The syntax of embedded clauses in Modern Scandinavian places the negation in front of the finite verb regardless of the presence of a subject gap, so we cannot detect any movement here. Still, apparently the adverb does something in relation to the subject gap, which may be essentially what it does in Icelandic, except that in Icelandic you have to move the adverb into that position.

Dutch presents an interesting case. A *that-t* structure where the complementizer is followed directly by the finite verb seems to be quite generally unpreferred:

(70) *Wie denk je [dat komt]?
who think you that comes

One way of avoiding this is inserting the expletive *er*:

(71) Wie denk je dat **er** komt?
who think you that EX comes
'Who do you think is coming?'

For some speakers, a nonfinite verb in front of the finite auxiliary improves acceptability (in subject gap clauses), so that there is a contrast between (72a, b):

(72) a. Wie denk je dat **komen** zal?
who think you that come shall
'Who do you think will come?'
b. ?Wie denk je dat zal komen.

For some speakers even just an adverb between the complementizer and the finite verb helps (according to Reuland 1985):

(73) Wie denk je dat **morgen** komt?
who think you that tomorrow comes
'Who do you think is coming tomorrow?'

Finally, if there is an object (which by virtue of the word order rules of Dutch will be preverbal), the sentence is fine:

(74) Wie denk je [dat **het vlees** snijdt]?
who think you that the meat cuts
'Who do you think cuts the meat?'

See Holmberg (2000) for discussion. Note in particular (73a), which is strikingly similar to SF. But (73) and even (74) can be analyzed as SF, in the sense of movement of a category to the subject gap position, although the movement in this case will be string-vacuous.

It appears, then, that SF falls together with a group of operations, including movements and lexical insertions, which all serve to mask or obliterate a *that-t* configuration. Why that should be needed in the first place remains a controversial question.

But SF in main clauses, and perhaps more generally, in impersonal clauses, has no such function. There, it seems that SF, much like LHM in Breton, serves to fill a 'first position' as a last resort, that is it has to do with V2 and/or the EPP. Whether this first position is Spec,CP or Spec,IP, and whether it is the same position in main and embedded clauses is open to debate. The answer will depend in part on which theory of V2 one condones (see Branigan 1996).

Still, as we have seen, SF is subject to the same conditions in the two cases, regarding the choice of categories moved and the locality conditions. Apparently the grammar of the languages concerned makes available a movement operation moving a category to the position of a subject gap. This movement has a different function in subject extraction clauses and impersonal clauses. We would therefore not be surprised to find a language which has one but not the other. In fact, according to Cecilia Falk (p.c.) it could be noted that Falk (1993) claims that Old Swedish does not seem to have main clause SF, while SF is common in embedded clauses.

10 Conclusion

In the introduction I posed the following questions, identified as key questions in the study of SF: What kind of movement is SF? Does it fall into any of the established types of movement (A-movement, A-bar movement, head movement), or is it a distinct, new type of movement? Is it movement in the phonological component? What function does it have, or, in other words, what is the movement trigger? Are there similar movements in other languages?

I believe we can be fairly confident that SF is not head-to-head movement, in spite of the claims that have been made to that effect in the literature. At least it cannot be head-to-head movement universally, since what are unmistakably XPs undergo SF, in particular PPs, but also DPs. As argued, there are other reasons, as well, to reject the analysis where the fronted category is adjoined to I. The possibility was discussed that all SF is fronting of a phrase which in some cases is emptied of all constituents except the head. The question raised by such an analysis is, why must the fronted phrase be emptied in this way, in some cases? Why can't, for example, a ParticleP with verb and particle and possibly an object undergo SF?

It may well be argued that SF is a form of A-bar movement: the fronted category does not check case or agreement in the target position, and it is presumably 'reconstructed' in the sense that it is interpreted in its pre-movement position. On the other hand, as discussed already by Maling (1980/90) it differs in several crucial respects from classical cases of A-bar movement such as Topicalization and focus movement. For instance, it does not affect scope relations or information structure. This is consistent with the hypothesis that SF is in some sense phonological; it satisfies some condition which purely concerns form, and has no direct relation to meaning, similar in this sense to a phonological condition or rule (say, word stress rules or contraction rules). In a T-model grammar this could be formally expressed by locating SF after spell-out, on the PF-side. Some complicating factors were discussed, though; in particular the fact that SF treats purely functional auxiliary verbs differently from other verbs, implying that it is sensitive to the presence or absence of semantic features.

It was suggested that the function of SF in subject extraction contexts can be characterized as 'avoiding *that-t*'. As discussed, languages seem to use a variety of means to avoid *that-t*, some of which look rather similar to SF. In impersonal clauses SF seems to be a last resort operation to lexically fill the subject position, which is to say, it is related to the EPP and/or to V2. It is formally similar to LHM, perhaps more so than has been acknowledged in the literature.

As mentioned, the operation is aptly called stylistic, since its use is governed only by stylistic considerations. The stylistic considerations vary from case to case, though. Many cases of SF in main clauses, including (4) and (16), belong to a formal, or even archaic, register. But (75) may occur in informal discourse:[21]

(75) Greinilegt er að okkur vantar meiri peninga.
obvious is that we need more money
'It's obvious that we need more money.'

SF in embedded impersonal clauses can be found in colloquial registers as well as formal ones, and this is also the case with SF in subject relatives, while SF in embedded questions, or in connection with subject extraction from an object clause, again belongs to a formal, literary style. The optionality of SF in subject extraction contexts may, in fact, be a peculiarity of Icelandic, where *that-t* happens to be a perfectly acceptable configuration. In Faroese *that-t* is not acceptable (see Thráinsson et al. 2004: 216f.), and, as mentioned, SF is not generally optional in Faroese. The Dutch or Norwegian counterparts to SF discussed in section 9 are also not optional in quite the same sense as SF is in Icelandic.

NOTES

1 Many thanks to Thorbjörg Hróarsdóttir and Halldór A. Sigurdsson for their help with the Icelandic data.

2 The examples are mainly taken from the literature. The source is shown within parentheses. The abbreviations are:

J = Jónsson (1991)
M = Maling (1980/90)
RT = Rögnvaldsson and Thrainsson (1990)
S = Sigurðsson (1997)

3 There are a couple of small changes in the revised version. One is that the term 'stylistic inversion' is replaced by 'stylistic fronting'. The page numbers refer to the (1990) version.

4 There is topicalization in embedded clauses in Icelandic; see Rögnvaldsson and Thrainsson (1990). The examples are chosen to exclude this possibility, though: it does not occur in relative clauses, adverbial clauses, or in combination with extraction from an embedded clause.

5 So (17b) may be construed as an argument that there is no overt *wh*-movement in main clause subject questions in languages which have SF.

6 In (25) the adjective is not a complement of the verb, and is thus predicted not to undergo SF. Why, however, cannot the whole small clause move (given that some phrasal categories do undergo SF)? This is a question which we have no answer to, at present. It is interesting that the verb-particle construction appears to fall under the generalization that the head and its complement may both move, since the particle is not universally analyzed as a complement of the verb, but rather as the head of a small clause which is the complement of the verb. See for instance Den Dikken (1995c).

7 Rögnvaldsson and Thráinsson obviously want to avoid this conclusion, but their counterargument is unconvincing.

8 There is a curious exception to the locality of SF in Poole (1996):

(i) þetta er maðurinn sem ljúka vildi aldrei bókinni.
this is the man who finish wanted never the book

We expect fronting of the infinitival to be blocked by the adverb *aldrei*. As it happens, this is a case where there Icelandic speakers and linguists seem to disagree strongly:

Of the three that I have consulted, two assign (i) a star, while one (Poole's informant) regards it as acceptable, especially if the adverb is the negation *ekki*.

9 Neither the infinitive *að mála*, nor any one of its constituents can undergo SF, for some reason.

10 Jónsson needed this also to explain why, for instance, the negation blocks SF (analyzed as head movement to I) but does not block verb movement to I (V-to-I). The reason would then be that V-to-I is adjunction to the tense and agreement affix in I, which the negation cannot itself do, while SF is adjunction to V+Tns/Agr, which the negation can do. Therefore the negation blocks SF of a lower head but does not block V-to-I.

11 The term 'narrow syntax' implies that there is something like 'broad syntax', which would include at least some of the post-spell-out phonological component; see the text below.

12 That is a theory where sentences are derived strictly from bottom up by adding categories one by one to a derived structure, and movement is strictly cyclic in that once a movement has targeted a position P in the structure, no subsequent movement can target a position lower than P. See Chomsky (1993).

13 Cf., however, the classical analysis of *wanna*-contraction in Chomsky (1976), according to which a *wh*-trace blocks the contraction.

14 As observed by Halldor Á. Sigurðsson (p.c.) there are various complications regarding SF of DPs (perhaps not surprising, given that they are marginal to begin with). For instance, there is a contrast between (i) and (ii), which has to do with abstract vs. concrete reference. On the other hand, as shown by the (iii), in this case there is no clear specificity effect.

(i) þeir sem þessa erfiðu ákvörðun verða að taka
those that this difficult decision have to take

(ii) ?þeir sem þessa leiðinlegu bók verða að lesa
those that this boring book have to read

(iii) þeir sem erfiðar ákvarðanir verða að taka
those that difficult decisions have to take

15 Predicative adjectives cannot be topicalized in Icelandic, unlike Mainland Scandinavian, a fact which may or may not be significant in this connection.

(i) a. Syk er han ikke. Norwegian
sick is he not
'He is not SICK.'
b. *Veikur er hann ekki. Icelandic
sick is he not

VP-fronting, too, is not permitted in Icelandic, unlike Mainland Scandinavian; see Holmberg and Platzack (1995: 222).

16 Note, however, that Delsing (2001) has found some examples in Old Swedish of SF of a preposition whose complement is stranded, as in (i):

(i) huiuitna thz som vnder ær himblenom
everything that under is heaven
'everything that is under heaven'

17 Note that this will put the question of locality in a new light, though. Under the remnant movement hypothesis the category that is moved by SF in a case like (i) is not the category that is closest to the target position of SF (even abstracting away from the problem caused by the *wh*-subject, discussed around (49) above). In fact, since the structure prior to SF will be something like (ii), the category that is moved by SF is the category that is furthest away from the target position, namely the VP which has been evacuated by all its constituents except the main verb:

(i) Hver heldur þú að **stolið** hafi hjólinu?
who think you that stolen has the bike
'Who do you think has stolen the bike?'

(ii) $[_{IP}$ hafi+I [hjólinu$_i$ [(hver) $[_{VP}$ stolið t$_i$]]]]

18 Middle English seems to have SF, which is not surprising as it has several other properties of the sort which go together with SF in the sense that they are found in Icelandic, Faroese, and Old Scandinavian, but are lacking in Mainland Scandinavian and modern English; see Platzack (1987).

(i) bigat upon his wyf, that called was Prudence, a daughter which that called was Sophie. (Traugott 1972: 156)

19 In some of the LHM-languages the negation appears to move along with the verb, though.

20 Faroese has an interesting instantiation of this, noted by Barnes (1987), discussed also by Vikner (1995: 118) and Thráinsson et al. (2004): in subject relatives the 'relative complementizer' *sum* (the proper analysis of this category is controversial; see Holmberg 2000 for some discussion) can be omitted but only if SF applies:

(i) Tær konurnar, sum skulu vera heima, eru burturstaddar.
those women that should be home are away

(ii) *Tær konurnar, skulu vera heima, eru burturstaddar.

(iii) Tær konurnar, heima skulu vera, eru burturstaddar.

21 This word order (predicative adjective-BE-extraposed clause) is possible even in modern Swedish (in a somewhat formal style):

(i) Tydligt är att vi behöver mer pengar.
obvious is that we need more money

This suggests that we are not dealing with SF proper, but topicalization of a predicative AP.

5 Subextraction in Slavic languages
6 Conclusion

1 Introduction

Displacement is a core property of human language. Constituents can be rearranged in syntactic structure. In (1a), for example, the direct object noun phrase (*this car*) has been moved to the left periphery of the clause and no longer occupies its base position, i.e., complement to V, as in (1b):

(1) a. *This car* I really like.
    b. I really like *this car*.

In (1a), the noun phrase selected by the verb *like* is moved to a landing site within the so-called extended projection of that verb (cf. Grimshaw 1991), which is the clause (i.e. CP). The direct object remains within the structure projected from the verb, so to speak.

Turning to (2), the direct object *this car* is no longer part of the extended projection of the selecting verb *to like*. Rather, the direct object noun phrase has been moved out of the embedded clause and finds its landing site within the matrix clause.

(2) *This car* I believe [that you will really like –]

This instance of displacement is a case of *subextraction*: the direct object noun phrase is extracted from within the embedded clause. That is, it is moved to a landing position which is external to the extended projection of the head (*like*) with which it stands in a certain base relationship (in this case, a thematic relationship).

In the spirit of the search for restrictions on displacement, the question should be raised what restrictions hold on subextraction. Can any element be freely removed from the extended projection of some head X to which it stands in a particular relation? Schematically:

(3) $[_{yp} \ldots \alpha \ldots [_{xp} \ldots \beta\ X \ldots]]$
where α is the landing site and β the extraction site (order of X and β is irrelevant).

When X and β in (3) stand in a predicate–argument relationship, subextraction is generally allowed in a language like English:

(4) a. $[_{CP}$ *Whose throat* did you stick your finger $[_{PP}$ into –]]?
b. the man $[_{CP}$ *of whom* I saw $[_{DP}$ several pictures –]]
c. a man $[_{CP}$ *of whom* I'll never be $[_{AP}$ proud –]]

In these examples it is the complement to a lexical head (P, N, A) that has been extracted from the extended projection (PP, DP, AP) of this head.

Displacement very often does not apply to what is traditionally (cf. Chomsky 1970) called the specifier system of a phrase.[1] As illustrated in (5–8), for example, the specifier system of the noun phrase is inaccessible to movement operations: determiners carrying demonstrative or interrogative force and possessors like *whose* cannot be removed from the nominal domain. As shown by the b-examples, the entire noun phrase has to be fronted. Under the assumption that it is some grammatical property of the specifying element (e.g., a *wh*-feature) that triggers the displacement process, we can say that the determiners and the nominal possessor drag along the rest of the noun phrase. This phenomenon in which a category properly containing a category targeted for movement is displaced is termed *Pied-Piping* (cf. Ross 1986). (See chapter 50.)

(5) a. **This* I really like [– car]!
b. *This car* I really like –!

(6) a. **Which* do you like [– car]?
b. *Which car* do you like –?

(7) a. **What* he is [– a fool]!
b. *What a fool* he is –!

(8) a. **Whose* do you like [– car]?
b. *Whose car* do you like –?

As shown by (9) and (10), it is not only the specifier system of the noun phrase that is inaccessible to movement. Such modifying elements as attributive APs cannot be removed from the noun phrase either.

(9) a. **That big* John bought [– a car]!
b. *That big a car* John bought –!

(10) a. **How big* did John buy [– a car]?
b. *How big a car* did John buy –?

Examples (11) and (12) illustrate the inaccessibility of the specifier system for the adjectival domain: degree words like *that* and *how* cannot be extracted from the adjectival phrase. Also in this case, preposing must apply to the entire adjective phrase. More precisely: the degree word that is targeted for movement carries along (i.e., pied-pipes) the other material contained within the dominating AP.

(11) a. **That* she certainly isn't [– tall]!
b. *That tall* she certainly isn't –!

(12) a. **How* are you [– tall]? / *How* you are [– tall]!
b. *How tall* are you –? / *How tall* you are –!

The following question, of course, arises: what blocks subextraction of those (left-branch) specifiers and modifiers from within the nominal and adjectival domain?[2] A first attempt to answer this question was given in Ross (1986), who proposed his Left Branch Condition to account for the above-mentioned facts (see section 2). After Ross's formulation of this island constraint, alternative analyses were proposed that try to capture the impossibility of extracting left-branch elements from within the nominal and adjectival system in a language like English. These analyses are discussed in section 3.

Another question which arises: is this restriction on subextraction from noun phrases and adjective phrases a universal one? As Ross pointed out himself

(section 2), the answer is 'no'; there are languages (e.g., Russian and Latin) that quite freely permit extraction of specifying and modifying elements from within the nominal and/or adjectival domain. The question then, of course, arises what underlies this cross-linguistic variation in subextraction behavior. Section 5 discusses a number of proposals that have been made to account for this cross-linguistic variation. Besides languages quite freely permitting subextraction from noun phrases and/or adjective phrases, there are languages that in general exclude such subextraction but have one or more construction types that exceptionally permit subextraction. In section 4 one such construction will be highlighted, namely, the so-called *wat voor N*-construction in Dutch ('what kind of N'), a construction type which is also found in other Germanic languages. This nominal construction has the exceptional property that the left-branch interrogative element *wat* can be moved out of the noun phrase.

2 The Left Branch Condition

Ross (1986) was one of the first who observed the immobility of elements that specify or modify nominal and adjectival constituents. In order to account for this restriction on subextraction, he formulated his Left Branch Condition:[3]

(13) **Left Branch Condition (LBC):**
No NP which is the leftmost constituent of a larger NP can be reordered out of this NP by a transformational rule.

Reference to the notion 'left branch' is prompted by the fact that determiners, possessors like *whose*, and (AP-internal) degree words occupy a position to the left of the nominal/adjectival projection line. In the formulation of the condition it is the linear property of 'leftmostness' that determines the non-extractability of certain elements, i.e., NPs according to Ross. We should add immediately here that for Ross the categorial label 'NP' applies not only to a lexical item like *whose* in (8), but also to adjective phrases (as in (9–10)) and such degree words as *that* and *how* in (11–12). Given this assumption, the LBC correctly predicts the ill-formedness of the a-examples in (5–12).[4] In (8a), for example, the NP *whose* is the leftmost element within the containing NP and therefore cannot be moved out of it. In (12a), the NP *how* is extracted from the larger NP (*how tall*). Since *how* is the leftmost element within the larger NP, subextraction yields a LBC-violation. In (10a) it is the *wh*-degree word *how* that is targeted for movement. *How* itself cannot be fronted since it is the leftmost element within the NP *how big*: **How did John buy [[– big] a car]?* The NP *how big* cannot be fronted either; it is the leftmost element within the NP *how big a car*. The only legitimate displacement is movement of the entire direct object NP. So the interrogative degree word *how*, which is targeted for movement, drags along the dominating attributive AP and the dominating NP.

