – came for an interview.
b. *More women than the company was willing to hire [– men] came for an interview.

(70) a. How many more men than you had invited – decided to come?
b. ?*How many more men than you had invited [– women] decided to come?

Since Bresnan's rule of Subdeletion deletes either a part or the entire compared element, we would expect the same judgments for these two pairs. However, as indicated, subremoval yields an ill-formed sentence when the comparative clause occupies a sentence-internal position.

3.3 Comparative formation as a bounded movement rule

Chomsky's (1977b) analysis of Comparative Deletion constructions is part of a research program, initiated in Chomsky (1973), which aims at (i) dismantling the formalism for writing construction-specific transformations in terms of features of the Structural Description (SD) or the Structural Change (SC) of the transformational rule, and (ii) identifying transformational properties which hold at a more general (say, cross-constructional) level and which can be attributed to general laws governing transformations, derivations, or their output. On the basis of an examination of a variety of construction types (e.g., topicalization, clefts, *wh*-interrogatives, relatives), Chomsky claims that each of these constructions is characterized by the application of a general movement schema, called Move *Wh*, which moves a *wh*-constituent to Comp (i.e., [Spec, CP]). This 'rule of *wh*-movement', furthermore, has the following general characteristics, referred to as the *wh*-diagnostics:

(71) a. It leaves a gap.
b. Certain verbs (so-called bridge verbs; see chapter 10) license (apparent) violations of subjacency.
c. It observes island constraints such as the Complex NP Constraint, the *Wh*-Island constraint, the Adjunct Condition, the CSC, etc.

Chomsky further argues that all movement processes (hence, *wh*-movement) apply in a local fashion and that unbounded relationships between a moved phrase and a source position are the result of successive cyclic application of local movement steps (i.e., Comp to Comp).

The considerations above raise two questions for the syntax of Comparative Deletion and Comparative Subdeletion. First, do they display the *wh*-movement

diagnostics? Second, is there any empirical evidence for the successive cyclic application of *wh*-movement within the domain of the comparative clause?

Let me first address the question of whether the *wh*-diagnostics hold of Comparative Deletion constructions. As was already observed in Ross (1986), Comparative Deletion constructions exhibit the properties in (71) (see also (58–59)):

(72) *John met more linguists than Sue had met (*them). (diagnostic a)

(73) a. John met more linguists than I believed that Sue had met. (diagnostic b)
b. *John met more linguists than I quipped that Sue had met.

(74) a. *John met more linguists than I believed the claim that Sue had met. (diagnostic c)
b. *John met more linguists than I wondered when Sue had met.

As regards the derivation of Subdeletion constructions, Chomsky considers two alternative approaches toward the phenomenon of Subdeletion: (i) an approach according to which Subdeletion does not really exhibit the *wh*-diagnostics, and (ii) one according to which it does. Which approach should be taken depends on judgments of grammaticality of such examples as in (75) (grammaticality judgments indicated are those of Chomsky 1977b):

(75) a. The desk is as high as it is [– wide].
b. *The desk is as high as they believe the claim that it is [– wide].
c. ?The desk is as high as they believe that Bill claims that it is [– wide].
d. The desk is as high as they believe that Bill claims that it is –.

The basic judgments seem to be that (75a) and (75d) are fully acceptable, whereas (75b) and (75c) are not. The pair (75a, b) shows that further embedding of a subdeleted phrase inside an island leads to a decay of acceptability. Example (75d) shows that depth of embedding of the compared constituent has no effect on the acceptability of comparative deletion construction.

The contrast between (75c) and (75d) may be interpreted as providing evidence against a uniform treatment of the two types of comparatives. If Comparative Deletion involves *wh*-movement and hence displays the *wh*-diagnostics, then Subdeletion should not be accounted for in terms of this movement rule. It might then be formulated as a rule deleting a quantifier in place, but – as opposed to Bresnan's analysis – not deleting it 'over a variable', since the antecedent of deletion may not be arbitrarily far from the deletion site (given the decreased status of (75c)). The decreased acceptability of the long-distance dependency in (75c) might be analyzed in terms of some as yet unkown 'complex phrase constraint'. This complex phrase constraint might also rule out apparent island violations like (75b), to the effect that Subdeletion does not really display the island diagnostics.

Alternatively, the contrast between (75b) and (75c) might be taken to support an analysis which predicts Subdeletion will display properties of *wh*-movement. On this view, the relative unacceptability of (75c) might be explained in terms of some performance factor. Obviously, this *wh*-movement approach raises the questions of what element undergoes Move *Wh* and why it does not display any left-branch effect. Chomsky proposes that a lexically empty *wh*-element or *wh*-feature is extracted from the compared constituent and raised to COMP. He further suggests that, since this feature lacks phonetic content, it does not fall under RAOAC.

The two alternative analyses are schematically represented in (76):

(76) a. The desk is as high as [it is [$_{AP}$ [$_{QP}$ x-much] wide]] (Subdeletion as (locally) delete QP)
↓
ø

b. The desk is as high as [*wh* it is [$_{AP}$ [$_{QP}$ *e* much] wide]] (Subdeletion as Move *Wh*)

As Chomsky (1977b: 124) states: "The choice between the two constructions will have to await a better understanding of the conditions on complexity and parallelism involved in C-Subconstructions."

3.4 Problems for a wh*-movement approach toward Subdeletion*

In the literature, a number of arguments have been presented against a treatment of Subdeletion in terms of the rule Move *Wh*. First of all, as noted in Bresnan (1976a), Chomsky's (tentative) proposal that a phonetically empty *wh*-element can escape a left-branch effect (i.e., disobey the Left Branch Condition) is merely an ad hoc stipulation. Furthermore, if it can escape the LBC, why not other island constraints as well (Corver 1990)?

Second, the Subdeletion site – which under a *wh*-movement analysis is occupied by a *wh*-trace – may occur in structural configurations which normally do not allow the presence of a *wh*-trace. As noted in Grimshaw (1987), for example, *that*-trace effects have much less effect on the Subdeletion gap than on the 'Comparative Deletion' gap (see also Bresnan 1977):

(77) a. Even fewer books were published than we expected that [– magazines] would be.

b. Even fewer books were published than we expected (*that) – would be.

Taraldsen (1978) also observes that the Subdeletion site can occur in typical island configurations. He observes for Norwegian that 'Subdeletion' can apply to

a possessor noun phrase which occupies the specifier position of a larger noun phrase. An English equivalent is given in (78b):[24]

(78) a. Han er like mange studenters venn som han er [$_{NP}$ [$_{NP}$ – læreres] fiende].
He is as many students' friend as he is teacher's enemy
b. John is as many women's lover as he is [$_{NP}$ [$_{NP}$ – men's] enemy].

Under a movement analysis, these structures should have been rejected by the Subjacency Condition, since the moved element crosses (at least) two bounding nodes, viz., the two NP-nodes.

A language like Dutch also displays the occurrence of subcompared phrases in typical island configurations. As illustrated in (79), a subcompared NP containing a quantifier gap occurs as a complement of a preposition (Corver 1993; see also Kennedy 2002 for Czech). Normally, removal of a complement of a preposition (see Van Riemsdijk 1978b) – as in (80a), the comparative equivalent of (79) – or subextraction of an element contained within the NP-complement – see (80b), involving extraction out of a so-called *wat voor*-phrase; see chapter 66 – is excluded in Dutch:

(79) Jan heeft [$_{PP}$ voor [$_{NP}$ meer voetbalclubs]] gevoetbald dan hij [$_{PP}$ voor [$_{NP}$ – tennisclubs]] getennist heeft.
John has for more soccer teams played-soccer than he for tennis clubs played-tennis has

(80) a. *Jan heeft [$_{PP}$ voor [$_{NP}$ meer clubs]] gevoetbald dan hij
John has for more clubs played-soccer than he
[$_{PP}$ voor –] getennist heeft.
for played-tennis has
b. *Wat$_i$ heeft Jan [$_{PP}$ met [$_{NP}$ t$_i$ voor meisje]] gedanst?
What has John with for girl danced
'What kind of girl did John dance with?'

The third argument against a *wh*-movement analysis of Subdeletion also comes from Dutch. In this language it is possible to have a subcompared constituent within a syntactic domain that does not include a [Spec, CP] position, which functions as the landing site for the left-branch *wh*-item (Corver 1990, 1993). This is illustrated by (81), where a topicalized VP occupying the [Spec, CP] position of the matrix clause contains the compared noun phrase *meisjes*.[25] Note that the comparative phrase *dan meisjes gekust* (than girls kissed) does not (and cannot) contain an overt subject (say, *Piet* 'Pete'), which seems to suggest that the sequence following *dan* (i.e., *meisjes gekust*) constitutes a non-clausal phrase (arguably VP) rather than a finite clause (say, CP) (but see Izvorski 1995):[26]

(81) [$_{VP}$ [Meer jongens] geslagen dan [– meisjes] gekust]$_i$ zei Jan [$_{CP}$ dat
More boys hit than girls kissed said John that
[$_{IP}$ hij t_i had]].
he had
'John said that he had hit more boys than he had kissed girls.'

Fourth, as argued in Corver (1993), the existence of so-called multiple subcomparatives (i.e., Subdeletion constructions containing a comparative clause featuring more than a single Subdeletion site; see section 6) seems to pose a problem for a *wh*-movement analysis, since they would involve multiple *wh*-movement to [Spec, CP], which is something that is excluded in English (e.g., **I don't know who$_i$ where$_j$ John will meet t_i t_j*):[27]

(82) In this class, [more girls] know [more Romance languages] than [– boys] know [– Germanic languages].

3.5 *On the presence and absence of* wh-*elements in Comp*

As observed in Chomsky (1977b), constructions featuring *wh*-movement to Comp differ with respect to the overtness of the *wh*-phrase in Comp. Whereas some constructions require overtness of the *wh*-phrase (as in question formation: *I wonder who$_i$/*Ø$_i$ John met t_i*), other constructions are characterized by the optional presence of an overt *wh*-element (as in tensed object relative clauses: *the boy whom$_i$/Ø$_i$ I met t_i*). Within the theory of *wh*-movement outlined by Chomsky, the occurrence of an overt *wh*-phrase in [Spec, CP] provides a very strong argument for the application of *wh*-movement within a certain construction.

The question therefore arises whether Comparative Deletion constructions can also feature an overt *wh*-phrase. In the English examples discussed so far, no overt *wh*-phrase was attested. However, as was already observed in some of the earliest treatments of comparative constructions, certain dialects of American English feature an overt *wh*-phrase in Comp (Hankamer 1971; Bresnan 1972; see also Chomsky and Lasnik 1977; Huang 1977). This phenomenon is exemplified in (83):[28]

(83) a. John is taller than what Mary is. (Chomsky 1977b)
b. No one sold more Kool-Aid than what Jimmy sold. (Huang 1977)
c. I hope you can walk quicker than what you eat. (Huang 1977)
d. They're just as quick with their tongues as what you are.
(Jespersen 1954–1958, vol. III: 9.6)

Chomsky (1977b) interprets this phenomenon as providing overt evidence for the application of *wh*-movement in Comparative Deletion constructions.[29] He states that languages which do not feature an overt *wh*-phrase in the comparative

clause differ from those which do only in the application of a local deletion rule which changes the overt phrase into a null phrase. Chomsky's analysis, which takes *than/as* to be a preposition, is depicted in (84) (CP is used here instead of S'):

(84) John is taller [$_{PP}$ than [$_{CP}$ what$_i$ [$_{IP}$ Mary is t$_i$]]].
↓
ø

Den Besten (1978) observes similar phenomena in standard Dutch, where both options simultaneously occur:

(85) a. Jan krijgt nu al meer geld dan wat zijn vader vroeger verdiende.
John gets now already more money than what his father formerly earned
b. Jan krijgt nu al meer geld dan – zijn vader vroeger verdiende.
John gets now already more money than his father formerly earned

He observes, however, that in principle there are two logically possible analyses for (85a). One is along the lines suggested in Chomsky (1977b): the comparative clause is a sentential complement of the preposition *dan* 'than'. The other analyzes the complement of *dan* as a free relative clause (see chapter 27). Under the latter analysis, we would have in fact a phrasal comparative, where the comparative clause is embedded within a containing NP:[30,31]

(86) [$_{PP}$ dan [$_{NP}$ [$_{NP}$] [$_{CP}$ wat$_i$ [$_{IP}$ zijn vader vroeger t$_i$ verdiende]]]]

This free-relative analysis cannot be extended to the comparative clause in (85b), because free relatives normally do not allow a phonetically empty relativizer (*Jan verdient *(wat) zijn vader vroeger verdiende* 'John earns *(what) his father earned in the past'). Thus, comparative constructions like (85b) are assigned a structure like (87), in which the comparative clause functions as a complement to *dan/than*:

(87) [$_{PP}$ dan [$_{CP}$ Ø$_i$ [$_{IP}$ zijn vader vroeger t$_i$ verdiende]]]

Den Besten observes that under a unified structural analysis of (85a, b), one would expect a similar grammatical behavior of the two comparatives. He points out, however, that they display a different grammatical behavior. This suggests that (85a) and (85b) have different underlying structures (viz., (86) and (87), respectively). A first difference concerns the interpretation of free relative comparatives and 'normal' Comparative Deletion constructions. This difference can be illustrated on the basis of the following minimal pair:

(88) a. Jan heeft meer mensen uitgenodigd [$_{PP}$ dan [Ø$_i$ [$_{IP}$ hij vorig jaar t$_i$ had uitgenodigd]]].
John has more people invited than he last year – had invited

b. Jan heeft meer mensen uitgenodigd [$_{PP}$ dan [$_{NP}$ [$_{CP}$ die$_i$ [$_{IP}$ hij vorig jaar t_i had uitgenodigd]]]].
John has more people invited than who he last year had invited

The Comparative Deletion construction (88a) only implies that the number of people Jan invited exceeds the number of people he invited last year. The comparative free relative (88b), on the contrary, implies not only this but also that the set of people that Jan has invited includes the set of people that he invited last year.

A second difference is that free relative comparatives do not allow quantitative *-er* (see section 2.1) within the comparative clause, whereas Comparative Deletion constructions do:

(89) a. Jan heeft meer mensen uitgenodigd dan hij er vorig jaar had uitgenodigd.
John has more people invited than he of-them last year had invited
b. *Jan heeft meer mensen uitgenodigd dan die hij er vorig jaar had uitgenodigd.
John has more people invited than who he of-them last year had invited

In sum, there are reasons for assigning the comparatives (85a) and (85b) a different structural analysis, and hence, not interpreting them as having a unified structural analysis with the options of an overt or covert realization of the *wh*-phrase.

Given the above considerations for Dutch, Den Besten (1978: fn. 15) suggests that also the equivalent English facts in (83) should not be treated as providing overt evidence for the application of overt *wh*-movement within a Comparative Deletion construction. A free relative analysis along the lines sketched above for Dutch seems a plausible alternative.[32,33]

Although it is difficult, and maybe even impossible, to find overt evidence in the form of an overt *wh*-phrase for the application of *wh*-movement within Comparative Deletion constructions, it has been argued that there is indirect evidence for the presence of a *wh*-phrase in the Comp-position (i.e., [Spec, CP]) of the comparative clause. Den Besten (1978), for example, observes a correlation between the obligatory absence of the Complementizer *dat* and the presence of a *wh*-phrase in Comp (i.e., [Spec, CP]). The relevant minimal pair is given in (90):[34]

(90) a. Jan zal eerder Kees uitnodigen, *dan dat* ie Marie zal uitnodigen.
John will rather Kees invite, than that he Mary will invite
'It is rather the case that John will invite Kees than that he will invite Mary.'
b. Jan had meer mensen uitgenodigd dan (*dat) hij vorig jaar – had uitgenodigd.
John had more people invited than (*that) he last year – had invited

The comparative construction (90a) does not feature a gap (corresponding to the compared phrase) in the comparative clause; rather, the comparative clause itself represents the compared constituent.[35] As suggested by the well-formedness of the sequence *dan dat*, a complementizer can be present overtly in the sentential complement of *dan* as long as no movement to [Spec, C] has taken place. Contrary to (90a), the Comparative Deletion construction (90b) has a gap in the comparative clause, which corresponds to the compared constituent. As indicated, *dat* cannot be present. This suggests that *wh*-movement blocks the appearance of an overt complementizer (or, to put it differently, triggers the deletion of a lexical *wh*-phrase). As such, the impossibilty of an overt complementizer can be used as a diagnostic for the application of *wh*-movement within a comparative clause.[36,37]

French also provides indirect evidence for the presence of a *wh*-element in the [Spec, C] position of the comparative clause in Comparative Deletion constructions. This evidence comes from the phenomenon of Stylistic Inversion. As Kayne and Pollock (1978) have shown, inversion of the subject and the verb can only apply in a clause (CP) if a *wh*-element has been moved into the [Spec, C] position of that clause. Given this restriction on the application of Stylistic Inversion, we cannot but conclude that in the comparative clauses in (91) a fronted *wh*-phrase occupies the [Spec, C] position (see Milner 1978a):

(91) a. Pierre a plus de livres que n'en a Paul.
Peter has more of books than NEG of-them has Paul
'Peter owns more books than Paul does.'
b. Elle est aussi triste que l'était Jeanne hier.
She is as sad as it was Jeanne yesterday
'She is as sad as Jeanne was yesterday.'

Note at this point that French Stylistic Inversion also provides an argument in support of the successive cyclic application of *wh*-movement. As shown in (92a), inversion of the subject (*Paul*) with the verb (*était*) is possible in an embedded declarative clause selected by the main verb (*disais*) of the comparative clause. If inversion can only take place if during the derivation some *wh*-element has been moved to [Spec, CP], then we must conclude that in a comparative clause such as (92a), a *wh*-element has been moved successive-cyclically, i.e., via the [Spec, CP] of the most deeply embedded clause (see (92a)):

(92) a. Pierre est plus gentil que tu ne disais qu'était Paul.
b. Pierre est plus gentil [$_{CP}$ Ø$_i$ [$_{C'}$ que[$_{IP}$ tu ne disais [$_{CP}$ t$'_i$ [$_{C'}$ que [– était t$_i$ *Paul*]]]]]]

Summarizing, in certain languages, comparative clauses display an overt *wh*-element in Comp (i.e., [Spec, CP]). This may be interpreted as evidence for the application of *wh*-movement in Comparative Deletion constructions. One should not draw this conclusion too quickly, though: the comparative clause could be a

free relative and not an embedded clause as found in true Comparative Deletion constructions. It was further shown that the appearance of inversion effects in the embedded comparative clause hints at the application of *wh*-movement in Comparative Deletion constructions.

4 Lexical pro-forms and base-generated gaps: an interpretive approach toward comparative formation

Section 3 presented two major types of analyses of Comparative Deletion and Subdeletion, viz., (i) an analysis in terms of an unbounded deletion rule (Bresnan), and (ii) an analysis in terms of *wh*-movement (Chomsky). According to the first analysis, the understood compared phrase in the comparative clause is deleted (possibly over a long distance) under identity with the compared phrase of the matrix clause. According to the second analysis, the missing element in the comparative clause is a *wh*-trace which is A′-bound by an (empty) *wh*-phrase in Comp (i.e., [Spec, CP]), whose content can be locally identified by the head of the comparative construction. Importantly, under both analyses the emptiness of the gap within the comparative clause is the result of some transformational operation (deletion or *wh*-movement). In this section, a third, more interpretive, approach toward Comparative Deletion and Subdeletion will be discussed, viz., the one proposed in Pinkham (1982). As opposed to the deletion and movement analyses, this analysis assumes that the gap in the (sub)comparative clause is a (base-generated) empty pronominal element, which is licensed by means of an interpretive rule.

As shown in (93), Comparative Deletion constructions in English are characterized by the presence of a gap, which stands for the compared constituent of the comparative clause:

(93) a. These days, John has more money than he used to have –.
b. John is taller than I am –.

As Pinkham (1982) observes, the French equivalents of these sentences feature a lexical proform (*en*, *le*), which replaces (part of) the compared constituent. In (94a), the compared element *d'argent* of the *than*-clause has been replaced by the proform *en*; in (94b), the proform *le* replaces the compared adjective *grand*. Pinkham further argues that the use of these pronouns is obligatory when the compared element of the matrix clause and that of the comparative clause are identical:[38]

(94) a. Ces jours-ci, il a plus d'argent qu'il n'*(en) avait.
These days, he has more of money than he NEG (of-it) had
'These days, he has more money than he used to have.'

b. Jean est plus grand que je ne *(le) suis.
John is more tall than I NEG (it) am
'John is taller than I am.'

The proform *en* is interpreted as the quantitative clitic which also features in such clauses as (95a), where it replaces part of the noun phrase (say, N'), leaving the quantifier unaffected. The pro-form *le* is the same clitic as in (95b), where it replaces the adjective phrase except for the quantifier and the associated *que*-phrase (i.e., A'-replacement):

(95) a. Il en a beaucoup.
He of-it has a-lot
'He has a lot of it (e.g., money).'
b. (Tu trouves Jean intelligent?) Il l'est bien moins que mon frère.
(You find John intelligent?) He it is quite less than my brother
'(Do you find John intelligent?) He is less so than my brother.'

The only difference between (94), on the one hand, and (95), on the other, is that while the latter feature an overt quantifier within the quantified phrase, the former do not. Given the 'quantified reading' of the compared phrase (i.e., *x-much money, x-much intelligent*) in (94), it is assumed that there is a QP present within this phrase.

What makes the examples in (94a) and (94b) interesting is that they seem to pose a problem for analyses which make use of a rule which deletes the compared constituent of the comparative clause (e.g., Bresnan's unbounded deletion rule; Chomsky's local deletion rule, which removes the compared constituent after it has been moved to Comp). That is, there is no gap; therefore, comparative formation in French does not seem to involve a deletion rule. Of course, one might argue that the proforms are copies or resumptive proforms that are left behind after application of the Comparative formation rule. For Bresnan's analysis, this would mean that after the unbounded rule of Subdeletion has deleted the compared constituent of the comparative clause, a resumptive pronoun is inserted in the deletion site late in the derivation. For Chomsky's analysis, this would imply that after application of *wh*-movement, a pronominal copy is left behind in the position of the *wh*-trace. Pinkham argues against such a resumptive pronoun analysis on the grounds that in French no other rules applying over a variable (e.g., relative clause formation, question formation) employ this resumptive pronoun strategy:

(96) a. Paul a vu la fille que tu (*la) connais.
Paul has seen the girl that you (*her) knows
b. Qui est-ce que tu (*la) connais?
Who is it that you (*her) know
'Who do you know?'

In view of the above, Pinkham proposes an interpretive approach toward comparative formation, according to which an anaphoric proform (*en/le*) is base generated within the compared constituent of the comparative clause. This proform (N′) gets co-indexed with the N′/A′ of the 'antecedent' compared phrase (i.e., the N′/A′ of the head of the comparative clause) by means of the rule of comparative indexing. Besides the comparative indexing rule, which renders the proforms interpretable, Pinkham also proposes an indexing rule (called Quantifier Binding) which relates the phonetically empty QP of the compared phrase to the highest COMP of the comparative clause (i.e., the comparative subordinator: *than* in English; *que* in French). This binding relation identifies the locus of the compared constituent within the comparative clause.

Under this analysis, the sentences (94a) and (94b) are assigned the representations (97a) and (97b), respectively, after application of the two co-indexing rules:

(97) a. Ces jours-ci, il a [[[$_{QP}$ plus] [$_{N'}$ d'argent]$_i$] [qu$_j$'il n'avait [$_{NP}$ QP$_j$ [$_{N'}$ en]$_i$]]].
b. Jean est [[$_{AP}$ [$_{QP}$ plus] [$_{A'}$ grand]$_i$] [que$_j$ je ne suis [$_{AP}$ QP$_j$ [$_{A'}$ le]$_i$]]].

After co-indexing has taken place, the proform undergoes the syntactic rule of cliticization and ends up in its surface position. This yields the structures in (94).

Given the overall similarity between French and English, Pinkham extends this interpretive analysis of comparative constructions to English comparatives. The two languages only differ from each other with respect to the lexicalization of the anaphoric pronoun: French Comparative Deletion constructions contain overt pronominals such as *le/en*, whereas English uses empty base-generated pronominals, i.e., PRO in Pinkham's analysis.[39,40] The comparative constructions (93a) and (93b) get the following representations, respectively:

(98) a. These days, John has [[$_{NP}$ [$_{QP}$ more] [$_{N'}$ money]$_i$] [than$_j$ he used to have [$_{NP}$ QP$_j$ [$_{N'}$ PRO]$_i$]]].
b. John is [[$_{AP}$ [$_{QP}$ -er much] [$_{A'}$ tall]$_i$] [than$_j$ I am [$_{AP}$ QP$_j$ [$_{A'}$ PRO]$_i$]]].

In Subdeletion constructions, the rule of comparative indexing will not apply, since the compared element of the comparative clause is not identical (in kind) to that of the matrix clause. Thus, Quantifier Binding is the only interpretive rule which is operative in Subdeletion contexts, and it is this rule which unifies Comparative Deletion constructions and Subdeletion constructions. After Quantifier Binding has applied, we get such Subdeletion structures as (99):

(99) a. La table est [[$_{AP}$ [$_{QP}$ plus] [$_{A'}$ longue]] [qu'$_i$ elle n'est [$_{AP}$ QP$_i$ [$_{A'}$ large]]]].
The table is more long than she NEG is wide
'The table is longer than it is wide.'
b. Ces jours-ci, ils ont embauché [[$_{NP}$[$_{QP}$ plus] de femmes]
These days, they have hired more of women
[qu$_i$ 'ils n'ont embauché [$_{NP}$ [QP$_i$] [d'hommes]]]].
than they NEG have hired of men
'These days, they hired more women than they hired men.'