A question which obviously arises is whether the inaccessibility of left-branch elements (in the nominal and adjectival domain) is a universal property of human language. That is, is the LBC a universal constraint? As Ross (1986) himself already observed, in certain languages (e.g., Russian, Latin) subextraction of left-branch specifiers and modifiers is permitted. Consider, for example, the following examples from Polish, where a specifying or modifying element is removed from the containing noun phrase (examples from Rappaport 2000):

(14) a. *Czyją ukradłeś* [– książkę]? Polish
whose you-stole – book
'Whose book did you steal?'
b. *Jaką* kupiłeś [– książkę]?
what-kind-of$_{\text{Fem.Sg.Acc}}$ you-bought-book$_{\text{Fem.Sg.Acc}}$
'What kind of book did you buy?'
c. *Jak duże* widziałeś [– auto]
how big you-saw – car
'How big a car did you see?'

About those languages which do not display the LBC-effect Ross (1986: 146) remarks, "As far as I know, it is only in highly inflected languages, in whose grammar the rule *Scrambling* appears, that the Left Branch Condition is not operative, but it is not the case that it is not operative in all such languages. [e.g., Finnish, NC] At present, therefore, I am unable to predict when a language will exhibit the Left Branch Condition and when not."[5] In section 5, a number of proposals will be discussed that try to account for this cross-linguistic variation in subextraction behavior.

Besides those languages which rather freely admit subextraction from the nominal and/or adjectival system, there are also languages which, on the whole, obey the LBC, except for some special construction(s). Consider, for example, the following cases:

(15) a. *Wat* heeft Jan [– voor boeken] verkocht? Dutch
what has John – for books sold
'What kind of books did John sell?'
b. **Welke* heeft Jan [– boeken] verkocht?
which has John – books sold
'Which books did John sell?'

(16) a. *Combien* a-t-il vendu [– de livres]? French
how-many has-he sold – of books
'How many books did he sell ?'
b. **Quels* a-t-il vendu [– livres]?
which has-he sold – books
'Which books did he sell?'

(17) a. *Ki-nek* akarod, hogy halljam [– a hang-já-t]? Hungarian
who-Dat you-want that I-hear – the voice-Poss.3SG-Acc
'Whose voice do you want me to hear?'
b. **Melyik* akarod, hogy halljam [a – hang-t]?
which you-want that I-hear the – voice-Acc
'Which voice do you want me to hear?'

In the a-examples in (15), (16), and (17), a left-branch element is removed from a containing noun phrase. In (15a) the *wh*-element *wat* has been extracted out of a so-called *wat voor N*-construction, yielding a discontinuous noun phrase. In (16a) the interrogative quantifier *combien* has undergone subextraction from within the noun phrase. In (17a), finally, a nominal possessor has been reordered out of the containing noun phrase (cf. Szabolcsi 1983). These subextractions are exceptional in those languages. In general, left-branch elements cannot be removed out of the noun phrase in those languages, as is illustrated by the b-examples.

Some instances of left-branch extraction have been noted for the adjectival domain. (cf. Grosu 1974; Bracco 1980; Rivero 1980; Rizzi 1990b; Corver 2000):

(18) a. *¿Cómo* dices que es [– de inteligente]? Spanish
how you-say that he-is – of intelligent
'How intelligent do you say he is?'
b. **Tan* es [– intelligente]
so-much he-is – intelligent
'He is so intelligent.'

(19) a. *Cît* e Maria [– de frumoasă]! Romanian
how-much is Mary – of beautiful
'How beautiful Mary is!'
b. **Ce* e Maria [– frumoasă]!
what is Mary – beautiful
'How beautiful Mary is!'

(20) a. *Quanto* è [– alto]? Italian
how-much he-is – tall
'How tall is he?'
b. **Troppo* è [– alto]!
too-much he-is – tall
'Too tall he is!'

The limited subextraction phenomenon exemplified in the a-examples in (15–17) and (18–20) raises the question why extraction is permitted in those cases. That is, in what way do these constructions differ from normal noun phrases or adjective phrases, which do not permit subextraction. In section 4, one construction type will be highlighted, namely, the *wat voor N*-construction, which is exemplified in (15).

3 Constraints on left-branch subextraction

We discuss here a number of analyses that have been given to account for the Left Branch effect. Each of these analyses relates the impossibility of subextraction to some grammatical property of the syntactic structure: (a) the linear or hierarchical position of the subextracted element (section 3.1); (b) the nature of the phrase dominating the left-branch element that is targeted for movement (section 3.2); (c) the licensing (i.e., proper government) of the trace left behind after subextraction (section 3.3); (d) the morphological or phonological interpretability of the syntactic structure after subextraction has applied (section 3.4).

3.1 Constraints in terms of the extraction site

In Ross (1986), the immobility of NP- and AP-internal left-branch specifiers and modifiers was noted. According to his LBC, the factor determining their immobility is their syntactic placement within the containing phrase (i.e., NP); that is, when some element α is leftmost within NP, α cannot be extracted out of that NP. Strictly speaking, the formulation in (13) does not account for the ungrammaticality of the following examples:

(21) a. **Very pretty* I saw [John's – daughter].
b. **Very intelligent* I met [several – girls].

In these examples the attributive AP is not the leftmost constituent of the containing NP. Nevertheless, subextraction is not permitted. Evidently, reference to leftmostness is too weak.

Emonds (1976, 1980, 1985) proposed various reformulations of Ross's LBC. In Emonds (1985) the following definition is given:

(22) **Generalized Left Branch Condition (GLBC):**
No syntactic category C^j to the left of the lexical head of an X^2 can be analyzed as a C^j by a transformation.

Like Ross's LBC, the GLBC states that the (linear) property of being to the left of the (lexical) head of a phrase is the relevant factor that accounts for non-extractability. Emonds's reformulation differs, however, in one crucial respect from Ross's LBC: the GLBC refers to all material to the left of the head of a phrase, not only to the constituent which is leftmost of the head of a phrase. So the ill-formedness of the examples in (21) is predicted.

Chomsky (1973: n 10) gives a reinterpretation of Ross's LBC as a condition that would prevent extraction of the specifier of an NP or an AP. He argues that the ungrammaticality of sentences such as (5–10) "can perhaps be attributed to a principle that requires that if the specifier of a noun phrase or an adjective phrase [. . .] is extracted, then the whole phrase must be extracted." As opposed to

Ross's LBC, which refers to the property of leftmostness, Chomsky's Specifier Constraint refers to the property of being in a certain hierarchical position within the phrase, namely, the specifier position of a phrase XP.

A similar reinterpretation of Ross's LBC is proposed by May (1977). He formulates the following condition:

(23) **Condition on Analyzability:**
If a rule Ø mentions SPEC, then Ø applies to the minimal [+N]-phrase dominating SPEC, which is not immediately dominated by another [+N]-phrase.

This condition states that if a transformational rule targets an element occupying the specifier position of a [+N]-projection (i.e., NP and AP), the dominating [+N]-projection is the category that is displaced. The addition "which is not immediately dominated by another [+N]-phrase" excludes displacements like (24):

(24) **Whose father's* did you see [– car]?

The *wh*-element *who*(*se*) is targeted for *wh*-movement. The containing NP (*whose father*) cannot be fronted, however, since it is immediately dominated by another NP (i.e., [+N]-projection).

The four constraints mentioned here (LBC, GLBC, the Specifier Constraint, and the Condition on Analyzability) all try to account for the impossibility of left-branch subextraction in English in terms of a property of the extraction site. This could be either the linear property 'leftmostness' or 'being to the left of the head', or the hierarchical property of being in the specifier position. The former refers to a string-peripheral position, the latter to a hierarchically peripheral position.

It is interesting to see that in the generative literature conditions have been proposed that claim exactly the opposite. These conditions state that extraction of some element A from within a phrase is only possible if A is in a string-peripheral/hierarchically peripheral position. An example of a condition stating the accessibility of string-peripheral positions is De Haan's (1979) Accessibility Condition.[6]

(25) **Accessibility Condition:**
No transformational rule can involve X^1, Y or X^2, Y in the structure:
$\ldots X^1 \ldots [_\alpha \ldots Y \ldots] \ldots X^2 \ldots$
where α is a bounding node,
unless Y is left peripheral in α, or
Y is right peripheral in α, respectively.

According to this condition, some targeted constituent Y can leave the dominating phrase (α) only if Y is in a peripheral position: left-peripheral for leftward subextraction, right-peripheral for rightward subextraction.

An example of a constraint stating that structurally peripheral positions are accessible to movement is Van Riemsdijk's (1978a) Head Constraint:[7]

(26) **The Head Constraint:**
No rule may involve X_i/X_j and Y_i/Y_j in the structure
$\ldots X_i \ldots [_H n \ldots [_{H'} \ldots Y_i \ldots H \ldots Y_j \ldots]_{H'} \ldots]_H n \ldots X_j \ldots$
(where H is the phonologically specified (i.e., non-null) head and H^n is the maximal projection of H, and H ranges over V, N, A, P.)

Van Riemsdijk points out that in a language like Dutch certain complements of P (namely, pronominal elements such as *het* 'it', *wat* 'what', *dat* 'that') are moved to [Spec, PP], where they change their formal appearance, i.e., they become R-pronouns (*er* 'there', *daar* 'there', *waar* 'where'). Due to this PP-internal movement the R-pronoun is no longer within the complement domain of P (i.e., H in (26)). Being in the specifier position of PP, the R-pronoun is accessible to transformation rules:[8]

(27) a. *Daar*$_i$ heeft Jan [$_{PP}$ t'$_i$ [$_{P'}$ op t$_i$]] gerekend. Dutch
there has John – on – counted
'That, John counted on.'
b. *Waar*$_i$ heeft Jan [$_{PP}$ t'$_i$ [$_{P'}$ op t$_i$]] gerekend?
where has John – on – counted
'What did John count on?'

As shown by the ill-formedness of (28), nominal elements that remain in the complement position within the PP cannot be reordered out of the PP (cf. (28a); pied-piping of the dominating PP is required, as in (28b)).

(28) a. **Wie*$_i$ heb je [$_{PP}$ [$_{P'}$ op t$_i$]] gerekend? Dutch
who have you on – counted
'Who did you count on?'
b. [Op wie] heb je gerekend?
on who have you counted
'Who did you count on?'

Obviously, if the Left Branch effect is not explained in terms of a distributional property of the extraction site (i.e., leftmost/string-peripheral within projection XP or hierarchically peripheral within XP), some other linguistic property must be found that is responsible for the non-extractability of NP- or AP-internal left-branch elements in a language like English.

3.2 Subextraction and the containing extraction domain

In section 3.1 several approaches to left-branch subextraction were discussed that tried to characterize the inaccessibility of certain constituents in terms of the (structural or linear) position of the element targeted for movement. Other approaches to the non-extractability of left-branch specifiers/modifiers have

emphasized properties of the extraction domain, i.e., the category (or categories) that contain the left-branch element.

3.2.1 The Relativized A-over-A Condition

Bresnan (1976c) tried to account for the restrictions on left-branch subextraction in terms of her Relativized A-over-A condition (RAOAC). This condition is a reformulation of Chomsky's (1964a) A-over-A Condition, which is stated in (29):

(29) **A-over-A Condition:**
In a structure $\ldots [_{A \ldots} [_{A} \ldots] \ldots] \ldots$, if a structural description refers to A ambiguously, then the structural description can only analyze the higher, more inclusive, node A.

The A-over-A Condition accounts for the facts in (30): fronting can only apply to the maximal (i.e., more inclusive) NP.

(30) a. **Whose* do you like [– car]?
b. *Whose car* do you like –?

Bresnan reformulates Chomsky's A-over-A Condition in two respects. First of all, she states that a phrase of type A (= the target predicate) that a transformation effects must be maximal, not in the absolute sense of Chomsky's condition given in (29), but with respect to the context predicates (i.e., the constant factor not operated on by the rule) of the structural condition in the transformational rule. Secondly, maximalization is considered to be a function of the categorial features (+/–N, +/–V) mentioned in the structural description of the transformational rule, rather than a function of the categories as such.

Consider now Bresnan's rule of question movement, which is a cross-categorial rule affecting such constituents as NP, AP, ADVP, and QP that begin with an interrogative morpheme (*wh*):

(31) $[_{S'}$ Q - W_1 – $[_{XP}$ *wh* – $W_2]$ - W3
1 2 3 4 5 →
2 4 2 0 5
(where Q represents the question complementizer)

The maximal projection XP in (31) is the target predicate, i.e., the element operated on by the transformational rule. Q (= Comp) is a context predicate; it dominates the node into which the *wh*-phrase is moved. The RAOAC predicts that the transformational rule of question movement can apply only when a proper analysis assigns a maximal value to XP for the fixed values Q and S' (i.e., the context predicates of the structural condition). Subextractions like in (30a) above and (32a) violate the RAOAC. The [+wh] possessor-NP and the [+wh] attributive AP satisfy the question movement rule (i.e., [+wh]NP/AP are constituents that

can substitute for Comp), but they are not the maximal values in relation to Comp. Movement of the entire direct object-NP, as in (30b) and (32b), satisfies the maximalization requirement.

(32) a. **How big* did he buy [– a car]?
b. *How big a car* did he buy?

3.2.2 The Subjacency Condition

Another constraint which ascribes the impossibility of certain movement operations to the configuration that contains the node to be moved is Chomsky's (1973, 1977b) Subjacency Condition.[9] This locality constraint states that a transformational rule cannot move a constituent from position Y to position X in a configuration like (33) if α and β are bounding nodes (NP and S being bounding nodes for English).

(33) . . . X . . . [$_{\alpha}$ . . . [$_{\beta}$ . . . Y . . .] . . .] . . . X . . .

Chomsky points out that various island constraints – the Complex NP Constraint, the *Wh*-island constraint, and the Subject Condition, for example – are subsumed under the Subjacency Condition. The possibility of deriving the ill-formed subextractions in (5–10) is not discussed in Chomsky (1973, 1977b).[10] Movement of determiners, possessors, and attributive APs from within the nominal domain to Comp always crosses two bounding nodes in English, namely, NP and S. So it seems that at least for English, part of the LBC-effects can be reduced to the Subjacency condition as formulated above.

Chomsky (1981: 168), however, points out that a Subjacency account of the ill-formed sub-extraction examples in (5–10) is unlikely, given the fact that similar sub-extractions are ill-formed in a language like Italian (cf. (34) and (35)), which, as argued by Rizzi (1982b), has NP and S' as bounding nodes for Subjacency. If Italian has S' rather than S as a bounding node, left-branch extraction out of a noun phrase is not blocked.

(34) **Questi* hai incontrato [$_{NP}$ – ragazzi]? Italian
which you-have met – boys
'Which boys did you meet?'

(35) *Quanti hai incontrato[$_{NP}$ – ragazzi]?
how-many you-have met – boys
'How many boys did you meet?'

In view of the fact that the LBC-effect cannot be subsumed under the Subjacency Condition, we should try to find some other principle of grammar to which it can be reduced. Chomsky (1981: 168) suggests that the Empty Category Principle (ECP) is a good candidate for explaining the impossibility of left-branch subextraction from NP. The ECP is discussed in section 3.3.

3.3 Subextraction and proper government

Another approach towards the restrictions on left-branch subextraction is in terms of the empty category (i.e., trace) left behind after movement. The principle of grammar regulating the distribution of (non-pronominal) empty categories is the Empty Category Principle (ECP) (cf. Chomsky 1980a, 1981). This principle requires that traces be properly governed (i.e., locally identified) by a proper governor. In Chomsky (1981), the relation of proper government is defined as follows:

(36) **Proper government:**
A properly governs B iff A governs B, and
(i) A is lexical (= X^o), or
(ii) A locally binds B

Under this approach, subextraction of NP- and AP-internal specifiers and modifiers is blocked due to the fact that the trace is not properly governed.

Chomsky (1981: 168) contains a short discussion of the non-extractability of left-branch possessor noun phrases from within NPs in English (e.g., **Whose did you see book?*). He accounts for the ill-formedness of this possessor-subextraction by stating that even though N governs the trace in the specifier position of NP, it does not *properly* govern this empty element; that is, N does not belong to the set of proper governors. This account of the non-extractability of left-branch possessors from within NP obviously extends to other left-branch effects, e.g., those involving determiners (cf. (5), (6)) and attributive APs (cf. (9), (10)).

Chomsky's analysis relies on the assumption that the trace occupying the specifier position of NP cannot be properly governed from outside. If proper government of the empty category in [Spec, NP] by a noun phrase-external proper governor (e.g., V) were possible, subextraction (e.g., of *whose*) should be permitted. Thus, the question arises as to what blocks proper government of the trace in [Spec, NP] by an external governor, say V. As pointed out earlier, Chomsky assumes that even though the trace is not properly governed by N, it falls within the government domain of N (for reasons of genitive-case assignment). Implicit in this analysis is the idea that potential proper governors that are external to NP do not have access to [Spec, NP] if this position falls within the government domain of the lexical head N. So, a trace always falls within the government domain of a single head. Giorgi and Longobardi (1991: 101) state this explicitly in terms of their Uniqueness Constraint on Government:[11]

(37) **Uniqueness Constraint on Government:**
If a position β is governed by a lexical head α, it has no other governors

They point out that left-branch possessors, attributive APs, and other left-branch elements that cannot be removed from within NP fall within the government domain of N; the reason is that these left-branch elements enter into a

case-dependency with N (i.e., N assigns genitive case to the possessor) or into an agreement relationship with N (e.g., in number or gender). With Chomsky, they assume that even though N governs these left-branch positions, it does not properly govern them.

Rizzi (1990b) also proposes an ECP-account for such ill-formed specifier extractions as *Whose did you see [– car]?* In contrast with Chomsky (1981) he adopts a conjunctive definition of the ECP. More specifically, he states that a non-pronominal empty category must be (i) properly head-governed and (ii) antecedent-governed or theta-governed (cf. Rizzi 1990b: 32). The former component of this formulation of the ECP captures the formal licensing relation; i.e., it characterizes the formal environment in which the null element can be found. The second component is the principle of identification, which recovers some contentive property of the null element on the basis of its immediate structural environment. As for the formal licensing relation, Rizzi assumes that a trace must be head-governed within the immediate projection of the head. In other words, complements to a head H are properly head-governed, specifiers are not. As a consequence, specifier (or modifier) extractions like those in (5–8) and (9–10) from within the nominal domain are impossible, given the fact that the trace left behind after subextraction falls outside the proper-head government domain of the head (N). It is furthermore assumed that potential proper governors (like V) do not have access to the NP- or AP-internal specifier position. In other words, government into the nominal domain is excluded. This opacity of the NP is determined as follows: even though N does not head-govern the specifier position, it has m-command over the specifier position. This way, the lexical head N always intervenes between the specifier of N and the external governor.

Giorgi and Longobardi (1991) and Rizzi (1990b: 111, n. 4) point out that the impossibility of specifier extraction from within AP (cf. (11), (12)) can be explained along the same lines: A is not a proper governor for the trace in [Spec, AP]. Government of the trace in [Spec, AP] by some external governor (say V) is blocked because the lexical head A protects its Spec-position for government from outside.

Thus far, it was shown that the restrictions on subextraction from NP and AP can be explained in terms of the theory of proper government (ECP), if it is assumed that N and A are not sufficient governors and that NP-/AP-external governors cannot govern into the nominal or adjectival domain. Of course, there are cases where subextraction is permitted: subject noun phrases in [Spec, IP] can be extracted from within IP (cf. (38)), and *wh*-phrases in [Spec, CP] (via successive cyclic movement) can be removed from CP (cf. (39)).

(38) *Who* (do you think) [$_{IP}$ – left]?

(39) *What* did she say [$_{CP}$ – [$_{C'}$ that [$_{IP}$ John bought –]]]

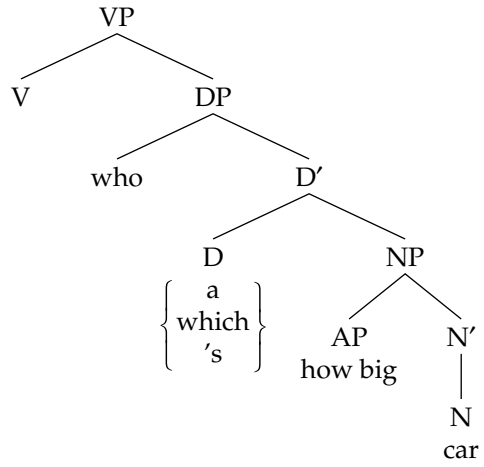
These examples show that certain specifier positions are accessible to subextraction. Giorgi and Longobardi (1991: 101) and Rizzi (1990b) relate this contrast in Spec-accessibility to the lexical/non-lexical distinction: Specifiers of I and C are available to external government, specifiers of lexical categories (e.g., N, A) are not.

The proper government-approaches discussed so far adopt the so-called lexical head analysis for noun phrases and adjective phrases: that is, specifying elements like *that*, *which*, *whose*, and *how* occupy the specifier position of a lexical head (N/A):

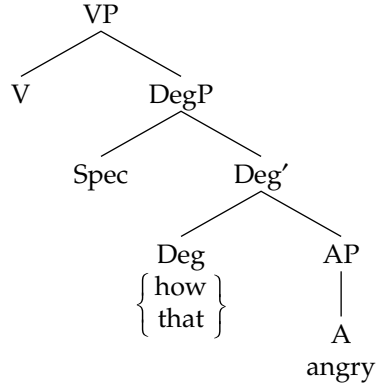
(40) a. [$_{NP}$ that/which/whose [$_{N'}$ car]]
b. [$_{AP}$ how [$_{A'}$ tall]]

In Corver (1990, 1992, 1997a, b) a proper-government approach towards the Left Branch effect is developed which makes use of the DP- and DegP-hypotheses for nominal and adjectival structures (cf. Abney 1987). The relevant structural configurations are then as in (41) and (42).

(41)



(42)



Adopting a Barriers-type theory of locality (cf. Chomsky 1986a), Corver accounts for the left-branch extraction effects in the following way. Subextraction of the *wh*-determiner *which* in (41) is blocked by ECP (and Subjacency). Being a head (D), *which* must move directly to the left periphery of the clause (CP). The *wh*-determiner cannot escape the barrierhood of intervening maximal projections (VP and IP) by

adjoining to them; this is due to the structure preservation requirement that a X°-category cannot adjoin to an XP-category. So, movement to the left periphery of the clause crosses two barriers: VP and IP (the latter by inheritance according to Chomsky's 1986a theory). This is represented schematically in (43).

(43) $[_{CP}$ Spec $[_{C'}$ C $[_{\mathbf{IP}} \ldots . [_{\mathbf{VP}}$ V $[_{DP} [_{D}$ *which*$]$ $[_{NP}$ car$]]]]]]$

After having been moved (directly) to the left periphery of the clause, the *wh*-determiner would not be able to antecedent-govern the trace. Moreover, Subjacency would be violated since two barriers (i.e., bounding nodes) would have been crossed.

The non-extractability of the attributive AP is explained as follows. Under the Barriers theory, both the NP and the DP would be barriers. NP is an inherent barrier because it is not governed by a lexical category (i.e., it is governed by D), and DP is a barrier by inheritance, i.e., it immediately contains an inherent barrier. Direct movement of the attributive AP out of DP would yield a subjacency violation. It should be noted, though, that the AP could escape a Subjacency violation by moving into [Spec, DP] before leaving the DP. This intermediate step crosses only one barrier, namely, NP. Even though a Subjacency violation may be circumvented this way, the trace in the original position of the moved attributive AP would not satisfy ECP. The trace is not lexically governed (i.e., N does not stand in a theta relation to the AP), nor is it antecedent governed; the NP-projection protects the trace in the original position from government from outside.[12]

The non-extractability of *whose* in (41) is explained as follows. With Abney (1987), Corver assumes that this possessor is not a constituent: *who* occupies [Spec, DP] while *-s* is the D-head. Given the fact that only constituents can move, *whose* is frozen in situ; fronting is possible only if the rest of the noun phrase is pied-piped.

Consider next the adjectival structure in (42). Extraction of the degree word is out for the same reason why determiners cannot be extracted. The Deg° must be moved directly to the left periphery of the clause; it cannot escape the barrierhood of intervening XP-categories (e.g., DegP, VP, IP) due to the fact that a X° cannot adjoin to a maximal category (XP). Fronting of the degree word makes it cross three barriers, yielding ECP- and Subjacency violations. Schematically:

(44) $[_{CP}$ Spec $[_{C'}$ C $[_{\mathbf{IP}} \ldots . [_{\mathbf{VP}}$ V $[_{\mathbf{DegP}} [_{Deg}$ how$]$ $[_{AP}$ angry$]]]]]]$

3.4 Subextraction and morphological/phonological constraints

Movement operations have often been formulated in terms of the category that is moved. For example, in a *wh*-movement construction like *Which car did you see?*, it is the *wh*-word *which* that is targeted by the movement rule. In Chomsky (1995c) it is not so much the category itself (say, D) that is targeted for movement, but rather some property of the feature inventory making up the category. In the case of a *wh*-determiner like *which*, it is a *wh*-feature rather than the category D

(i.e., the element instantiating the entire feature structure) which is targeted. It is further assumed that this feature associated with a lexical item is raised to some position in the functional domain where this feature is checked off (i.e., where it enters into a matching relation with a functional head which is specified for this grammatical feature). Chomsky (1995c: 262 ff.) assumes that for reasons of economy, the operation Move just seeks to raise the feature F (e.g., *wh*). More material is moved along (i.e., pied-piped) with the raised feature if this is needed for getting an interface representation that is interpretable. Chomsky argues that it is especially properties of the phonological component that require such pied-piping. Isolated features and other scattered parts of words may not be subject to phonological rules; the representation will be "unpronounceable". Chomsky further notes that there may be a morphological requirement that features of a single lexical item must be within a single X^o (cf. McGinnis 1995). Or, to put it differently, subextraction of a feature F from within the feature constellation making up a lexical item is impossible (at least in overt syntax). The targeted feature will move along the rest of the feature constellation making up the lexical item, and possibly other material will be moved along.

Chomsky gives the following example of this approach toward 'phonology driven' pied-piping: a *wh*-word like *who* has three components: the *wh*-feature, an abstract element underlying indefinite pronouns, and the feature [± human]. The operation of *wh*-movement raises just the *wh*-feature. Movement of this feature (i.e., subextraction from within the word) alone would result in an illegitimate PF-representation; the features making up the word would be scattered and consequently be unpronounceable. Therefore, at least the whole word *who* will have to be pied-piped in overt movement. Chomsky further points out that in a string like (45a) with the representation (45b), the *wh*-feature must drag along the entire DP.

(45) a. whose car
b. $[_{DP}$ who $[_{D'}$ -s(e) $[_{NP}$ car]]]

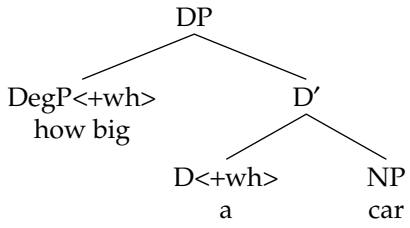
Raising of *who* alone leaves behind the sequence *-'s book*, which is an illegimate PF-object. *Who's* (= *whose*) cannot raise either since it is not a syntactic object (i.e., not a constituent), and hence not input to any movement operation (see also Corver 1990; 172). So, it is the entire DP (*whose car*) that must be moved in order to get a legitimate PF-representation. Thus, according to Chomsky (1995c), LBC-effects reduce to phonological and morphological requirements, rather than syntactic requirements like the ECP. Certain subextractions, that is, yield representations that cannot be interpreted by morphological or phonological rules.

Kennedy and Merchant (2000), too, argue that the principles underlying the LBC must be formulated in terms of PF representations. In line with the idea of Full Interpretation (cf. Chomsky 1995c), they argue that (at least) all terminal nodes must have a phonological value. In the Late-insertion model of Halle and Marantz (1993) the notion of 'having a phonological value' is implemented in terms of the presence or absence in the lexicon of lexical items instantiating the

featural combinations on syntactic objects. So, the syntax feeds the PF-interface by supplying the latter with feature bundles which the morphology must then make sense of, namely, by finding lexical items that correspond to the various feature combinations and inserting the items under the relevant nodes, which may then be pronounced. If the lexicon lacks an item with a particular feature specification, the derivation crashes: the PF representation is uninterpretable.

Kennedy and Merchant, who focus on the extractability of DP-internal APs, point out that the impossibility of extracting an attributive adjective phrase is due to an uninterpretable feature-combination created by agreement between a [+wh]DegP and the head of the nominal constituent in which it originates. Under the assumption that DegP-extraction from within DP proceeds through [Spec, DP] and that Spec–Head agreement takes place between a functional head and its specifier, the [+wh] feature on DegP is passed to the head of DP, deriving the structure in (46).

(46)



Subsequent subextraction of DegP does not alter the feature values in DP, leading to a PF-representation in which there is an occurrence of the [+wh]-feature on D. Such a representation, they claim, is uninterpretable because there is no D-element of English vocabulary that can be inserted into this context. Since Full Interpretation requires all symbols in the PF-representation to have a phonological interpretation (i.e., instantiated by lexical insertion), the derivation crashes.

Movement (i.e., pied-piping) of the entire DP (*how big a car*) to [Spec, CP] avoids a violation at PF. When the entire DP is pied-piped along with DegP, the [+wh]-feature on D (as well as DegP) is checked off in [Spec, CP] by a [+wh] C-head. Since the +wh-feature is no longer present on D, the indefinite article *a* can be lexically inserted in D.

4 Subextraction from the *wat voor N*-construction

4.1 Introductory remarks on the wat voor N-*construction*

As was noted in section 1, there are languages that do not permit (left-branch) subextraction from the nominal (or adjectival) domain, except for some special constructions. Dutch is such a language. Subextraction of specifying elements from within the nominal domain is ruled out in general. There is a nominal construction, however, which permits removal of a left-branch specifying element, namely, the so-called *wat voor N* ('what kind of N') noun phrase. This nominal construction

asks for the nature, quality, or sort of person or object. As shown in (47b), subextraction of the *wh*-element *wat* from within the noun phrase is permitted.[13] Sentence (47a) shows that the containing noun phrase can be pied-piped.[14]

(47) a. [Wat voor (een) boek]$_i$ heb je t_i gelezen?
b. Wat$_i$ heb je [t_i voor (een) boek] gelezen?

This same extraction pattern is found in many other Germanic languages:[15]

(48) a. *Was* hast du [– für ein Buch] gelesen? German
what have you – for a book read
'What kind of book did you read?'
b. *Hva* leser du [– for ei bok]? Norwegian
what read you – for a book
'What kind of book do you read?'
c. *Vad* läser du [– för en bok]? Swedish
what read you – for a book
'What kind of book do you read?'

Subextraction of *wat* obviously poses a problem for Ross's Left Branch Condition (or any of its reformulations; cf. sections 2 and 3.1). The *wh*-element is the leftmost constituent within the noun phrase and should therefore not be accessible to movement operations according to the LBC. Under Bresnan's Relativized A-over-A condition (section 3.2.1), the possibility of extracting the nominal element *wat* out of the containing noun phrase (*wat voor een boek*) is not expected either: it is the containing NP which is the maximal target predicate for question formation. As regards the Subjacency condition (section 3.2.2), the question obviously arises why movement of an element from within the noun phrase to the left periphery of the clause does not yield a violation of this locality constraint; this under the assumption that NP and S are the bounding nodes for Dutch.[16] And if one adopts an approach towards subextraction possibilities in terms of proper government (i.e., ECP), the question should be raised why the trace left behind in (47) is accessible to proper goverment, whereas a trace of some other *wh*-determiner (e.g., *welke* 'which') is not; see (49):

(49) **Welk* heb je [– boek] gelezen? Dutch
which have you – book read
'Which book have you read?'

All in all, the question that arises is the following: what property does the *wat voor N*-construction have that other nominal constructions also featuring a *wh*-determiner (e.g., *welke auto* 'which car') lack? In what follows, a number of analyses of the discontinuous *wat voor N*-construction will be presented. At the outset it should be pointed out that one logically possible analysis should be rejected immediately, namely, an analysis according to which (47b) does not

feature subextraction of *wat* but, rather, involves fronting of the entire noun phrase and subsequent extraposition of the sequence *voor (een) boek*. Such an analysis is excluded for the simple reason that the sequence *voor N* does not occupy an 'extraposed' position. In (50a), for example, the sequence *voor boek* precedes the verb and hence occupies a clause-internal (i.e., non-extraposed) position. If extaposition were involved, we would have the structure in (50b).[17] Notice also that the string *voor N* can be followed by an obligatory constituent selected by the verb; cf. (51).

(50) a. *Wat* heb je [– voor boek] gekocht? Dutch
what have you – for book bought
'What kind of book did you buy?'
b. #*Wat* heb je gekocht *voor boek?*
what have you bought for book
'What kind of book did you buy?'

(51) *Wat* heeft Jan [– voor boeken] op tafel gelegd?
what has Jan – for books on table put
'What kind of books did Jan put on the table?'

4.2 *Approaches to the split* wat voor N-*construction*

4.2.1 *Categorial change: the* wat voor N-*phrase as a [–V]-category*

Den Besten (1985) argues that the proper treatment of the split *wat voor*-construction involves subextraction of the question word *wat*. He assumes that extraction of *wat* from within the NP changes the categorial status of the containing noun phrase. After subextraction, the [t_i *voor N*]-phrase changes from [+N, –V]^3 into [–V]^3.

(52) [$_{-V3}$ wat [$_{-V2}$ [$_{-V1}$ [$_{-V}$ voor] [$_{NP}$ een auto]]]]

According to Den Besten, this categorial change is due to the presence of the preposition *voor*, which becomes the head of the [–V]^3-category after subextraction of *wat*. The [–V]^3-internal trace gets properly governed by the verb via the preposition which is the head of the [–V]^3-phrase. It is further argued that the switch from [+N, –V]^3 to [–V]^3 accounts for the absence of subjacency effects in the split wat voor-construction.[18] Under the assumption that [–V]^3 is not a bounding node, no subjacency violation is triggered if *wat* is moved to Comp, because S is the only bounding node separating the moved *wh*-element and its trace.

(53) Ik vraag me af [$_{S'}$ wat [$_{S}$ Jan [$_{VP}$ [$_{-V3}$ – voor een auto] koopt]]]. Dutch
I wonder Refl Prt what John – for a car buys
'I wonder what kind of car John will buy.'

Notice that this account holds only if the Subjacency condition is considered a condition on representations and not a condition on rule application. That is, the condition must apply to the output of the movement rule.

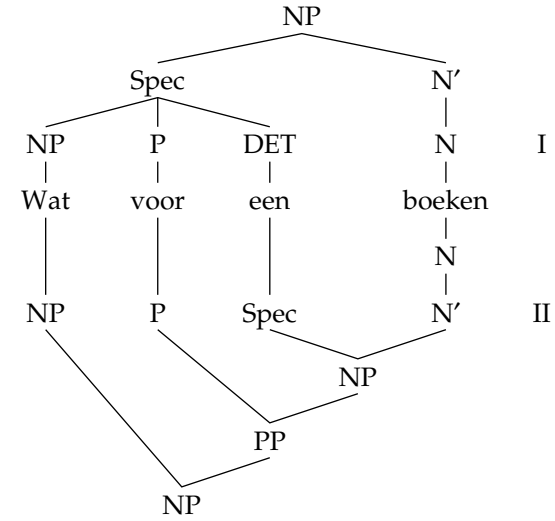
Den Besten further argues that the Left Branch Condition effect, which is said to be reducible to the ECP, is suspended because the trace of *wat* is licensed by the preposition *voor*. He claims that *voor* will not suffice as a proper governor itself since it is a weak governor. It is assumed that the lexical category V properly governs the trace of *wat* through the head of the new category $[-V]^3$, i.e., through the preposition *voor*. The property of proper government trickles down to the head [–V] (cf. section 3.3 for discussion of proper government of V into the noun phrase). So the *wh*-trace in $[-V]^3$ will be licensed (= properly governed) by a chain of governors.