Pinkham's interpretive approach toward Comparative (Sub)deletion raises a number of questions. A first obvious question concerns the existence of empty noun phrases as structured NPs containing an anaphoric pronoun in the specifier position and an anaphoric pronoun for N'. If such 'layered' empty nominals are allowed by the grammar, one would expect them to occur in different structural environments as well. As Moltmann (1992) observes, however, other plausible structural environments do not permit the occurrence of a layered empty noun phrase: **John told [[the]$_i$ man$_j$] that Mary liked [[pro]$_i$ [pro]$_j$]*. Second, given the fact that Comparative Deletion (and also Subdeletion, according to Pinkham) respects Ross's island constraints and Subjacency, in general, Pinkham's binding approach toward comparatives leads to a model of grammar in which binding/construal rules and movement rules are no longer distinguished in terms of locality conditions. This is quite remarkable, given the fact that it is generally assumed that construal rules are not subject to island/subjacency effects. This is shown, for example, by the well-formedness of such sentences as *[$_{IP}$ They$_i$ thought [$_{IP}$ I said that [$_{IP}$ [PRO to feed each other] would be difficult]]]* (Chomsky 1981), where *they* can be the antecedent of PRO across more than one bounding node *IP*.

It should be pointed out that the occurrence of lexical proforms in comparative clauses is not necessarily incompatible with a *wh*-movement approach toward Comparative (Sub)deletion. Two possible movement approaches toward the derivation of a sentence like (94a) are possible (abstracting away from the question of whether the clitic is base generated in situ or undergoes syntactic movement; gap indicated by ""). According to the first analysis, it is only the QP which is moved to [Spec, CP]; i.e., Comparative Deletion, in that case, resembles Subdeletion in that a subpart of the compared constituent, viz., QP, gets removed (see Milner 1978a; Kayne 1981a; see also Bennis 1978 for a similar proposal for Dutch Comparative Deletion constructions featuring the quantitative clitic *er* – see (21b)). According to the second analysis, it is the entire compared constituent (i.e., NP) that is moved to [Spec, CP]; the only difference with English is that the fronted phrase contains a gap that is related to the clitic *en* (see Den Besten 1978 for Dutch comparative deletion constructions featuring *er*):

(100) a. . . . plus d'argent [QP$_i$ [qu'il n'en avait [$_{NP}$ [$_{QP}$ t$_i$] [$_{N'}$ Δ]]]].
b. . . . plus d'argent [[$_{NP}$ [$_{QP}$ t]$_i$ [$_{N'}$ Δ]] [qu'il n'en avait t$_i$]].

5 On the coordinate-like nature of comparatives

This section addresses the question of the nature of the relationship between the comparative clause and the matrix clause. In line with Bresnan's (1972) phrase structural analysis of the comparative clause, it is generally assumed that the comparative clause stands in a subordinate relation to the matrix compared constituent and hence also to the clause containing the 'antecedent' compared constituent:

(101) [More linguists [than I had ever met –]] were present at the party.

Comparative clauses standing in a sentence-final position are analyzed as extraposed constituents (see chapter 25). It is generally assumed that the clause extraposed from within the subject noun phrase gets adjoined to the matrix IP:

(102) $[_{IP}\ [_{IP}\ [_{NP}$ More linguists –] were at the party] [than I had ever met –]].

There has been some discussion in the literature concerning the categorial status of the comparative subordinator *than*. Bresnan (1972) treats *than* on a par with the declarative subordinator *that*: i.e., *than* is subsumed under the category Comp. Chomsky and Lasnik (1977) offer several considerations against Bresnan's interpretation of *than/as* as COMP. Following a suggestion by Hankamer (1973b) for phrasal comparatives, Chomsky (1977b: 88) analyzes the comparative subordinator *than* in (101) as a Preposition, which takes a clause as its complement.

Besides the above analysis, according to which the comparative clause stands in a subordinate relationship to the matrix clause, it has been proposed that (certain) comparative structures instantiate syntactic coordination. According to such an analysis, the 'antecedent' clause and the comparative clause stand in a 'symmetric' relation to each other, in the sense that one is not hierarchically superior to the other.[41] Although such a coordination analysis is not very plausible for a structure like (101), in which the comparative clause occupies a position embedded within the matrix clause, it is defensible for those comparative structures in which the comparative clause surfaces in clause-final position, as in (102). Rather than interpreting these sentence-final clauses as extraposed subordinate clauses, one might analyze them as (base-generated) right conjuncts of a coordinate structure in which *than/as* functions as the coordinating conjunction. Schematically:

(103) $[_{CP/IP}\ [_{CP/IP}\ \ldots\ ]$ than/as $[_{CP/IP}\ \ldots\ ]]$

In what follows, some arguments in support of *than/as* as a coordinator will be presented. The discussion will initially focus on comparative clauses involving Subdeletion.

A first argument in support of a coordinate relationship between the antecedent clause and the comparative clause comes from Gapping, a rule which deletes strings including a finite verb in the right conjunct of a coordinated structure under identity with the verb(s) in the left conjunct (Huang 1977; Thiersch 1982; Corver 1990). As shown by the contrast between (104a) and (104b), this deletion rule only applies in clauses that are in a coordinate relationship to the preceding clause (Jackendoff 1971):

(104) a. John kissed Mary and Sue – Bill.
b. *John kissed Mary when Sue – Bill.

Observe now that Gapping is permitted in the comparative clause, suggesting that the antecedent clause and the comparative clause form a coordinate structure:[42]

(105) John kissed more girls than Mary – boys.

As shown in Huang (1977), properties of Gapping attested in standard coordinate constructions are also found in Subdeletion constructions (see also Hendriks 1995 for Dutch). First, as shown in (106), Gapping cannot apply in the right conjunct to a clause that is embedded within another clause. The same restriction holds for Gapping in comparative clauses:

(106) a. John wore the top hat and (*I believe that) Mary – the suspenders.
b. Felix knows more Greek than (*I believe that) Max – Latin.

Second, as observed by Bresnan (1975), the sequence *take advantage* behaves as a verbal unit (a complex verb) with respect to Gapping in coordinate structures; that is, Gapping does not remove just the verb *take*:

(107) John took advantage of Mary, and Mary – (*advantage) of John.

The same restriction holds for the sequence *take advantage* showing up in subcomparative clauses:

(108) John took more advantage of Mary than Mary – (*advantage) of John.

Finally, as observed in Ross (1970a), whenever Gapping applies to a string of verbs, it cannot delete a verb unless all the verbs to its left are deleted as well. This restriction is illustrated by the paradigm in (109):

(109) I want to try to begin to write a novel and
a. Mary – to try to begin to write a play.
b. Mary – to begin to write a play.
c. Mary – to write a play.
d. Mary – a play.
e. *Mary wants – a play.
f. *Mary wants – to begin – a play.

Huang observes that exactly the same deletion pattern holds for verb strings in comparative clauses:

(110) I want to try to begin to grow more cauliflowers than
a. Mary – to try to begin to grow carrots.
b. Mary – to begin to grow carrots.
c. Mary – to grow carrots.
d. Mary – carrots.
e. *Mary wants – carrots.
f. *Mary wants – to begin – carrots.

In sum, Gapping, a rule whose application is restricted to coordinate environments, occurs under exactly the same conditions in comparative clauses displaying Subdeletion. This strongly suggests that the antecedent clause and the comparative clause stand in a coordinate relationship with respect to each other.

A second argument that the subcomparative clause stands in a coordinate relation to the antecedent clause comes from Right Node Raising, a phenomenon which is only attested in coordinated structures:

(111) a. Mary liked –, but John hated [the man with the red beard].
b. *Mary liked –, although John hated [the man with the red beard].

As shown in (112), Right Node Raising is also possible in Comparative Subdeletion constructions (Corver 1993; Hendriks 1995). This again favors an analysis in which the (sentence-final) comparative clause is treated as the right conjunct of a coordinate structure:

(112) More women like –, than men hate [the man with the red beard].

A third argument supporting a coordination analysis of Subcomparative constructions is the fact that these comparatives exhibit the same behavior with respect to subextraction operations as coordinate structures do (Huang 1977; Corver 1990, 1993). As Ross (1986) stated in his Coordinate Structure Constraint (CSC), no element contained within a conjunct may be moved out of that conjunct. As an exception to this constraint, he added that extraction is permitted if the same element is removed from both conjuncts, that is, in an Across-The-Board (ATB) fashion. The CSC and the ATB-exception to this constraint are illustrated in (113a) and (113b), respectively:

(113) a. *What kind of vegetable do women like – and men detest Brussels sprouts?
b. What kind of vegetable do women like – and men detest –?

Notice now that exactly the same movement effects are found in subcomparative constructions, a fact that is again compatible with a coordination analysis of subcomparative constructions:

(114) a. *What kind of vegetable do more women like – than men detest Brussels sprouts?
b. What kind of vegetable do more women like – than men detest –?

Another characteristic of coordinate structures is what might intuitively be called the property of 'parallelism'. Although the exact nature of these effects is often ill-understood, it is sufficient to observe that parallelism effects are found at various levels in coordinate structures. ATB-extractions, for example, typically apply to constituents occupying parallel structural positions within the two coordinated clauses (cf. Williams 1978).

Interestingly, parallelism effects have also been claimed to exist in Subdeletion constructions. George (1980), for example, observes a contrast between the a-examples in (115–116) and the b-examples. In the former, the compared phrases occupy parallel structural positions (viz., the direct object position in (115a) and the subject position in (115b)), whereas in the latter, they occupy different (i.e., non-parallel) structural positions:

(115) a. John killed more Englishmen than the Inquisition burned – Frenchmen.
b. *John killed more Englishmen than – Frenchmen fought the Inquisition.

(116) a. More Frenchmen revered John than – Englishmen adored Sir Thomas.
b. *More Frenchmen revered John than Sir Thomas More converted – Englishmen.

Similar contrasts are observed in Pinkham (1982):

(117) a. More women have been hired than men were supposed to be (hired).
b. ?More women have been hired than they were supposed to hire men.

As argued by Bresnan (1976a), and also by Pinkham, this parallelism requirement might also be at the basis of the decay in acceptability of such constructions as (118) (see section 3):

(118) a. This desk is as high as it is wide.
b. ?This desk is as high as they believe that Bill claims it is wide.

Although the two compared (adjective phrase) constituents occupy parallel structural positions, they differ in their level of embedding.

In view of the above considerations, it seems fair to conclude that Subcomparative constructions have coordinate-like properties. Note at this point that the awkwardness or even ungrammaticality of Subdeletion in contexts where the comparative clause is very clearly embedded in (and, hence, subordinate to) the 'antecedent' clause is not unexpected, if comparative clauses involving Subdeletion are in fact clauses which can only occur in a coordinate relationship with a preceding clause (cf. Corver 1990, 1993; Moltmann 1992). Thus, in (119a), as opposed to (119b), the comparative clause is obviously in a sentence-internal, 'non-extraposed' position, as it is followed by the indirect object PP of the matrix clause. In (120), the comparative clause is moved along with the *wh*-phase *how many* to [Spec, CP]. Being part of the *wh*-phrase, the comparative clause cannot possibly stand in a coordinate relationship with the matrix clause:

(119) a. *John gave more books than he had given – pencils to Sue to his best friend Peter.
b. John gave more books to Sue than he had given – pencils to his best friend Peter.

(120) *How many more records than Sue owns books will John buy?

If Subdeletion constructions obligatorily instantiate coordination structures, then it seems plausible to interpret the clause-introducing element *than/as* as a coordinating conjunction (rather than a prepositional subordinator). The question naturally arises why subcomparison should require a coordinate structure. One possibility discussed in Corver (1993), who rejects a (syntactic) *wh*-movement approach toward Subdeletion, is that a coordination configuration is required for a Subdeletion construction like (121a) in order to be able to interpret via ATB-binding the QP-gap in the comparative clause as a variable at LF. That is, starting from a coordinate structure as in (121b) for a sentence like (5), the base-generated gap within the subcomparative clause is locally A'-bound in an ATB-fashion by the quantifier of the antecedent clause (i.e., the left conjunct) that has been raised at LF and adjoined to IP:[43]

(121) a. John met $[_{NP}[_{QP}$more] biologists] than I met $[_{NP}[_{QP}\ e]$ biologists].

b. more x_i | $[_{IP}$ John met $[x_i$ biologists]] |
| than |
$|_{IP}$ $[_{IP}$ I met $[x_i$ linguists]] |

Turning now to Comparative Deletion, we can observe that this phenomenon differs from Subdeletion in being permitted to occur in truly subordinate comparative clauses:

(122) a. John gave more books than he had given – to Sue to his best friend Peter.

b. [How many more records [than Sue owns –]] will he buy –?

In fact, coordination of the CP *he had given to Sue* with the NP *more books* would be impossible, since it would violate the Law of the Coordination of Likes. That is, the two strings do not have the same syntactic and semantic function and hence cannot be analyzed as standing in a coordinate relationship to each other. The same holds for *how many more records* and *Sue owns* in (122b). Notice further that in this example, the head of the relative clause and the comparative clause have been fronted together, with the result that the comparative clause is structurally subordinate to the head of the comparative clause.

The question which now arises is whether sentence-final comparative clauses featuring Comparative Deletion display properties characteristic of coordinate structures. At several places in the literature, it has been observed that Comparative Deletion constructions exhibit coordination-like properties. Bresnan (1977), for example, points out that Comparative Deletion constructions resemble coordinate constructions in permitting relativization when there are parallel (i.e., ATB) applications into every clause (cf. also Napoli 1983).[44] This is exemplified in (123a). Napoli (1983) observes that Comparative Deletion constructions allow for Right Node Raising, as in (123b). Emonds (1985) further points out that the phenomenon of Gapping is found in comparative clauses featuring comparative deletion; see, for example (123c), where the infinitival verb *read* has been deleted in the comparative clause:

(123) a. a man who Mary called – an idiot as often as June called – a cretin
b. More people admire than love [this woman I met yesterday in the park].
c. Fred can read newspapers as quickly as Jim can – letters.

Although certain coordination-like characteristics of Comparative Deletion constructions have been observed, it has not been investigated in any systematic and detailed way (though see Moltmann 1992). The same essentially holds for Subdeletion constructions. One of the puzzles is that a comparative clause sometimes displays coordinate and subordinate characteristics at the same time. In the Dutch example (124), for example, ATB-extraction of *waar* has taken place from the main clause and the comparative clause, which suggests a coordinate relationship between the two clauses. At the same, the comparative clause has the subordinate characteristic of having the finite verb (the second *heeft* in (124)) in final position (i.e., not in the Verb Second position characteristic of root clauses; that is, the position occupied by *heeft* in the matrix clause):

(124) Waar$_i$ *heeft* Jan [$_{NP}$ evenveel foto's [$_{PP}$ t$_i$ van]] gezien als Marie [$_{NP}$
What has John as-many pictures – of seen as Mary
tekeningen [$_{PP}$ t$_i$ van]] *heeft* gekocht.
drawings – of has bought
'What did John see as many pictures of as Mary saw drawings of?'

Given this mixed behavior of the comparative clause, Moltmann (1992) argues that comparative constructions have two structural representations simultaneously: one in which the comparative clause stands in a coordinate relationship with the 'matrix' clause, and one in which it stands in a subordinate relationship to this clause.[45] The coordinate structural representation encodes the coordinate properties, whereas the other structure represents the subordinate characteristics. Another line of approach would be to say that an alleged diagnostic for subordination or coordination is not a true diagnostic. In Hendriks (1995), for example, it is argued that the Verb Second property is not a true diagnostic for subordination.

Thus, although it seems fair to state that comparative constructions display coordinate-like behavior, it is obvious that more research is needed to substantiate this claim (for recent discussion, see Lechner 1999).

6 Multiple Comparative Subdeletion

In the previous section, it was argued that *than* in Subdeletion constructions behaves like a coordinator and that the two clauses containing a compared constituent stand in a coordinate relationship with each other. Thus far, we have only seen comparative constructions containing one compared constituent in each clause. As exemplified in (125), it is also possible to have more than one

compared constituent in each of the two clauses (cf. von Stechow 1984; Corver 1990, 1993; Moltmann 1992):

(125) More women ate more sandwiches than men ate bananas.

This phenomenon of multiple comparative Subdeletion is interesting for a number of reasons. First of all, it seems to argue against an analysis according to which the clause-final position of the *than*-clause is derived by extraposition; the problem for an extraposition analysis is that there is not a unique source position for the 'extraposed' clause. A coordinate-like analysis seems more plausible and is supported by the possibility of gapping:

(126) More women ate more sandwiches than men bananas.

Second, as pointed out in Corver (1993), multiple subdeletion is problematic for a *wh*-movement analysis of Subdeletion (Chomsky 1977b), for the simple reason that it would involve multiple *wh*-movement to [Spec, CP]. That is, if subcomparative formation involves *wh*-movement of an underlying quantifier to [Spec, CP], then multiple subdeletion is problematic since it would involve multiple *wh*-movement to [Spec, CP]. It is impossible, however, for a language like English to have more than one *wh*-element in [Spec, CP] (**I don't know who where John will meet*).[46]

Third, multiple Subdeletion instantiates another asymmetry with Comparative Deletion; multiple Comparative Deletion is impossible (Corver 1990, 1993; Ishii 1991):[47,48]

(127) a. More men sold more apples than [– women] had bought [– pears].
b. *More men sold more apples than – had bought –.

In fact, under a *wh*-movement analysis of Comparative Deletion, as in Chomsky (1977b), the ill-formedness of (127b) directly follows from the fact that multiple *wh*-movement to [Spec, CP] is impossible in English.

Much of the syntactic analysis of Multiple Subdeletion will depend on the semantics of this construction. As von Stechow (1984) has pointed out, a multiple Subdeletion construction like (125) does not involve a simple comparison of the number of sandwiches and the number of bananas, on the one hand, and the number of women and the number of men, on the other. It rather involves a comparison of (i) the number of women that ate sandwiches to the number of men that ate bananas (requiring that the first outnumbers the second), and (ii) the number of sandwiches eaten by women to the number of bananas eaten by men (with the result that the first outnumbers the second).[49]

This interpretation of multiple Subdeletion as comparison at the clausal level can be captured quite easily by those syntactic analyses which take Subdeletion to instantiate comparison at the event level (i.e., between the event described by the matrix clause and that described by the comparative clause) rather than

comparison between individuals. Such an analysis was discussed in section 2.3 (see especially Ishii 1991; Moltmann 1992). According to this analysis, the multiple Subdeletion construction in (125) in fact involves a single comparison of two events, viz., the number of events at which women ate sandwiches and the number of events in which men ate bananas, where the former outnumbers the latter. This event comparison is syntactically encoded by the presence of an 'adverbial' (i.e., VP-modifying) QP, which quantifies over the events rather than over individuals participating in the event. Schematically:

(128) More women ate more sandwiches [than men ate bananas MORE].

7 Comparative Deletion and Subdeletion: one and the same phenomenon?

In the previous sections, various grammatical properties of Comparative Deletion and Subdeletion were discussed. In some cases, the two comparative construction types seemed to display similar behavior (e.g., the syntactic presence of a non-overt compared element, the obeying of certain locality constraints), while in other cases they seemed to differ in their syntactic behavior (e.g., the possibility of multiple Subdeletion vs. the impossibility of multiple Comparative Deletion). A question which has always been central in research on Comparative Deletion and Subdeletion constructions is about their uniformity: should the two phenomena be unified and accounted for in terms of a single syntactic rule of comparative formation? Or should one take the opposite view and assign different syntactic analyses to them? This section gives an overview of some of the positions taken on this issue, making use of facts discussed in previous sections.

The hypothesis that Comparative Deletion and Subdeletion involve a single rule of comparative formation is most fully developed in Bresnan (1973b, 1975). Her (unbounded) rule of Subdeletion (56) unifies the phenomena of Comparative Deletion and Subdeletion. They are considered the derivational output of one and the same syntactic rule (cf. section 3.1). The same holds for Chomsky's (1977b) analysis of comparatives, at least if one adopts an analysis of Subdeletion in terms of movement of a *wh*-feature (cf. section 3.3). Pinkham's (1982) interpretive approach toward comparative formation also provides a unified analysis of Comparative Deletion and Subdeletion; both involve quantifier binding of the empty QP within the compared phrase (see section 4).

If one adopts Chomsky's (1977b) alternative analysis of Subdeletion in terms of some local operation deleting QP, Comparative Deletion and Subdeletion are no longer considered to be instantiations of the same phenomenon. (Other) advocates of a non-unified approach toward Comparative Deletion and Subdeletion are Taraldsen (1978), Grimshaw (1987), and Corver (1993). While these three analyses seem to agree on an analysis of Comparative Deletion in terms of syntactic *wh*-movement (à la Chomsky 1977b), they differ in their analysis of Subdeletion. Taraldsen essentially states that the comparative clause is a clause without

any gap and without any quantifier syntactically representing the amount of the compared phrase (cf. section 2.3). Grimshaw, building on Taraldsen's analysis, argues that the comparative clause in Subdeletion environments is characterized by the presence of a phonetically empty extent-modifier which has scope over the compared phrase (cf. section 3.2). Corver, finally, treats the comparative clause in Subdeletion constructions as a right conjunct containing a base-generated QP-gap, which gets interpreted in an ATB-fashion by being bound by the quantifier of the left conjunct that has undergone QP-raising at LF (see section 5).

How can we decide between the unified and the non-unified approach toward Comparative Deletion and Subdeletion? In (129), an overview is given of some of the similarities and differences between Comparative Deletion and Subdeletion that have been noted in the literature:[50]

(129)

	Comparative Deletion:	**Subdeletion**:
a. Requires a gap	Yes	Yes
b. Gap can be embedded in an extraction island	CNPC: no (58a) CSC: no (58b) Sentential Subject C: no (58c) *Wh*-island: no (58d) Adjunct Condition: no (58e) Possessor phrase: no (cf. note 24) PP-island: no (80a)	CNPC: no (59a) CSC: no (59b) Sentential Subject C: no (59c) *Wh*-island: no (59d) Adjunct Condition: no (59e) Possessor phrase: yes (78) PP-island: yes (79)
c. Gap can be long-distance bound	Yes (49), (75d)	Yes/no (52), (75c)
d. Displays *that*-trace effect	Yes (77b)	No (77a)
e. Displays crossover effects	Yes (62)	Yes (63)
f. Can apply in sentence-internal (i.e., non-extraposed) clauses	Yes (69a), (70a)	No (69b), (70b)
g. Blocks contraction	Yes (19b), (20b)	Yes (Bresnan), no (Grimshaw) (17b), (18b)
h. Multiple comparative formation	No (127a)	Yes (127b)

The question is, of course, how to interpret these differences. Are there independent, non-syntactic (e.g., performance) reasons for these contrasts, so that one

could maintain a unified syntactic analysis of the two comparative construction types? Or should the differences be attributed to the fact that distinct syntactic rules are at the basis of Comparative Deletion and Subdeletion? In connection with the asymmetries related to (129c, f), Bresnan (1976a) hints at the first way of dealing with the noted asymmetries. The decreased acceptability of Subdeletion in embedded contexts is related to the non-syntactic factor that Subdeletion constructions (as opposed to Comparative Deletion) involves a comparison of 'contrasts'; i.e., the compared constituents are contrasted with each other. This additional complicating semantic factor may explain the observed decay in acceptability. She also hints at the possibility that Subdeletion constructions are harder to parse, because the Subdeletion site is not as obviously marked syntactically as in the case of Comparative Deletion. Even though this account in terms of performance factors may be applied to asymmetries such as those in (129c, f), it is quite clear that the asymmetries in (129b, d, g, h) are less easily reducible to performance factors.

Two recent studies on Comparative Formation, Izvorski (1995) and Kennedy (2002), take the position that Comparative Deletion and Subdeletion are the same in their syntactic properties; i.e., they involve the same type of elements and are subject to the same syntactic operations. To start with Izvorksi, she argues that Subdeletion constructions, just like Comparative Deletion constructions, involve *wh*-movement. Importantly, though, she assumes that the term targeted by movement in subcomparatives is not a prehead (i.e., left-branch) modifier (i.e., a functional degree-head), but rather a (phonologically empty) adjoined degree/amount phrase of the type *in what quantity/to what degree* (see the proposal by Grimshaw 1987, discussed in section 2.3). A sentence like (130a) is then assigned the derived structure in (130b):

(130) a. John met more linguists than I met biologists.
b. John met more linguists than [in what quantity]$_i$ I met biologists t_i.

As Izvorski notes, *wh*-movement of a degree-amount-denoting adverbial is possible:

(131) a. [In what quantity] did Mary eat apples?
b. We know [in what quantities] Mary used to drink wine.

If this adjunct analysis is adopted, the *wh*-movement analysis of Subdeletion constructions no longer faces the 'left-branch extraction puzzle' (i.e., why would extraction of a left-branch degree/amount term be possible in Subdeletion constructions, but not, e.g., in question formation constructions – cf. (53)?). The sensitivity to island constraints such as the CNPC, Sentential Subject Condition, etc. (cf. (129b)) obviously still follows: the amount adverbial is fronted to the left periphery of the (sub)comparative clause, and the *wh*-trace left behind cannot be located inside an island. So the ill-formedness of (59a), repeated here as (132a), follows straightforwardly: the amount adjunct is moved from its adverbial

position and extracted out of a complex NP, which leads to a violation of the CNPC (and consequently Subjacency); cf. (132b):

(132) a. *John bought more oranges than we had discussed [a plan [to buy apples]].
b. John bought more oranges than [in what quantity]$_i$ we had discussed [a plan [to buy apples t_i]].

Izvorksi further tries to show that apparent 'problems' for a unified analysis of Comparative Deletion and Subdeletion (e.g., the absence of a *that*-trace effect, the existence of multiple subcomparatives) can be accounted for under her *wh*-movement analysis. To give an example: the absence of a *that*-trace effect with subcomparatives directly follows from the fact that the presence of overt complementizers does not have any effect on adjunct extraction (cf. Lasnik and Saito 1984).