In short, it is the categorial change of the containing noun phrase from [+N, –V] into [–V] that is of importance in this analysis: the [–V]-projection is not a bounding node for Subjacency; furthermore, this projection is accessible to government from outside. A noun phrase like *welke auto* ('which car'), which lacks a prepositional element like *voor*, does not permit such a categorial change. Subextraction of *welke* will be from within the maximal projection of [+N, –V] (i.e., NP) and consequently yield a Subjacency-violation and an ECP-violation (under the assumption that [Spec, NP] is not accessible to external governors; see section 3.3).

4.2.2 *The* wat voor N-*construction as a reanalyzed structure*

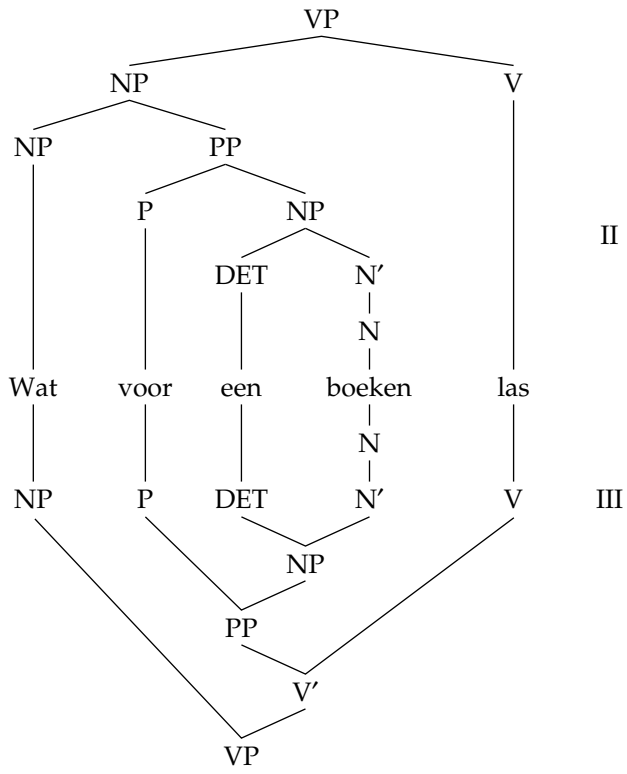
Bennis (1983) proposes that the string *wat voor N* is best viewed as a co-analyzed or reanalyzed structure. Co-analysis refers to a situation in which a string is assigned more than one structural analysis because of the ambiguous behavior of some linguistic element. The co-analyzed structure can be represented by a 'double tree representation', i.e., a tree with two dimensions. Under this reanalysis approach, the string *wat voor N* is assigned two structural representations: one in which *wat voor* forms a unit separate from N (dimension I in (54)) another in which *voor N* forms a unit that combines with *wat* (dimension II in (54)). The tree is displayed as two coexisting dimensions, each of which is a tree with its own properties.

(54)



Bennis notes that movement rules can apply to both levels of representation. He further argues that the reanalyzed structure in (54) as such cannot account for the split pattern. Removal of the question phrase *wat* would still be from within NP and consequently violate such principles as the LBC, the Subjacency Condition, and the ECP. It is therefore suggested that a second reanalysis operation applies to the output of the first reanalysis operation (i.e., the lower dimension in (54)). This yields a triple tree structure. For the sake of clarity, (55) only gives the two reanalyzed dimensions.

(55)



Dimension III permits extraction of the question word *wat*, which is no longer within the noun phrase after the second reanalysis operation has applied. The LBC is not violated in this dimension since the question word is not a left-branch specifier of the noun phrase in this third dimension. The Subjacency Condition is not violated either in dimension III because movement of *wat* crosses only the bounding node S. ECP is also satisfied, since the verb properly governs the trace of the moved question word.

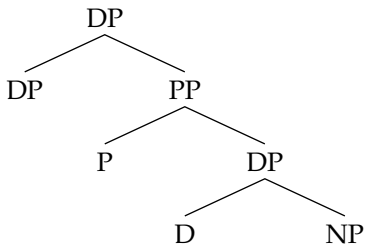
What distinguishes the *wat voor N*-construction from nominal constructions that do not permit left-branch subextraction is the property of reanalysis. The noun phrase *wat voor N* can be restructured in such a way that the *wh*-element *wat* is no longer part of the noun phrase. The underlying assumption is that

similar restructurings are not possible with such noun phrases as *welke auto* ('which car'), that do not allow subextraction of the *wh*-element.

4.2.3 The wat voor N*-construction as an adjunction configuration*

In Corver (1990; 1991b) it is argued that the proper analysis of a *wat voor N*-phrase like *wat voor een auto* is the one given in (56).

(56)



The interrogative element is the head of this phrase; the string *voor* (*een*) *N* forms a PP which is base-adjoined to DP. The optional article *een* occupies the lower D-position and takes an NP-complement. It is assumed that the DP *wat* is not an argument of some predicate; e.g., it is not assigned a theta role by the verb.[19] It is the entire *wat voor*-phrase which is the argument of the verb. It is further proposed that the PP headed by *voor* behaves as predicative phrase with regard to *wat*. Support for the predicative status of the PP headed by *voor* is given by the following examples, where *voor* also shows up in predicative contexts.

(57) a. Ik schold hem uit [voor (een) bedrieger].
I called him Prt for (an) impostor
'I called him an impostor.'
b. Ik hield het [voor waar].
I held it for true
'I took it to be true.'

Adopting a Barriers-type framework, Corver accounts for the possibility of subextracting *wat* in the following way. In (58) *wat* has been reordered out of a direct object noun phrase. Neither the Subjacency Condition nor the ECP is violated since the fronted *wat* can reach [Spec, CP] without crossing any barrier (i.e., a maximal projection that is not L-marked). The direct object-DP itself is L-marked (i.e., assigned a theta role by a lexical category) and therefore does not constitute a barrier for extraction. The potential barrierhood of VP can be voided via adjunction to it, and IP is not a barrier by stipulation. Schematically (note that the finite verb has been moved to C):

(58) $[_{CP}$ wat$_i$ $[_{C'}$ heb $[_{IP}$ je $[_{VP}$ t$_i'$ $[_{VP}$ $[_{DP}$ t$_i$ voor boek] gekocht]]]]]

(e.g., *welke auto*, 'which car') that do not feature subextraction. The former involves an adjunction configuration: a predicative PP is base-adjoined to the DP *wat*. In a nominal construction like *welke auto*, the *wh*-determiner *welke* heads the DP-projection and takes the NP *auto* as its complement: [$_{DP}$ [$_{D'}$ *welke* [$_{NP}$ *auto*]]]. The D-head cannot be extracted from within the containing DP; see Corver's analysis of the left-branch effect in section 3.3.[20]

4.2.4 *The* wat voor N-*construction as a predicate displacement construction*

The analyses presented thus far assume that the *wh*-element *wat* is base-generated as a left peripheral element within the containing noun phrase. Contrary to those analyses, Bennis et al. (1998) claim that the *wh*-element *wat* is in a derived position. They assume that *wat* originates as a DP-internal nominal predicate which is moved to the left periphery of the extended nominal projection (i.e., [Spec, DP]).[21] Obviously, this *wh*-movement process is similar to *wh*-movement within the clausal domain. According to this analysis, a noun phrase like *wat voor boeken* 'what for books' has the underlying structure in (59a). In this structure, the noun phrase contains a Small Clause structure (XP), which configurationally defines the predication relationship between *boeken* and *wat*. After predicate displacement has applied to the *wh*-word, *wat* ends up in [Spec, DP], which is the leftmost position within the nominal domain. This derived structure is given in (59b).[22]

(59) a. [$_{DP}$ [$_{D'}$ voor$_{[+wh]}$ [$_{XP}$ boeken [$_{X'}$ X wat]]]]
b. [$_{DP}$ wat$_i$ [$_{D'}$ voor$_{[+wh]}$ [$_{XP}$ boeken [$_{X'}$ X t$_i$]]]]

As depicted in (59), *voor* is taken to be a [+WH] operator head, i.e., a prepositional head with interrogative force. Evidence for this analysis comes from the fact that many southern varieties of Dutch and substandard Dutch in fact use *voor* as the infinitival complementizer in constructions that feature operator (OP) movement to [Spec, CP].

(60) een boek [OP$_i$ *voor* [$_{IP}$ t$_i$ in te kijken]] Dutch
a book OP for – into to look
'a book to look into'

(61) Dit is een man [OP$_i$ *voor* [$_{IP}$ PRO t$_i$ in het oog te houden]].
this is a man OP for PRO – in the eye to keep
'That is a man to keep an eye on.'

The subextraction phenomenon is not dicussed by Bennis et al., though it is quite clear that the subextraction possibility should be related to the fact that the fronted *wat* occupies the highest A'-position within the extended nominal projection. Analogous to subextraction from the clausal domain via [Spec, CP], elements leave the noun phrase via [Spec, DP]. On the assumption that the

specifier position of functional projections (like IP, CP, and DP) is accessible to an external proper governor, say, V, (cf. section 3.3) the extractability of *wat* is compatible with the ECP-constraint. Notice also that subextraction is compatible with Kennedy and Merchant's theory on subextraction (cf. section 3.4). They argued that subextraction from within a noun phrase (i.e., DP) is blocked if after subextraction has applied a nominal configuration is created with a feature specification on D for which no lexical item with a matching feature constellation can be found in the lexicon. Since the prepositional determiner *voor* carries the [+wh]-feature, subextraction of the *wh*-element *wat* from within DP does not yield an uninterpretable phonological representation.

4.3 A subject–object asymmetry

As first observed in Den Besten (1981), the *wat voor*-noun phrase can be split (by subextraction of *wat*) if it occupies the direct object position, but not when it is in the subject position of the clause, i.e., [Spec, IP] (see also Hoekstra 1984b; Koster 1987). Sentence (62) exemplifies subextraction of *wat* from a direct object noun phrase. The examples in (63) show that subextraction is not permitted when the *wat voor*-phrase is in [Spec, IP].

(62) a. *Wat* heb je [– voor boeken] gelezen? Dutch
what have you – for books read
'What kind of books have you read?'
b. *Wat* denk je dat Jan [– voor boeken] heeft gekocht?
what think you that John – for books has bought
'What kind of books do you think John bought?'

(63) a. **Wat* hebben [– voor mensen] gisteren hun huis verkocht?
what have – for people yesterday their house sold
'What kind of people sold their house yesterday?'
b. **Wat* denk je dat [– voor mensen] hun huis hebben verkocht?
what think you that – for people their house have sold
'What kind of people do you think have sold their house?'

Den Besten explains this subject–object asymmetry in terms of the Empty Category Principle (ECP). In (62), the trace left behind after subextraction of *wat* is properly governed by the verb which takes the noun phrase as its complement. The verb is able to govern the specifier position of the direct object noun phrase. For subjects, however, there is no proper governor, which explains the ungrammaticality of the examples in (63). Interestingly, a similar contrast can be observed in examples like (64) and (65).

(64) a. *Wat* werd hem gisteren [– voor iets] aangeboden?
what was him yesterday – for something offered
'What kind of thing was offered to him yesterday?'

b. *Wat* zijn hem toen [– voor rampen] overkomen?
what are him then – for disasters happened-to
'What kind of disasters happened to him?'

(65) a. **Wat* werd [– voor iets] hem gisteren aangeboden?
what was – for something him yesterday offered
'What kind of thing was offered to him yesterday?'
b. **Wat* zijn [– voor rampen] hem toen overkomen?
what are – for disasters him then happened-to
'What kind of disasters happened to him?'

If the contrast between (64) and (65) is to be explained in terms of ECP, it should be concluded that the grammatical subject *wat voor iets/wat voor rampen* (i.e., the noun phrase that agrees with the finite verb) occupies the (VP-internal) direct object position. Only in this position is the (specifier position of the) noun phrase properly governed by the verb. In (64a) it is a passive verb which acts as a proper governor; in (64b) an ergative verb properly governs the trace. In the ill-formed examples in (65) the grammatical subject is in the structural subject position, i.e., [Spec, IP], hence, no longer within the proper government domain of the verb. Consequently, subextraction is not permitted.

5 Subextraction in Slavic languages

As Ross (1986: 145ff.) himself already observed, left-branch-specifying or modifying elements can be removed from the nominal domain in a language like Russian:[23]

(66) a. *Č'ju knigu* čitaješ –? Russian
whose book you-are reading-
'Whose book are you reading?'
b. *Č'ju čitaješ* [– knigu]?
whose you-are-reading – book
'Whose book are you reading?'

Given the well-formedness of the subextraction in (66), Ross concludes that the LBC is not operative in Russian. The question, of course, arises whether this difference in subextraction behavior can be reduced to some grammatical property on which languages can vary. As was already hinted at by Ross, languages violating the LBC are characterized by a rich morphology. One might therefore want to propose that discontinuous patterns are possible as long as the dependency between the extracted specifier (e.g., in (66)) and the remote head (*knigu*) is morphologically recoverable. This is the approach taken by Horn (1974, 1978, 1983). He proposes a condition called the Noun Phrase Constraint (NPC), which excludes removal of any element from within the noun phrase. So this

locality constraint rules out left- and right-branch extractions out of the English noun phrase:

(67) a. **Which* did you destroy [– book]?
b. **About whom* did you destroy [a book –]?

Horn points out that in a language like Polish, subextraction of an agreeing element – which typically occurs on a left-branch – is permitted, while extraction of a non-agreeing constituent (e.g., a PP) is not:

(68) a. *Jakie* pożyczyłeś [$_{NP}$ – książki] z biblioteki? Polish
which-Acc you-borrow – books-Acc from library
'Which books did you borrow from the library?'
b. **O kim* on zniszczył [$_{NP}$ książkę –]?
about whom he destroyed book-Acc
'He destroyed a book about whom?'

Adjectival forms like *jaki* are marked morphologically to agree with the head noun that they are related to in gender, number, and case. In contrast, PPs are not marked according to whether they occur in an NP. On the basis of the asymmetry in (68), Horn concludes that "the NPC is valid in Polish, but can be overridden just in case there are morphological markers present in the surface structure that can function to associate a constituent in Comp with an empty node elsewhere in the structure" (Horn 1983: 188).

In Corver (1990, 1992), a different approach is taken to the asymmetry between left-branch subextraction languages and non-subextraction languages. He relates the contrast to the configurational structure of the noun phrase, more specifically, the presence of the DP-layer within the extended nominal projection. That is, languages whose nominals project to DP do not permit subextraction of specifying or modifying elements. Languages whose nominal projections lack the DP-level (i.e., 'bare' NPs) permit subextraction from the nominal domain.[24] The impossibility of subextraction from DP in a language like English has been discussed in section 3.3. As regards the transparancy of bare NPs, consider the following structural environment, where α is the left-branch element targeted for movement:

(69) [$_{CP}$ . . . [$_{VP}$ V [$_{NP}$ α [$_{N'}$ N]]]]

In a Barriers framework, the extractability of left-branch specifiers (and modifiers) follows directly. The NP is L-marked by the verb and therefore does not constitute a barrier. Via intermediate adjunction to VP, the left-branch element can reach [Spec, CP] without violating Subjacency or the ECP. Schematically, (68a) has the following derived structure:

(70) [$_{CP}$ *Jakie*$_i$ [$_{C'}$ [$_{IP}$ . . . [$_{VP}$ t$_i$'[$_{VP}$ [$_{NP}$ – [$_{N'}$ książkę]]]]]]]

As pointed out by Corver (1990: 332), potential support for the claim that languages like Russian, Czech, and Polish lack a DP is the fact that they do not have articles corresponding to *the* or *a* in English (cf. also Zlatić (1997)). Clearly, articles are the canonical realizations of D.[25]

(71) Ptak patrzy na kota. Polish
bird looks at cat
'The/a bird is looking at the/a cat.'

Corver further argues that potential candidates for the category D, like demonstratives, possessive pronouns, etc., should be analyzed as adjectives (see also Horn 1978, 1983). Being adjectives, they are part of the NP-projection. Evidence for their adjectival status comes from the fact that demonstratives and possessive pronouns have (declension) endings similar to normal adjectives.

As pointed out in Rappaport (2000), a bare NP-analysis for those languages that permit left-branch subextraction raises the question why subextraction of right-branch elements (e.g., PPs) is not permitted either (see also Horn 1974, 1978, 1983). If V takes a bare NP-complement containing a PP, this PP should be able to leave the NP, since the latter is L-marked by the verb and, therefore, not a barrier for extraction. As shown by the following examples, however, PPs cannot be removed from within the noun phrase (see also Horn); examples taken from Rappaport (2000):

(72) a. **Z czym* postrzelili przed domem [chłopca –]? Polish
with what he-shot in-front-of house boy
'With what did they shoot [a boy –] in front of the house?'
A: Ze skakanką
with jump.rope
A: with a jump rope
b. **Od kogo* zniszczyłeś [list –]?
From whom you-destroyed letter –
'From whom did you destroy [a letter –]?'

In English, right-branch adjunct-PPs cannot be removed either from within the noun phrase:

(73) a. Peter kissed [a girl with red hair].
b. *With what did Peter kiss [a girl –]?