Kennedy (2002) also takes the position that Comparative Deletion and Subdeletion are the same in their basic syntactic properties. They both involve A'-movement of the compared constituent to the specifier of the clausal complement of *than* (i.e., [Spec, CP]). A crucial assumption in his analysis is that the two constructions differ in when this movement applies. He claims that Comparative Deletion involves overt movement of the compared constituent to [Spec, CP] of the comparative clause plus deletion under identity with the head of the comparative. The overtness of the movement operation implies that the movement is represented (i.e., visible) at PF (and typically at LF as well). As opposed to Comparative Deletion, Subdeletion involves covert movement of the compared constituent to [Spec, CP] of the comparative clause. This means that the A'-movement is only visible at LF. A consequence of this proposal is that Comparative Deletion and Subdeletion have structurally identical LF representations (but distinct PF representations). This is illustrated in the pair (133–134):[51]

(133) a. John met more linguists than I met.
b. John met more linguists than [$_{CP}$ [$_{DP}$ D^o_C linguists]$_i$ I met t_i]. (LF)

(134) a. John met more linguists than I met biologists.
b. John met more linguists than [$_{CP}$ [$_{DP}$ D^o_C biologists]$_i$ I met t_i]. (LF)

Kennedy notes that the observed similarities between Comparative Deletion and Subdeletion, such as sensitivity to extraction islands and crossover effects, are phenomena that have typically been analyzed as involving constraints on LF representations. If the two types of comparatives have structurally identical LF structures, it follows that they should display the same range of (un)acceptability in these contexts. Kennedy further argues that the properties that differentiate Comparative Deletion and Subdeletion (e.g., P-stranding, *that*-trace effects, and contraction) are phenomena that involve conditions on overt movement only.

To give an example: P-stranding is impossible in overt syntax in many languages (cf. (135a)). Application of covert movement to a *wh*-in-situ phrase is possible, though (cf. (135b)):

(135) a. *Wie_i heeft Jan [$_{PP}$ op t_i] gerekend. Dutch
Who has John on ? counted
b. Wie heeft er [$_{PP}$ op [wie]] gerekend?
Who has there on whom counted
'Who counted on whom?'

To illustrate how Kennedy's analysis accounts for the contrast in PP-island sensitivity (cf. (129b)), consider again the Comparative Deletion construction in (80a) and the Subdeletion construction in (79):

(80) a. *Jan heeft [$_{PP}$ voor [$_{NP}$ meer clubs]] gevoetbald dan hij [$_{PP}$ voor –]
John has for more clubs played-soccer than he for
getennist heeft.
played-tennis has

(79) Jan heeft [$_{PP}$ voor [$_{NP}$ meer voetbalclubs]] gevoetbald dan hij [$_{PP}$voor [$_{NP}$–tennisclubs]] getennist heeft.
John has for more soccer teams played-soccer than he for tennis clubs played-tennis has

The Comparative Deletion construction in (80a) involves overt A'-movement of the compared constituent (*x-many clubs*) to the [Spec, CP] of the comparative clause (with subsequent deletion applied to it). Since overt extraction is sensitive to the PP-island constraint, the sentence is ruled out. In the Subdeletion construction in (79), the compared constituent raises to [Spec, CP] at LF. Since covert movement is not sensitive to the PP-island constraint, the sentence is well-formed. Thus, in both types of comparatives A'-movement applies, which means: uniformity. The different behavior with respect to the PP-island condition is explained in terms of a derivational distinction: application of A'-movement in overt syntax (Comparative Deletion) or covert syntax (Subdeletion).

8 Conclusion

In this chapter, several aspects of the syntax of Comparative Deletion and Subdeletion have been discussed. The aim of this chapter was to give an impression of the various thoughts on these constructions, as they can be found in the generative literature. On the whole, there seems to have emerged a certain amount of consensus on the right analysis of the phenomenon of Comparative Deletion; that is, the majority of analyses follow Chomsky's (1977b) *wh*-movement approach, according to which the compared constituent of the comparative

clause undergoes *wh*-movement to Comp (i.e., [Spec, CP]); see Lechner (1999), though, for a different approach. There is much more controversy about the correct analysis of Subdeletion. Is there really a gap within the subcompared phrase? And if there is a gap, where is it located in the syntactic structure? Also, what rule is 'responsible' for the gap in the subcompared phrase? And, finally, is this rule the same type of computational operation as is at the basis of Comparative Deletion constructions? Clearly, interesting answers have been given to these questions. It is also clear, however, that many issues are still open to debate.

NOTES

I would like to thank two anonymous reviewers for insightful comments and suggestions. I take full responsibility for any shortcomings that remain in this chapter after all of the helpful input.

1 In the discussion of comparatives, no further distinction will be made between comparatives of equality (so-called equative constructions (as in (i)) and inequality (as in (iia, b)):

(i) John met as many linguists as I met.
(ii) a. John met more linguists than I met.
b. John met fewer linguists than I met.

2 In McCawley (1988), it is suggested that the degree element contained within the QP is the (demonstrative) pronominal degree word *that* (i.e., *that many linguists*). Chomsky (1977b) proposes that the degree word is interrogative and represents the degree element as *wh* (i.e., *wh-many linguists*).

3 For discussion of the semantics of comparative constructions, see Klein (1980); von Stechow (1984); Heim (1985); Kennedy (1997b); Lechner (1999).

4 As noted in Bresnan (1976c: fn. 10), the sequence *x-many linguists* is not strictly identical to *x-many linguists*. The degree element (DegP) of the compared phrase to be deleted is a designated element *x* (or in Bresnan's description, Δ), while that of the 'antecedent' compared constituent is *-er*. Thus, the notion of structural identity should be replaced by the notion of structural non-distinctness, to permit deletion of structures dominating designated elements under 'identity' to lexically saturated structures. Just as in Bresnan's articles, the notion of structural identity will be used here.

5 In this chapter, the precise phrase-structural analysis of the compared phrase will be abstracted away from. Essentially, Bresnan's analysis, according to which the QP occupies the specifier of the compared phrase (e.g., noun phrase or adjective phrase), will be followed. Her analysis will be slightly adapted to more common versions of X-Bar Theory (Chomsky 1970). More precisely, Bresnan assumes QP to be a sister of AP and daughter of AP'. She also uses the label Det for the Degree element which specifies Q and takes this element to be a left-branch sister of Q. In this chapter, the structure of the compared noun phrase and the compared adjective phrase will be as in (ia) and (ib), respectively:

(i) a. $[_{NP}\ [_{QP}\ [_{DegP}$ -er/as$]\ [_{Q'}$ many$]]\ [_{N'}$ books$]]$
b. $[_{AP}\ [_{QP}\ [_{DegP}$ -er/as$]\ [_{Q'}$ much$]]\ [_{N'}$ tall$]]$

In Bresnan's analysis, a comparative form like *more* (as in *more books* and *more interesting*) is derived by a transformational operation which attaches the comparative morpheme *-er* to the quantifier, yielding *many+-er* and *much+-er*. These are spelled out as the suppletive form *more*.

In recent analyses of nominal and adjectival phrase structure, the lexical part of the phrase is often analyzed as being contained within the functional structure of the phrase. For the nominal domain, this yields a structure like (iia) (see among others Abney 1987; Ritter 1991) and for the adjectival domain, a structure like (iib) (see Abney 1987; Corver 1991a, 1997a):

(ii) a. $[_{DP}$ D $[_{QP}$ Q $[_{NP}$ N]]]
b. $[_{DegP}$ Deg $[_{QP}$ Q $[_{AP}$ A]]]

6 Under an analysis in which *-ly* adverbs are reduced to adjectives (Emonds 1976; see also chapter 4), (9b) and (10b) would be instances of compared adjective phrases as well.

7 For discussions about the syntax of phrasal comparatives, see, among others, Pinkham (1982); Hoeksema (1983); Napoli (1983). It should be noted that not all comparative structures in which the lexical item *than* or *as* is followed immediately by a non-clausal constituent qualify as phrasal comparatives; e.g., comparatives with VP remnants like: *I introduced [VP Sally more often to linguistics] than [VP Bill to biologists].*

8 Not all QPs are licit in this context:

(i) This mouse weighs *most/*no ounces.

9 Grimshaw (1987) observes that in certain contexts, a measure verb can take a "bare" measure phrase as its sister. Observe that in these contexts the measure nominal tends to be focused:

(i) a. You can't pick that one up – it weighs ounces.
b. This one's easy to pick up – it only weighs ounces.

10 Besides quantitative *er*, Dutch has three other uses of the clitic *er*: prepositional *er*, as in (ia), locative *er*, as in (ib), and expletive *er*, as in (ic). See Bennis (1986) for extensive discussion of the various types of *er*:

(i) a. Jan rekende $[_{PP}$ erop].
John counted it on
'John counted on it.'
b. Jan woonde er.
'John lived there.'
c. Er was eens een koning.
'There was once a king.'

11 See Pinkham (1982) for an elaborate discussion of the parallel behavior of quantitative *en* in comparative environments and quantitative *en* in non-comparative environments.

12 In fact, Bresnan (1975) is aware of these asymmetries between 'normal' subcomparatives and *of*-comparatives. She attributes the contrast to Kuno's (1973a) Clause Nonfinal Incomplete Constituent Constraint.

13 As pointed out by an anonymous reviewer, another test distinguishing between the two analyses for *of*-comparatives (Subdeletion vs. Comparative Deletion) could be based on the parallelism constraint on Subdeletion (George 1980; see the discussion of (115) and (116)). If *of*-comparatives were instances of Subdeletion, mixed grammatical functions for the comparative NP and the Subdeletion site should lead to ungrammaticality. This expectation seems to be borne out:

(i) *More of the linguists were invited by Sam than I invited of the biologists.

14 Recent analyses of bare plurals (Delfitto and Schroten 1991; Longobardi 1994), making use of the DP-hypothesis, provide syntactic arguments for the presence of an empty determiner-like element (D) within bare plural noun phrases.

15 As pointed out by an anonymous reviewer, a question which arises for this analysis is why the Adverb Phrase cannot be overt:

(i) *I met more linguists than you met biologists [to a certain/great extent].

16 Ishii further assumes that the adverbial phrase undergoes syntactic *wh*-movement to [Spec, CP]. This (adverbial) *wh*-analysis of Subdeletion makes this phenomenon more similar to Comparative Deletion, which Ishii, following Chomsky (1977b), analyzes as *wh*-movement of the compared constituent of the comparative clause:

(i) I met more linguists $[_{PP}$ than $[_{CP}$ $\emptyset_i$ $[_{IP}$ you met biologists $[_{AdvP}$ $t]_i]]]$.

There is an important interpretive difference, though, between Subdeletion and Comparative Deletion: the former involves comparison of the event expressed in the matrix clause with that of the comparative clause; the latter, on the contrary, involves comparison of individuals.

Interestingly, Ishii's adverbial analysis of Subdeletion is to a certain extent similar to Obenauer's (1984/1985) treatment of so-called QAD-structures (i.e., Quantification At a Distance), like (ii):

(ii) J'ai beaucoup conduit de camions.
I have a-lot driven of trucks
'I drove many trucks.'

Obenauer argues that the quantified interpretation of the direct object (i.e., *[e de camions]*) is obtained through quantification of the verb meaning (*conduit*), i.e., the verb's ability to lend itself to an 'X TIMES V' interpretation when combined with the preverbal (i.e., adverbial) QP. Thus, quite similarly to Ishii's analysis of Subdeletion in English, Obenauer's analysis of QAD-structures involves quantification over the event denoted by the verb. The interpretation of (ii) is that the event of my driving a truck took place many times.

17 See Kennedy and Merchant (2000) for a recent discussion of the syntax of attributive comparative deletion. On the basis of data from a variety of languages, they derive two empirical generalizations: (i) that there is a direct correlation between left-branch extractions in interrogatives and the acceptability of attributive Comparative Deletion constructions, and (ii) that languages in which left-branch extractions are impossible can 'bypass' this constraint by eliding a constituent that includes the extraction site.

18 As pointed out by an anonyomous reviewer, a closer adverbial paraphrase for (48a), which parallels (47), would be: *Mary has a good ear more than she has a voice*.

19 Pinkham formulates a number of conditions (unified under the label 'equivalence requirement') which must be satisfied in order for semantic restructuring to take place. A first restriction is that the attributive adjective must be of a certain type, e.g., *good*, *successful*, *convincing*. Other restrictions are that the action is understood as a general property rather than a specific occurrence and that the verb denotes a creative process.

20 According to Chomsky (1977b), removal out of a 'picture noun phrase' can only take place after the *of*-phrase has been extraposed or reanalyzed out of the NP. Thus, subextraction applies to the extraposed phrase. Note, however, that for an analysis of Subdeletion in terms of subextraction of a *wh*-feature, the subextracted *wh*-element would still pass two bounding nodes, viz., NP and S, and hence, strictly speaking, violate the Subjacency Condition.

21 It should be pointed out that Bresnan (1976a) argues that Chomsky's claim that the RAOAC is incompatible with the fact in (64) is the result of a misinterpretation of her analysis. She argues that the RAOAC is, strictly speaking, not incompatible with the facts in (64). The only thing the RAOAC states is that phrases undergoing some transformation must be maximal *relative to* a fixed context specified by the transformation. That is, phrases do not have to be *absolutely* maximal in the set of possible movements or deletions. Thus, a sentence like (i) would involve deletion, with the QP *-er much* of the antecedent compared phrase as the context predicate:

(i) $[_{Y'''}$ *-er much* tall$][_{S'''}$ W_2 $[_{Y'''}$ *x-much* tall$]$ W_4 $]$ 4≤1
1 2 3 4 5 6 →
1 2 3 ø 5 6

A comparative deletion featuring total deletion of the entire compared constituent (as in *John is taller now than he was – yesterday*) takes the head of the comparative clause in its entirety as the context predicate:

(ii) $[_{Y'''}$ *-er much tall* ø $][_{S'''}$ W_2 $[_{Y'''}$ *x-much tall* ø $]$ W_4 $]$ 4≤1
1 2 3 4 5 6 →
1 2 3 ø 5 6

In sum, the RAOAC permits optionality: although deletion should always be maximal, maximality being defined relative to the context predicate.

22 Pinkham's adverbial analysis might possibly be extended to such examples as (i), presented in Bresnan (1975) as an instance of subremoval from an AP. Under such an analysis, (i) would roughly be interpreted as: 'It is more nearly so that her eyes are ogival than that they are oval':

(i) Her eyes are $[_{AP}$[more nearly] ogival] than they are $[_{AP}$ – oval].

Other instances of subremoval are the following:

(ii) a. Mary is $[_{AP}$ [more expensively] coiffed] than Sue is $[_{AP}$ – dressed].
b. My town lies $[_{PP}$[as many feet] below sea-level] as your town lies $[_{PP}$ – above it].

In (iia), a subpart of the AP headed by *dressed* has been removed; in (iib), it is the measure phrase *x-many feet* that has been removed from the locative PP. It should be noted that these instances of subremoval are not incompatible with Chomsky's (1977b) movement approach toward Comparative Deletion. The reason is that syntactic movement of these left-branch constituents is permitted. This is shown by the well-formedness of the following subextractions:

(iii) a. How expensively did he say she was [– dressed]?
b. How many feet does your town lie [– above sea-level]?

23 As Bresnan (1976c) observes, there are examples involving Subdeletion in a sentence-internal comparative clause which are quite acceptable:

(i) a. I can tell you that fewer women than there are fingers on my right hand, passed.
b. He has as many women as he has horses, in his stable.

She further remarks that certain examples featuring Comparative Deletion in sentence-internal position sound very awkward:

(ii) a. More women than – flunked, passed.
b. I gave as many women as I had – in my courses, A's.

24 Observe that the Comparative Deletion counterpart of (78b) is ungrammatical. This gives us another asymmetry between Subdeletion and Comparative Deletion:

(i) *John is as many women's lover as he is [$_{NP}$ [$_{NP}$ –] enemy].

25 Similar examples in English mixing subdeletion and VP-topicalization are not very acceptable:

(i) *? . . . and give more girls an apple than boys a pear, John certainly will.

26 Not all speakers of Dutch find sentence (81) acceptable.

27 As pointed out by an anonymous reviewer, one could develop an analysis in which the second comparative NP is treated as an instance of *wh*-in-situ. The empty operator associated with the second comparative could then move at LF, in analogy to multiple *wh*-questions.

28 On the basis of such examples as (83), among others, the earliest generative accounts of comparatives (Hankamer 1971; Bresnan 1972) suggest that comparative formation is analogous to relative clause formation and involves a movement rule.

29 See also van Riemsdijk (1978b) for a similar line of argumentation on the basis of Dutch comparatives featuring an overt *wh*-word.

30 The analysis of free relatives as defended in Groos and Van Riemsdijk (1981) is adopted here.

31 See also Izvorksi (1995) for a free-relative analysis of certain comparative clauses. She further points out that in certain languages an overt *wh*-phrase is found not only in the embedded clause of Comparative Deletion constructions (cf. (i)), but also in the embedded clause of Subdeletion constructions (cf. (ii)); the example from Afrikaans is drawn from den Besten 1978: fn. 13:

(i) a. Ivan izpi poveče vino ot-*kolkoto* bjahme kupili. Bulgarian
Ivan drank more wine from-how-much were-1pl bought.
'Ivan drank more wine than we had bought.'
b. Jan het meer boeke gekoop as *wat* Piet gekoop het. Afrikaans
John has more books bought than what Pete bought has

(ii) a. Ivan izpi poveče vino ot-*kolkoto* Maria bira Bulgarian
Ivan drank more wine from-how-much-REL Maria beer
'Ivan drank more wine than Maria drank beer.'
b. Jan koop meer boeke as *wat* Piet plate koop. Afrikaans
John buys more books than what Pete records buy
'John buys more books than Peter buys records.'

32 Also in English, there turn out to be asymmetries between comparatives featuring an overt *wh*-phrase and 'normal' comparative deletion constructions. As observed in Huang (1977), for example, a subject 'deletion site' is permitted in the latter (cf. (ib)), whereas it is impossible to have *what* when the subject is the compared constituent (cf. (ia)):

(i) a. *More girls know Harry than what know Sam.
b. More girls know Harry than know Sam.

Den Besten (1978: fn. 15) argues that, given its invariant form, it is improbable that dialectal *what* is a *wh*-phrase. He proposes that *what* in examples such as (83) is a complementizer, whose shape has changed from *that* into *what* as the result of a *wh*-element in COMP that has been deleted.

33 Chomsky (1977b) discusses examples like (i) and uses them as counter-evidence to Bresnan's deletion analysis of comparatives. Chomsky remarks that for an example like (i), a deletion analysis seems rather artificial, since in contrast with normal comparatives there is no overt matrix phrase that can trigger and control the deletion. He then argues that this example is derived as follows: a *wh*-phrase *what* is moved within the comparative clause to COMP, yielding (ii); this *wh*-phrase in COMP is subsequently deleted, yielding the surface pattern in (i):

(i) Mary is (more or less) as she was five years ago.

(ii) Mary is (more or less) as [$_{S'}$ what$_i$ she was t$_i$ five years ago].

As an alternative, along the lines of den Besten's free-relative interpretation of certain comparative clauses, one might explore the free-relative analysis, with *as* functioning as the relativizer:

(iii) Mary is (more or less) [$_{AP}$ Δ [as$_i$ she was t$_i$ five years ago]].

34 It should be noted here that many Dutch speakers accept sentence (90b), which is considered to be ungrammatical in Den Besten's article.

35 The pattern in (90a) is referred to as a 'metacomparative' in McCawley (1988).

36 Thus, three 'COMP'-configurations can be distinguished for Dutch comparatives, according to Den Besten:

(i) a. $[_{PP}$ dan $[_{S'}$ $[_{comp}$ dat] . . .]] (dan dat)
b. $[_{PP}$ dan $[_{S'}$ $[_{comp}$ $[_{XP}$ *e*] *e*]]] (dan)
c. $[_{PP}$ dan $[_{NP}$ $[_{NP}$ Δ] $[_{S'}$ $[_{comp}$ $[_{XP}$ +WH] *e*] . . .]]] (dan *wh*-phrase)

37 Den Besten argues that the same judgments hold for Subdeletion constructions, i.e., an overt *dat* is blocked in subdeletion environments. According to Den Besten's theory, the obligatory absence of the complementizer means that a *wh*-phrase has been moved to COMP. Thus, *wh*-movement takes place in Dutch Subdeletion contexts:

(i) Deze tafel is langer dan (?dat) die tafel breed is.
This table is longer than (?that) that table wide is

It should be noted here that for many speakers of Dutch the pattern containing *dat* is just as acceptable as the one without *dat*.

38 Pinkham (1982) argues that the use of the proform *le* in the comparative clause is obligatory. Milner (1978a: fn. 13), however, notes that many speakers of French also accept the comparative clause without the lexical pro-form *le*, as in (ii):

(i) *Jean est plus grand que je ne suis.

(ii) Elle est aussi triste qu'elle était.

39 Pinkham observes that compared adverb phrases do not lexicalize in French. In this respect, French and English are alike. That is, in both languages, the compared adverb phrase of the comparative clause is an empty element (as in (ib)):

(i) a. Je tape plus vite que je n'écris.
'I type faster than I write.'
b. Je tape plus vite que je n'écris $[_{ADVP}$ PRO].

40 See also Gazdar (1981) for an analysis in terms of a base-generated gap within the comparative clause that gets interpreted by being linked to *than*.

41 For the sake of simplicity, recent analyses will be ignored here according to which coordinate structures are in fact asymmetric syntactic structures (see, among others, Thiersch 1993; Kayne 1994).

42 Similar examples featuring Gapping have been observed for French in Kayne (1981a):

(i) Marie a écrit autant d'articles que Jean de livres
Mary has written as-many of articles as John of books
'Mary has written as many articles as John has written books.'

43 This analysis raises the question why the QP-gap has to be ATB-bound in the first place.

44 Chomsky and Lasnik (1977) consider these ATB-facts rather marginal.

45 See Goodall (1987b) for a discussion of parallel structures in syntax.

46 As pointed out by an anonymous reviewer, one line to explore would be an analysis in which the second instance of movement proceeds at LF (*wh*-in-situ style).

47 As noted in Kennedy (2002), 'mixed' multiply-headed comparatives – i.e., comparatives involving both Comparative Deletion and Subdeletion – are acceptable:

(i) a. Christmas makes as many people as happy as it makes – [– unhappy].
b. Max persuaded more people to buy more cars than you persuaded – to buy [– trucks].

48 Multiple comparatives are acceptable when other material has been elided within the comparative clause, as arguably in the following examples from Andrews (1985):

(i) a. People do crazier things at higher speeds on the McGrath Highway than they do other places.
b. Marcille gave a longer talk at a better attended session than did her husband.

49 In Hendriks (1992), von Stechow's (1984) interpretation of multiple Subdeletion constructions, and hence the idea that Subdeletion can apply twice in one comparative, is criticized on the basis of the uninterpretability of cases like: *Fewer dogs ate more rats than cats ate mice*.

50 See also Kennedy (2002) for a systematic overview of the similarities and differences between Comparative Deletion and Subdeletion.

51 Kennedy (2002) adopts a copy theory of movement. Thus, in both (133b) and (134b) there is a copy of the fronted compared constituent in the extraction site at LF.

16 Conditionals

RAJESH BHATT AND
ROUMYANA PANCHEVA

1 Introduction
2 Defining conditionals
  2.1 What is a conditional?
  2.2 The marking of conditionals
3 Structural issues
  3.1 The position of merger of the *if*-clause
    3.1.1 *If*-clauses as adverbial clauses
    3.1.2 Height of attachment
    3.1.3 A source for sentence-initial *if*-clauses
  3.2 Clause-internal syntax of the *if*-clause
    3.2.1 The location of *if*
    3.2.2 The conditional–interrogative link
    3.2.3 The absence of low construals
    3.2.4 Conditional inversion
4 The conditional–interrogative link
  4.1 *Then* as a correlative proform
    4.1.1 The semantic contribution of *then*
    4.1.2 The distribution of *then*
  4.2 Structure of conditionals with *then*

7 Conclusion

1 Introduction

This chapter provides a survey of the major issues in the syntax of conditionals. We present and critically evaluate the findings in the literature pertaining to conditional structures. We furthermore advance a particular view, not articulated in its entirety before, namely that conditional clauses (e.g., *if*-clauses) are essentially free relatives of possible worlds. Similarly to the more familiar instances of free relatives of individuals, (i) conditional clauses likely involve clause-internal operator-movement to Spec, CP; (ii) they receive the interpretation of definite descriptions; and (iii) they may participate in correlative structures, as happens in the subcase of conditionals with the proform *then*.

Conditional structures involve an adverbial clause, often referred to as the conditional clause, antecedent, or protasis (the underlined constituent in (1)), and a main clause, known as the consequent or apodosis. Conditional structures are interpreted, in general terms, with the proposition expressed by the antecedent clause specifying the (modal) circumstances in which the proposition expressed by the main clause is true. Thus, (1) states that the possible worlds/situations in which Andrea arrives late (the denotation of the conditional clause) are possible worlds/situations in which Clara gets upset (the denotation of the main clause):

(1) <u>If Andrea arrives late</u>, Clara will get upset.

Conditionals as in (1) are known as hypothetical conditionals. They are the most common kind of conditional structures discussed in the literature, and consequently, our contribution will mostly focus on them.

Other types of conditionals exist as well, notably relevance conditionals, as illustrated in (2a), and factual conditionals (cf. Iatridou 1991; also called premise-conditionals in Haegeman 2003), as in (2b):

(2) a. If you are thirsty, there is beer in the fridge.
    b. If Fred is (indeed) so smart, why didn't he get the job?

In the case of relevance conditionals, clearly the antecedent does not specify the circumstances in which the proposition expressed by the consequent is true, as the latter is, in fact, asserted to be true (in the world of evaluation). Rather, the possible worlds/situations in which the proposition expressed by the antecedent is true are possible worlds/situations in which it is relevant, from the perspective of the speech act, that the proposition expressed by the consequent clause is true. It is as if in a relevance conditional, there is an implicit performative clause embedding the surface main clause, and this performative is the true consequent in a (hypothetical) conditional structure (*If you are thirsty, then* it is relevant for you to know *that there is beer in the fridge*).[1]

Factual conditionals are somewhat harder to distinguish from hypothetical conditionals. According to Iatridou (1991), the conditional clause in a factual

conditional is presupposed to be true. Haegeman (2003) notes that while in a hypothetical conditional the antecedent clause is integrated into the speech act of the matrix clause, the antecedent in a factual conditional has an independent illocutionary force.