As Culicover and Rochemont (1992) noted, the ill-formedness of (73b) can be explained straightforwardly if one adopts the DP-hypothesis. The category NP, by which the adjunct-PP is dominated, forms a barrier for extraction. Rappaport argues that if right-branch PP-extractions are blocked in English by the presence of a DP, the Polish facts in (72) suggest that NPs are associated with a DP in this

language as well. In other words, the 'right-branch effect' provides support for the presence of a DP-layer.[26]

If languages permitting left-branch subextraction and those blocking it share the same nominal phrase structure (i.e., DP), the question arises how to account for the left-branch subextraction asymmetry. Following ideas proposed by Giorgi and Longobardi (1991) in their account of possessor-extraction phenomena, Rappaport argues that extraction of some element Y from within the nominal domain is possible if (i) [Spec, DP] is available as an intermediate landing site for Y, and (ii) the trace in [Spec, DP] can be lexically governed from outside (e.g., by V) (cf. section 3.3). As regards the first condition, it is stated that only those elements can move through [Spec, DP] that enter into a Spec–Head agreement relationship with D (this is under the assumption that D is the locus of phi-features and case). This implies that agreeing elements like attributive APs, possessive pronouns, and agreeing *wh*-elements can move through [Spec, DP] whereas non-agreeing modfiers like PPs cannot. The second condition states that the element in [Spec, DP] can leave this position only if the trace left behind can be lexically governed from outside, e.g., by V. In languages like Polish and Russian, V is able to govern into DP: [Spec, DP], that is, is accessible to government from outside. In a language like English (and other languages blocking left-branch subextraction), V is not able to govern the specifier of a DP-complement. Thus, on this analysis, the parametric distinction between Polish and Russian, on the one hand, and, say, English, lies in whether or not V has the ability to govern inside its DP-complement.[27]

6 Conclusion

Displacement is a core property of natural language: satellite constituents of the verbal predicate can be reordered within the clausal domain, for example to [Spec, CP]. It was shown that it is sometimes not the entire satellite of the verbal predicate (say a direct object noun phrase) that moves to [Spec, CP], but a subpart of it (e.g., a left-branch *wh*-determiner). In those cases, subextraction applies to the satellite-XP: a left-branch element is moved out of the larger phrase that functions as an argument or a predicate within the clause. In certain languages, left-branch subextraction is blocked in general and is only found in certain construction types (e.g., subextraction of *wat* from within the *wat voor N*-construction). In other languages (e.g., Russian, Polish) subextraction of left-branch elements applies much more freely. The central questions that were addressed in this study were: (a) what grammatical property accounts for the inaccessibility of left-branch elements in those languages that generally block left-branch subextraction? (b) why are certain left-branch elements (e.g., *wat* in the *wat voor N*-construction) available for subextraction in those languages that generally do not allow subextraction? (c) what grammatical property explains the rather free accessibility of left-branch elements in such languages as Polish and Russian?

NOTES

1 Left-branch subextraction is permitted from the prepositional domain (cf. Emonds 1985; Corver 1990):

(i) a. *How far* did he go [– into the woods]?
b. *How many meters* did he raise his head [– above the water]?

2 Right-branch modifiers typically cannot be removed either from within the nominal domain (cf. Bach and Horn 1976):

(i) a. **With how many wheels* did John see [a car –]?
b. **From which shelf* did Susan read [a book –]?

This chapter focusses on left-branch subextractions; see section 5 for a brief discussion on right branch subextractions.

3 The impossibility of removing an NP from a larger, containing, NP is also captured by Chomsky's (1964a) A-over-A principle. This condition asserts that if a phrase X of category A (say, NP) is embedded within a larger phrase ZXW which is also of category A (say, NP), then no rule applying to category A applies to X (but only to ZXW); see also section 3.2.1.

4 Ross (1986: 127 ff.) does not discuss instances of determiner extractions, e.g., *Which did he buy [– car]?* Obviously, these cases of subextraction fall under the LBC, assuming that determiners are nominal (i.e., NPs).

5 Ross claims that the grammar of each language is provided with what he calls a *conditions box*, in which all language-particular constraints (e.g., the LBC) are stated once for the whole language. By a universal convention of interpretation, all conditions in the conditions box will be understood to be conditions on the operation of every rule in the grammar (topicalization, relative clause formation, question formation, etc.).

6 The idea that the periphery of a phrase is accessible to movement operations is also proposed in Chomsky (2000, 2001b). He formulates his Phase Impenetrability Condition (PIC), which states that the domain of a head H is not accessible to operations outside HP, but only H and its edge. The edge is defined as the residue outside of H-bar, i.e., SPECs or elements adjoined to HP. Direct extraction of an element from the complement position of H to a position external to HP is not allowed. Extraction from HP must always proceed via the edge of HP.

7 Van Riemsdijk notes that the Head Constraint can be interpreted in terms of the c-command relation: an element cannot be extracted out of a maximal projection if it is within the c-command domain of the head of that maximal projection.

8 Pied-piping of the entire PP is also possible; e.g., *Daarop heeft Jan gerekend* and *Waarop heeft Jan gerekend?*

9 Another locality constraint that captures the Left Branch effect is Horn's (1974, 1978, 1983) Noun Phrase Constraint (see also Bach and Horn 1976). According to this condition, no element can be removed from within NP. See also section 5.

10 Chomsky's (1973) n. 10 suggests that he does not assume that the Left Branch effect reduces to a locality constraint like Subjacency (see section 3.1. for discussion).

11 As Giorgi and Longobardi point out, their Uniqueness Constraint on Government can be subsumed under the Minimality condition (Chomsky 1986a).

12 The question arises why English allows such strings as *how big a car*. If these are derived by movement of the AP to [Spec, DP], one would expect an ECP-violation. Corver (1990: 320) tentatively proposes that such strings as *how big a car* are not derived by syntactic movement of *how big* to [Spec, DP] but rather by a PF-process that lowers the 'indefinite article' to a position in between the attributive AP (which is NP-internal) and the noun. See Kennedy and Merchant (2000), though, for an analysis in which the DegP moves to [Spec, DP] in syntax.

13 Certain exclamative constructions in Dutch also display a split noun phrase. As shown in (ia), the entire exclamative noun phrase can be fronted. (ib) exemplifies the split pattern, which arguably involves subextraction of the *wh*-element *wat*.

(i) a. *Wat een boeken* heeft Jan – gekocht!
what a books has John – bought
'The books John bought!'
b. *Wat* heeft Jan *een boeken* gekocht!

In Corver (1990) it is argued, though, that the split construction in (ib) does not involve subextraction from within the noun phrase; he points out that the element *wat* can be 'removed' from a noun phrase that is contained within an island (e.g., a PP-island; cf. (ii)).

(ii) a. *Wat* is Jan [$_{PP}$ met [*een leuke vrouw*] getrouwd!
what is John with a nice woman married
'John is married to such a nice woman!'
b. [$_{PP}$ Met [*wat een leuke vrouw*]] is Jan getrouwd!

Note that a *wat voor N*-noun phrase does not permit subextraction from such an island context (cf. (iiia)); pied-piping of the PP is required, as in (iiib).

(iii) a. *Wat is Jan [$_{PP}$ met [– voor een vrouw]] getrouwd?
what is John with – for a woman married
'What kind of woman is John married to?'
b. Met wat voor een vrouw is Jan getrouwd?

The phenomenon of subextraction from exclamative noun phrases has also been studied for Romance languages. See, for example, Gérard (1980), Milner (1978b), Obenauer (1976), and Radford (1982).

14 The indefinite article *een* is optional in the Dutch *wat voor N*-construction. A remarkable property of this indefinite article in Dutch is its cooccurrence with a plural N: *wat voor een boeken* ('what kind of books'). In Bennis et al. (1998), it is claimed that this (spurious) indefinite article does not belong to the following noun (and nor to the preceding *wh*-element). They argue that *een* is the head of a DP-internal Small Clause, i.e., X, in (59).

15 The *wat voor N*-construction has also been examined for other Germanic languages. See, e.g., Lie (1982) for Norwegian, Borjärs (1992) for Swedish, Den Besten (1981), and Beermann (1997) for German.

16 On the basis of the Swedish *hva for N*-construction, Lie (1982) proposes that S' rather than S is the bounding node for Subjacency in Swedish.

17 The observation that the string *voor N* may undergo PP Extraposition was made in Bennis (1983). There is vacillation about the well-formedness of such split patterns involving PP-extraposition (see Den Besten 1985).

18 Den Besten takes NP and S as bounding nodes for Dutch.

19 Evidence for the nonargument-status of *wat* comes from a number of phenomena: (a) movement of *wat* across a *wh*-island yields a strong (i.e., ECP) violation (cf. (i)); (b) *wat* cannot be moved across negation (i.e., sensitivity to the negative island effect; cf. (ii)); (c) the trace of *wat* cannot license a parasitic gap (*pg*) (cf. (iii)). See Corver (1990, 1991b), Honcoop (1998) for discussion.

(i) **Wat* vraag jij je af [wanneer Jan [– voor boeken] gekocht heeft]?
what wonder you Refl Prt when John – for books bought has

(ii) **Wat* heeft Jan niet [– voor boeken] gelezen?
what has John not – for books read
'What kind of books didn't John read?'

(iii) Wat heeft Jan [zonder PRO [*pg* voor tijdschriften] te lezen [– voor boeken] weggegooid?
what has John without PRO pg for magazines to read – for books thrown away

Extraction of argumental *wat* does not display the above-mentioned effects.

(iv) ??*Wat* vraag jij je af [wanneer Jan – gekocht heeft]?

(v) *Wat* heeft Jan niet — gelezen?

(vi) *Wat* heeft Jan [zonder PRO *pg* te lezen] – weggegooid?

20 Borjärs develops an analysis of the Swedish *vad for N*-construction in which *vad* is analyzed as the D-head and *for N* as the PP-complement of the *wh*-element. She points out that such an analysis leaves unaccounted for the subextraction contrast between a *vad for N*-construction and a nominal construction like *vilken N* (which N). She explores the possibility that *vad* is base-generated in [Spec, DP], a position which is accessible to movement.

21 See Postma (1994, 1995) and Bennis (1995) for a discussion of the meaning of *wat*. They both come to the conclusion that the meaning of *wat* is determined by the structural configuration in which it occurs. That is, if *wat* remains in its base position (e.g., complement to V), it gets an indefinite reading (cf. (i)), and if it occurs in the specifier position of an interrogative C, it gets an interrogative interpretation under Spec–Head agreement (cf. (ii)).

(i) Jan heeft wat gegeten.
John has what eaten
'John has eaten something.'

(ii) *Wat* heeft Jan – gegeten?
what has John eaten
'What did John eat?'

Bennis et al. (1998) assume that the element *wat* in the *wat voor N*-construction gets its interrogative force by occupying the Spec position of an interrogative (prepositional) determiner, namely, *voor*.

22 Bennis et al. (1998) argue that in *wat voor N*-constructions featuring the (spurious) indefinite article *een*, two types of predicate-movements take place. First, the nominal predicate *wat* undergoes Predicate Inversion (i.e., A-movement) to the Spec-position of some higher functional head F. This movement of the nominal predicate across the subject of the DP-internal Small Clause (*boeken* in (i)) can apply only if the indefinite article heading the SC has raised to the higher functional head F; this is so for reasons of locality (i.e., Equidistance, cf. Chomsky 1995c). The second step involves movement of *wat* from [Spec, FP] to the operator-position [Spec, DP]. Schematically:

(i) $[_{DP}\ wat_i\ [_{D'}\ voor\ [_{FP}\ t'_i\ [_{F'}\ X_j\ (= een) + F\ [_{XP}\ boeken\ [_{X'}\ t_j\ t_i]]]]]]$

23 In Rappaport (2000) it is claimed that the Left Branch Condition is observed in Polish for extraction from Adjective (and Adverb) Phrases. He gives the following examples:

(i) a. *Jak Piotr jest [– mądry]?
how Peter is – smart
'How smart is Peter?'
b. Jak mądry jest Piotr?

(ii) a. Jak on [– ładnie] recytuje wiersze?
how he well recites poetry
'How well does he recite poetry?'
b. Jak ładnie on – recytuje wiersze?
How well he – recites poetry

In Horn (1983), it is argued that sometimes left-branch subextraction from AP is possible. He gives the following examples from Polish:

(iii) *Bardzo* czuł się [– niepewnie].
very he-felt Refl – uncertainly
'He felt very uncertain.'

(iv) ?*Bardzo* studenci w mojej grupie są [– wysocy].
very students in my group are – tall
'The students in my group are very tall.'

In Borsley (1981), finally, it is observed that the uninflected *wh*-degree word *jak* ('how') cannot be removed from within the adjectival phrase in Polish (see also Rappaport 2000). He argues that subextraction is possible, however, when *jak* is inflected (cf. (vi)). As shown by the b-examples, pied-piping of the entire AP always yields a well-formed sentence:

(v) a. *Jak Jan jest przystojny?
how John is handsome
'How handsome is John?'
b. Jak przystojny jest Jan?

(vi) a. Jaki Jan jest przystojny?
b. Jaki przystojny jest Jan?

24 For other studies in which a bare-NP analysis is defended, see, among others, Rozwadowska (1995a), Willim (1997, 2000), Zlátić (1997), Stjepanović (2000).
25 See also Uriagereka (1988) for the observation that left-branch extraction correlates with the 'richness' of D. The Left Branch Condition, he argues, holds for languages with D rich.
26 For further studies on the Slavic noun phrase, in which a DP-structure is adopted, see, e.g., Fowler and Franks (1994), Babyonyshev (1998), Engelhardt and Trugman (1998, 2000), Progovac (1998).
27 In the final part of his paper, Rappaport (2001) presents a minimalist account of the left-branch effects, making use of Chomsky's Phase Impenetrability Condition (Chomsky 1998, 1999). See note 6.

> Condorcet, *Cinquième Mémoire sur l'Instruction Publique*

1 Introduction: on the syntax of questions in French

As has often been noted in the generative literature over the last 30 or so years – see, e.g., Kayne (1972) and (1975) and their references – the syntax of yes/no and *wh*-questions in Modern French is bafflingly rich; whereas 'well-behaved' languages like English treat their subjects, auxiliary verbs, and *wh*-phrases in all question types in a uniform fashion, as (1) shows, French has a much more intricate system, which distinguishes syntactically pronominal subjects and non-pronominal subjects (cf. (2), (4)), *wh*-questions and yes/no questions (cf. (3), (4)), and different types of *wh*-words (cf. (5) and (6)):

(1) a. (When, who) will {Yves, he} phone?
b. I don't know whether/when/who Yves/he will phone.
c. *I don't know whether/when/who will Yves/he phone.

(2) a. (Quand) va-t-il téléphoner?
when will-t he phone
b. *(Quand) va(-t-) {Yves, cet homme} téléphoner?
when will(-t){Yves, this man} phone
c. Quand va téléphoner {Yves, cet homme}?
when will phone {Yves, this man}
d. *Quand va téléphoner il?
when will phone he
e. À qui pense-t-il téléphoner?
to who thinks he (to) phone
f. *À qui pense(-t-) {Yves, cet homme} téléphoner?
to whom thinks {Yves, this man} (to) phone
g. À qui pense téléphoner {Yves, cet homme}?
to whom thinks to phone {Yves, cet homme}
h. *À qui pense téléphoner il?
to whom thinks to phone he
i. Quand téléphonera*(-t-)il?
when will-phone* (-*t*) he
j. Quand téléphonera(*-t-){Yves, cet homme}?
when will-phone(*-*t*){Yves, this man}

(3) a. Va-t-il téléphoner?
will-*t*-he phone
b. *Va téléphoner {Yves, cet homme}?
will phone {Yves, this man}

(4) a. Je ne sais pas {quand, à qui} il va téléphoner.
I don't know {when, to whom} he will phone
b. Je ne sais pas {quand, à qui} Yves va téléphoner.
I don't know {when, to whom} Yves will phone

c. *Je ne sais pas {quand, à qui} va-t-il téléphoner.
I don't know {when, to whom} will he phone
d. Je ne sais pas {quand, à qui} va téléphoner {Yves, cet homme}.
I don't know {when, to whom} will phone {Yves, cet homme}

(5) a. {À qui, quand}, à ton avis, a téléphoné Yves?
{to whom, when}, in your opinion, has phoned Yves
b. {À qui, quand}, à ton avis, a-t-il téléphoné?
{to whom, when}, in your opinion, has-*t* he phoned

(6) a. *Que, à ton avis, lui a téléphoné Yves?
what, in your opinion, to him has phoned Yves
b. *Que, à ton avis, lui a-t-il téléphoné?
what, in your opinion, to-him has-*t* he phoned

Examples (2a, b) and (2e, f) show that an auxiliary verb like *aller* or a main verb like *penser* can 'invert' with pronominal subjects like *je, tu, nous, vous, il(s), elle(s),* which thus come to precede infinitives or participles, although they cannnot 'invert' with non pronominal proper nouns like *Yves*; on the other hand, (2c, d) and (2g, h) show that a proper noun like *Yves* and a full DP like *cet homme*, unlike pronominals like *il*, can occur in post-infinitival or post-participial position.

In sentences with only one finite main verb like (2i, j) the pronominal- vs. non-pronomimal-subject distinction shows up in another guise; third person pronouns *il*(*s*) and *elle*(*s*) require the presence of the so-called 'epenthetic' *-t-* which full NPs like *Yves* ban, even though *il* and *Yves* are minimal pairs phonologically – [il] vs. [iv] – and differ only in their final consonant, which simply could not be responsible for the required presence/absence of *-t-*.

Taking up a time-honored terminonology – the justification of which we come back to presently – let us say that sentences like (2a, e) and (3a) are cases of Subject Clitic Inversion (SCLI) and (2c, g) and (4d) cases of Stylistic Inversion (SI); facts like (1) to (4) show, then, that SCLI is restricted to main (yes/no or *wh-*) questions while SI is restricted to ('local' – see Kayne and Pollock 1978, 2001: section 18) *wh*-contexts and can (optionally) occur in embedded clauses.[1]

In addition to SCLI and (some, see n. 2) SI sentences, French and Valdôtain[2] have a third type of mono-clausal[3] interrogative construction, the so-called complex inversion (CI) (see Kayne 1972, 1983; Rizzi and Roberts 1989a;[4] Roberts 1993a) which neither English nor most of the other Romance languages have; CI is examplified in (7):

(7) a. (Quand) {Yves, cet homme} va-t-il téléphoner?
(when) {Yves, cet home} will-t he phone
b. (À qui) {Yves, cet homme} va-t-il téléphoner?
(to whom) {Yves, cet home} will-t he phone
c. Martin mindze-të de seuppa?
Martin eats he the soup Valdôtain, Aosta

b. Pequè lo mèinô medze-t-i la pomma?
why the child eats-t-he the apple Valdôtain, St Nicholas

As has been repeatedly emphasized in the literature (cf., e.g., Kayne 1972, 1983), CI in French contrasts sharply with clitic left dislocations like (8) not only in terms of the position DPs like *Yves*, *cet homme* etc. stand with respect to the *wh*-phrase but also prosodically, as the obligatory coma intonation of (8) indicates:

(8) a. {Yves, cet homme}, (Quand) va-t-il téléphoner?
b. {Yves, cet homme}, (À qui) va-t-il téléphoner?