We note some facts about the syntax of relevance and factual conditionals in section 5, but we remain primarily concerned with hypothetical conditionals in this introduction.

Conditionals are not unique in their overall structure; rather conditional clauses belong to a class of adverbial clauses that includes, among others, clausal adverbials of time, cause, and concession, as illustrated in (3):[2]

(3) a. If Andrea arrived late, Clara must have gotten upset.
b. When Andrea arrived late, Clara got upset.
c. Because Andrea arrived late, Clara got upset.
d. Although Andrea arrived on time, Clara got upset.

Like the other clausal adverbials, conditional clauses are typically introduced by a CP-related element, a complementizer or an operator in Spec, CP (cf. *if*, *when*, *because*, *although* in (3) above). And like the other adverbial clauses, conditional clauses may precede or follow the main clause. Historically, and typologically, clausal adverbials are related, though of course, in individual languages they may have undergone distinct development and as a result diverged from each other. For instance, in English, conditionals allow the presence of a proform in the main clause 'linked' to the adverbial clause (i.e., *then*), and concessives do too (i.e., *still*, *nevertheless*). However, *because*-clauses disallow such proforms, and *when*-clauses allow them only marginally (cf. (4)):

(4) a. If Andrea arrived late, then Clara must have gotten upset.
b. When Andrea arrived late, (*/??then) Clara got upset (??then).
c. Because Andrea arrived late, (*for that reason) Clara got upset (*for that reason).
d. Although Andrea arrived on time, (still/nevertheless) Clara (still/nevertheless) got upset.

In this chapter, we discuss both the internal and external syntax of conditional clauses: the structure of the adverbial CP and the way it is merged to the matrix clause. We draw some, though not extensive, parallels with the other kinds of adverbial clauses, and suggest a direction for their analysis in a uniform manner.

A caveat regarding the scope of our presentation is in order: here we only discuss in detail issues having to do with the syntax of conditionals. Some reference to their semantics is made, when necessary for the exposition, but it is not put in formal terms, and is not claimed to be in any way exhaustive. There is a vast philosophical literature on the topic of conditional reasoning and logic, and also a growing number of formal semantic analyses of conditionals in natural

language, to which we could not do a proper justice even in references (still, see Harper et al. 1981; Jackson 1991; among many others).

2 Defining conditionals

2.1 What is a conditional?

Before we begin, we have to clarify the basis on which we decide whether a particular sentence is a conditional or not. Above, we have defined conditionals as structures involving an adverbial clause interpreted as stating the conditions under which the proposition expressed by the main clause is true (or its truth is relevant, as in the case of relevance conditionals). Surely there are other syntactic ways to convey a conditional meaning. The following examples illustrate just such cases:

(5) a. Kiss my dog and you'll get fleas.
b. For you to do that would be nice.

Sentence (5a) is interpreted along the lines of *If you kiss my dog you'll get fleas*; similarly sentence (5b) receives a conditional interpretation such as *It would be nice if you do that*. Cases like these are not some peculiarity of English. In a number of languages a structure involving an imperative clause conjoined with a non-past indicative clause receives a conditional interpretation: the imperative clause is interpreted as the antecedent clause of a conditional, and the indicative clause in the coordination is interpreted as the consequent (cf. Clark 1993; Han 2000; among others). This structure-to-meaning mapping appears to be compositional, given that the coordinating conjunction *or* has the semantic import of the coordinating conjunction *and* plus negation of the proposition expressed by the imperative clause. In other words, whereas (6a), with *and* as the coordinator, is interpreted as *if* p, q (where p and q are the propositions denoted by the imperative and indicative clauses, respectively), (6b), with *or* as the coordinator, is interpreted as *if* $\neg$ p, q. The facts of (6) are furthermore cross-linguistically attested:

(6) a. Kiss my dog and you'll get fleas.
p *and* $q \rightarrow$ *if* p, q
b. Kiss my dog or you'll get fleas.
p *or* $q \rightarrow$ *if* $\neg$ p, q

Turning to (5b), here the relevant facts in deriving the conditional interpretation are the non-finiteness of the sentential subject, and the mood morphology in the main clause. In many languages a specialized mood, often called conditional mood, is employed in such cases.[3] Again, as in the case of the conjoined imperative, the two clauses involved in (5b) correspond systematically to the antecedent and consequent of a conditional: the non-finite sentential subject is interpreted as

the antecedent, and the main clause is interpreted as the consequent of a conditional. (See Pesetsky 1995 for a discussion of such structures.)

Do the regularities characterizing the structure-to-interpretation mapping in sentences such as the ones in (5) and their cross-linguistic availability justify considering these to be conditionals? We believe that comprehensive discussions of conditionality should include an investigation of cases such as these. The term 'conditional' in its strict sense, however, is being used in the literature only to refer to constructions involving an *adverbial* clause merged to a particular position in a main clause. We follow this convention here and discuss further only such adverbial structures, partly for reasons of space, partly because the literature has been almost exclusively devoted to the adverbial structures, but partly also because the conventional split isolates a well-defined class of cases whose properties can be fruitfully explored. The fact that we do not mention any further cases like the ones in (5) should not be taken to mean that they should be excluded from a wider study of conditional expressions.

2.2 *The marking of conditionals*

Languages use a variety of means to indicate that a particular syntactic structure is a conditional rather than some other construction that involves two clauses. Without an attempt to give an exhaustive description of the range of options and typological tendencies, we present in this section some of the common structural means of forming conditionals.

Overt marking of the protasis (the antecedent of the conditional) appears to be the commonest strategy, cross-linguistically (cf. Comrie 1986; Zaefferer 1991). This can be done by employing certain lexical items (i.e., free morphemes), through particular inflectional morphology, or by purely syntactic means (e.g., verb-movement).[4] The English *if*, the German *wenn* and *falls*, and the Mandarin Chinese *ruguo* exemplify the marking of an antecedent using lexical items, arguably functional elements in the CP-domain – complementizers or operators in Spec, CP:

(7) a. *If* it is sunny, I will go for a walk.
b. *Wenn* Steffi gewinnt, wird gefeiert. German
if Steffi wins Impers.Passive celebrate
'If Steffi wins, people celebrate.'
c. *Falls* Steffi gewinnt, wird gefeiert. German
in-case Steffi wins Impers.Passive celebrate
'In case Steffi wins, people celebrate.'
d. *Rúguǒ* Zhangsan hē jǐu, wǒ mà tā. Mandarin
if Zhangsan drink wine I scold him
'If Zhangsan drinks wine, I will scold him.'

Many languages use temporal *wh*-pronouns (e.g., German *wenn* 'when/if'[5]) as conditional markers (cf. Traugott et al. 1986). Other common lexical devices for

forming a conditional are interrogative complementizers/operators, e.g., English *if* is also used in embedded yes/no questions.[6]

The marker on the antecedent does not have to be a single lexical item. It can also be a phrase, as is the case with the English *in case*, and the Spanish *con tal que* literally 'with such that':

(8) Te perdono con tal que vayas. Spanish
To-you forgive-1s with such that go-Sbjv-2s
'I forgive you if you go.'

Languages can also mark the antecedent through inflectional morphology on the verb in the antecedent clause. Examples of such languages include West Greenlandic, Turkish, and Basque:

(9) **West Greenlandic (cf. Fortescue 1984):**
pakasa-anna-rukku pissanganar-niru-vuq.
surprise-just-2s.3s.COND be.exciting-more-3s.INDIC
'If you just surprise him, it will be more exciting.'

The inflection that serves as the overt marker of the antecedent clause need not be unambiguously conditional (i.e., only realized in conditionals). Some languages mark antecedent clauses by using imperative verbs (in the absence of a coordinating conjunction). Consider (10), from Jacab (forthcoming):

(10) Znaj ja kakoj-nibud' inostrannyj jazyk, Russian
know-imper.2sg I some-kind foreign language
rabotal by perevodčikom.
worked would translator-instr
'If I knew some foreign language, I would work as a translator.'

Morphosyntactically, conditionals like (10) differ from true imperatives in, at least, the absence of subject–verb agreement and the fact that they can be formed from verbs that do not normally appear in the imperative, such as *happen* or *turn out* (see Hacking 1998; Jacab forthcoming; for discussion). The imperative verb, which in imperatives can show number distinction, with forms for 2sg and 2pl, can only be 2sg in its use in this type of conditionals.[7]

The use of subjunctive morphology is another common formal device in building conditional antecedents. Consider the following examples from Russian in this respect (from Hacking 1998):

(11) Pročitala by ona etu stat'ju, ona smogla Russian
read-sg.fem subj she this-acc article-acc she can-sg.fem
by otvetit' na vaš vopros.
subj answer-inf to your question
'Had she read/were she to read the article, she would have been/be able to answer your question.'

Interestingly, when there is no conditional complementizer, as in the above Russian examples, the verb, whether marked as subjunctive or imperative, undergoes movement to C. I-to-C movement is in fact another formal mechanism for forming antecedents of conditionals, often employed by languages in the absence of any other indicator, lexical or morphological, of conditional marking.

In English, I-to-C movement is restricted to the antecedents of counterfactual conditionals (cf. Iatridou and Embick 1994), and also some future-less-vivid conditionals, i.e., conditionals that implicate that if p is the proposition expressed by the antecedent, $\neg p$ is more likely than p (the term 'future-less-vivid' is introduced in Iatridou 2000). In other languages, inversion is less restricted and is available in indicative conditionals as well, as the German example below illustrates:

(12) a. Had I known, I would not have gone.
b. Were he to come, we would not go.
c. Hast du was, dann bist du was. German
Have you something then are you something
'If you have something, then you are something.'

The preceding discussion might suggest that the explicit marking of the antecedent is cross-linguistically obligatory. This is not the case. In Bengali (cf. Comrie 1986) and Hindi, for example, it is the presence of the *then* which is obligatory, not the presence of the *if*:

(13) **Hindi (cf. McGregor 1995):**
(agar) mehnat karoge to safal hoge.
if hard-work do-Fut.2Pl then succesful be-Fut.2Pl
'If you work hard, you'll be successful.'

The marker of the apodosis (the main clause) in Bengali and Hindi is clearly of pronominal origin. Comrie (1986) notes that all instances of overt apodosis marking known to him involve particles, often of pronominal origin. He suggests that these may therefore be analyzable as resumptive pronouns.

Finally, there are conditional constructions where no overt marking of any sort seems to be necessary. Mandarin Chinese allows for conditional interpretation in the absence of any overt marking of conditionality, since *rugou* 'if' is optional, and so is the pronominal in the consequent clause *jiu* 'then':

(14) (rúguǒ) Zhangsan hē jǐu, wǒ (jìu) mà tā. Mandarin
if Zhangsan drink wine I then scold him
'If Zhangsan drinks wine, (then) I will scold him.'

However, Comrie (1986) notes that in the absence of any overt conditional marking, a sentence like (14) is ambiguous between a variety of relations holding between the two clauses (e.g., *if/when/because*).[8]

In summary, conditionals are formed through a variety of means. They share a basic bi-clausal structure, with the antecedent adjoined to the main clause, though, as we will see below in the discussion of adnominal conditionals, other adjunction possibilities are also attested. The internal syntax of the antecedent clause involves the CP-domain, where presumably clause-typing features are lexicalized by special complementizers or they trigger verb-movement. A particularly interesting question arises regarding the structure of conditionals: how, in the absence of a specialized marker, such as a conditional complementizer or conditional inflection, can a clausal adjunct receive the interpretation of a conditional? In other words, *ruguo* in Mandarin may be posited to carry the relevant features that a semantics for conditionals would need, and that would distinguish an adjunct clause headed by *ruguo* from one headed by, e.g., *because*. However, given that I-to-C movement in English is clearly not limited to conditionals, that is, it is also found in matrix questions, and in certain focus contexts,[9] why is it that an adjunct as in (12a) is interpreted as a conditional rather than as a *because*-clause? Similar facts obtain in other languages besides English that employ I-to-C movement in conditionals.

3 Structural issues

We begin with a discussion of simple conditionals without *then*, like *If you open the refrigerator, it won't explode*. Once these basic cases have been discussed, we will look at conditionals with *then* and the different structural properties of other kinds of conditionals.

A basic observation is that *if*-clauses can be clause-initial or clause-final. To the limited extent to which they can be clause-medial, they must be set off by parenthetical intonation ((15), from Lasersohn 1996):

(15) a. **Clause initial:**
If you bother him long enough, John will give you five dollars.
b. **Clause final:**
John will give you five dollars if you bother him long enough.
c. **Clause medial:**
John, if you bother him long enough, will give you five dollars.
*John if you bother him long enough will give you five dollars.

We will address two questions concerning the *if*-clause here. First, what is the structural location of the *if*-clause with respect to the main clause? And second, what is the clause-internal syntax of the *if*-clause?

3.1 The position of merger of the if*-clause*

Greenberg (1963) states the following universal concerning the linear order between the antecedent and the consequent clause of a conditional.

Universal of Word Order 14:
In conditional statements, the conditional clause precedes the conclusion as the normal order in all languages.

Comrie (1986) claims that while many languages allow for both clause-initial and clause-final placement of the *if*-clause, there are also rigidly verb-final languages, where the clause-final option is unavailable.[10,11]

Greenberg's and Comrie's observations are important, but it should be noted that they are observations about the surface positions of *if*-clauses. Typological tendencies are compatible with *if*-clauses having an origin distinct from their clause-initial surface position. As we will see soon, there is evidence that the clause-initial/clause-final difference reflects difference in attachment height, and that at least some clause-initial *if*-clauses need to be derived via movement from clause-final *if*-clauses.

3.1.1 If-*clauses as adverbial clauses*

One logically possible analysis of conditional sentences is that the two clauses are coordinated syntactically, with *if* functioning as a 'true conjunction', to borrow a phrase from Jespersen (1954–1958). There have not been explicit syntactic proposals that the antecedent and consequent of conditional sentences are coordinated clauses, as far as we are aware.[12] There are, in fact, important differences between *if* and a coordinator like *and*. Whereas *if*-clauses can appear both sentence-initially and sentence-finally, the same is not true in the case of coordinated structures involving *and*/*but*/*or*:

(16) a. Joe will leave and/but/or Mary will stay.
b. *And/but/or Mary will stay, Joe will leave.

Furthermore, *only* and *even* can modify *if*-clauses but not second conjuncts in coordinations:

(17) a. Lee will give you five dollars only/even [if you bother him].
b. Lee will give you five dollars (*only/*even) [and/but/or Ken will give you ten].

In being able to appear both sentence-initially and sentence-finally conditional clauses are like other adverbial clauses:

(18) a. I will leave at noon/because you leave.
b. At noon/because you leave, I will leave.

Clear evidence that sentence-final *if*-clauses are constituents of the VP and therefore adverbials comes from VP deletion and *do so* anaphora. The most conservative interpretation of the data below is that the place holders refer back to

constituents, and therefore that the conditional clauses are constituents of the VP. Hence they are also adverbials (given that they are not nominal arguments):

(19) a. I will leave if you do and John will $_{\text{leave if you do}}$, too.
b. I will leave if you do and John will *do so* too.

Evidence for the adjuncthood of *if*-clauses also comes from their behavior under *it*-clefting. *If*-clauses can be clefted but not out of a *wh*-island ((20), from Collins 1998):

(20) a. It is if the student fails that the teacher will fire the TA.
b. ?It is if the student fails that Bill said that the teacher would fire the TA.
c. *It is if the student fails that Bill wonders why the teacher will fire the TA.

The severity of the violation in (20c) – what used to be analyzed as an ECP rather than a Subjacency violation – suggests that the *if*-clause is an adjunct (given that it is clearly not a subject).

The data involving modification by *only* and *even* (cf. 17), and VP ellipsis phenomena (cf. 19), provide strong evidence against the view that the antecedent and consequent of conditionals are coordinated. These data support the view that *if*-clauses are adverbials, like temporal phrases and clauses. Furthermore, pronominalization by *then* suggests that *if*-clauses are adverbials, since their anaphoric reflex – *then* – is an adverb.

3.1.2 *Height of attachment*

If sentence-initial *if*-clauses are in an adjoined position, then they are clearly adjoined to the main clause, as opposed to a constituent inside it.[13] As expected, sentence-initial *if*-clauses are not c-commanded by the subject of the main clause (cf. (21b)). Concerning the position of sentence-final *if*-clauses, there is evidence suggesting that adjunction to the main clause is not involved. Condition C judgments show that an *if*-clause in sentence-final position is c-commanded by the subject of the main clause. Consider example (21). Coreference between *she* and *Mary* is prohibited in (21a) but possible in the minimally distinct (21b, c). Given these facts, the *if*-clause must be adjoined at most as high as I', and if adjunction to a bar-level projection is to be avoided, the *if*-clause must be merged even lower:

(21) a. *She$_i$ yells at Bill if Mary$_i$ is hungry.
b. If Mary$_i$ is hungry, she$_i$ yells at Bill.
c. If she$_i$ is hungry, Mary$_i$ yells at Bill.

A direct object cannot c-command into an *if*-clause, irrespective of whether it is sentence-initial or sentence-final:

(22) a. Bill visits her$_i$ if Mary$_i$ is sick.
b. If Mary$_i$ is sick, Bill visits her$_i$.

We have so far concluded that a sentence-final *if*-clause is adjoined lower than IP but above the VP or at least higher than the object. Further evidence concerning the structural location of the sentence-final *if*-clause comes from VP topicalization. We see that while the *if*-clause can be topicalized with the VP, it does not have to be:

(23) I told Peter to take the dog out if it rains,
a. . . . and take the dog out if it rains, he will.
b. . . . and take the dog out he will if it rains.

Based on these tests, Iatridou (1991) proposes that sentence-final *if*-clauses involve VP-adjunction, while sentence-initial *if*-clauses involve IP-adjunction (or in some cases CP-adjunction, to accommodate sentences like the ones in (24)):

(24) a. If it rains, what shall we do?
b. If it rains, are we going to leave?
c. If he is right, what a fool I've been!

Saying that sentence-final *if*-clauses are adjoined to VP underdetermines their actual position. There is evidence from their interaction with negation which suggests that they can be adjoined below or above negation. Sentence-final, but not sentence-initial, *if*-clauses interact scopally with negation.[14]

As indicated by the two continuations provided, (25) is ambiguous between two readings, one where the negation takes scope over the entire conditional (= 25a), and another where the negation takes scope only over the main clause (= 25b):

(25) Mary doesn't yell at Bill if she is hungry
a. . . . but if she is sleepy. ($\neg > if$)
b. . . . since hunger keeps her quiet. ($if > \neg$)

The ambiguity may be due to LF-raising of the *if*-clause and scopal interaction with negation. Iatridou argues, however, that the ambiguity is the result of different levels of attachment. Combining VP topicalization and interaction with negation provides the relevant piece of evidence in favor of Iatridou's position:

(26) a. Smile at Bill if she is hungry though she doesn't . . . ($\neg > if$)
b. Smile at Bill though she doesn't if she is hungry . . . ($if > \neg$)

The above are unambiguous: in the former negation has scope over the *if*-clause and in the latter the scopes are reversed. This strongly suggests that a postverbal *if*-clause can adjoin at different sites – above negation and below negation.

3.1.3 *A source for sentence-initial* if*-clauses*

A natural question that arises is whether the clause-initial and clause-final positions for *if*-clauses are related by movement. There is evidence that at least some sentence-initial *if*-clauses have a source lower than their surface position. This evidence comes from the interpretation of sentences like (27):

(27) a. I think that if you leave I will leave.
b. If you leave, I think that I will leave.

In (27b), on the most plausible reading, there is no conditional relationship between the hearer's leaving and the speaker's thinking about leaving, contrary to what we would expect from the surface form. We can account for this by saying that the *if*-clause has been preposed from an underlying position within the scope of *think*, perhaps as in (27a). Of course, this is only evidence, furthermore indirect, of movement of the *if*-clause from one clause-initial position to another. It may still be the case that clause-initial antecedent clauses are never the result of movement from the VP-adjoined position in which the *if*-clause may also surface.

To further complicate the picture, along with evidence that certain sentence-initial *if*-clauses involve fronting from a lower position, there also seems to be evidence that not all sentence-initial *if*-clauses involve movement. The analysis is complicated by the fact that the *if*-clause is an adjunct and so its reconstruction is not obligatory (or alternatively, it can be merged counter-cyclically; cf. Lebeaux 1990). This can be seen by the absence of a Condition C violation in (28b):

(28) a. *She$_i$ yells at Bill if Mary$_i$ is hungry.
b. If Mary$_i$ is hungry, she$_i$ yells at Bill.

Either it is not obligatory (or not possible, assuming late merge) to reconstruct the sentence-initial *if*-clause to a sentence-final position, or base generation in a sentence-initial site is also an option.

Iatridou (1991) discusses a number of cases where she argues that reconstruction of the *if*-clause is obligatory. It should be noted, however, that her tests illustrate that reconstruction is obligatory only for a sentence-initial position. Her facts are silent about whether reconstruction to a sentence-final position is obligatory. The cases where Iatridou argues reconstruction is obligatory are like the ones in (27): the *if*-clause is construed below the matrix verb:

(29) If it rains, Mary believes/said/heard/assumed that Bill will come.

That these cases involve movement of the *if*-clause to a sentence-initial position and not base generation is demonstrated by the fact that the relationship between the *if*-clause and the clause it is associated with is sensitive to islands:

(30) a. *If it rains Mary regretted/forgot/resented/recognized that Bill will come. (factive island)
b. *If it rains Mary didn't say that Bill will come. (negative island)
c. *If it rains Mary heard the rumor that Bill will come. (complex NP island)
d. *If it rains Mary wondered whether Bill will come. (*wh*-island)

In such cases, reconstruction is obligatory, as is shown by the Condition C effect in (31):[15]

(31) *If John$_i$ is sick, he$_i$ thinks that Bill will visit.

To derive the Condition C effect in (31), we only need reconstruction to the sentence-initial position in the embedded clause. Reconstruction to the sentence-final position of the embedded clause is not required. In fact there is evidence that reconstruction to the sentence-final position of the embedded clause is not obligatory. This is shown by the possibility of coreference between *John* and *he* in (32). Obligatory sentence-final reconstruction would induce a Condition C violation. Thus we can conclude that this is a case where the *if*-clause is generated clause-initially (below the matrix), and is then preposed to the sentence-initial position:

(32) If John$_i$ is sick Mary says that he$_i$ should take aspirin.

We have just seen that reconstruction of the *if*-clause to the sentence-final position is not obligatory. Is there evidence that reconstruction to the sentence-final position is ever possible? Given certain assumptions, it seems that there is. It is reasonable to assume that c-command has to obtain at some point in the derivation prior to spell-out, for anaphoric and variable binding.

In (33a) and (34a), the binder surface c-commands the bindee, and a binding relationship is possible. In (33b) and (34b), the binder does not c-command the bindee in overt syntax, but a binding relationship is still possible. We can take the possibility of binding as showing there must be a point in the derivation where the sentence-initial *if*-clause is in the c-command domain of the binder, i.e., in the sentence-final VP-adjoined position:

(33) a. John$_i$ will be happy if pictures of himself$_i$ are on sale.
b. If pictures of himself$_i$ are on sale, John$_i$ will be happy.

(34) a. Every mother$_i$ is upset if her$_i$ child is late from school.
b. If her$_i$ child is late from school, every mother$_i$ is upset.

Complications are introduced in (34b), where it seems that the quantifier *every mother* could scope over the conditional clause and bind a variable in the *if*-clause at LF. Note, however, that binding achieved in such a way would lead to an illegitimate Weak Crossover configuration.[16]

The proposal that reconstruction is necessary to receive a bound reading in (33) and (34) receives support from the fact that reconstruction for binding reasons can yield a Condition C violation:

(35) a. Every mother$_i$ is upset at John if he ignores her$_i$ child.
b. *Every mother$_i$ is upset at him if John ignores her$_i$ child.
c. *If John ignores her$_i$ child, every mother$_i$ is upset at him.

If QR applied to the spell-out of the sentence above, and QR and not reconstruction produced the configuration for variable binding, then we would have no account of why (35c) is ungrammatical. Therefore, it is reasonable to assume that reconstruction is necessary to obtain a bound-variable reading.

3.2 *Clause-internal syntax of the* **if**-*clause*

3.2.1 *The location of* if

It is quite commonly assumed that *if* is a complementizer. There is indeed evidence that *if* is within the CP-domain. But it turns out that it is not easy to find conclusive arguments as to its being in C. Furthermore, in some languages the counterpart to *if* is a *wh*-pronoun, suggesting that it is an element in Spec, CP, at least in these languages.

Let us begin with the arguments that *if* is within the CP-domain. *If* and *when* pattern differently than *until/before/after* with respect to anaphora possibilities:

(36) a. I will work until Joe leaves and Harry will work until then too.
b. *I will leave when/if Joe leaves and Harry will leave when/if then, too.
(vs. I will leave when/if Joe leaves and Harry will leave then, too.)

We see that it is possible to refer back to the complement of *after/before/until* with a pronoun but not to the complement/sister constituent of *if/when*. It is, however, possible to refer to the entire complex, i.e., to the *if/when* together. This situation resembles what we find with questions:

(37) Sean wonders whether Mirwais likes Madonna.
a. Rob wonders *that*, too.
b. *Rob wonders whether *that*, too.

The contrast between *if/when* and *until/before/after* suggests that the former are either in [Spec, CP] or C^0, while the latter are prepositions that take CP/IPs as complements.

To decide on the the location of *if* in the CP-domain, researchers have looked at interrogative complements. Kayne (1991) in particular has argued that the conditional *if* and the interrogative *if* are one and the same. If so, we can conjecture that *if* in conditional clauses and in questions occupies the same position:

(38) a. *Lee knows [if [PRO to leave]].
b. Lee knows [whether [PRO to leave]].