Furthermore, quantified DPs like *tout le monde*, *chaque homme* and bare QPs like *tout* or *rien* can occur in the preverbal position in (7) in French, though not in the CLLD position of (8), as (7′) and (8′) show:[5]

(7′) a. Quand rien ne s'est-il passé?
when nothing Neg Refl-is it happened
'When has nothing happened?'
b. Pour qui tout est-il toujours un problème?
for whom all is-it always a problem

(8′) a. *Rien, quand ne s'est-il passé?
nothing when Neg Refl-is it happened
b. *Tout, pour qui est-il toujours une problème?
all for whom is-it always a problem
c. *Tout le monde, pourquoi est-il parti?
everybody why is he gone
d. *Chaque homme, pourquoi n'aime-t-il pas la linguistique?
every man, why Neg-likes-he not linguistics?

It would thus appear that *Yves* and *cet homme* in (7) stand in the same position with respect to the *wh*-phrases as the 'ordinary' subjects of embedded questions like (9):

(9) a. Je ne sais pas quand {Yves, cet homme} va téléphoner.
I do not know when {Yves, this man} will phone
b. J'ignore à qui {Yves, cet homme} va téléphoner.
I don't know to whom {Yves, this man} will phone
c. On voudrait savoir quand rien ne s'est passé.
one would like to know when nothing happened
d. Dis moi pour qui tout est toujours un problème.
tell me for whom everything is always a problem

Put in another way, elementary facts like (7) vs. (8) or (7′) vs. (8′) provide fairly direct evidence that the position in which *Yves*, *cet homme*, *tout*, *rien* are standing

in (7) and (7′) is closer to the ordinary subject position of simple statements like (10a, b, c) than to the CLLD position of (10d, e, f):

(10) a. {Yves, cet homme} va téléphoner.
{Yves, this man} will phone
b. Rien ne s'est passé.
nothing happened
c. Tout est toujours un problème pour Paul.
everything is always a problem for Paul
d. {Yves, cet homme}, il va téléphoner.
{Yves, this man}, he will phone
e. *Rien, il ne s'est passé.
nothing it happened
f. *Tout, il est toujours un problème pour Paul.
everything, it is always a problem for Paul

However, like SCLI but unlike SI and, of course, simple statements like (10a, b, c), CI is restricted to root (interrogative)[6] contexts:

(11) a. *Je ne sais pas quand Yves va-t-il téléphoner.
I don't know when Yves is he going to phone
b. *Dis-moi à qui Yves va-t-il téléphoner.
tell me when Yves is going to phone
c. *L'homme à qui Yves va-t-il téléphoner s'appelle Jean.
the man to whom Yves will he phone is called John
d. *C'est Jean à qui Yves va-t-il téléphoner.
it's Jean to whom Yves will-he phone

The explanatory task of the linguist attempting to shed light on CI is thus by no means trivial: he must both account for the properties shared by CI and SCLI – in particular he must offer an account of the two constructions that explains their common restriction to root (interrogative) contexts, say, why both require what we have dubbed empenthetic *-t-* on the finite verb with postverbal third person pronouns and why the postverbal position of CI and SCLI is restricted to pronominals – and somehow capture the traditional grammarians' intuition that CI is at the same time a 'non-inverted' structure. In addition he should also say in what way and why CI and SCLI differ from SI.

We shall try to answer all these questions in this chapter. The essential element in the analysis to be developed will consist in claiming that the displacements to the left periphery at work in CI and SCLI share one important property with the computations that yield SI configurations on the analysis of Kayne and Pollock (2001): they are yet another instance of Remnant IP movement to the Comp area. Sections 2, 3, and 4 lay the groundwork by providing an analysis of subject clitics and an account of their non occurrence in SI. Sections 5 and 6 will introduce the Remnant Movement analysis of SCLI and CI and show in what way it is superior

to previous head movement analyses, whether taken to involve overt or covert computations to the left periphery; section 7 will develop an account of the morphology–syntax interface in SCLI and CI that will shed light on further properties of these constructions in French and Valdôtain and explain why the two constructions yield the spell-out strings that they do. Section 8 concludes and summarizes the chapter.

2 Subject clitics[7]

In saying that paradigms like (2), repeated here as (12),

(12) a. (Quand) va-t-il téléphoner?
when will-t he phone
b. *(Quand) va(-t-) {Yves, cet homme} téléphoner?
when whill(-t){Yves, this man} phone
c. Quand va téléphoner {Yves, cet homme}?
when will phone {Yves, this man}
d. *Quand va téléphoner il?
when will phone he
e. À qui pense-t-il téléphoner?
to who thinks he (to) phone
f. *À qui pense(-t-) {Yves, cet homme}téléphoner?
to whom thinks {Yves, this man} (to) phone
g. À qui pense téléphoner {Yves, cet homme}?
to whom thinks to phone {Yves, cet homme}
h. *À qui pense téléphoner il?
to whom thinks to phone he
i. Quand téléphonera*(-t-)il?
when will-phone* (-t) he
j. Quand téléphonera(*-t-){Yves, cet homme}?
when will-phone(*-t){Yves, this man}

show that French SCLI and SI treat pronominal and non-pronominal subjects differently, we have been insufficiently precise since this terminology would lead one to expect strong – or 'tonic' – pronouns like *lui* or *toi* to behave like *il* in SCLI constructions, contrary to facts; such strong pronouns behave exactly like proper nouns and full DPs:

(13) a. *Quand va {lui, toi} téléphoner?
when will {him, you} phone
b. *Quand va(-t-) {Yves, cet homme} téléphoner?
when will(-t-) {Yves, this man} phone
c. *À qui pense {lui, toi} téléphoner?
to who thinks {him, you} (to) phone

d. *À qui pense(-t-) {Yves, cet homme} téléphoner?
to whom thinks {Yves, this man} (to) phone

Pairs like (12a–13a) and (12e–13c) should, of course, be tied to other well-known differences between the two classes of pronominal forms: *je*, *tu*, *il*, *elle*, *nous*, *vous*, *ils*, *elles* – also *ce* and *on* –[8] are nominative *weak* or *clitic* pronouns while *moi*, *toi*, *lui*, *eux*, *elles* are strong or tonic pronouns.[9] Independently of their specific role in SCLI or CI, *je*, *tu*, *il*, *elle*, *nous*, *vous*, *ils, elles*, *ce*, and *on* exhibit a number of characteristic properties that distinguish them from strong pronouns (cf. Kayne (1975, section 2.4)):

(i) Unlike strong forms, (nominative) clitics cannot be modified:[10]

(14) a. Partiront-ils *(deux)?
will go they two
b. Partirez vous *(autres).
will go you others
c. Ils *(deux) partiront demain.
they (two) will go tomorrow
d. {Eux, nous} deux partiront demain.
{They, us} two will go tomorrow

(ii) Unlike strong forms and full DP subjects they cannot be conjoined:

(15) a. Partiront-ils *(et elles).
will go they (Masc.) and they (Fem.)
b. Viendrez-vous *(et Jean).
will come-you and John)
c. Ils *(et elles) partiront demain.
they (Masc.) and they (Fem.) will-go tomorrow
d. Eux et elles partiront demain.
they and they will go tomorrow

(iii) Unlike strong forms and full DP subjects they cannot be felicilitous answers to *wh*-questions:

(16) A. Qui viendra?
'Who will come?'
B. a. *il, *tu, *on, (he, you, one)
b. lui, nous, vous, Jean (he, we, you, John)

(iv) Unlike strong pronouns and full DP subjects, they cannot be separated from the finite verb by anything except other clitics (accusative *le*, *la*, *les*, etc.), dative (*lui*, *leur*), subnominal (*en*),[11] or locative (*y*); so, for example, parentheticals cannot occur in between clitics and the finite verb, while they can intervene between strong pronouns, full DPs and the finite verb:

(17) a. *Il, paraît-il, aime la linguistique.
he, it appears likes linguistics
b. *Tu, m'a-t-on dit, partiras bientôt en vacances.
you, I have been told, will soon go on vacation

(18) a. Lui, paraît-il, aime la linguistique.
Him it appears likes linguistics
b. Yves, m'a-t-on dit, partira bientôt en vacances.
Yves, I have been told, will go soon on vacation

(v) Unlike strong pronouns and full DP subjects, (nominative) clitics cannot occur in Clitic left dislocated positions:

(19) a. *Il, il viendra.
he he will-come
b. *Tu, tu te trompes.
you you are mistaken

(20) a. Lui, il viendra.
him, he will-come
b. Toi, tu te trompes.
you, you are mistaken
c. Yves, il est parti en vacances.
Yves, he is (=has) gone on vacation

(vi) Plural nominative clitics trigger obligatory /-z/ liaison with the following finite verb while ordinary singular /z/ 'liaison' is impossible with proper nouns (cf. (21b) and plural liaison is never obligatory (cf. (21c, d)); on (21c, d), see note 27:

(21) a. {Ils, elles, nous, vous} *(-z) {ont, avons, avez} compris.
{they, we, you} *(-z) have understood
b. Yves (*-z) a compris.
Yves (*-z) has understood
c. Mes amis (-z) ont compris.
my friends (-z) have understood
d. Eux (-z) ont compris.
them (-z) have understood

3 Subject clitics, strong pronouns, 'pro', and stylistic inversion[12]

We shall start our analysis of subject clitics with an account of the ungrammaticality of examples like (22),

(22) a. *Quand va téléphoner il?
b. *À qui ont téléphoné ils?
c. *Où ai été je?
d. *À qui as parlé tu?

which show that they cannot occur in SI; as in Kayne and Pollock (2001: section 6), we shall claim that (22) is to be seen in the same light as (19), on the one hand, and gerunds like (23) (= (58) in Kayne and Pollock 2001) on the other:

(23) a. Jean ayant dit la vérité, tout va bien.
John having told the truth, all goes well
b. *{Il, tu, je, nous, vous} ayant dit la vérité, tout va bien. he, you, I, . . .

Our claim is that these facts are tied to the overt case properties of the weak clitic forms *il*(*s*), *elle*(*s*), *je*, *tu*, etc. that distinguish them from morphologically caseless strong pronouns like *lui*, *eux* or full DPs like *cet homme*, *Jean*; we shall suggest further that the case properties of those two different types of pronominal subjects should be tied to the respective syntactic status of the clitic forms and the strong forms: the former are heads while the latter are phrases.[13]

As noted in Kayne and Pollock (2001: section 6) SI is compatible with strong (deictic[14]) third person pronouns:

(24) a. Qu'a mangé LUI?
what-has eaten he/him
'What has HE eaten?'
b. Quand ont téléphoné EUX?
when have telephoned they/them?

LUI and *EUX* can also surface in preverbal position:

(25) a. LUI a téléphoné.
he/him has telephoned
b. EUX ont téléphoné.
they/them have telephoned

First and second person strong pronons are excluded both in postverbal position in SI and in preverbal 'canonical' subject position:

(26) a. *Quand ai téléphoné MOI?
when have telephoned I/me
b. *Qu'as mangé TOI?
what have eaten YOU
c. *Quand avez téléphoné VOUS?
when have telephoned you
d. *Qu'avons mangé NOUS?
what have eaten we/us

(27) a. *MOI ai téléphoné hier.
I/me have telephoned yesterday
b. *TOI as mangé un gâteau.
you have eaten a cake
c. *VOUS avez téléphoné hier.
you have telephoned yesterday
d. *NOUS avons mangé un gâteau.
we/us have eaten a cake[15]

Any analysis of such contrasts should take into account the fact that (27) has an acceptable counterpart with an overt (nominative) subject clitic:

(28) a. Moi, j'ai téléphoné hier.
I/me I have telephoned yesterday
b. Toi, tu as mangé un gâteau.
you you have eaten a cake
c. Vous, vous avez téléphoné hier.
you you have telephoned yesterday
d. Nous, nous avons mangé un gâteau.
we/us we have eaten a cake

The preverbal third person strong pronouns of (25), although they do not need to, can co-occur with a subject clitic:

(29) a. Lui, il a téléphoné.
he/him, he has telephoned
b. Eux, ils ont téléphoné.
they/them, they have telephoned

Example (25) is somewhat 'recherché' whereas (29) is more colloquial. We now claim that (25) contains a covert subject clitic while (28) and (29) contain an overt one. We can now make use of Kayne and Pollock's (2001) principle (45), repeated here as (30),[16]

(30) Silent clitics in French are limited to the third person.

to account for the contrast between (24) and (26), and (25) and (27): these pairs follow if all of them necessarily contain a silent (preverbal) subject clitic; since (24) and (25) have third person subjects, they can without difficulty contain one in [Spec, Infl]. But in (26) and (27) that silent clitic would have to be first or second person, as (28) shows. Therefore (26) and (27) necessarily violate (30). Clearly, our use of (30) to explain pairs like (24) and (26) crucially relies on the idea that SI involves leftward movement of the subject out of IP to the Specifier of a higher functional projecton in the left periphery of the clause. What (30) says is that that movement leaves behind a covert subject clitic (on this and much else see Kayne and Pollock 2001).

Adapting ideas about complex inversion in Kayne (1972)[17] we say with Kayne and Pollock (2001) that the postverbal SI subject starts out as the DP specifier of a silent subject clitic that heads a larger DP, a Clitic Phrase. Once that larger DP reaches [Spec, IP], its DP specifier moves out into the Spec of another higher functional projection FP. In SI constructions, IP itself moves past [Spec, FP] to the Specifier of a still higher functional category GP – see also Rizzi (1997), Pollock et al. (2003) on the 'split' Comp domain thus presupposed. Abstracting away from the *wh*-phrase and representing the covert subject clitic as 'pro', a sentence like (31) would thus have the partial derivation in (32):[18]

(31) Le jour où a téléphoné Jean
the day when has telephoned John

(32) $[_{IP}$ Jean-pro a téléphoné $] \Rightarrow [_{FP}$ Jean$_i$ F^0 $[_{IP}$ t$_i$-pro a téléphoné$]] \Rightarrow$
$[_{GP}$ $[_{IP}$ t$_i$-pro a téléphoné$]_j$ G^0 $[_{FP}$ Jean$_i$ F^0 t$_j$$]]$

Granted this, we now come back to pairs like (33):

(33) a. Le jour où téléphonera Jean.
the day when will-telephone John
b. *Le jour où téléphonera il. . . . he

Sentence (33a) contains a silent clitic in addition to the postverbal lexical subject. As noted above, lexical subject and subject clitics also cooccur in cases like (34):

(34) a. {Jean, lui}, il mangera ce gâteau.
John, HE, he will-eat that cake
b. Il mangera ce gâteau, {Jean, lui}

Replacing the lexical subjects in (34) with a subject clitic leads to sharply ungrammatical sentences:

(35) a. *Il, il mangera ce gâteau.
he, he, he will-eat that cake
b. *Il mangera ce gâteau, il.

As in Kayne and Pollock (2001: section 6), though in a slighly different way, we attribute the unacceptability of (35) and (33b) – which contains two subject clitics, one of which is covert – to a factor also at work in pairs like (23), which we repeat and enrich in (36):

(36) a. Jean ayant dit la vérité, tout va bien.
John having told the truth, all goes well
b. {Eux, lui, elle} ayant passé l'examen, . . .
them, him, her having passed the exam, . . .

c. *{Il, ils, je, tu} ayant dit la vérité, tout va bien
he, they, I, you . . .
d. *{Moi, nous, vous, toi} ayant passé l'examen, . . .
{me, us, you} having passed the exam, . . .

The gerund form of the verb allows lexical subjects, including strong third person pronouns, as in (36b), but no clitic subject or strong first and second person pronoun;[19] It is worth noting that the first and second vs. third person contrast at work in (36) and SI pairs like (24) and (26) does not show up in infinitives like (37):

(37) {Eux, nous, vous, toi, moi} passer l'examen? Jamais!
{them, us, you, me} to take the exam, never

Let us start with the ungrammaticality of (36c). It will follow simply on the assumption that French subject clitics must check a nominative feature in an AgrS projection and that AgrS is missing in gerunds. If so, (36a, b) require that the (non-morphological) Case feature of third person strong pronouns and full DPs be checked some other way; we posit it is because such subjects can be in (a chain with a null pronominal in) [Spec, (finite) TP], which gerunds unlike infinitives have, as sketched in structure (38):[20]

(38) $[_{FP}$ {eux, lui, elle}$_i$ $[_{TP}$ [t_i pro] [ayant T^0] . . .]]

We say that the case feature (of pro, hence also that) of *eux*, *lui*, *Jean*, *cet homme*, etc. is checked off against that of finite T^0; in (39), however,

(39) $[_{FP}$ {il, je, tu}$_i$ $[_{TP}$ [pro t_i] [ayant T^0] . . .]]

the morphological case feature of clitics *il*, *je*, *tu*, etc. cannot be checked since they are not in the checking relation with the $AgrS^0$ they require; this, then, accounts for (36c); we exclude (36d) by claiming that for (40) to be acceptable clitic pro would have to be first or second person, which it cannot be, by (30).[21]

(40) $[_{FP}$ {moi, toi, nous, vous}$_i$ $[_{TP}$ [[t_i pro] [ayant T^0] . . .]]

As for (35), it has only one AgrS projection; one of the two subject clitics will therefore remain with an unchecked case feature, which results in the derivation crashing.[22]

Let us now at long last go back to unaccceptable SI sentences like (33b); on the derivation sketched above (33b) has the spell-out parse in (41):

(41) $[_{GP}$ $[_{AgrSP}$ t_i AgrS] $[_{TP}$ $[_{DP}$ pro t_i] [a T^0] . . . téléphoné]]$_j$ G^0 $[_{FP}$ il_i F^0 t_j]]

Structure (41) contains a complex DP subject – Kayne's (1972) clitic phrase – in which *il* is the (displaced) head and phrasal pro the specifier. If phrasal pro always had to check its Case feature in AgrSP the unacceptability of (33b) would be accounted for since there would be one nominative pronoun too many in such sentences, just as there is in (35). But ordinary gerunds like, say, *Ayant compris le problème, (je suis allé au cinéma)* ('having understood the problem, (I went to the cinema)') almost certainly have a phrasal pro subject whose (non-morphological) case must have been checked in [Spec, TP]; therefore in SI sentences like (33b) as well phrasal pro could be expected to check its Case in [Spec, TP], as (41) shows; *il* could then check its own morphologically overt case in AgrS before moving up to [Spec, FP], which should incorrectly allow (41) to converge. In short, an account of the ban of nominative clitics in SI sentences like (33b) in purely case theoretic terms requires that phrasal pro share all its case properties with overt nominative *clitics*, which would be unexpected for phrasal pro in the first place and which ordinary null subject gerunds show cannot be right.