Kayne (1991) argues that *if* is in C^0 while *whether* is in [Spec, CP]. The grammaticality contrast between (38a) and (38b) is argued to follow from the respective location of *if* and *whether*. In particular, (38a) is ungrammatical because *if* illicitly governs PRO.[17]

The explanation for the contrast in (38) is in need of reconsideration, however. Note that in English, *if* can take participial complements ((39), from the *Wall Street Journal* corpus):

(39) a. If elected, he has said that he will seek to renegotiate much of the country's foreign debt.
b. If convicted on all counts, the individuals could be imprisoned for as long as five years and fined $250,000 each.

Presumably *elected* and *convicted* have PRO subjects. It is not clear why government by *if* does not render these illegitimate. Furthermore, given minimalist aspirations to eliminate the notion of government from the theoretical apparatus, and given alternative accounts for the distribution of PRO based on case (cf. Lasnik 1995a, among others), the distinction in grammaticality in (38) may not be used to argue for a different syntactic location of *if* and *whether*.

The proposal that *if* is in C^0 receives some support from the complementary distribution of *if* and conditional inversion ((40), from Iatridou and Embick 1994):

(40) a. If John had eaten the calamari, he would have been better now.
b. Had John eaten the calamari, he would have been better now.

When conditional inversion takes place, an *if* may not be present. Pesetsky (1989) and Iatridou and Embick (1994) propose that conditional inversion involves I-to-C movement. The complementary distribution of *if* and conditional inversion, and the analysis of conditional inversion as movement to C^0, suggest that *if* is in C^0.

On the analysis of *if* as a complementizer, the fact that its presence blocks conditional inversion may thus receive the same explanation as the root-embedded asymmetry with respect to V2 in languages such as German and Dutch. In these languages, when the complementizer is present the finite verb does not raise to C, but in main clauses, and in complements of certain verbs when there is no complementizer present, I-to-C movement obtains.[18] Note, however, that the complementarity between conditional inversion and the presence of a CP-related element is seen in German as well. Yet in German, *wenn* 'if, when' does not appear to have a different location whether it functions as a conditional marker or a relative pronoun.[19] Thus, the complementarity of *if* and conditional inversion is also not a conclusive argument in favor of *if* being a complementizer.

We have to conclude that there is suggestive but not conclusive evidence in favor of analyzing *if* in conditionals as a complementizer. Fortunately, not much hinges on this particular point. Conditional C^0 will have to have certain features, distinguishing it from other types of clauses, and whether *if* lexicalizes these features, or enters into a checking relationship in a Spec–head agreement with them, is of lesser importance. Furthermore, languages likely differ in this respect. Languages where the counterpart of *if* is a *wh*-related pronoun would merge it as a specifier of CP, possibly after extraction from within the clause (on that see further below), while other languages would merge the counterpart of *if* as a C^0.

3.2.2 *The conditional–interrogative link*

As noted above, Kayne (1991) has proposed that conditional and interrogative *if* are the same element. Presumably what is meant is that the featural content of *if* is the same whether it appears in a conditional clause or in an interrogative clause. This is in fact a phenomenon wider than English. For instance, in Bulgarian one of the ways to form a conditional clause is to use the interrogative complementizer *li*:

(41) a. Znae li anglijski, šte go vzemat na rabota.
know-3sg Q English will him take to work
'If he knows English they will hire him.'
b. (Čudja se) znae li anglijski?
wonder-1sg refl know-3sg Q English
'I wonder whether he knows English/Does he know English?'

Similarly, antecedent clauses in Mandarin Chinese *dou*-conditionals have been analyzed by Cheng and Huang (1996) as interrogative clauses, showing that the parallels between conditionals and questions extend beyond the use of identical complementizers.

Furthermore, arguably, I-to-C movement is another formal instantiation of the close structural parallels between conditionals and questions. As Iatridou and Embick (1994) have pointed out, languages that exhibit I-to-C movement in conditionals also have I-to-C movement in questions. The facts of *if-/li-* use in questions and conditionals, and the facts of conditional inversion, can then be unified under the following generalization:

(42) Interrogative adjunct clauses are interpreted as conditionals.

A similar conclusion is reached on independent grounds in Izvorski (2001). It is argued there that free relative clauses used as free adjuncts (see (43)) depend for their interpretation on the following factors (in addition to some others): (i) having the structure and semantics of questions, and (ii) conditional interpretation being available to clausal adjuncts:

(43) Whatever Bill says, Mary will quit her job.

Further elaboration on the link between conditionals and questions comes from Larson's (1985a) suggestion of a covert operator in the Spec, CP of conditional and interrogative *if*-clauses. Larson (1985a) posits that in interrogative *if*-clauses there is a covert *whether* marking the scope of covert *or*. This covert *whether* is what makes *if*-interrogatives into *wh*-islands. It is the case that extraction of complements is degraded out of embedded yes/no questions, while the extraction of adjuncts and subjects is impossible:

(44) a. ?Who did you wonder if/whether Mary saw?
b. *Who did you wonder if/whether saw Mary?
c. *How/when did you wonder if/whether Mary fixed the car?

By Larson's proposal, the difference between interrogative and conditional *if*-clauses extends beyond their attachment site. Larson has a covert *whether* in the [Spec, CP] of an *if*-clause as well. (Conditional clauses, being adjuncts, are of course strong islands.)

We believe something like Larson's proposal to be on the right track. Arguably, conditional *if*-clauses have a structure, and correspondingly aspects of interpretation, similar to those of questions, including the presence of an operator in Spec, CP. Yet ultimately, conditionals and questions diverge in interpretation. Conditionals receive the interpretation of free relatives, that is, of definite expressions. Thus, there is indeed a link between conditionals and questions but this link is indirect, derivative of the link between free relatives and questions. Parallels between *if*- and temporal *when*-clauses have prompted Geis (1985) to argue that conditionals are species of relative clauses. Our proposal is a further step in this direction, arguing for an isomorphism between conditionals and free relatives.

Let us consider the relation between conditionals/free relatives and questions in some detail. *Wh*-questions and free relatives have a common structure (cf. (45a)). Some of the features in C^0 are common as well (presumably the one(s) triggering *wh*-movement), which accounts for common syncretisms across languages between questions and free relatives. Some of the features in C^0 are different, which leads to questions and free relatives being interpreted differently. Questions are interpreted as sets of propositions where the variable abstracted over (as a result of *wh*-movement) has been existentially quantified (e.g., Hamblin 1973; Karttunen 1977) (cf. the simplified (45b)). Free relatives are interpreted as definite descriptions, i.e., with the variable abstracted over being bound by a definite operator (e.g., Jacobson 1995, among others) (cf. (45c)):

(45) what John bought
a. LF: wh_x C^0 John bought x
b. $\lambda p[p = \exists x[\text{John bought x}]]$
c. $\iota x[\text{John bought x}]$

Turning to conditionals, our proposal that they are interpreted as free relatives amounts to the claim that they are definite descriptions of possible worlds. The

structure yielding this interpretation is analogous to the one in (45a) in all the relevant respects:

(46) if John arrives late
  a. LF: Op_w C^0 John arrives late in w
  b. ιw[John arrives late in w]

Conditionals involve abstraction over a possible world variable. The null operator in Spec, CP of *if*-clauses, and likely the *when* itself in, e.g., German conditionals, is a definite binder of the possible world variable.

Schein (2001) argues on independent grounds that *if*-clauses are plural definite descriptions of events. Similarly, that conditionals are interpreted as definite descriptions of possible worlds has recently been independently proposed by Schlenker (2001b). Within a general program of semantic uniformity (cf. Schlenker 1999, 2001b), he analyzes *if* as the counterpart of *the* applied to a description of possible worlds rather than of individuals. Thus *if p* denotes the closest *p*-world(s), whereas *the P* denotes the most salient *P*-individual(s). Schlenker points out that *if*-clauses, like definites, may be topicalized; that they may be coreferential with a world pronoun *then*, the way definites may be coreferential with individual pronouns; and that they may give rise to Condition C effects in certain structural configurations, just as definites can. We will return to Schlenker's proposal below, when we discuss in more detail conditionals with *then* and the parallels with correlatives.

We are now in a position to give an explanation for the conditional–interrogative link, to an extent that has not been previously achieved. The fact that *if* functions in many languages as both a conditional and an interrogative complementizer makes sense within the general proposal that conditionals are free relative clauses. In English, and in many other languages, this syncretism would be part of a more general structural parallelism between questions and free relatives in these languages.

3.2.3 *The absence of low construals*

The parallel between conditional clauses and free relatives suggested above is apparently challenged by certain facts, first noticed by Geis (1970). These facts led him to conclude in fact that conditionals should be given a distinct analysis from relative clauses, a position which he reversed in Geis (1985). Geis (1970, 1985) noted that whereas *when*-clauses are ambiguous as per extraction sites of the relative pronoun, *if*-clauses are not. Conditional statements employing overt headed relatives are ambiguous. We can further observe that conditionals formed with *in case* and conditionals formed with I-to-C movement are also not ambiguous and only allow for high construals:

(47) a. I will leave when you say you'll do.
  high construal: I will leave at time *t* s.t. at time *t*, you say that you'll leave (at time *t'*).

low construal: I will leave at time *t*. You said that you would leave at time *t*.

b. I will leave if you say you will do.
high construal: In situations *s*, you say you'll leave (in situations *s'*). In those situations *s*, I will leave.
*low construal: You say that in situations *s*, you'll leave. In those situations *s*, I will leave.

c. I will leave in any circumstance in which you say you'll leave.
high construal: In situations *s*, you say you'll leave (in situations *s'*). In those situations *s*, I will leave.
low construal: You say that in situations *c*, you'll leave. In those situations *c*, I will leave.

(48) a. I will leave in case you say you'll leave. (high construal only)
b. Had he said he would leave, I would have left. (high construal only)

The ambiguity in (47a, c) arises due to two possible sources for the adjunct phrase that undergoes A'-movement, *when* in (47a), *in which circumstances* in (47c). The lack of low construals in *if*-clauses suggests that *if*-clauses do not involve A'-movement of a covert adjunct.

One response would be to say, as Iatridou (1991) does, that *if*-clauses do not involve A'-movement. If this is the case, *if*-clauses would be perhaps more akin to reduced relatives where only the top-level argument can be abstracted over. Other than this difference, conditional constructions would be like free relative constructions. Still, we think that the explanation lies elsewhere.[20]

In lacking low construals, *if*-clauses resemble *because* and causal *since*-clauses. *Because* and *since* are sentential functions and not quantifiers, that is, they do not bind positions inside their clause. Thus in (49), my leaving has to be due to John's writing and not to Mary's leaving. In other words, it cannot be for the reason *r* such that John wrote that Mary left for reason *r*:

(49) I left because/since John wrote that Mary left.

This point can be made even sharper by abstracting away from the question of matrix vs. embedded extraction and corresponding ambiguities. The complement of *because/since* in (50a) gives the reason for Mary's leaving. This is not the case with (50b), where it is stated that the two events have the same cause:

(50) a. Mary left because/since the bell rang
reason for Mary's leaving = the bell ringing
b. Mary left for the reason for which the bell rang
reason for Mary's leaving = reason for the bell's ringing

Unlike the case of *because* and *since* clauses, however, judgments are not as clear cut with *if*-clauses. Thus Iatridou (1991) suggests that it is not in fact obvious

whether in (51) *if* has a construal like that in (50b), i.e., whether we have 'John will leave in any circumstance in which Peter calls Mary' or 'John will leave under the condition that Peter calls Mary'. The latter involves no variable-binding in the *if*-clause:

(51) John will leave if Peter calls Mary.

The above proposal gets locality by stipulating that *if*-clauses do not involve A'-movement. However, such a proposal seems less attractive for languages like German where the equivalent of *if* is *wenn*, which also appears in *when*-clauses. There seems to be no evidence suggesting that the syntactic behavior of *wenn* is different in conditional and in temporal clauses, i.e., it does undergo A'-movement in both cases. However, the locality effects seen in English conditionals are also found in German. When *wenn* is interpreted as a temporal pronoun it allows low construals; when it is interpreted as a conditional marker, it only allows high construals. So perhaps the explanation is not to be sought in the absence of a null operator, and corresponding absence of A'-movement in conditionals, but in the kind of variable that is being abstracted over.

Thus we believe that while *if*-clauses do not have low construals, they do in fact involve binding. Simplifying grossly, what is said in (51) is that the situations of Peter calling Mary all extend to situations of John leaving. So we do have a situation/world variable which is abstracted over. What is special about conditionals is that we can only abstract over the situation/world variable of the highest predicate. That perhaps situation/world variables only allow local abstraction has been suggested by Heim (p.c., to Iatridou 1991). Hence local A'-movement would proceed unconstrained. But if A'-movements creates a long-distance chain involving a situation/world variable, such a chain would be ruled out on independent grounds, which remain to be explicated.[21]

3.2.4 *Conditional inversion*

Forming conditionals through I-to-C movement is a cross-linguistically attested phenomeonon. On the basis of a survey of several Romance, Germanic, and Slavic languages, and Greek, Iatridou and Embick (1994) make several observations regarding conditional inversion.

First, it appears to be the case that languages which exhibit conditional inversion also have inversion in questions.[22] We are now in a position to account for this generalization. We could assume that V1 antecedents are interrogative clauses, and that they are interpreted as conditional in conformity with the principle in (42), which states that interrogative adjunct clauses are interpreted as conditionals. If V1 antecedents are structurally questions, then it follows that languages which have conditional inversion will have I-to-C movement in questions.

Second, Iatridou and Embick observe that V1 tensed adjunct clauses (i.e., clauses where I-to-C movement has occurred) are always interpreted as conditional and never as, e.g., *because*-clauses. This is an important generalization which we are now in a position to reduce to the principle in (42). This generalization

follows from our assumption above that V1 adjuncts are interrogative clauses and from the principle that interrogative adjuncts are interpreted as conditionals (cf. (42)).

Third, Iatridou and Embick point out that V1 conditional clauses may not be focused. In particular, they show that V1 antecedents may not be the associates of focus adverbs like *only* and *even* and of constituent negation; that they may not be clefted; and that they may not be used as answers to questions. The sentences below illustrate these findings:

(52) a. *Only had I thought that he was sick would I have called him.
b. Only if I had thought that he was sick would I have called him.

(53) a. ??Even had Joe served truffles Kathy would not have been happy.
b. Even if Joe had served truffles Kathy would not have been happy.

(54) a. *It is had John come that Mary would have left.
b. It is if John had come that Mary would have left.

(55) Under what circumstances would Mary have come?
a. #Had she been offered many artichokes.
b. If she had been offered many artichokes.

Iatridou and Embick propose that the truth-value of the proposition expressed by a V1 conditional has to be discourse-old, i.e., there is a requirement not just that the proposition has been under discussion but that also its truth-value is known. This raises some issues with respect to indicative conditionals. If Iatridou and Embick's suggestion is on the right track, the requirement that the truth-value of the proposition expressed by a V1 conditional be known may be the reason why conditional inversion is so restricted in indicative conditionals, given that indicative conditionals do not come with the presupposition or implicature that the truth-value of their antecedent is known. Yet some languages allow conditional inversion in indicative conditionals (e.g., the German examples (12c) and (59c) below). It remains an open question how the discourse-old requirement is to apply to cases like these.[23]

One possibility to explore is that the inability of V1 conditional antecedents to be focused may be derived from their syntactic position. In the discussion of sentence-initial and sentence-final *if*-clauses above we noted that some sentence-initial antecedents are moved from a lower position in the clause, whereas some have to be analyzed as having been base generated as clausal adjuncts. Later we will see evidence for the relation between conditionals and correlative structures. As a preview, correlative adjuncts are base generated outside of the clause and are co-indexed with a proform (in the case of conditionals the proform is *then*). As a result of this structure, correlative clauses may not be focused. If V1 conditional antecedents are in fact base generated in a correlative structure, then it will follow that they should not be able to be focused.

The tests for base generation of the V1 antecedent clause, however, are not conclusive. The absence of Condition C effects with sentence-initial V1 conditionals is in conformity with a proposal that suggests that such antecedents are generated in a clause-adjoined position and not moved there. Yet of course, there is the possibility that V1 antecedents are generated in a lower position but reconstruction is not forced, given that they are adjuncts:

(56) a. Had Mary$_i$ been hungry, she$_i$ would have yelled at Bill.
b. *She$_i$ would have yelled at Bill had Mary$_i$ been hungry.
c. Mary$_i$ would have yelled at Bill had she$_i$ been hungry.

When reconstruction is forced for the purposes of variable-binding, the following paradigm obtains:

(57) a. Had pictures of himself$_i$ been on sale, John$_i$ would have been happy.
b. Had John ignored her$_j$ child, every mother$_j$ would have been upset.

(58) a. *Had John$_i$ ignored her$_j$ child every mother$_j$ would have been upset at him$_i$.
b. *Every mother$_j$ would have been upset at him$_i$ had John$_i$ ignored her$_j$ child.
c. Every mother$_j$ would have been upset at John$_i$ had he$_i$ ignored her$_j$ child.

The examples above show that V1 conditionals are apparently able to reconstruct to a lower position, for the purposes of variable-binding. If V1 clauses were not able to reconstruct, presumably the examples in (57) would have been ungrammatical. Condition C effects obtain, as (58a) shows, indicating that indeed reconstruction is forced for variable-binding. Thus, unfortunately, we cannot reach a conclusion with respect to Iatridou and Embick's generalization regarding the impossibility of focusing a V1 conditional antecedent.

Finally, Iatridou and Embick point out that inversion in counterfactual conditionals is more widely attested than inversion in indicative conditionals; that is, if a language allows inversion in indicatives it will also allow it in counterfactuals, whether the conditional clause is sentence-initial or sentence-final. German is an example of a language where sentence-initial V1 conditional antecedents may be either indicative or counterfactual, but sentence-final ones may only be counterfactual ((59), from Iatridou and Embick 1994):

(59) a. Susanne wäre abgefahren wäre Hans gekommen. German
Susanne would-have left had Hans come
'Susanne would have left if Hans had come.'
b. *Susanne geht kommt Hans
Susanne goes comes Hans
'Susanne goes if Hans comes.'

c. Kommt Hans dann geht Susanne.
comes Hans then goes Susanne
'If Hans comes then Susanne goes.'

In English, as mentioned earlier, counterfactual and future-less-vivid conditionals allow inversion, but indicative conditionals disallow it. The facts are the same in sentence-final conditional clauses:

(60) a. Had he come, we would not have gone.
b. Were he to come, we would not go.
c. Should he come, we would not go.
d. *Does he come, we will not go.
e. *Is he coming, we will not go.

Unlike the two generalizations which we were able to reduce to a single principle, on the assumption that V1 clauses are syntactically questions, this generalization turns out to be harder to explain. It is not clear why counterfactuals (and future-less-vivid conditionals) should more easily allow conditional inversion than indicative conditionals. Perhaps we should rephrase the question and refer to the principle in (42). It may be the case that some languages place restrictions on the kind of interrogative clauses in adjunct position that may be interpreted as conditional. Clearly, more research into this question is necessary.

It is interesting to further note that V1 and non-inverted counterfactual conditionals differ with respect to the implicature of counterfactuality. As often observed (e.g., Stalnaker 1975; Karttunen and Peters 1979; Palmer 1986) counterfactuality in conditionals is implicated, not asserted. The example given to illustrate this is as follows:

(61) If the patient had the measles, he would have exactly the symptoms he has now. We conclude, therefore, that the patient has the measles.

This example shows that although a counterfactual conditional does convey that the proposition expressed by the antecedent is false, this inference is an implicature because it is cancelable. Similarly, one can assert the falsity of the proposition expressed by the antecedent without redundancy:

(62) If the butler had done it, we would have found blood on the kitchen knife. The knife was clean, therefore the butler did not do it.

Interestingly, Iatridou and Embick (1994) point out that in V1 conditionals the counterfactuality inference cannot be canceled. Consider the contrast in the examples below (from Iatridou and Embick 1994):

(63) a. If he had broken his leg in his childhood, which, in fact, he did, he would have exactly this type of scar.

b. #Had he broken his leg in his childhood, which, in fact, he did, he would have exactly this type of scar.

Iatridou and Embick make the conjecture that the discourse-old status of the proposition expressed by a V1 conditional is responsible for the non-cancelability of the counterfactuality inference.

4 The conditional–correlative link

Correlative constructions involve a free relative clause adjoined to the matrix clause and co-indexed with a proform inside it (cf. Srivastav 1991b; Dayal 1996a; among others):

(64) [free relative]$_i$ [. . . proform$_i$ . . .]

In many languages conditionals are correlative structures themselves or are historically derived from correlative constructions. The *if*-clause is the correlative clause, and *then* is a correlative proform. Our proposal that *if*-clauses are free relatives, i.e., definite descriptions of possible worlds, naturally predicts that they should be able to appear in the correlative construction.

Geis (1985), von Fintel (1994), and Izvorski (1997b), among others, have suggested that conditional constructions are related to correlatives. Geis was perhaps the first to note that conditional constructions in English are the remnants of a strategy of correlativization that was once more productive in the language.

Treating some conditionals as correlatives helps us to understand several aspects of the behavior of conditionals cross-linguistically. In languages where correlativization is a productive strategy, it is apparent that conditionals are correlatives (e.g. Marathi) ((65), from Pandharipande 1997):

(65) a. *(dzar)* tyāne abhyās kelā *tar* to pā hoīl.
if he-ag studying do.Pst.3MSg then he pass be.Fut.3S
'If he studies, he will pass (the exam).'

b. *dzo* māṇūs tudzhyā śedzārī rāhto *to* māṇūs
which man your neighborhood-in live-Prs.3MSg that man
lekhak āhe.
writer is
'The man who lives in your neighborhood is a writer.'
(Lit. 'Which man lives in your neighborhood, that man is a writer.')

In addition, treating conditionals as correlatives helps to explain facts concerning the semantic contribution of *then* (section 4.1), the syntax of conditionals with *then* (section 4.2), and constraints on stacked *if*-clauses (section 4.2). There are also some challenges that need to be faced by a theory that treats conditionals as correlatives, and these are discussed in section 4.3.

4.1 Then *as a correlative proform*

One of the arguments for treating conditionals as correlatives is the existence of *then*, which is plausibly analyzed as the correlative proform corresponding to the *if*-clause. Treating *then* as a correlative proform is advantageous because we are able to provide a very general analysis of its syntax and semantics. Its semantic properties turn out to be properties shared by correlative proforms, and its syntactic properties turn out to be shared by correlative constructions more generally. Here we review a few properties of *then* and how they are part of the larger picture of correlative constructions.

4.1.1 *The semantic contribution of* then

Conditional *then* appears to have hardly any interpretive contribution. Its presence in conditionals is not required (except in reduced conditionals; see below), and the difference in meaning between *if p*, *q* and *if p*, *then q* is not obvious. For this reason, in semantic discussions *then* is usually either treated as part of a discontinuous logical connective *if . . . then* or simply ignored. Iatridou (1991, 1994) challenges the view that conditional *then* is semantically vacuous. She proposes that *then* is associated with a particular presupposition; when this presupposition is incompatible with the meaning of the conditional, the appearance of *then* is precluded.

Specifically, Iatridou proposes that a statement of the type *if p*, *then q* has the assertion of a conditional without *then*, and that, in addition, *then* contributes the presupposition that at least some of the $\neg$ *p*-cases are $\neg$ *q*-cases.

To illustrate with an example, the conditional in (66) asserts (66a) and presupposes (66b):

(66) If Stefan is happy, *then* he sings in the shower.
   a. In every case in which Stefan is happy, he sings in the shower.
   b. Not in every case in which Stefan is not happy does he sing in the shower.

The presupposition in (66b) is in effect a statement that there is some case in which Stefan is not happy and he does not sing in the shower. Thus (66) cannot be felicitously uttered if the speaker wants to convey that Stefan always sings in the shower, happy or not.

The interpretive contribution of conditional *then* is discussed in von Fintel (1994) as well. Von Fintel assumes Iatridou's proposal about the meaning of *then* but also differs from her in one respect. For him the use of *then* triggers a (conventional) implicature that alternatives to the antecedent (all $\neg$ *p* cases) do not satisfy the matrix proposition.

The meaning contribution of conditional *then* is of particular interest here, because Izvorski (1996b) shows that correlative proforms behave quite similarly to conditional *then*. In particular, Izvorski proposes that, given a choice between structures like (67a) (a correlative) and (67b) (a free relative in argument or

adjunct position inside the clause, i.e., a non-dislocated free relative), the structure with the proform is associated with a presupposition that alternatives to the free relative do not make the main clause true:[24]

(67) a. $[_{CP}$ [free relative]$_i$ $[_{CP}$ . . . proform$_i$ . . .]]
b. $[_{CP}$ . . . [free relative] . . .]

Thus, we see that there are good reasons to treat conditional *then* as an anaphoric element of the correlative proform type.

Next, we briefly examine several cases where *then* is unacceptable. The examples fall in two categories; namely, *then* is not felicitous (i) when the consequent of the conditional is asserted, and (ii) when the consequent presupposes the antecedent.

The set of examples in (68–70) illustrates the case of the asserted consequent. If the antecedent explicitly exhausts all possibilities (as in (68a)), is the associate of *even* (as in (68b)),[25] or is scalarly exhaustive (as in (68c) and (68d)), *then* is precluded (examples from Iatridou):

(68) a. If John is dead or alive, (#*then*) Bill will find him.
b. Even if John is drunk, (#*then*) Bill will vote for him.
c. If I were the richest linguist on earth, (#*then*) I (still) wouldn't be able to afford this house.
d. If he were to wear an Armani suit, (#*then*) she (still) wouldn't like him.

Consider (68a). Because the predicate *dead or alive* does not allow for alternatives (i.e., John is necessarily dead or alive), the conditional asserts that Bill will find John. Predictably, *then* is not acceptable. Similarly, in (68b), the conditional without *then* asserts that Bill will vote for John under any circumstances. As in the previous case, the antecedent is exhaustive: the use of *even* is associated with universal quantification over a scale; the associate of *even* marks an end-point on the scale and the proposition is taken to hold for all other alternatives to the associate on the scale (cf. Horn 1969; Fauconnier 1975; Karttunen and Peters 1979; Rooth 1985). The appearance of *then* brings about the presupposition that in some state of affairs Bill will not vote for John, which clearly clashes with the assertions of the sentence. Therefore, *then* is unacceptable in *even if* conditionals. Yet another way to have an exhaustive antecedent is to use a superlative or pragmatically determined end-point of a scale (cf. Fauconnier 1975). These cases are completely analogous to *even if* conditionals, and *then* behaves in a similar fashion, as (68c) and (68d) show.

Related to the above cases is the observation in von Fintel (1994) that *unless* conditionals also prohibit the use of *then*. This fact is illustrated in (69) (from von Fintel 1994: 96):

(69) Unless it rains tomorrow, (#*then*) I won't leave.

The behavior of *unless* conditionals with respect to *then* is predicted by Iatridou's proposal in combination with von Fintel's analysis of the semantics of *unless* clauses. Von Fintel proposes that *unless* is an exceptive operator on the restrictive clause of conditionals. Assuming the Lewis–Kratzer (cf. Lewis 1975; Kratzer 1986) approach to conditionals, *unless p*, *q* receives a semantic representation *Op [except p] [q]*, i.e., (69) is interpreted roughly as *All cases, except the ones in which it rains tomorrow, are cases in which I won't leave.* Under the approach pursued by von Fintel, *unless p*, *q* is paraphrasable as *except if p, q*, and it asserts that for all the alternatives to *p*, *q* holds. Since the presupposition associated with *then* requires at least some of the $\neg p$ cases to be $\neg q$ cases, clearly *then* is expected to be disallowed in an *unless* conditional.

Finally, relevance conditionals also prohibit *then*. Their antecedent does not form the restrictive clause of an operator (in a Lewis–Kratzer-style approach) but rather presents the conditions under which the information provided by the consequent would be relevant. Since the consequent in relevance conditionals is always asserted, the unacceptability of *then* is to be expected:

(70) If you are thirsty, (#*then*) there's beer in the fridge.

In (70) *then* would bring about the meaning that at least in some situations in which the hearer is not thirsty, there will not be beer in the fridge, which contradicts the assertion of the sentence.

The second set of cases in which *then* cannot appear in conditionals is when the antecedent is a presupposition of the consequent. Consider (71a) and (71b) (from Iatridou):

(71) a. If [there are clouds in the sky]$_i$ (#*then*) it$_i$ puts her in a good mood.
b. If Mary bakes [a cake]$_i$, (#*then*) she gives some slices of it$_i$ to John.

In (71a), in order for the consequent to be evaluated, *it* has to have a referent and therefore the antecedent should be true, i.e., the cases considered should be the cases in which there are clouds in the sky. However, the presupposition contributed by *then* is exactly that in some alternatives to the antecedent, i.e., situations where there are no clouds in the sky, the consequent is false. But to evaluate situations where there are no clouds in the sky would mean that *it* would no longer have its original referent. Thus, predictably, *then* is not permitted in (71a). In (71b) the consequent also has to presuppose the truth of the antecedent for the licensing of anaphora. Since in (71b) *it* refers to the cake baked by Mary, it requires the truth of the antecedent for establishing its reference. The use of *then*, on the other hand, requires evaluating at least some cases where the antecedent doesn't hold, thus preventing felicitous anaphora.

In discussing the environments that prohibit the use of conditional *then*, Iatridou (1994) identifies a problematic case: *only if* conditionals are compatible with the presupposition of *then*, yet they disallow it:

(72) #Only if it is sunny (#*then*) will I visit you.[26]

Only if conditionals are expected to permit *then* because their assertion in fact strengthens the presupposition introduced by *then*. Whereas the appearance of *then* requires that some of the $\neg p$ cases be $\neg q$ cases, the *only if* conditional asserts that none of the alternatives to p satisfies q; that is, that all $\neg p$ cases are $\neg q$ cases. The clash between *only* and *then*, then, is a puzzle. And, of course, *only* is not inherently incompatible with conditional *then*. When *only* takes *then* as its associate, rather than the antecedent clause, the sentences are grammatical:

(73) If he comes only then will she leave.

The solution to this problem cannot be quite as straightforward as the suggestion that *only* is a quantificational element and cannot be left-dislocated, together with its antecedent, on analogy with *everyone/someone* in the case of left dislocation in (74):

(74) *Everyone$_i$/someone$_i$, Mary likes him$_i$.

The reasons for this are several. First, treating *only* as a dyadic quantifier taking the antecedent and the consequent clause of conditionals as its arguments is problematic. Instead, as shown by von Fintel (1997), *only* is better analyzed as an operator on propositions. If so, constraints against left dislocation of *only* and the *if*-clause are harder to formulate, as the two do not form a constituent.

A second problem, as Iatridou points out, is that the discussion about *then* is situated within a semantic theory of conditionals that takes any conditional to be a quantificational construct, with the *if*-clause restricting an overt or covert operator. But then, *then* is expected to be always precluded, as in its presence the *if*-clause must be left-dislocated. We cannot simultaneously hold that the #*only if . . . then* problem is due to the fact that left-dislocated clauses do not make good restrictors of quantificational operators, and still analyze *if p then q* conditionals as quantificational constructions.

A solution to the #*only if . . . then* problem has been suggested in Izvorski (1997b). She proposes that the relevant factor in the behavior of proforms in the presence of *only* is a clash in the requirements of focus: the associate of *only* needs to be focused, yet the antecedent in the correlative construction cannot be focused.

4.1.2 *The distribution of* then

The proform *then* may be present without an overt *if*-clause:

(75) A: John might come.
B: Well, then I will leave.

However, with an overt *if*-clause, *then* may appear only if the *if*-clause is sentence-initial:

(76) a. If John leaves, I will come home.
b. If John leaves, then I will come home.

(77) a. I will come home if John leaves.
b. *Then I will come home, if John leaves.

More generally, an overt *if*-clause needs to be structurally adjacent to the *then*-clause with which it is associated ((78), from Izvorski 1997b; also see Collins 1998):

(78) a. If it rains, *then* I think that we should stay at home.
b. *If it rains, I think that *then* we should stay at home.

Correlative proforms can, in general, stand by themselves. Cross-linguistically they tend to be drawn from the class of demonstrative pronouns and in the absence of a correlative clause to restrict what they pick out, they just behave like ordinary demonstratives. This is why *then* can appear by itself (cf. 75). The relationship between a correlative proform and the correlative clause involves binding and thus requires c-command. (77b) is ungrammatical because the correlative clause (= the *if*-clause) does not c-command the correlative proform. In addition to the c-command requirement, there is also a locality requirement that holds between the correlative clause and correlative proform. There are different ways of stating this requirement, but the intuition is that the surface location of the *then* marks a predicate that combines with the *if*-clause. Thus the *if*-clause and the *then* must be structurally adjacent. (78b) is ungrammatical due to the failure of structural adjacency.

The assimilation of conditionals with correlatives also helps us to explain the distribution of *then* in stacked *if*-clauses. As discussed earlier, the presence of *then* in a conditional is not obligatory. However, if more than one *if*-clause is present, then only the most deeply embedded *then* may be omitted. All others must be present ((79), based on an example in Kratzer 1986):

(79) If you are back before eight, *(then) if the roast is ready, *(then) if we are both hungry, (then) we will have dinner together.

These facts are reminiscent of facts concerning stacked relative clauses discussed by Jacobson (1983), who noted that when more than one relative clause modifies a DP, all but the innermost relative clause must have overt material in its COMP domain, i.e., there must be an overt relative operator or an overt relative complementizer:

(80) every man (who/that) I like *(who/that) I invited

However, it is not plausible to analyze *then* as a relative pronoun. For one thing, it is the *if*-clause that we have analyzed as a free relative. It is well known that correlatives, unlike headed relative clauses, do not allow stacking. This falls out naturally from the semantics of correlatives which involve variable-binding. Once a correlative clause binds a correlative proform, that correlative proform cannot be bound by another correlative clause. In contrast, headed relative clauses combine with the head they modify by set-intersection, which imposes no such limitation. It is plausible that the requirement for overt *then* has a similar source. The lowest *if*-clause can combine directly with the main clause, and hence it does not require a *then*. The higher *if*-clause cannot combine directly with the main clause, because there is only one position for an *if*-clause and it is already occupied by the lowest *if*-clause. Any further modification requires an overt *then* which is bound by the next highest *if*-clause. A *then* can only be bound by its immediately superior *if*-clause. Therefore all but the lowest *if*-clauses need to appear with an overt *then*. According to this analysis there are never any truly stacked *if*-clauses.

4.2 *Structure for conditionals with* then

Collins (1998) and Iatridou (1991) have noted that there is a contrast between extraction from the main clause of a conditional with *then* and from a conditional without *then*. Extraction out of consequents of conditionals is degraded, but extraction out of the consequents of conditionals which have *then* is perceived to be worse:

(81) **Clefting (from Collins 1998):**
   a. ?It is the TA that if the student does poorly, the teacher will fire.
   b. ?*It is the TA that if the student does poorly, then the teacher will fire.

(82) **Question formation (from Collins 1998):**
   a. ?Which TA did John say that if the student does poorly, the teacher would fire?
   b. ?*Which TA did John say that if the student does poorly, then the teacher would fire?

It is possible to cleft *if*-clauses. However, clefting of the *if*-clause is blocked in the presence of *then* ((83–84), from Collins 1998):

(83) a. It is if Bill comes home that Mary will leave.
   b. *It is if Bill comes home that *then* Mary will leave.

(84) a. It is if Bill comes home that John said (that) Mary would leave.
   b. *It is if Bill comes home that John said (that) *then* Mary would leave.

Finally, the presence of *then* blocks adjunct extractions ((85–86), from Collins 1998):

(85) a. How did John say that Bill would fix the car if Mary brought the tools?
b. (?)How did John say that if Mary brought the tools, Bill would fix the car?
c. *How did John say that if Mary brought the tools, then Bill would fix the car?

(86) a. Why did John say that Bill would be upset, if Mary left?
b. (?)Why did John say that if Mary left, Bill would be upset?
c. * Why did John say that if Mary left, then Bill would be upset?

Iatridou (1991) and Collins (1998) propose structures which reflect the fact that extraction from conditionals with *then* is degraded. We have already seen that sentence-initial *if*-clauses without *then* can be handled as involving IP/CP adjunction and that sentence-final *if*-clauses involve VP-adjunction. The basic intuition that Iatridou's and Collins's structures capture is that conditionals with *then* involve additional structure which provides an extra barrier to movement. Due to this extra barrier, extraction is degraded.

Collins entertains the following structures for conditional with *then*. The extra FP layer is responsible for making extraction of the consequent clause degraded:

(87) a. $[_{FP}$ *if*-clause $[_{F'}$ $[_{F}$ then] $[_{IP} \ldots]]]$
b. $[_{FP}$ *if*-clause $[_{FP}$ then $[_{F'}$ F^0 $[_{IP} \ldots]]]]$

While Collins does not actually choose (87a) over (87b), he suggests that the structure in (87b) is unable to account for the fact seen in (83) and (84), namely that *if*-clauses can only be clefted in the absence of a *then*. This is putatively so because both (87b) and the structure assumed for *then*-less sentence-initial conditionals involve adjunction. Collins notes that in both these structures the *if*-clause crosses no barriers, and thus clefting should be good irrespective of the presence of *then*. The contrast between the location of the *if*-clause in a sentence-initial conditional without *then* (IP-adjunction) and in (87a) (= [Spec, FP]) is exploited by Collins within a Barriers-style extraction theory to derive the difference in grammaticality between (83a) and (83b), and (84a) and (84b), respectively.

The fact in (83) and (84) can be offered an alternative explanation, however. As Collins notes, the structure in (87b) resembles (88), which is a structure that has been proposed for topicalization:

(88) $[_{CP}$ NP $[_{CP}$ Op_i $[_{C'} \ldots]]]$

If-clauses have been claimed to be *topics* (cf. Haiman 1978, 1993), and so the structure in (87b) is preferable, since it captures the affinity between conditional constructions and topicalizations. The structure in (87b) also makes the parallel with correlatives clearest. Let us consider a variant of this structure:

(89) [*if*-clause]$_i$ [then$_i$ $[_{IP} \ldots t_i]]$

This variant of (87b) eliminates the functional projection FP. The main reason for postulating FP was to provide a barrier that would degrade the extraction of arguments and block the extraction of adjuncts. This blocking effect is created in (89) by the movement of *then*. We assume that *then* needs to move to create a predicate (cf. Heim and Kratzer 1998).[27]

That we need to move *then* is shown by contrasts like the following (= (78); from Izvorski 1997b; also see Collins 1998):

(90) a. If it rains, $then_i$ I think that [we should stay at home t_i].
b. * If it rains, I think that *then* we should stay at home.

For further arguments that the correlative proform undergoes obligatory movement in a number of languages, see Izvorski (1996b). This A'-movement of *then* makes further movements out of the main clause Subjacency violations.

The ungrammaticality of *then* with clefted *if*-clauses can be related to the marginality of variable-binding in *it*-clefts:

(91) a. No Italian man_i loves his_i mother.
b. ???/*It is no Italian man_i who loves his_i mother.

Under the proposed structure, there needs to be a relationship of variable-binding between the conditional clause and *then*. The clefted structures with *then* are bad because the structure of the *it*-cleft does not provide an appropriate configuration for a variable-binding relationship to hold between the *if*-clause and the *then*.

What happens when there is no *then*? In these cases, the *if*-clause, being an adjunct, can be merged at the IP-level (sentence-initial) or VP-level (sentence-final). As discussed earlier, there seems to be some evidence that an IP-level *if*-clause has two sources: it may have been merged there or it may have moved there from a VP-adjoined position. In the absence of *then*, the *if*-clause behaves like an ordinary free relative.

We could have assumed that in the absence of an overt *then*, there is always a covert *then*. However, this option can be ruled out. If a covert *then* was obligatorily present, it would move like the overt *then* and therefore block adjunct extractions. We would not find any extractability contrasts that depended upon the presence of *then*.

4.2.1 If-*clauses as definites*

As mentioned earlier, two recent semantic treatments of conditional clauses analyze them as plural definite descriptions (cf. Schein 2001; Schlenker 2001b). This is exactly the interpretation that conditionals would receive if they are free relatives involving abstraction over possible worlds. Free relatives involving abstraction over individuals are interpreted as plural definite descriptions of individuals (cf. Jacobson 1995; Dayal 1996a). The semantic arguments put forth by Schein and Schlenker are outside the scope of this chapter, but we will present some of the syntactic facts that Schlenker uses in support of his proposal.

Schlenker notes that if *if*-clauses are definite world descriptions which furthermore can be doubled by a world pronoun (*then*), we would expect them to share the binding properties of referential elements. In particular, it can be shown that *if*-clauses are subject to Condition C of the Binding Theory ((92), from Schlenker 2001b):

(92) a. [If it were sunny right now]$_i$ I would see people who would then$_i$ be getting sunburned.[28]
b. *I would then$_i$ see people who would be getting sunburned [if it were sunny right now]$_i$.
c. Because I would then$_i$ hear lots of people playing on the beach, I would be unhappy [if it were sunny right now]$_i$.

The examples make reference to the time of utterance, as a result of which *then* has to be interpreted modally and not temporally. Crucially, backward anaphora between the pronoun and the *if*-clause is possible, as (92c) shows, yet when the pronoun c-commands the *if*-clause, coreference is precluded. As Schlenker notes, the natural conclusion is that *if*-clauses, like other R-expressions, are subject to Condition C of the Binding Theory.

4.3 *Some apparent problems for the conditional–correlative link*

We have sketched some of the arguments, both conceptual and empirical, for treating conditionals with *then* in English as a kind of correlative construction. We believe that, on the whole, the evidence supports the analysis of conditionals as correlative constructions and *if*-clauses as free relatives. However, there are still some hurdles that this assimilatory analysis has to get over.

One may be the absence of low construals in the case of *if*-clauses, discussed earlier. Free relatives normally allow the variable abstracted over to be long-distance bound by the *wh*-operator. We suggested that possibly the nature of world variables is such that they need to be locally bound. Still, the issue needs further research.

Another problem arises in the apparent availability of reconstruction in the presence of *then*. Let us go over the analysis of conditionals with and without *then*:

(93) a. **Sentence-final *if*-clause:**
Bill will [$_{VP}$ [$_{VP}$ leave] [$_{CP}$ if Mary comes]].
b. **Sentence-initial *if*-clause, no *then*:**
Structure 1: merger in VP-adjoined position followed by fronting:
[$_{IP}$ [$_{CP}$ If Mary comes]$_i$ [Bill will [$_{VP}$ [$_{VP}$ leave] t$_i$]]]
Structure 2: merger in IP-adjoined position:
[$_{IP}$ [$_{CP}$ If Mary comes] [$_{IP}$ Bill will leave]]
c. **Sentence-initial *if*-clause, then**:
[$_{IP}$ [$_{CP}$ If Mary comes]$_i$ [$_{IP}$ then$_i$ [Bill will [$_{VP}$ [$_{VP}$ leave] t$_i$]]]

Note that according to the structures in (93), a sentence-initial *if*-clause can originate lower than its surface position only when there is no *then*. When a *then* is present, it is the *then* that moves, and not the *if*-clause.

However, an argument for reconstruction comes from cases like (94) and (95), where the *if*-clause appears separated from the structure it modifies:

(94) *If John$_i$ is sick, he$_i$ thought that Bill would visit.

(95) *If John$_i$ is sick, then he$_i$ thought that Bill would visit.

Under the proposed analysis, at LF the *if*-clause would appear in the c-command domain of *he*. This explains why coreference between *he* and *John* is ruled out in (94). However, as far as we can tell, the coreference judgments stay the same even if a *then* is present.

By the structures in (93), only the *then* has raised in (95). The *if*-clause is merged high. Hence the Condition C effects seen in (95) are unexpected.[29]

5 Factual and relevance conditionals

The conditionals we have discussed so far are also known as hypothetical conditionals. They are the prototypical example of the conditional construction, but in fact there are also two other types of conditionals.[30] Relevance conditionals, also called 'conditional speech acts', are illustrated below:

(96) a. If I may be honest, you are not looking good
b. If you want to know, 4 isn't a prime number.
c. If you are thirsty, there is beer in the fridge.

The *if*-clause in relevance conditionals specifies the circumstances in which the consequent is discourse-relevant, not the circumstances in which it is true.

Factual conditionals, on the other hand, carry the presupposition that someone (other than the speaker) believes the proposition expressed by the *if*-clause to be true:[31]

(97) A. This book that I am reading is really stupid.
B. I haven't read it but if it is so stupid you shouldn't bother with it.

(98) A. My friend Joe, whom you haven't met, is very smart.
B. Oh yeah? If he's so smart why isn't he rich?

Languages may employ distinct complementizers/operators to introduce factual conditionals. For instance, in Bulgarian, *štom* 'when, given that' may be used in factual conditionals but not in hypothetical or relevance conditionals, which employ *ako* 'if'.

Relevance and factual conditionals exhibit syntactic behavior distinct from that of hypothetical conditionals. Here we will examine a number of syntactic differences.

5.1 Relevance conditionals

Relevance conditionals cannot contain the world proform *then*:

(99) a. #If I may be honest, then you are not looking good
b. #If you want to know, then 4 isn't a prime number.
c. #If you are thirsty, then there is beer in the fridge.

If a *then* is nevertheless used, then the interpretation changes to one of a hypothetical conditional. This follows from the analysis of the semantic contribution of *then* proposed by Iatridou (1994), and discussed above.

In Dutch (and other V2 languages) the *if*-clause of a hypothetical conditional behaves like the first element for V2, but the antecedent of a relevance conditional does not:

(100) a. Als Jan weggaat ga ik ook weg.
if John away goes go I also away
'If John goes away I will go away too.'
b. *Als Jan weggaat ga ik ook weg.
c. Als je het wil weten 4 is geen priem getal.
if you it want know 4 is no prime number
'If you want to know 4 is not a prime number.'
d. *Als je het wil weten is is geen priem getal.

Again, if a V2 order is forced on a relevance conditional, then it is coerced into a hypothetical:

(101) Als je honger hebt is er een boterham op de tafel.
if you hunger have is there a sandwich on the table
'If you are hungry there is a sandwich on the table.'

The relevance conditional can only be embedded under speech-act verbs:

(102) a. John said that if you are thirsty there is beer in the fridge.
b. *John believes that if you are thirsty there is beer in the fridge.

There is evidence that even when it is sentence-final, the *if*-clause of a relevance conditional is attached high, to IP/CP. Relevance conditionals cannot be fronted by VP fronting (or left stranded):

(103) a. *Look sick if I may say so though John does . . .
b. ??Look sick though John does if I may say so . . .

5.2 Factual conditionals

The proposition expressed by the *if*-clause in a factual conditional is presupposed, as evidenced by the fact that the *if*-clause cannot associate with focus:

(104) *She only should leave [if she is so unhappy].

(105) a. It is if I drink too much wine that I get dizzy.
(Haegeman and Wekker 1984)
b. *It is if you like her so much that you should invite her.

Like hypothetical but unlike relevance conditionals, factual conditionals accept the proform *then*:

(106) a. If it is stupid then you shouldn't bother with it.
b. If he's so smart then why isn't he rich?

Like the *if*-clause in a hypothetical conditional, but unlike the antecedent in relevance conditionals, the *if*-clause in factual conditionals behaves as the first element for V2:

(107) a. Als je zo ongelukkig bent moet je weggaan. Dutch
if you so unhappy are must you leave
'If you are so unhappy you must leave.'
b. *Als je zo ongelukkig je moet weggaan.

Factual *if*-clauses cannot be preposed together with the VP in case of VP fronting; however, they can be stranded:

(108) a. *Leave this place if he is so unhappy though he should . . .
b. *Leave this place though he should if he is so unhappy . . .

The above facts suggest that the sentence-final *if*-clause in a factual conditional is adjoined higher than the VP. Yet Condition C effects also obtain, suggesting that the *if*-clause is not as high as the matrix IP/CP:

(109) *He$_i$ should leave if Bill$_i$ is so unhappy.

Generally, factual *if*-clauses share properties with appositives. As with appositives, no binding into factual *if*-clauses is possible:

(110) a. Every boy$_i$ saw the teacher who flunked him$_i$ walk away.
b. *Every boy$_i$ saw John, who flunked him$_i$, walk away.

(111) a. Every boy$_i$ yells at Bill if he$_i$ is hungry.
b. *Every boy$_i$ should leave if he$_i$ is so unhappy.

Parasitic gaps are possible in hypothetical conditionals but not in factual conditionals. This contrast cannot be attributed to a difference in attachment sites, because the anti-c-command requirement between the parasitic gap and the licensing variable is satisfied, no matter what the attachment of the *if*-clause is. Rather, this characteristic of factual antecedents is attributable to their similarity to appositives, i.e., they do not permit any dependence that is not satisfied in the clause itself:

(112) a. Who should she invite if she sees again?
b. *Who should she invite if she likes so much?
c. Bill, who she should invite if she sees again . . .
d. *Bill, who she should invite if she likes so much . . .

5.3 *Stacking* if*-clauses of different types*

The discussion above shows that *if*-clauses of different types attach at different levels. If they appear together, predictably ordering restrictions apply. Sentence-final *if*-clauses appear in the order hypothetical, factual, relevance:

(113) a. You should leave [$_{FC}$ if you are so unhappy] [$_{RC}$ if I may say so].
b. *You should leave [$_{RC}$ if I may say so] [$_{FC}$ if you are so unhappy].

(114) a. You should invite her to tea [$_{HC}$ if you see her again] [$_{FC}$ if you like her so much].
b. *You should invite her to tea [$_{FC}$ if you like her so much] [$_{HC}$ if you see her again].

(115) a. Peter takes his dog out [$_{HC}$ if it rains] [$_{RC}$ if you want to know].
b. *Peter takes his dog out [$_{RC}$ if you want to know] [$_{HC}$ if it rains].

(116) You should invite her to tea [$_{HC}$ if you see her again] [$_{FC}$ if you like her so much] [$_{RC}$ if I may say so].

6 Other conditional structures

6.1 *Adnominal conditionals*

The conditionals discussed so far have involved antecedents adjoined to clausal constituents (IP, VP). We have suggested that these should be analyzed on a par with free relative clauses, which sometimes appear clause-internally and sometimes in correlative structures. Lasersohn (1996) introduces a class of conditionals which he calls *adnominal* conditionals, where, he argues, the antecedent clause is adjoined to an NP:

(117) But we all know the consequences if we fail.

The structure that Lasersohn suggests has the *if*-clause internal to a DP:

(118) [Det [NP *if*-clause]]

This structure resembles closely the structure for headed relative clauses. Adnominal conditionals can thus be seen as the headed relative counterpart of VP/IP adjoined conditionals, which have been analyzed here as free relative clauses.

Since adnominal conditionals appear DP-internally, they can occur in positions where other DPs can, but where conditional clauses cannot. We have seen earlier that *if*-clauses cannot appear clause-medially unless they are set off by parenthetical intonation:

(119) a. John, if you bother him long enough, will give you five dollars.
b. * John if you bother him long enough will give you five dollars.

In contrast, adnominal conditionals can appear in clause-medial positions without requiring parenthetical intonation:

(120) a. The fine if you park in a handicapped spot is higher than the fine if your meter expires.
b. The outcome if John gets his way is sure to be unpleasant for the rest of us.

Evidence for the DP-internal location of the adnominal conditional is also provided by evidence from coordination, as well as the fact that a DP containing an adnominal conditional can be further modified by a relative clause:

(121) a. [[The location if it rains] and [the location if it doesn't rain]] are within five miles of each other.
b. The [[consequences if we fail] [that he mentioned]] are not nearly as bad as the [[consequences if we fail] [that he didn't mention]].

In certain cases, it seems plausible to treat the nominal expression modified by the adnominal conditional as a concealed question. If we do this the exceptionality of adnominal conditionals (modifying NPs instead of VP/IPs) seems to disappear:

(122) a. We all know the consequences if we fail.
b. We all know [what the consequences will be if we fail].

However, Lasersohn points out that such an approach is not generally tenable, because not all nominals modified by adnominal conditionals appear as complements of verbs that take interrogative complements.