We will correctly ban unwanted derivations like (41) if nominative clitics cannot undergo the movement to [Spec, FP] at work in SI. In line with much previous work on nominative clitics we claim that this is because they are heads[23] at the relevant point in the derivation, which will disallow the final displacements in (41), on the assumption that checking [+F] – a topic-like feature (see Kayne and Pollock (2001: note 21) – in derivations like (41) cannot be accomplished by head movement (in French).

4 (Subject) clitics as heads

Let us say that clitics like *il*, *elle*, *je*, etc. move as phrases from their input position in [Spec, vP][24] to [Spec, TP] – because they are the head of a clitic phrase and it is the clitic phrase as a whole that moves from [Spec, vP] to [Spec, TP] – but have to adjoin to $AgrS^0$ as heads. We claim further that unless final-head adjunction to $AgrS^0$ takes place a nominative clitic cannot check its uninterpretable case feature. We thus tie the case requirements of French nominative clitics to their status as heads: whereas phrases need only move to the Specifier position of finite IP – e.g., finite TP, as in gerunds – nominative clitics must head adjoin to $AgrS^0$.[25] Let us now say that once a string has adjoined as a head to some functional projection, it can no longer move as a phrase to a higher functional projection, in the spirit of Emonds's (1970) structure-preserving constraint; it follows, as desired, that nominative clitics cannot move from their $AgrS^0$ position to [Spec, FP] in (41).

In addition to this welcome result, we are now also in a position to account in the same terms for the properties of nominative clitics listed in (i) through (vi) in section 2. Let us start with the assumption that modification by numerals like *deux*, *trois*, etc., or by *autres* – as in, say, *nous deux*, *vous autres* – requires *nous*, *vous*, etc. to move to the specifier of the numerals or *autres*, *tous*, etc. This will exclude (14), repeated as (42), straightforwardly:

(42) a. Partiront-ils *(deux)?
will-go they *(two)?
b. Partirez-vous *(autres).
will-go you others
'Will you guys go?'
c. Ils *(deux) partiront demain.
they (two) will-go tomorrow
d. Eux deux partiront demain.
them (two) will-go tomorrow

Again, since *ils*, *vous* and *ils* in (42a, b, c) are clitics, they must adjoin to $AgrS^0$; if so they can no longer move to the specifier of the numerals or *autres*, *tous* etc. since this would require them to be phrases, which they can no longer be after adjoining to $AgrS^0$, again by some version of Emonds's structure preserving constraint. Should they fail to adjoin to $AgrS^0$, their uninterpretable nominative feature would survive at LF, causing the derivation to crash; sentences like (43),

(43) a. Partiront-ils *(et elles).
will-go they (Masc.) and they (Fem.)
b. Viendrez-vous *(et Jean).
will-go you and John
c. Ils *(et elles) partiront demain.
they (Masc.) and they (Fem.) will-go tomorrow
d. Eux et elles partiront demain.
them (Masc.) and them (Fem.) will-go tomorrow

can be dealt with in essentially the same way if (*et*) conjunctions have the simplified structure in (44) (cf. Kayne (1994: chapter 6)):

(44) $[_{ConjP}$ XP $Conj^0$ YP]

Clitics like *il*, *elle* in e.g. (43a) would rather require the structure in (45):

(45) $[_{ConjP}$ $[_{Cl^0}$ ils] $[_{C^0}$ et] $[_{Cl^0}$ elles]]

However, Kayne's LCA bans all such configurations – see Kayne (1994: chapter 6). If the clitics were merged as XP or YP phrases in (44) they would not be able check their uninterpretable Case feature since the conjunct *phrase* cannot head-adjoin to $AgrS^0$, evidently. This would prevent the case feature of the clitics from being adequately checked. In sum, none of the derivations that could yield (43a, b, c) will ever converge.

The fact that clitics cannot occur in (46B) (= (16B)) follows likewise from the natural idea that utterances in general and short answers like (46Bb) in particular can only be phrases. If *il*, *tu*, and *on* are so analyzed they fail to check their case feature, thus leading to ungrammaticality once more.

(46) A. Qui viendra?
B. a. *il, *tu, *on,
b. lui, nous, vous

The fact that unlike strong pronouns and full DP subjects, nominative clitics cannot be separated from the finite verb by a parenthetical, as (47) (= (17)) shows, would follow if parentheticals can merge only with the maximal IP projection AgrSP (and the maximal projection of the CP field, ForceP (see Poletto and Pollock 1999).[26]

(47) a. *Il, paraît-il, aime la linguistique.
b. *Tu, m'a-t-on dit, partiras bientôt en vacances.

As for the final morphosyntactic property that nominative clitics trigger obligatory /-z/ liaison with the following finite verb – cf. (21) – while strong pronouns, proper nouns, and full DPs cannot or need not, it follows from the hypothesized spell-out parse under the assumption that subject–verb 'liaison' can take place only between a head and its complement; on that view subject–verb liaison is comparable to obligatory liaison between a plural article and the following AP or NP as in, say, *les* *(-*z*) *enfants* ('the children'), *les* *(-*z*) *autres solutions* ('the other solutions'); here too *les* is a head and the liaison is between the final /-z/ in that head and the initial vowel in the following lexical item. In *Eux ont compris*, where no obligatory liaison takes place, on the other hand, *eux* is not a head but a phrase standing in the specifier of (some functional projection above) TP.[27]

In sum, it appears that all the specific (morpho)syntactic properties of (nominative) clitics reviewed above can be derived from their status as heads in conjunction with a set of fairly reasonable hypotheses concerning modification and coordination. We have also suggested a structural hierarchy for two different types of subject: strong (third person) pronouns and full DPs stand in [Spec, (finite) TP] while nominative clitics stand in $AgrS^0$ in a higher layer of the IP domain, missing in gerunds and infinitives.[28]

5 SCLI, CI, and movement to the CP field

As noted in section 1, the first major syntactic property of SCLI and CI constructions like (48),

(48) a. Quand ({Jean, Marie}) viendra-t-{il, elle}?
when ({John, Mary}) will-come {he, she}
b. À quoi penses-tu?
of what think-you
c. Partirons-nous?
will-go we

d. Qu'avez-vous compris?
What have you understood

is that it is sensitive to the root vs. non-root dimension:

(49) a. *Sais-tu quand ({Jean, Marie}) viendra-t-{il, elle}?
know you when ({John, Mary}) will-come {he, she}?
b. *Dis moi à quoi penses-tu?
tell me of what think-you
c. *J'ignore si partirons-nous?
I do not know whether will-go we
d. *Qu'as-tu dit qu'avez-vous compris?
what have you said that have you understood?

Since at least Den Besten (1983) such contrasts have been taken to follow from the fact that the CP domain of embedded clauses does not make available the position(s) to which the inflectional projection and the finite verb it hosts move in root clauses like (48); two variants of that idea have been explored in the literature on SCLI and CI in French; Kayne (1983), Roberts and Rizzi (1989), Laenzlinger (1998, section 3.1), among others, claim that in both constructions $Infl^0$ and the V^0 it hosts move in overt syntax to a position typically occupied by *que* in embedded clauses; on usual recoverability of deletion assumptions (cf. Chomsky (1965)) it follows that SCLI or CI cannot occur in embedded contexts, on the assumption that embedded C^0 is always lexically specified, even when it remains null (as in (49a, b)). Hulk (1993), Kayne (1994: chapter 6), Sportiche (1993b), and Friedemann (1997), on the other hand, claim that some such constraint is operative only at LF in (48) and they account for pairs like (50) and (51),

(50) a. *Sais-tu quand Paul viendra-t-il?
know you when Paul will-come he
b. *Dis moi à quoi Marie pense-t-elle?
tell me of what Mary thinks she

(51) a. Quand Paul viendra-t-il?
when Paul will-come he
b. À quoi Marie pense-t-elle?
of what Mary thinks she

by stating that although *Paul* and *viendra* stand in Spec IP and I^0 in (51) at Spell Out, I^0 must check some feature in the CP field at LF. Since no such feature is available in embedded contexts, (50) crashes while its presence in root contexts allows (51) to converge.

In this chapter we will not make use of the overt–covert distinction, in line with a radical interpretation of minimalist guide lines (see Chomsky 1995c, 1998, 2001b) attempting to eliminate feature movement, the last instance of covert

movement (see Kayne 1998), and we will claim, as Kayne (1983), Rizzi and Roberts (1989), and Laenzlinger (1998) did, that both CI and SCLI involve overt movement to the CP field;[29] like them, we shall maintain that the feature that triggers movement is non-existent in embedded clauses, thereby adopting an account of (48) vs. (49) and (50) vs. (51) very close in spirit to Den Besten's (1983): if this is right both (48) and (51) do involve overt, pre-spell out computations to the Complementizer area.

At the same time, we shall take seriously Kayne's (1994: section 4.6) arguments that negative, locative, subnominal, direct and indirect object clitics are not adjoined to the verb in sentences like (52):

(52) a. Pierre me l'a donné.
Peter to me it has given
b. Pierre ne lui a pas parlé.
Peter Neg to him has not spoken
c. Il ne m'en donnera pas.
he Neg to me of it will-give not
d. Elle m'y conduira.
she me there will-take

Rather, as in Kayne (1994) and Sportiche (1993b), we shall claim that those clitics are heads adjoined to specific functional projections – which Sportiche calls clitic voices – distinct from that to which the verb has adjoined. This conclusion is forced by the LCA, which we made use of in section 4 and therefore cannot disregard, and by independent arguments developed in Kayne (1994: section 4.6); to mention just two, he points out that certain clitics can fail to be adjacent to the verb, as in literary examples like (53a) and Classical French examples like (53b, c, d), from *Les lettres* de Madame de Sévigné,

(53) a. Il a dû en fort bien parler.
he must have of it very well spoken
b. [. . .] elle dit qu'elle lui doit tout son bonheur, par le soin qu'elle a eu de la bien élever.
she says she owes her her happiness because of the care she has had to her well bring up
c. [. . .] ils ont été affligés de ne vous point voir.
they were sorry to Neg you not see
d. Nous faisons une vie si réglée qu'il n'est quasi pas possible de se mal porter.
we lead such an orderly life that it is almost impossible to SE ill bear (= to be in poor health)

which suffice to show that (French) clitics need not/have not always adjoin(ed) to the verb; in addition, Kayne notes that claiming that they sometimes do would leave us without an account for the fact that referential expressions are typically

banned from appearing within words (compare OK *a self hater* and **an {it, her, you} hater*). Note also, with Hulk (1993: section 3.3), Kayne (1994: 45), and Terzi (1999: section 2), that on the standard assumption that in Romance imperatives the verb *does* move to some 'high' head position in the the CP field – see Terzi (1999) – the fact that in (54a) the clitics are obligatorily stranded by the verb is in itself an argument that no verb movement has applied in SCLI and CI sentences like (54b, c):

(54) a. Donne le lui!
give it to-him
b. Le lui donnera-t-il?
it to-him will-give you?
c. Pierre le lui donnera-t-il?
Peter it to-him will-give-*t*-him

Hulk (1993) and Terzi (1999) and her references – observes further that the negative head *ne*[30] blocks head movement in imperatives, as (55) shows:

(55) a. *Ne donne le lui pas.
b. Ne le lui donne pas.

and points out that if head movement was involved in (54b, c) one would expect, everything else being equal, perfectly fine SCLI and CI sentences like (56) to be ungrammatical, contrary to facts:

(56) a. Ne le lui donnera-t-il pas?
Neg it to him will-give you not
'Won't he give it to him?'
b. Pierre ne le lui donnera-t-il pas?
Peter Neg it to him will-give you not

Finally, Hulk (1993) makes the important observation that on Sportiche's (1988) account of Kayne's (1975) 'R-tous' configurations, in which the floating quantifiers are stranded by (the rest of the) DP moving to some higher position, we would expect CI constructions like *Mes amis n'ont-ils pas tous téléphoné?* (my friends NE have they not all phoned?) to have as an acceptable variant the ungrammatical **Mes amis n'ont-ils tous pas téléphoné?* (my friends NE have they all not phoned?). If the quantified subject *Tous mes amis* overtly moved from its subject position to some position in the Comp domain, as claimed in Kayne (1983), Rizzi and Roberts (1989), and Laenzlinger (1998), it is unclear why *tous* could not be stranded in the position it occupies in the well-formed *Tous me amis n'ont pas téléphoné*; so *tous* should be able to occur to the left of *pas* at Spell Out, contrary to facts.

We conclude, then, like Hulk (1993), Kayne (1994), and Sportiche (1993b) that SCLI and CI do not involve Verb movement to C and that the preverbal subject DP in CI is not independently attracted to some position in the CP field.

6 SCLI, CI, and Remnant Movement to the complementizer area

6.1 Remnant Movement

The two conclusions reached in the previous section are evidently paradoxical; we have claimed both that the root-non-root asymmetry displayed by SCLI and CI is the reflex of an overt displacement to the CP domain and, at the same time, that there is no verb movement to C^0 in SCLI or CI or subject movement to C in CI. Indeed, Hulk (1993), Kayne (1994), and Sportiche (1993b) all concluded from the facts mentioned in section 5 and from the functional position of clitics in such sentences that no overt movement to the CP field could have taken place. They all resorted to the idea that movement took place after Spell Out, at LF. Conversely, those linguists that have continued to claim that overt movement to the left periphery was involved in SCLI and CI, like Laenzlinger (1998), have attempted to deny that Kayne's or Sportiche's analyses of object clitics were correct.

Assuming they are indeed correct, as our arguments in the previous section indicate, note that the conclusion reached by Hulk (1993), Kayne (1994), and Sportiche (1993b) is the only logically valid one if and only if the computation to the CP field in SCLI and CI is head movement – i.e., I^0/V^0; suppose rather, extending to another syntactic context the spirit of Kayne and Pollock's (2001), Poletto and Pollock's (1999), Pollock et al.'s (2003) Remnant Movement analyses, that the entity displaced in those two constructions is in fact a phrase. Everything else being equal, nothing in the facts mentioned in section 5 would then prevent the XP phrase (57),

(57) $[_{XP}$ le $[_{YP}$ lui $[_{ZP}$ donnera . . .]]]

from being attracted to the specifier of some head in the CP field of root questions to check some (uninterpretable) feature.

Now, of course, on anyone's analysis object clitic + finite verb strings are typically not constituents. They are not in (58), for example:

(58) a. Pierre ne le lui donnera pas.
Peter Neg it to-him will-give not
b. Il ne m'a pas parlé.
he Neg to-me has not spoken
c. Je n'y suis pas allé.
I Neg there am not gone

Therefore for any such proposal to be a candidate for the analysis of SCLI and CI it has to be the case that XP in (57) can move as a constituent because the elements included in the '. . .' have vacated their input position; in short, any overt phrasal movement analysis of SCLI and CI is necessarily a Remnant XP

Movement analysis. The derivations that would have to be posited to yield the sentences in (59), for example, would of necessity involve previous displacement (topicalization) of the negative phrase *pas* in (59a), of the infinitival clause *lui prêter un livre* in (59b), or of the participial phrase *envoyé un livre à Paul* in (59c), followed by remnant movement, as sketched in the much simplified derivations of (60):

(59) a. Ne le lui donnera-t-il pas?
Neg it to-him will-give him not
b. Va-t-elle lui prêter un livre?
will she to-him lend a book
c. Avez-vous envoyé un livre à Paul?
have you sent a book to Paul

(60) a. Il ne le lui donera$_i$ [pas [t$_i$]] ⇒ Il [pas [t$_i$]]$_j$ [ne le lui donera$_i$ t$_j$] ⇒ [ne le lui donera$_i$ t$_j$]$_k$ il [pas [t$_i$]$_j$ t$_k$]
b. Elle [va [lui prêter un livre]] ⇒ Elle [lui prêter un livre]$_i$ [va t$_i$] ⇒ [va t$_i$]$_j$ elle [lui prêter un livre] t$_j$]
c. Vous [avez [envoyé un livre à Paul] ⇒ Vous [envoyé un livre à Paul]$_i$ [avez t$_i$] ⇒ [avez t$_i$]$_j$ vous [envoyé un livre à Paul]$_i$ t$_j$]

Of course if such an analysis is to become more than just another technical trick, among many other conceivable ones, we will have to specify what types of constituent topicalize to what position and why. We shall tackle the problem in section 7. Before we do so, however, it is worth pointing out here that the remnant T/XP analysis of SCLI and CI sketched in (60) has a number of clear advantages over its head-movement predecessors, whether taken to apply in overt syntax, as in Kayne (1983), Rizzi and Roberts (1989), Laenzlinger (1998), or covert syntax, as in Hulk (1993), Kayne (1994), Sportiche (1993b), and Friedemann (1997).

6.2 CI, preverbal subjects, and clitics

Given our analysis of clitic phrases in section 2 and what was said in section 3 of the way full DPs and nominative clitics check their respective case, the approach to SCLI sketched in (60) carries over naturally to CI sentences like (61a, b):

(61) a. Pierre ne le lui donnera-t-il pas?
Peter Neg it to-him will-give him not
b. Marie va-t-elle lui prêter un livre?
Mary will she to-him lend a book

Before the left periphery is merged, the possible parses for (61a, b) are (61c, d):

(61) c. [$_{AgrS^0}$ il$_i$ AgrS^0] [$_{XP}$ [$_{DP}$ Pierre t$_i$] ne le le lui donnera pas . . .]]
d. [$_{AgrS^0}$ elle$_i$ AgrS^0] [$_{TP}$ [$_{DP}$ Marie t$_i$] va [lui prêter un livre]]

Topicalization/adjunction of the constituents [*pas . . .*] and [*lui prêtre un livre*] to (a head immediately above) X/TP must also have taken place, followed by remnant X/TP movement to some pojection – call it HP – in the left periphery; this yields (62):

(62) a. $[_{HP}\,[_{XP}\,[_{DP}$ Pierre $t_i]$ [ne le le lui donnera $t_j]_k$ H^0 $[_{AgrS^0}$ il_i $AgrS^0]$ [pas . . . $]_j$ $t_k]$
b. $[_{HP}\,[_{TP}\,[_{DP}$ Marie $t_i]$ va $t_j]_k$ H^0 $[_{AgrS^0}$ $elle_i$ $AgrS^0]$ [lui prêter un livre$]_j$ $t_k]$

Two prominent features of these structures deserve pointing out. First, the preverbal subjects *Pierre* and *Marie* are just standing in the same subject position as in sentences like *Pierre ne le lui donnera pas*, *Marie va lui prêter une livre*, etc.; in other words, (62) provides a natural way of expressing the traditional intuition – see section 1 – that in CI constructions the preverbal subject is indeed an ordinary subject. As such, it can be a bare quantifier like *tout* or *rien*, a quantified DP like *chaque homme*, *tout le monde*, etc. Furthermore, granted something like (62), there is no need to assume the CP field allows for some special A-bar-like A position to host the preverbal subject, a move forced on Kayne (1983), Rizzi and Roberts (1989), and Laenzlinger (1998: section 2.11) and others by their head-movement analyses. Note also that on a Remnant Movement analysis the preverbal subject of CI does not move to the CP field independently of the finite verb and its clitics. Therefore we do not expect that the stranding of quantifiers in CI will be any different from what it is in simple sentences; in short Hulk's (1993) **Mes amis n'ont-ils tous pas téléphoné?* (my friends ne have they all not phoned?) is excluded for the same reason that **Mes amis n'ont tous pas téléphoné* (my friends ne have all not phoned) is, despite the fact that the subject DP of CI constructions has indeed moved to the Comp area: a Remnant Movement analysis of CI allows one to have one's cake and eat it!