Lasersohn considers another approach where the nominal modified by the adnominal conditional could be treated as a concealed free relative:

(123) a. the consequences if we fail
b. what(ever) the consequences would be if we fail

This approach seems initially plausible but requires much further justification. For one, the free relative *whatever the consequences would be* replaces *the consequences*. This means that the structure of the adnominal construction must be [[Det N] *if*-clause], and not [Det [N *if*-clause]]. Now consider (121b), which involves restrictive modification by a relative clause. To restrictively modify the free relative, the relative clause must be associated with *the consequences*. However, what it needs to really modify is *consequences [if we fail]*, and there does not seem to be any constituent in the free relative with equivalent semantics.

Instead Lasersohn provides a semantics to interpret [N *if*-clause] structures directly. According to his semantics, [N *if*-clause] picks out objects in the denotation of N in the words where the *if*-clause holds. The objects in the denotation of N have to exist in the world where the *if*-clause holds but need not exist in the actual world. Therefore an adnominal conditional gives us a way of making reference to non-existent objects.

6.2 Reduced conditionals

Typically, the consequents of conditionals constitute well-formed sentences by themselves:

(124) a. If it is sunny, then I will go to the park.
b. Then I will go to the park.

Schwarz (1998) discusses a class of conditionals from German where the consequent does not constitute a well-formed sentence by itself:

(125) **Reduced conditional:**
a. Wenn einer den Peter besucht, dann der Hans.
if someone-Nom the-Acc Peter visits then the-Nom Hans
'If someone visits Peter then it's Hans.'
b. Wenn der Hans wen besucht, dann den Peter.
if the-Nom Hans someone-Acc visits then the-Acc Peter
'If Hans visits someone then it's Peter.'

(126) a. *Dann der Hans
then the-Nom Hans
b. *Dann den Peter
then the-Acc Peter

Reduced conditionals can be related to the corresponding unreduced conditional by supplying material from the antecedent. Thus (125a, b) can be taken to involve the following reductions respectively:

(127) a. Wenn einer **den Peter besucht**, dann $_{\text{besucht}}$ der
if someone-Nom the-Acc Peter visits then the-Nom
Hans $_{\text{den Peter}}$.
Hans
'If someone visits Peter then it's Hans.'

b. Wenn **der Hans** wen **besucht**, dann $_{\text{besucht der Hans}}$
if the-Nom Hans someone-Acc visits then
den Peter.
the-Acc Peter
'If Hans visits someone then it's Peter.'

However, reduced conditionals seem to have several properties, both syntactic and semantic, that suggest that they are not merely reduced versions of their unreduced counterparts.[32] Structurally reduced conditionals differ from full conditionals in that *dann* 'then' is obligatory in reduced conditionals but optional in full conditionals. Interpretively, too, reduced conditionals differ from full conditionals on several properties identified by Schwarz (1998). The first difference is that the antecedent of a reduced conditional must contain an indefinite:

(128) **Indefiniteness requirement:**

a. *Wenn ich den Karl besuche, dann immer den Peter.
if I the-Acc Karl visit then always the-Acc Peter

b. Wenn ich den Karl besuche, dann besuche ich immer den
if I the-Acc Karl visit then visit I always the-Acc
Peter.
Peter
'If I visit Karl then I always visit Peter.'

c. Wenn ich wen besuche, dann immer den Peter.
if I someone-Acc visit then always the-Acc Peter
'If I visit someone then it's always Peter.'

The second distinction is shown in (129), which shows that reduced conditionals introduce presuppositional requirements that unreduced conditionals do not:

(129) **Presupposition effect:**

a. !!Wenn ich was zum Lesen mitnehme, dann immer
if I something to read along-take then always
meine Brille.
my glasses
'If I take something to read then it's always my glasses.'

b. Wenn ich was zum Lesen mitnehme, dann nehme ich immer
if I something to read along-take then take I always
meine Brille mit.
my glasses along
'If I take something to read then I always take my glasses.'

(129a) comes with a presupposition to the effect that glasses are something to read, and so it is perceived to be deviant. There is no such presupposition associated with (129b).

Schwarz refers to the third distinction as the *exhaustiveness* effect. This effect is exemplified by (130):

(130) **Exhaustiveness effect:**

a. Wenn ich wen besuche, dann immer den Peter.
if I someone-Acc visit then always the-Acc Peter
'If I visit someone then it's always Peter.'
(I cannot visit anybody other than Peter.)

b. Wenn ich wen besuche, dann besuche ich immer den Peter.
if I someone-Acc visit then visit I always the-Acc Peter
'If I visit someone then I always visit Peter.'
(I may visit people other than Peter.)

(130a, b) are both grammatical. However, as indicated, they differ in their truth-conditions.

According to Schwarz, these differences between reduced and unreduced conditionals follow if we assume that both the antecedent and the consequent clause in a reduced conditional make reference to the same event. In contrast, the antecedent and the consequent of an unreduced conditional can make reference to distinct events.

The indefiniteness requirement illustrated by the ungrammaticality of (128a) comes about as follows. Since (128a) is a reduced conditional, both the antecedent and the consequent make reference to the same event. For the truth of (128a), it is necessary that events of my visiting Karl are events of my visiting Peter. Now by the minimality of events, an event of my visiting Karl cannot simultaneously be an event of my visiting Peter. Thus (128a) is false if there is an event of my visiting Karl. From De Swart (1993), we know that multi-case conditional are felicitous only when there are at least two distinct events for the proposition expressed by the antecedent. The sentence is thus false whenever it is felicitous. In other words, it presupposes that it is false. Schwarz suggests that sentences that presuppose their falsehood are ungrammatical. This is why (128a) is ungrammatical.

The presupposition effect and the exhaustiveness effect also follow from the assumption that reduced conditionals involve the same event, and that events are minimal. For the truth of (129a), the minimal event of my taking something to read must involve my glasses. For this event to be truly minimal, my glasses

must be something to read. If not, we could always remove them and have a more minimal event. This is why (129a) presupposes that my glasses are something to read. The unreduced conditional in (129b) does not introduce such a presupposition because here the antecedent and the consequent make reference to distinct events. The event corresponding to the antecedent and the event corresponding to the consequent are both minimal, but since they are distinct events, minimality of events can be satisfied without presupposing that glasses are things to read.

The exhaustiveness effect follows similarly. For the truth of (130a), a minimal event of my visiting someone must be a minimal event of my visiting Karl. However, as noted earlier, a minimal event of my visiting Karl cannot also be a minimal event of my visiting Peter. Again, the possibility of having distinct events in the antecedent and the consequent of a unreduced conditional is responsible for the absence of an exhaustiveness effect. Since the antecedent and the consequent pick out distinct events, a minimal event of my visiting someone does not have to be identified with minimal events of my visiting Karl. The possibility is left open that there are minimal events of my visiting Peter.

6.3 *Chinese bare conditionals*

Bare conditionals in Chinese involve no obligatory overt marking in either the antecedent or the consequent clause. Optionally, *jiu* 'then' may be present in the consequent clause. It is, however, not clear whether the presence of *jiu* 'then' is not in fact indicative of another conditional structure in Mandarin Chinese – a conditional introduced by the complementizer *ruguo* (what Cheng and Huang 1996 call *ruguo*-conditional), given that *ruguo* 'if' may be dropped in certain cases.

Bare conditionals are further characterized by the presence of one or more *wh*-words in the antecedent clause matched by an equal *wh*-word in the consequent (cf. Cheng and Huang 1996). This last requirement is what distinguishes bare conditionals from *ruguo*-conditionals, given that *ruguo* 'if' need not appear overtly:

(131) shei yan shei, shei jiu xiang shei.
who plays who who then resemble who
'If X plays the role of Y, X then will resemble Y.'

The two other types of conditional structures in Chinese, *ruguo*- and *dou*-conditionals, may have *wh*-words in the antecedent. However, they need not have an anaphoric element in the consequent clause, and if they do, the anaphor cannot be a *wh*-word itself:

(132) a. *ruguo ni kandao shei qing jiao shei lai jian wo.
if you see who please tell who come see me
'If you see someone, please tell him/her to come see me.'

b. ruguo ni kandao shei qing jiao tal/Ø/na-ge-ren lai
if you see who please tell him/Ø/that-CL-person come
jian wo.
see me
'If you see someone, please tell him/her/that person to come see me.'

The interpretation of bare conditionals involves unselective binding by the (possibly covert) operator present in conditionals (as in Kratzer 1991), in the analyses of Cheng and Huang (1996) and Chierchia (2000). The two analyses differ as to the exact interpretation they assign to *wh*-words. Whereas for Cheng and Huang the *wh*-words are variables, bound DRT-style, for Chierchia they start out existentially quantified, but then a pair (one for each clause) of disclosure operators, associated with the conditional operator, removes the existential quantifier, and leaves the *wh*-words to be bound by the conditional operator. The two approaches' articulated LFs are given below:

(133) a. Operator$_i$ λ x$_i$ [. . . x$_i$ . . .] λ x$_i$ [. . . x$_i$ . . .] (Cheng and Huang 1996)
b. Operator$_i$ λ x$_i$ [. . . ∃x$_i$ x$_i$ . . .] λ x$_i$ [. . . ∃x$_i$ x$_i$ . . .] (Chierchia 2000)

A schematized LF of a bare conditional, and its interpretation, would be as follows:

(134) a. Operator$_i$ [. . . wh$_i$ . . .][. . . wh$_i$ . . .]
b. ∀x [. . . x . . .][. . . x . . .]

In sum, it is the syntactic dependency between the operator and the variables that it binds that make bare conditionals conditional.

7 Conclusion

Various questions arise in the syntax of conditionals, as we have seen in this chapter. We have tried to present some of the most important issues, and to relate distinct proposals that exist in the literature. We have also proposed a view that is distinct from previous analyses of conditionals, namely that conditional clauses are free relatives of possible worlds. Accordingly, conditionals with *then* are correlative structures. This view makes a number of facts about the syntactic behavior of conditionals and their interpretation fall out naturally.

Needless to say, many interesting questions have remained unaddressed. We have alluded to some, while some have not even been mentioned – these include, among others, issues of compositionality with *only if* and *even if* conditionals, exceptive and concessive conditionals, and the link with exceptive and concessive structures more generally.

NOTES

1 For this reason, relevance conditionals are often called speech act conditionals.

2 Some of these clausal adverbials are known as adverbials of contingency in traditional grammar (cf. Quirk et al. 1985): conditionals (e.g., *if q, p*), resultatives (e.g., *p, so q*), causatives (e.g., *because q, p*), exceptives (e.g., *p, except (that) q*), purpose clauses (e.g., *p, so that q*), and concessives (e.g., *although q, p*), where *p* is the proposition expressed by the main clause, and *q* is the proposition expressed by the adverbial clause.

3 See Iatridou (2000), who argues that the conditional mood is further decomposable, and one of its constituents is a past tense morpheme, which, however, is interpreted not along a temporal but along a modal dimension.

4 By 'purely syntactic' we mean the absence of accompanying insertion of a specialized lexical item or the appearance of specialized inflection. Of course, syntax still underlies the use of lexical items such as the complementizer *if*, or the licensing of conditional inflection on the verb.

5 Technically, the 'when/if' ambiguity obtains only in non-past clauses since past tense temporal adverbials require a different temporal relative pronoun, *wann*.

6 Finally, epistemic and optative modality, copulas, and topic markers are typologically very often employed in conditionals (cf. Traugott et al. 1986); some examples are given below:

(i) **Arrernte (cf. Wierzbicka (1997)):**
   a. Ingwenthe *peke* kwatye urnte-me.
      tomorrow maybe water fall
      'Perhaps it will rain tomorrow.'
   b. Kwatye *peke* urnte-me, ayenge petye-tyekenhe.
      water maybe fall 1sgS come-Vb-Neg
      'If it rains I won't come.'

7 And, given the absence of subject-verb agreement, pro-drop in such conditionals is impossible in Russian. All these features, in addition to the adjoined status of the conditional clause, distinguish a conditional such as (10) from a conjoined imperative with a conditional meaning, as in (i), again from Jacab (to appear).

(i) Udar' menja i ty ob etom požaleješ! Russian
   hit-2sg me and you-sg about this regret
   'Hit me (you-sg) and you will be sorry about it.'

8 Similar facts obtain in the case of free adjuncts in English. A free adjunct such as the one in (i) can be interpreted as an adjunct of condition, cause, or concession, depending in part on the tense of the matrix clause:

(i) a. Working hard, I will finish at 8.
   b. Working hard, I finished at 8.

Stump (1985) proposes that the grammar assigns a conjunctive interpretation to a free adjunct structure (*I (will) work(ed) hard and I will finish(ed) at 8*), with context providing the eventual interpretation.

9 Consider (i):

(i) a. Never before has Dana seen anything like this.
b. Only with Rebecca will Pat be happy.

10 A language in which Comrie claims this is the case is Turkish. As far as we have been able to verify with native speakers, however, all the following word orders are possible in Turkish:

(i) a. Biz eger hava günesli ol-ur-sa disari çik-acag-iz.
we if weather sunny be-pres.-cond. out go-fut.-2pl
'If it is sunny we will go out.'
b. Biz disari çik-acag-iz eger hava günesli ol-ur-sa
we out go-fut-agr.2nd.pl if weather sunny be-pres.-cond.
'We will go out if it is sunny.'
c. Eger hava günesli ol-ur-sa biz disari çik-acag-iz.
if weather sunny be-pres.-cond. we out go-fut.-2pl
'If it is sunny, we'll go out.'

11 Additionally, Greenberg's and Comrie's typological claim may need to be qualified. Geis (1985) cites Zwicky (p.c.) for the claim that there are languages which cannot place *if*-clauses in sentence-initial position. We have not been able to verify this claim for a particular language.

12 Geis (1985) points out that Heinämäki (1974) proposed that temporal connectives like *when*, *before*, and *until* be analyzed as coordinating conjunctions. Given the similarities between *when* and *if*, it seems reasonable to assume that Heinämäki's proposal could extend to *if*.

13 Assuming an approach to adverbials as specifiers of functional projections, as in Alexiadou (1997) and Cinque (1999), would naturally involve an analysis of sentence-initial *if*-clauses as specifiers of a covert functional head.

14 In this they resemble *because* clauses:

(i) Mary didn't vote for Bush because she supported Nader.
a. . . . she voted for Bush because she is rich. ($\neg$ > *because*)
b. . . . she voted for Nader. (*because* > $\neg$)

See Linebarger (1987) for extensive discussion of cases like these.

15 This sentence only has a reading where John's thinking is conditional on his being sick, i.e., where the matrix clause is part of the consequent.

16 Unless, just by virtue of being adjoined to IP as a result of QR, the quantifier can have scope over the IP-adjoined adverbial clause. May (1985) proposed, in fact, that quantified expressions adjoined to IP can be interpreted in each other's scopes.

17 This test cannot be replicated in conditionals, since infinitival conditionals are ungrammatical in English:

(i) a. *If to come, Bill will leave.
b. *When to come, Bill will leave.

The ungrammaticality of (ia) follows if we assume that *if* is in C^0 and illicitly governs PRO. (Of course, this account retains government as a theoretical construct, and uses

it further to constrain the distribution of PRO, and both of these approaches have been challenged.) The location of *when* in [Spec, CP] does not predict the ungrammaticality of (ib). The ungrammaticality follows if we assume that (i) non-interrogative *when*-clauses are free relatives, and (ii) infinitival free relatives are ungrammatical in English, and perhaps cross-linguistically (cf. Izvorski 1998). Note further that treating conditional *if*-clauses analogously to free relatives would give (ia) and (ib) a uniform explanation.

18 Consider (i), which is a case of V2 in an embedded clause, which obtains in case the complementizer is not present:

(i) a. Er sagt dass die Kinder diesen Film gesehn haben. German
he says that the kids this film seen have
'He says that the kids have seen this movie.'
b. Er sagt diesen Film haben die Kinder gesehen.
he says this film have the kids seen
'He says that the kids have seen this movie.'

The examples in (i) are particularly telling because they demonstrate that I-to-C movement in German correlates with the presence of an overt complementizer, and not, as is the case in English, with the root/embedded asymmetry.

19 The absence of inversion, i.e., V2 in German *wenn* clauses follows from the fact that *wenn* clauses are free relatives, and free relatives, unlike questions, do not permit V2.

20 It has to be noted that the ambiguity obtains only with sentence-final *when*-clauses. When *when*-clauses are sentence-initial, only local (high) construals are available:

(i) When you say you'll leave, I'll leave. (unambiguous)

At least this is the case with neutral intonation. If the *when*-clause is interpreted as focused then ambiguity becomes a possibility, which may be due to the fact that in such a case the *when*-clause is moved from sentence-final position.

Sentence-initial *when*-clauses would still presumably involve A'-movement. Thus an account of the absence of low construals in terms of absence of A'-movement is undermined.

21 Philippe Schlenker suggested to us the relevance of Orin Percus's work in this respect. Percus (2000) argues that some world variables need to be locally bound.

22 Curiously, while in English contracted negation can be moved with I to C in questions, it may not be in conditionals. The following sentences are from Iatridou and Embick (1994):

(i) a. Hadn't he seen the car coming?
b. *Hadn't he seen the car coming, he would have been killed.
c. Had he not seen the car coming, he would have been killed.

23 There is some suggestion that non-counterfactual inverted conditionals are special – in Icelandic and Old English, indicative inverted conditionals are not technically 'indicative', since the raised verb in C has to be subjunctive:

(i) a. Ef hann hefur faridh eg kom. Icelandic (Iatridou and Embick 1994)
if he has-pres.ind. gone I come
'If he has gone, I will come.'
b. Hafi hann faridh eg kom.
has-pres.subj. he gone I come
'If he has gone, I will come.'
c.* *Hefur hann faridh eg kom.
has-pres.ind. he gone I come
'If he has gone, I will come.'
d. *Ef hann hafi faridh eg kom.
if he has-pres.subj. gone I come
'If he has gone, I will come.'

The subjunctive is also used in concessive ('although, even though') clauses, which are normally taken to presuppose the truth of the proposition they express.

24 The choice condition is meant to restrict the proposal to languages which allow 'optionality' of this kind, as there are languages which do not permit free relatives inside the clause (e.g., according to Srivastav 1991b, free relatives in Hindi cannot appear in argument position). For this latter type of language see Bhatt (2002).

25 Care should be taken to interpret the whole antecedent as the associate of *even*. In cases when some constituent of the antecedent is the associate of *even*, *then* should be acceptable.

26 The other syntactic option, without verb-raising, is also unacceptable:

(i) #Only if it is sunny *then* I will visit you.

27 It is also plausible that *then*, being a bare NP-adverb in the sense of Larson (1985a), needs to be merged lower in the tree where it can be licensed. In this it would differ from an *if*-clause, which could be merged high or low.

28 We find this example slightly marginal. It becomes perfect with *then* A'-moved to the front of the matrix clause. This does not affect Schlenker's argument.

29 These effects are a problem only if we assume that reconstruction effects imply movement. As much work on connectivity has argued, such an assumption is far from obvious.

30 The discussion in this section is based on Iatridou (1991).

31 Thus, the antecedent *if p* in a factual conditional can always be substituted by *if it is true that p*.

32 Though see Romero (2000) for an alternative analysis of reduced conditionals in German. Romero argues that the distinctions between full and reduced conditionals can be derived without stipulating different LF representations for full and reduced conditionals.

1 Introduction

'Contraction' is the term traditionally used to describe phenomena where one word is reduced and apparently affixed to another, as when *have not* is realized as *haven't*, or *we have* as *we've*. It should be stressed that this is only a descriptive term and does not presuppose any particular type of analysis. Indeed, whether a particular type of contraction is to be analyzed in morphological, phonological, or syntactic terms is often a point of contention. Here we will examine some contraction phenomena which have been thought to relate to syntax, i.e., those which appear to result from or interact with syntactic processes.

2 *Wanna*-contraction

2.1 The basic paradigm

The best-known such contraction by far is that in which *want to* is realized as *wanna*. This phenomenon first caught the eye of syntacticians because of facts like (1), first discussed by Lakoff (1970):

(1) a. Who do you wanna dance with?
b. *Who do you wanna dance?

The contrast between (1a) and (1b) here is surprising at first, because they would seem to result from the contraction of the *want to* sequences in (2a) and (2b), respectively, which are both fine:

(2) a. Who do you want to dance with?
b. Who do you want to dance?

The most obvious difference between (2a) and (2b), though, is that the *wh*-phrase originates as the object of *with* in (a), and as the subject of *dance* in (b). If we assume that *want* and *to* may contract only when they are adjacent, and that the trace of *who* intervenes between *want* and *to* in (b) but not in (a), then the contrast follows. This is the thrust of the analysis in Chomsky (1976), and it is still presented in many basic textbooks as an argument for the existence of traces (e.g., Napoli 1993; Radford 1997).

Although very appealing, this analysis is less straightforward than it might seem. First, one could argue that there is also an intervening trace in (2a), since by successive cyclic movement the *wh*-phrase will stop in the embedded SPEC of CP (between *want* and *to*) before moving to its surface position. Second, there is a PRO subject in the embedded clause in (2a), and this would appear to make *want* and *to* non-adjacent. Third, traces of A-movement do not seem to block similar types of contraction. This may be seen in (3), where the fact that *John* might originate in a position between *going* and *to* does not prevent contraction of these to *gonna*:

(3) a. John is going to dance with Mary.
b. John is gonna dance with Mary.

Thus, simply saying that *wanna*-contraction is sensitive to the presence of empty categories is not sufficient, since we have seen that only some empty categories appear to block contraction. As Jaeggli (1980) pointed out, those that do are Case-marked (in GB terms). This of course opens up the question of why contraction would be sensitive to the presence of an intervening Case-marked empty category but not to Case-less empty categories such as the intermediate *wh*-trace,

PRO, and NP-trace mentioned above. For the facts seen so far, however, Jaeggli's distinction based on Case seems to yield the right results.

2.2 Fuller view of data

The picture is complicated by the fact that *wanna*-contraction is sometimes blocked even when there is no intervening Case-marked trace, as noted by Postal and Pullum (1982). Contraction is impossible in all of the following sentences, for example:

(4) a. I don't want to flagellate oneself in public to become standard practice in this monastery.
b. It seems like to want to regret that one does not have.
c. I don't want anyone who continues to want to stop wanting.
d. One must want (in order) to become an over-effective consumer.
e. I want to dance and to sing.
f. I don't need or want to hear about it.

In (4c) in particular, there is arguably no empty category at all intervening between *want* and *to*, but in none of them is there an intervening Case-marked trace. What, then, is the difference between (2a), where contraction is possible, and (4), where it is not? In (2a), *to* is in I of the complement clause of *want*, but this configuration does not obtain in any of the examples in (4). This may be seen straightforwardly in (4a–d). In (4e) it appears that *to* is in an I embedded within a coordinate structure, and in (f) *want* is part of a coordinate structure.

2.3 Adding government

The generalization which now emerges is that contraction between *want* and *to* is possible only when *to* is in the main I of the complement of *want*. This sort of head-complement requirement between the verb *want* and the *to* of its complement clause is reminiscent of the government relation, and it is thus tempting to formulate the conditions on *wanna*-contraction in terms of this relation, i.e., by saying that for *want* and *to* to contract, *want* must govern *to* (see Aoun and Lightfoot 1984; Lobeck and Kaisse 1984; Bouchard 1986).

The basic intuition behind government-based accounts, that *want* and *to* must be in a kind of head-complement relation, is clear enough, but getting the technical details to work out right is more challenging. Under standard assumptions about clause structure and government, in fact, *want* does not govern *to* in ordinary sentences where contraction is possible (e.g., (1a)), the reason being that there is an intervening CP maximal projection which will prevent *want* from governing IP and its head *to*. Under standard GB assumptions about PRO, we want this CP to be present, since otherwise the PRO subject of the embedded clause would be governed illicitly. Of course there are a number of ways one might address these difficulties. Barss (1995), for

instance, adopts the view that there is no intervening CP in control clauses and that PRO can be governed.

2.4 Contraction and restructuring

It has been known for a long time that there are some significant similarities between *wanna*-contraction and the phenomenon known as restructuring (or clause reduction), and analyses making use of this fact have been developed which either complement or are in opposition to those based on the presence of a trace and/or a government requirement (e.g., Frantz 1978; Postal and Pullum 1978; Goodall 1991; Roberts 1997b). An example of restructuring is given in (5), from Spanish:

(5) Juan lo quiere ver.
Juan it want see
'Juan wants to see it.'

Despite the presence of two verbs here, sentences of this type display some properties of a single clause, such as the clitic-climbing seen in (5).

One obvious similarity between restructuring and *wanna*-contraction is that they both affect the verb *want*. This fact in itself is not very impressive, but it becomes more so if one considers that there are other verbs which have been argued to participate in contraction with *to* of the same type as *wanna* (see, e.g., Pullum 1997):

(6)

	Verb	**Contracted form**	**Example**
a.	go	gonna	I'm gonna dance.
b.	used	usta	I usta dance.
c.	have	hafta	I hafta dance.
d.	got	gotta	I gotta dance.
e.	ought	oughta	I oughta dance.
f.	supposed	suposta	I'm suposta dance

These verbs are either aspectual, as in (6a–b), or modal, as in (6c–f) and *want*. These turn out to be two of the major classes of verbs which participate in restructuring.

This similarity in verb classes could of course just be a coincidence, but when considered in combination with a number of significant syntactic similarities, this seems less likely (see Goodall 1991 for discussion). We have seen, for instance, that contraction is only possible when *to* is in the complement clause of *want*, and likewise restructuring is only possible between a verb and its complement clause. Both phenomena are also restricted to control or raising structures, i.e., neither is possible when the embedded subject is not coreferential with the matrix subject (cf. (1b) for contraction). In addition, the behavior

of contraction in coordinate structures that we saw earlier in (4e–f) is replicated exactly with restructuring.

If these similarities are in fact significant, then of course one would want to know why they obtain. This question is particularly intriguing since at a descriptive level, contraction and restructuring would not seem to have much in common in terms of how they operate. One possible account is given by Roberts (1997b), who argues that restructuring is the result of raising embedded T into the matrix clause through head movement. Assuming that *to* is generated in T, contraction could then be seen as the same process. This then gives us an immediate account of the cases in (4).

Since contraction is now the result of syntactic head movement, it is disallowed here for whatever reasons generally prevent movement out of a subject, adjunct, or coordinate structure, or into a subject or coordinate structure.

This also allows us to explain the contrast between (1a) and (1b). With the ECM use of *want*, it is often assumed that there is a null version of *for* in C, which provides case for the embedded subject. If true, this complementizer should block raising of *to* to the matrix clause. This accounts for the ungrammaticality of (1b). (1a), on the other hand, is not an ECM structure, so C is not filled and nothing should prevent raising of *to*.

This analysis thus allows us to account for the constraints on contraction and its fundamental similarities with restructuring in an elegant and relatively simple way. In fact, for reasons having to do with the theory of adjunction he is assuming, Roberts proposes that *wanna* itself is formed in the lexicon, so there is actually no syntactic raising of *to* as such. Instead, *wanna* is endowed with a restructuring feature which must be checked by T of the embedded clause. Given that this checking is accomplished by raising of the embedded T, the account of the constraints on *wanna*-contraction just sketched remains basically unchanged.

2.5 Wanna *and subcategorization*

Under Roberts's checking analysis, the T embedded under *wanna* must be null, since overt *to* is neither adjoined to *wanna* nor present in the embedded clause, and the embedded clause cannot be tensed. Thus we can say that *wanna* subcategorizes for a kind of bare infinitive. This may seem like an innocent conclusion, but in fact it can account for much of the data seen so far in and of itself, if we make the standard assumption that a head may subcategorize only for a complement. Thus the fact that contraction is disallowed in (4) now follows. In (4a–d), the clause to the right of *want* is not a complement of *want*, so even if we used *wanna* in place of *want*, the clause to its right would not be licensed as a bare infinitive. In (4e), replacing *want* with *wanna* would mean that both conjuncts would have to be bare infinitives, not just the first, and in (4f), using *wanna* would result in a conjunction of verbs with different subcategorization requirements, which we would expect to be ungrammatical. Specifically, only *wanna* would subcategorize for a bare infinitival.

By saying that *wanna* subcategorizes for a bare infinitive, then, as appears to be necessary under Roberts's analysis, we can straightforwardly account for the lack of contraction in (4) without appealing to raising of the embedded T. This is in fact the analysis that Pullum (1997) proposes: *wanna* is related to *want* by derivational morphology and it subcategorizes for a bare infinitive. One can now reasonably ask whether there is any evidence for the raising of T that Roberts proposes, given that subcategorization alone can account for a significant range of facts. One possible piece of evidence may come from the basic contrast we saw in (1).

In order to account for the ungrammaticality of (1b) under a subcategorization-only analysis, we have to say that *wanna* subcategorizes specifically for a control bare infinitival clause, with a PRO subject (cf. Pullum 1997). Such a specification is independently needed to account for impossible contractions such as (7):

(7) *You wanna Bill eat the pie.

What remains unexplained under this account, though, is why *wanna* should be restricted in this way. It cannot be that overt subjects are disallowed in principle in bare infinitival clauses, because verbs like *make*, for example, allow them, as in (8):

(8) Bill made it rain.

Under Roberts's analysis with raising of embedded T, the ungrammaticality of (1b) and (7) follows from the assumption that these ECM cases require a filled C in order to license case on the embedded subject. If C is filled, then raising of T to matrix V is blocked, and contraction is impossible. Thus there is some advantage to adopting an account which makes use of more than just subcategorization, in that we can then account for the impossibility of an overt embedded subject with *wanna* without stipulating it.

Whether or not we supplement it with raising of the embedded T, the subcategorization account of *wanna* predicts that we should find no evidence for the presence of *to* in the embedded clause. Pullum (1997) points out that in principle we should be able to look for such evidence by examining the behavior of *wanna* vs. *want to* in constructions where an overt element in T is required. VP ellipsis (as opposed to null complement anaphora) and VP fronting are two such constructions. Examples of the latter are given in (9):

(9) a. I said I'd wash the dishes, and wash them I did.
    b. *I said I'd help wash the dishes, and wash them I helped.

If *wanna* involves no overt element in the embedded T, we would then predict that (10b) would be worse than (10a):

(10) a. I said I'd feel like climbing the mountain, and climb it I want to.
     b. I said I'd feel like climbing the mountain, and climb it I wanna.

Pullum reports that unfortunately, judgments on sentences like these are so unclear and inconsistent as to be of little use (and similar results obtain with examples involving VP ellipsis), so at this point it is an open question whether it is possible to find evidence for or against the presence of *to* in the clause embedded under *wanna*.

2.6 Adjacency again

One interesting property of the accounts of Roberts (1997b) and Pullum (1997) just examined is that adjacency between *want* and *to* plays no role in the analysis. That is, the only restriction on *wanna* is that its complement clause be of the appropriate type and, for Roberts, that the T of this complement clause raise to check the restructuring feature of *wanna*. Since they assume that *wanna* is formed in the lexicon, there is no requirement, nor could there be, that for *wanna* to be well-formed, the non-*wanna* version of the sentence must have *want* and *to* in adjacent positions.

The data which originally motivated such a requirement, such as (1) and (7), can now be accounted for in a different way, as we have seen.

For Pullum, (1b) and (7) are out because *wanna* subcategorizes for a bare infinitival clause with a PRO subject, and for Roberts, they are out because T of the embedded clause is unable to raise to *wanna*. The subject of the embedded clause requires a filled C for case reasons, and this blocks movement of T to the matrix V.

Thus the role that (1b) played historically as a kind of unusually concrete evidence for the existence of traces is gone under these analyses. An account of (1b) may still crucially involve a trace (although there are ways to do this without a trace also; see Pullum 1997 for discussion), but only in the way that many other sentence types do. That is, positing a trace in (1b) may allow us to give a unified account of (1b) and (7), but we cannot say under these analyses that it is the trace itself which directly blocks the contraction.

This point is of more than historical interest. Recall that one of the problems facing an adjacency analysis of *wanna*-contraction is that an A′-trace disrupts the adjacency of *want* and *to* but PRO does not (as seen, for instance, in the contrast in (1)). One possible response to this problem is to say that if we assume that the adjacency analysis is correct and that A′-trace and PRO are present in the syntactic structure, then it must be that only A′-trace intervenes between *want* and *to*. This amounts to saying that A′-trace raises to the specifier of an inflectional head but that PRO does not, or at least does not need to. This is the line of argument adopted by Baltin (1995), who proposes that PRO remains in a VP-internal position. Under this analysis, then, *wanna*-contraction can provide valuable evidence regarding the surface position of PRO.

Another possible response to the problem for an adjacency analysis of intervening PRO is to assimilate control to A-movement, as in Horstein (1999), and to assume that A-movement does not leave a trace/copy. This is essentially the analysis of Boeckx (2000), who shows that adopting these assumptions allows

one to say that *want* and *to* are indeed adjacent in (1a) and (3), but not in (1b), where the A'-trace intervenes, just as in the classical analysis. This solves the problems of PRO and NP-trace for an adjacency analysis that we examined earlier (and see Boeckx 2000 for a brief discussion of how facts like (4) might be handled under his analysis).

So far, then, we have seen analyses such as those by Roberts (1997b) and Pullum (1997), which account for the 'adjacency' facts of *wanna*-contraction (i.e., (1) and (7)) without actually appealing to adjacency as part of the analysis, and analyses such as those by Baltin (1995) and Boeckx (2000), which claim that *wanna* is possible only when *want* and *to* are adjacent. To decide between these two approaches, one could look for cases of non-adjacent contraction, i.e., cases where *wanna* is possible but where *want* and *to* would not be adjacent in the corresponding sentence without contraction. Such cases might be expected to surface if Roberts (1997b) and Pullum (1997) are correct, but they are clearly predicted to be impossible under Baltin's (1995) and Boeckx's (2000) accounts. One possible example of such a case is the 'Langendoen dialect' noted by Postal and Pullum (1978) and discussed more recently by Pullum (1997). In this dialect, reportedly spoken by Terence Langendoen, (11a) is possible but (11b) is not:

(11) a. %I wanna very MUCH go to the game this evening!
b. *I want to very MUCH go to the game this evening!

The adverbial expression *very much* must clearly appear within the matrix clause, i.e., to the left of *to* in (11b). Thus the possibility of *wanna* in this dialect is very surprising if we assume an adjacency analysis. With an analysis such as Roberts's or Pullum's, on the other hand, (11a) is straightforward. What would seem more difficult, in fact, is explaining why most speakers do not accept it. Pullum points out, though, that the ungrammaticality of (11a) for most speakers is probably due to the fact that in general, verbs must be adjacent to their bare infinitival complements (for whatever reason). *Wanna* then falls into the general pattern. (11a) appears to be good for Langendoen because for some reason he does not have this restriction in general, so of course he does not have it for *wanna* either.

The contrast in (11) thus in principle provides interesting evidence in favor of a non-adjacency analysis of *wanna*-contraction, but it is difficult to place much confidence in this conclusion, since it is hard to find speakers who accept this contrast. Using different adverbials may help; I have found that some speakers detect a slight contrast between (12a) and (12b), for instance:

(12) a. ??I wanna with all my heart go with you.
b. *I want to with all my heart go with you. (cf. I want with all my heart to go with you.)

Still, the judgments are subtle at best, so neither (11) nor (12) is as decisive as one would like.

2.7 The liberal dialects

Another area of possible dialectal variation concerns the so-called "liberal dialects" (Postal and Pullum 1982), for whose speakers (1b) is grammatical. This type of dialect is very difficult to account for with an adjacency analysis, and it is not much easier with a non-adjacency analysis such as those of Roberts (1997b) or Pullum (1997). Probably the best that can be done under these latter analyses is to say that the liberal dialects differ from others in their phonology, not in their syntax, in that they allow reduction of *want to* to *wanna* within a phonological phrase, as proposed in Pullum (1997).

But it is hard to know to what extent one should take these liberal dialects into account without better documentation of their existence. As Carden (1983: 48, fn. 11) stated, "the force of the data based on the liberal dialects is weakened by worries about whether the claimed dialect difference is real, or whether the subjects are simply reporting introspections based on different assumed speech rates." Unfortunately, we know nothing more about this now than we did when Carden made this statement.

2.8 Conclusion

As we have seen, there are some analyses, such as those of Baltin (1995), Boeckx (2000), and their many predecessors, that claim that *wanna* is only possible when *want* and *to* are adjacent, and other analyses, such as those of Roberts (1997b) and Pullum (1997), that claim that adjacency is not relevant. Notice that under the latter approach, the term '*wanna*-contraction' is in a sense a misnomer, since it really doesn't involve contraction at all, at least not in the phonological or syntactic sense. *Wanna* under these analyses is formed in the lexicon, and it is inserted in the syntax just like an ordinary verb. The fact that it seems to interact in such interesting ways with the syntax, which is what drew attention to this phenomenon in the first place, follows from its subcategorization properties and, for Roberts, from the fact that it must check a feature on the embedded T.

3 Finite auxiliary contraction

3.1 A comparison with wanna-contraction

The term 'finite auxiliary contraction' is used to label the phenomenon in which finite auxiliaries (*have*, *be*, and modals *will* and *would*) appear to contract with elements to their left, as in (13):

(13) a. We've eaten the pie.
b. We're eating the pie.
c. We'll eat the pie.
d. We'd eat the pie.

This phenomenon resembles *wanna*-contraction in a couple of ways which could turn out to be significant. First, it involves the apparent contraction of an element in T with something to its left (though see Bresnan 1971a for an alternative view). Assuming that *to* is in T, this description would fit *wanna*-contraction as well. Second, the finite auxiliary cannot skip over a lexical subject to contract with something further to the left. This is seen in (14):

(14) *I don't know who's John going to the party with.

Here *is* has contracted with *who* despite the intervening subject *John*, and the result is ill-formed. This is reminiscent of the restriction that we saw in (7), where *wanna*-contraction may not cross an intervening subject.

Although we saw earlier that both of these descriptions of *wanna*-contraction (that it involves contraction of an element in T and that it may not cross intervening material) are open to question, still the initial similarity between it and finite auxiliary contraction might give us hope that they could receive a common analysis and that the additional data that auxiliary contraction could provide might resolve some of the open questions remaining in the analysis of *wanna*-contraction.

However, a closer look shows that there are some significant differences between the two phenomena. For example, *wanna*-contraction involves the apparent contraction of *to* with a specific word to its left, i.e., the verb *want* or one of the handful of other verbs that behave similarly (see the list in (6)). The finite auxiliary, on the other hand, contracts with whatever is to its left. This means that the sort of subcategorization analysis that we saw earlier for *wanna*-contraction will be unworkable for finite auxiliary contraction. In fact, the finite auxiliary is able to contract with more than just subjects, as seen in (15):

(15) Who's John going to the party with?

In this case, *is* has presumably raised to C, but it is still able to contract.

An even more striking difference is that finite auxiliary contraction does not behave like *wanna*-contraction in terms of the latter's most celebrated property: its inability to contract across an A'-trace. Whereas *wanna*-contraction is impossible in cases like (1b), finite auxiliary contraction is perfect in analogous cases such as (16):

(16) Who do you think's dancing?

The well-formedness of (16) is particularly interesting given the fact that auxiliary contraction is not able to operate across an overt subject, as we saw in (14). Thus the parallelism between overt arguments and A'-traces that has drawn so much attention in *wanna*-contraction is not found in finite auxiliary contraction.

3.2 Finite auxiliary contraction and syntax

The above differences should make us somewhat pessimistic about finding a common analysis for these two types of contraction. In fact, they could even suggest that whereas *wanna*-contraction is clearly sensitive to a number of syntactic factors, finite auxiliary contraction seems largely oblivious to the syntax. For instance, we have seen that the finite auxiliary may contract with a variety of elements to its left (e.g., a subject in (13), an element in SPEC/C in (15), a verb in (16)) regardless of the syntactic position. Moreover, finite auxiliary contraction is blocked by the presence of intervening overt material, but not by the presence of a trace (e.g., (14) and (16)). We might thus conclude that finite auxiliary contraction, unlike *wanna*-contraction, is an entirely phonological operation. This conclusion is rendered more plausible by the fact that contraction of *is* undergoes voicing assimilation with the preceding segment:

(17) a. Ted's eating the pie.
b. Pete's eating the pie.

Contracted *'s* is voiced in (17a) and voiceless in (17b).

However, the literature points to a number of ways in which this conclusion appears to be too hasty, in that finite auxiliary contraction does seem to be sensitive to the syntax in a way we would not expect of a purely phonological process. First, whether or not a finite auxiliary may contract with a preceding adverb depends on the class, and presumably structural position, of the adverb. Sentential adverbs allow contraction, as seen in (18), but aspectual adverbs do not, as seen in (19) (Baker 1971; Bresnan 1971a; Kaisse 1985):

(18) a. John clearly'd eat the pie if he had the chance.
b. Jane apparently's eating the pie.

(19) a. *John never'd eat the pie.
b. *Jane often's eating pie.

The full, non-contracted form of the auxiliary is possible to the right of the adverb in cases like (19) (though the position to the left of the adverb is preferred), as is the 'reduced' form, i.e., the form in which the vowel of the auxiliary is reduced but still present. Given this, it is not clear why further phonological reduction of the auxiliary, resulting in the contracted form, would not be possible here. But if auxiliary contraction is at least partly a syntactic operation, the different positions of the adverbs in (18) and (19) might make an explanation possible (see Wilder 1997 for an analysis). Radford (1997) points out that the position of the auxiliary itself seems to affect the possibility of contraction as well, as seen in (20):

(20) a. *The chairman may've gone home.
b. *It would have been a pity to've given up syntax.

c. *She wouldn't let me've gone there on my own.
d. *Should we've helped him?

It can be argued in all of these cases that the auxiliary is not in T, and that would seem to be related to their inability to contract. This of course is why the phenomenon we are examining is called 'finite auxiliary contraction', but the very fact that the auxiliary must be finite (i.e., in T) makes it unlikely that a purely phonological analysis would suffice, especially since the finite and non-finite forms of the auxiliary in question in (20) (*have*) can be homophonous.

Another way in which finite auxiliary contraction might be sensitive to the syntax is that contraction is barred when the element immediately to the right of the auxiliary is null, either because of movement or deletion (see Baker 1971; Bresnan 1971a; King 1970; Lakoff 1970):

(21) a. *I don't know what kind of lawyer Mary's.
b. *Tom has eaten as much pie as we've.
c. *They'll water the plants on Tuesday, and I'll on Thursday.
d. *If John would get some exercise, then Mary'd as well.

All of these sentences are grammatical without contraction. What seems odd about this restriction, of course, is that the auxiliary contracts with the word to its left, yet here we see it is sensitive to the type of material to its right. One way to make sense of this is to assume that the contracted auxiliary is not able to properly govern the null element to its right and thus attribute the ungrammaticality of (21) to the ECP (see Zagona 1982 and Wilder 1997 for discussion). Another way is to assume some sort of prosodic condition which prohibits contracted forms before a gap (see Wilder 1997 for recent discussion of this approach). This view is supported by the fact that contraction is still prohibited even when the destressed, weak pronoun *it* intervenes between the auxiliary and the gap, as seen in (22) (from Bresnan 1971a):

(22) a. *What's it? (cf. What's that?)
b. What's it for?

It appears that the word immediately to the left of the gap must bear stress, and if *it* can't do this, then the auxiliary can take over. But a contracted auxiliary can't bear stress either, so (22a) is ruled out, as are the examples in (21). Notice that (22b) is fine, because *for* can bear stress. If a prosodic account such as this is ultimately successful, then (21) may be irrelevant to the issue of whether finite auxiliary contraction is syntactic in some sense, but for now the proper treatment of (21) remains an open question.

A third area in which finite auxiliary contraction seems to show an interesting interaction with syntax is in the differing behavior of contraction with stage-level and individual-level predicates. Barss (1995) shows that when the predicate to the right of the auxiliary is stage-level, as in (23), contraction is perfect, but when the predicate is individual-level, as in (24), it is not:

(23) a. Who do you think's available?
b. Who did you say's coming to the party?
c. Who do you think's outside?

(24) a. ?*Who do you think's altruistic?
b. ?*Who did you say's tall?
c. ?*Who do you think's moral?

The distinction is subtle, although it appears to be real. Barss claims that one can account for this contrast if one assumes that stage-level predicates theta-mark their subjects internal to their projections and that with individual-level predicates, there is a control relation between a subject outside the predicate projection (in SPEC of TP) and a PRO subject inside the predicate projection, as in Diesing (1990a). This means that in (23), the *wh*-phrase can move directly from the predicate-internal position to SPEC of CP, without leaving a trace in SPEC of TP. In (24), on the other hand, the *wh*-phrase starts out in SPEC of TP and so does leave a trace there before moving to SPEC of CP. With certain further reasonable assumptions, the presence or absence of this trace accounts for the contrast between (23) and (24), and for the contrast that we saw earlier between finite auxiliary contraction and *wanna*-contraction in (1b) and (16). Under Barss's account, then, finite auxiliary contraction is just as sensitive to the presence of an A'-trace as *wanna*-contraction is, but this sensitivity is not apparent in (23) because there is no A'-trace in SPEC of TP. Unfortunately, perhaps, this account may not be fully compatible with some current assumptions. For instance, if we say that T has an EPP feature that needs to be checked, then the *wh*-phrase will need to stop in SPEC of TP even in structures like (23), and the contrast between (23) and (24) will be lost. At a minimum, though, Barss's analysis shows that one cannot be too quick to reject the possibility that finite auxiliary contraction has a syntactic basis.

A fourth type of possible syntactic effect with finite auxiliary contraction comes from Radford (1997). Radford points out that contraction between an auxiliary and a head is always perfect, as in (25), whereas contraction between an auxiliary and a phrase seems degraded, as in (26):

(25) a. You've upset her.
b. They'd probably refuse you if you asked them.
c. We'll help you out.
d. Who've they chosen?

(26) a. *John and you've got a lot in common.
b. *The Masai've been driven out of their homeland.
c. *Di'd like to be an ambassador for Britain.
d. *Which one of you've they chosen?

Why would this be? Radford proposes that contracted auxiliaries are affixal heads in T which are only legitimate PF objects if another head adjoins to them.

Thus pronouns are able to adjoin and, as a result, check case, but full DPs are not. Contraction with full DPs is therefore ruled out.

A few comments about the contrast between (25) and (26) are in order. First, as Radford points out, this contrast only obtains with the fully contracted forms of the auxiliaries, where what remains of the auxiliary is just a single consonant. Reduced auxiliaries, in which a schwa vowel is still present, are fine in (26). Second, Radford claims that the contrast is also restricted to those auxiliaries whose fully contracted forms can only attach to a previous vowel. Auxiliaries *have*, *had*, *would*, *will*, and *am* have this constraint on what they can be fully contracted with, but *has* and *is* do not, as seen in (27):

(27) a. Tom's been to the zoo several times.
b. The girl in the car's studying chemistry.

As (27) also shows, *has* and *is* are also not restricted to contracting with a head. Finally, not all combinations of full DPs and contracted auxiliaries of this class seem equally bad. (28), for instance, seems quite good, but the sentences in (29) are noticeably worse (when the auxiliaries are fully contracted):

(28) An Apache'd never do something like that.

(29) a. ?*The Apache've opened a new hotel.
b. ?*An Apache'll be waiting for you at the gate.

Clearly, then, the data need to be explored more deeply before firm conclusions can be drawn, but the contrast in (25) and (26) presents an intriguing case where syntax might be intimately involved in a constraint on finite auxiliary contraction.

3.3 Conclusion

The literature offers no grand consensus on how finite auxiliary contraction is to be analyzed. We have seen that in some ways it appears to operate independently of syntax, such as in (16), where it seems to be oblivious to the presence of an A'-trace. On the other hand, we have seen a number of cases where syntactic factors appear to be crucially involved. Even (16) may turn out to require a purely syntactic approach, as in Barss's account. For now, though, the question of the precise role of syntax in accounting for finite auxiliary contraction remains open.

4 Conclusion

It is often said that nature does not necessarily divide itself up the way our a priori ideas would lead us to expect. Within the realm of language, contraction is a perfect example of this, for two reasons. First, given that contraction involves the loss of segments and word boundaries, one would expect that accounting for

it would be a matter for phonology. In fact, however, investigation has shown that contraction behaves, to one degree or another, in ways that are not consistent with a purely phonological analysis and that seem to require some recourse to syntax. Second, the fact that we use the term 'contraction' does not mean that there is truly a unified phenomenon that this term refers to. We have seen that *wanna*-contraction and finite auxiliary contraction exhibit some significant differences, at least superficially, and whether they share any basic mechanisms is an empirical question that has yet to be fully resolved. As we explore other contraction phenomena in English and in other languages, it is good to keep in mind that there is no guarantee that they will in fact have much in common with what we have examined here beyond the descriptive label.

Left Branch Condition (LBC), I.597, I.605, II.97, II.444, IV.485, IV.572–3
definition, III.574–5
effect reduction, IV.576, IV.581
and pied-piping, III.574, III.583, III.584, III.587, III.624–5
and Russian, IV.590
and subextraction, IV.569–71, IV.583
violations, III.625, III.669, IV.446, IV.586
left branching, IV.484–5
left dislocation (LD), II.185, II.668–99, IV.480
frame, III.205
movement vs. base generation, II.670–1, II.676–87
types, II.669–71
see also Clitic Left Dislocation (CLLD); Contrastive Left Dislocation (CLD); Hanging Topic Left Dislocation (HTLD); Loose Aboutness Left Dislocation (LALD)
left-branch subextraction, IV.572–82
and containing extraction domain, IV.574–6
in terms of extraction site, IV.572–4
leftward-moved constituents, frozenness, II.389–91, II.399
Legate, Julie Anne, III.443, III.444, III.451
Legendre, Géraldine, III.290, III.300, IV.185, IV.217
Lehmann, Winfred P., III.686
Lehtinen, Meri, II.442
Leísta Spanish, I.562–3, I.565
Lekakou, Marika, III.155, III.158, III.182, III.195
Leko, Nedzad, V.48
Lenerz, Jürgen, III.231
Lepschy, Anna L., III.508
Lepschy, Giulio C., III.508
Levin, Beth, I.29, I.35, I.38–9, II.461, II.482, III.162
secondary predication, IV.214, IV.224, IV.226, IV.227–8
spray-load alternation, IV.467, IV.469–71, IV.472, IV.474, IV.477
Levin, Lori, III.654–5, IV.221
Levin, Nancy, II.413
Lewis, David, I.230, I.664, III.5, III.281, V.110, V.134
lexical ambiguities, vs. scope ambiguities, IV.9–11
lexical chain hypothesis, II.598–601
Lexical Conceptual Structure (LCS), II.488, II.626–9, IV.191, IV.469–71

Lexical Functional Grammar (LFG), IV.218
and accusative plus infinitive construction, I.4, I.9
and binding, I.261
and case marking, I.304, I.313
complex predicates, II.487
and control infinitives, V.317
and derived nominals, II.47
and double object constructions, II.83–6
mixed categories, II.454–5
and quantifiers, V.26–7, V.52
and topic structures in Asian languages, V.148
verb particle constructions, V.356–7
lexical government, III.113–14
lexical heads, government and Case property, III.641–4
Lexical Integrity Principle, V.353–5, V.368
Lexical Mapping Theory, II.49
Lexical Parameterization Hypothesis, III.49
lexical redundancy rules, II.84
vs. Anderson's "Theme Rule", I.31–3
lexical semantics, I.19
scope and, IV.32–3
lexical words, and grammatical words, II.459–60
Lexicalist Hypothesis, vs. transformationalists over derived nominals, II.26
lexicon, II.27
and verb particle constructions, V.353–4
LF *see* Logical Form (LF)
LF-movement, III.250, III.251
and pied-piping, III.618–23
of SE, III.97–9
of SE-anaphors, III.103
LF-pied-piping, III.572, III.577, III.578
overview, III.618–23
strong islands, IV.486
LF-scope position, *wh*-phrases, III.438, III.439–40, III.442, III.444, III.449