Second, neither *Pierre* nor *Marie* c-commands *il* and *elle* in (62); this solves another major problem in past analyses of CI, namely, how come CI constructions allow their preverbal subject to be interpreted as coreferent with a following pronominal in the same sentence? Why doesn't that constitute a Principle B violation, on the view, shared by Kayne (1983), Rizzi and Roberts (1989), and Friedemann (1997), that the preverbal subject in CI constructions c-commands the postverbal clitic? What the analysis underlying (62) does, rather, is deny that assumption; as a consequence it clearly does not need to appeal to the idea that *il* and *elle* are (exceptional) expletives[31] in such constructions, as Kayne (1983) did, or that in questions – and only in questions, for mysterious reasons, as Laenzlinger (1998: section 3.1) observes – they are 'pure' agreement markers of the NID variety, as Friedemann (1997) did; the Remnant Movement analysis of CI solves the problem by simply alligning it with the standard Binding Theoretic account of the possible coreference of *Pierre* and *le* in sentences like [*la mère* [*de Pierre*$_i$]] [l_i*'aime*]. This is clearly a step forward, out of reach of both the overt and covert head movement analyses of CI put forward in the literature.

In sum, our Remnant Movement analysis of CI immediately solves in a principled way three major empirical problems with all previous accounts known to

us; this should be enough for anyone to take it very seriously; the three additional arguments to which we now turn will give it further weight.

6.3 CI and restrictions on preverbal pronouns

CI inversion bans weak nominative clitics from the preverbal position:

(63)	a.	*Où il est-il allé?	where he is he gone
	b.	*Où je suis-je allé?	. . . I . . . I . . .
	c.	*Où tu es-tu allé?	. . . you . . . you . . .
	d.	*C'est-il vrai?	that is it true
	e.	*Où on est-on arrivé?	where we are we arrived
	f.	*C'est-ce fini?	that is that finished

These facts follow as an automatic consequence from the analysis of subject clitics adopted in section 4: the input structure of such ungrammatical sentences would have to contain a complex Clitic Phrase of the form $[_{ClP}$ il $[_{Cl^0}$ il]], $[_{ClP}$ je $[_{Cl^0}$ je]] . . . Since there is only one $AgrS^0$ position in the higher functional field of the sentences, one of the two will of necessity remain incapable of checking its Case feature, causing the derivations of (63) to crash at LF.[32]

CI constructions also display a surprising pattern of strong preverbal pronouns. Third person strong pronouns are acceptable but first and second persons are banned:[33]

(64) a. Quel livre lui a-t-il apporté?
what book him to-him has he brought
b. Quel livre eux ont-ils apporté?
what book them to-him has they brought

(65) a. *Quel livre toi as-tu apporté?
what book you to-him have you brought
b. *Quel livre moi ai-je apporté?
. . . me . . . I . . .
c. *Quel livre nous avons-nous apporté?
. . . us . . . we . . .
d. *Quel livre vous avez-vous apporté?
. . . you . . . you . . .

On the analysis of CI sketched above the input structure of (64) and (65) would be something like (66) and (67) is the Spell Out parse resulting from topicalization/adjunction to (a head above) TP, remnant TP movement to HP and *wh*-movement to the highest layer of the CP field, ForceP:

(66) $[_{AgrS^0}$ Clitic$_i$ AgrS$^0][_{TP}$ $[_{DP}$ strong pronoun $t_i]$ a apporté . . .]]

(67) $[_{ForceP}$ Quel livre$_m$ Force^0 $[_{HP}$ $[_{TP}$ $[_{DP}$ Strong pronoun $t_i]$ V $t_j]_k$ H$^0[_{AgrS^0}$ clitic$_i$ AgrS$^0]$ [apporté $t_m]_j$ $t_k]]]$

The idea that we would like to entertain is that the pairs in (64) and (65) should be seen in the same light as (25) and (27), repeated here as (68) and (69):[34]

(68) a. LUI a téléphoné. he/him has telephoned
b. EUX ont téléphoné. they/them have telephoned

(69) a. *MOI ai téléphoné hier. I/me have telephoned yesterday
b. *TOI as mangé un gâteau. you have eaten a cake
c. *VOUS avez téléphoné hier. you have telephoned yesterday
d. *NOUS avons mangé un gâteau. we have eaten a cake

We can easily achieve this result if we analyze such contrasts as resulting from the principle in (70), which is just (30) – repeated as (71) – seen in a 'static' light:[35]

(70) Only strong third person pronouns can remain in [Spec, TP].

(71) Silent clitics in French are limited to the third person.

Note that only on a Remnant Movement analysis of CI – in which the preverbal subject of CI sentences is a real subject in [Spec, TP] – can (64–68) and (65–69) be dealt with in a uniform fashion. We take it that the fact that it can express this generalization is a further argument in its favor. In addition, this analysis also explains contrasts like the following (adapted from Friedemann 1997: 164):

(72) a. *Pourquoi vous ne viendriez-vous pas à la fête?
why you Neg would-come you to the party
b. Pourquoi ta femme et toi ne viendriez-vous pas à la fête?
why your wife and you Neg would-come you to the party
c. *Où nous somme-nous invités?
where we are we invited
d. Où moi et mes enfants sommes-nous invités?
where me and my children are we invited

They simply follow from the fact that coordinations like *moi et mes enfants* or *ta femme et toi* can remain in [Spec, TP], unlike strong first and second person pronouns.[36]

6.4 Remnant Movement to the CP field and clitic sequences in imperatives

The fact that some instances of verb movement to the Comp area can profitably be (re)analyzed as Remnant Movement to the specifier of various heads in that domain may be argued for independently of CI and SCLI on the basis of the clitic ordering in French imperatives. As is well known, French affirmative sentences exhibit two dative–accusative orderings, depending on the person–non-person dimension:

(73) a. Pierre me le donnera.
Peter to-me it will-give
b. *Pierre le me donnera.
Peter it to-me will-give
c. Pierre te le donnera.
Peter to-you it will-give
d. *Pierre le te donnera.
Peter it to-you will-give

(74) a. Pierre le lui donnera.
Peter it to-him will-give
b. *Pierre lui le donnera.
Peter to-him it will-give

The corresponding clitic sequences in imperatives differ considerably; the 'standard' order for first and second person is (75),

(75) a. Donne le moi!
give it me
b. Mets le toi dans la poche!
put it you in the pocket

which, modulo the *me* ~ *moi* and *te* ~ *toi* alternations, corresponds to the *le me*, *le te* orders of unacceptable affirmatives like (73b, d); only in colloquial French can (75) also surface as (76), which displays the expected dative accusative ordering of (73a, c).

(76) a. Donne moi le!
give me it
b. Mets toi le dans la poche!
put you it in the pocket

In third person pronoun cases standard French imperatives show the expected ordering of (74a):

(77) Donne le lui!
give it him

However, colloquial French also has the order in (78),

(78) Donne lui le!
give him it

which is that of the unacceptable (74). How can one make sense of such data?

We shall assume the null hypothesis that the underlying order of clitics in all French sentence-types is the same, specifically that of affirmative sentences. For our present purposes it will suffice to assume that there are two such orders, given in (73a, c) and (74a), respectively. Our second hypothesis is that some imperative feature high in the Comp area must be checked off by verb adjunction; in short we follow Kayne (1994), Hulk (1993), Terzi (1999), and many others in claiming that the obligatory enclitic configuration in positive imperatives results from verb movement to that high position, 'stranding' the clitics. For the sake of clarity, let us call the high position to which the imperative verb must head adjoin Imp^0.[37]

If ordinary verb movement was all there was to imperatives, these assumptions would only allow us to derive (77) and (76); we would have nothing to say concerning the standard French ordering of first and second person in (75) or the colloquial third person order of (78). Suppose, rather, that only the last leg of the displacement to Imp^0 is head movement, and that intermediate position(s) in the CP field can accommodate various (remnant) phrases; let us posit more specifically that (remnant) IP moves to the specifier of what we called HP in the previous sections;[38] suppose further that ForceP stands between Imp^0 and HP; adopting Sportiche's terminology for the sake of illustration we now say that the accusative-voice phrase in (79a) and the dative-voice phrase of (79b),

(79) a. $[_{HP}\ [_{TP} \ldots [_{\text{Dative voiceP}}$ {me, te, nous, vous} $[_{\text{Accusative voiceP}}$ {le, la, les} V]]]$_i$ H^0 t_i]
b. $[_{HP}\ [_{TP} \ldots [_{\text{Accusative voiceP}}$ {le, la, les} $[_{\text{Dative voiceP}}$ {lui, leur} V]]]$_i$ H^0 t_i]

can be pied-piped to the specifier of ForceP before the verb finally moves as a head to Imp^0; this will yield (80a, b):

(80) a. $[_{Imp^0}$ donn{e, ons, ez}$_k$ $Imp^0]$ $[_{\text{ForceP}}$ $[_{\text{Accusative voiceP}}$ {le, la, les}$t_k]_j$ $Force^0[_{HP}[_{\text{Dative voiceP}}$ {moi, toi, nous, vous} $t_j]_i$ $H^0]$ $[t_i]]$
b. $[_{Imp^0}$ donne$_k$ $Imp^0]$ $[_{\text{ForceP}}$ $[_{\text{Dative voiceP}}$ {lui, leur} $t_k]_j$ $Force^0[_{HP}[_{\text{Accusative voiceP}}$ {le, la, les}$t_j]_i$ $H^0]$ $[t_i]]$

This, I claim, is how the standard order of first and second person imperatives and the colloquial order of third person imperatives are derived – modulo the *me* ~ *moi* and *te* ~ *toi* suppletion.[39] When such pied-piping does not take place we derive the non-standard (76) and the standard (77).

Naturally, this is only a plausible sketch, and other conceivable executions of the same basic idea come to mind;[40] nonetheless, I believe the main point of this discussion should be clear: even in imperatives, which, unlike CI and SCLI sentences, do seem to require verb movement to the (highest layer of the) Comp area, there is evidence that verb related displacements to lower layers of the left periphery can take the shape of (Remnant) Phrasal Movement. Without that assumption it is difficult to see how all the possible clitic sequences of French positive imperatives could be derived syntactically.[41] The plausibility of our Remnant Movement approach to SCLI and CI is thus enhanced by the syntax of clitics in French imperatives.

7 Fine-tuning Remnant Movement in CI and SCLI

7.1 V2 and Remnant Movement

Accepting the conclusions of section 6, we must now go back to our task of defining the properties of Remnant Movement to HP in CI and SCLI more precisely than we have done so far. There are two conceivable tacks one might take; one tack would attempt to maximize the scope of the results reached in the previous section, the other would restrict it to Romance, perhaps even to French and Valdôtain.

On an approach of the first type – a priori the more appealing one by far – CI and SCLI in French should most probably be seen in the same light as so-called Subject–Aux inversion in English and its various V2 analogues in the Germanic languages. It would argue that French CI and SCLI and English Subject–Aux inversion share too many properties – e.g., their root–embedded asymmetry, the fact that in English as well the subject must immediately follow the 'inverted' finite verb (an auxiliary for independent reasons (see, e.g., Pollock 1989, 1997, Chomsky 1995c: chapter 1, and Cinque 1999) – to warrant two different analyses; this would mean, then, that English Subject–Aux inversion, too, involves the sort of Remnant Movement operative in French CI and SCLI. One would then have to look for an explanation of the previous topicalization of the negative phrase, the infinitival phrase or the participial phrase in examples like (81),

(81) a. Has he not understood?
b. Should he go?
c. Has he phoned you?

that would carry over to the (almost) identical French cases in (82):

(82) a. (Pierre) n'a-t-il pas compris? (Pierre) + (81a)
b. (Pierre) devrait-il partir? (Pierre) + (81b)
c. (Pierre) t'a-t-il téléphoné? (Pierre) + (81c)

The second approach would bank on the one major syntactic difference between English Subject–Aux Inversion and French SCLI – *Has John phoned?* vs. **A Jean téléphoné?*; see section 1 – on the comparative diachronic facts alluded to in note 45 (on the analysis sketched there) and on the necessary presence of the evidently language specific 'epenthetic' *-t-* in French CI and SCLI to argue that the two types of languages and constructions should be construed differently, despite their common restriction to root contexts and the similarity in their spell-out strings; this may in turn lead one to wish to continue analyzing English Subject–Aux inversion in terms of I^0 (head) movement to the left periphery – in line with all work on that topic known to us – and to look for an account of the way previous topicalization works in the Remnant Movement process at work in French and Valdôtain SCLI/CI that would be specific to those languages (or to Romance).

In part for the sake of execution and in part because the more ambitious line clearly lies beyond the scope of the present pedagogical presentation, we shall now tentatively develop an analysis of the second sort.

7.2 -t- in CI and SCLI

Let us start with the one prominent feature of CI and SCLI which we have failed, up to now, to integrate into our analysis, namely, the epenthetic *-t-* of examples like (83):

(83) a. Où Pierre va *(-t-) il aller?
Where Peter will *(*-t-*) he go
b. À qui Marie va *(-t-) elle s'adresser?
To whom Mary will *(*-t-*) she talk
c. Où va *(-t-) elle?
Where goes *(*-t-*) she
d. Où va (*-t-) Yves?
Where goes (*-*t-*) Yves

As (83) shows, *-t-* is obligatorily present in such sentences. It is often taken to be a purely epenthetic consonant introduced at PF to avoid two consecutive vowels. This seems unlikely; if it was, as was noted in section 1, one would expect it to surface also in SI cases like (83d), especially since liaison is indeed possible in sentences like *Où vont (/-t/) Yves et Marie?* Furthermore, the data in (88a, b),

(84) a. Ven-lo-li? come-Interr marker-they 'Are they coming?'
Morgeux, Provençal
b. Ven-lo-lou? come-Interr marker-she 'Is she coming?'

from Morgeux, a Provençal dialect, seem to show clearly that this purely morpho-phonological approach is insufficiently general; in Morgeux Standard French *-t-*

surfaces as *lo* but its insertion cannot be a purely PF phenomenon since neither *-li* (they) nor *-lou* (she) are in need of an epenthetic consonant.[42]

We shall hypothesize rather that *-t-* in French and *lo* in Morgeux have syntactic import and are the H^0 morphemes of main clause interrogatives. More precisely, we follow much traditional work in claiming that French *-t-* and Morgeux *lo* are 'conjugation interrogative' markers, [+interrogative] finite tense morphemes merged in H^0. They thus bear an uninterpretable [+interrogative] feature and attract a constituent so marked to their specifier. In CI and SCLI the entire sentence – what we have called XP or TP in our analyses so far, save the constituents that have been extracted at previous stages of the derivation – moves to check it. Put slightly differently, French *-t-* and Morgeux *lo* are the elements that 'type' the sentence in their specifier as (root) questions. A little bit more technically, we say that the head of the 'sentence', I^0, $AgrS^0$, or T^0, as the case may be, is marked [+interrogative] in the numeration; as a consequence its maximal projection is so marked too and it is attracted to Spec H^0 to delete H^0's uninterpretable [+interrogative] feature; in sum, CI and SCLI are cases of – obligatory, see below – pied-piping. This, we take it, provides the syntactic characterization of *-t-* (and Morgeux *lo*) we need here. In addition, we claim that French *-t-*[43] has two defining morpho-phonological characteristics:

(85) a. *-t-* is a morphological enclitic; therefore, as a tense morpheme, it must be right adjacent to a finite verb at PF.
b. *-t-* is a deficient morpheme at PF, i.e., it cannot in and of itself bear word-final stress; it must therefore be left adjacent to a term that can play the part of an additional stress bearing suffix;

Concerning (85b) we will make the following hypothesis:

(86) Nominative clitics can bear main stress and can be morphological suffixes.

Adopting the spirit of recent work by Bošković (cf. Bošković (2001)) on Slavic clitics and Shlonsky on the construct state in Semitic (cf. Shlonsky 2004), but at variance with one aspect of much recent work in the distributed morphology literature, we will also make the following crucial assumption concerning the syntax–PF interface:

(87) Morpho-phonological processes do not reorder terms.

Hypothesis (85), in combination with (87), will act as a PF filter on syntactic computations; whenever the syntactic output turns out to be inconsistant with the morphophonological requirements on *-t-* listed in (85) a PF violation will result, and so the whole derivation will crash.

Let us illustrate how the system works by considering ill-formed sentences like (88):

(88) a. *Où a Yves mangé?
where has Yves eaten

b. *Où va-t Yves aller demain?
where will-go Yves eat tomorrow
c. *Où Pierre va aller demain t-il?
where Pierre will go tomorrow he
d. *Où Pierre croit que je suis t-il?
where Peter thinks that I am-*t*-he
e. *Où sa femme mettra les livres qu'il lit t-elle?
where his wife will put the books that he reads -*t* she
f. *À qui il va-t parler?
to whom he will-go-*t* speak

In (88a) -*t*- has failed to merge in H^0, so, on our analysis so far Remnant TP Movement to [Spec, HP] should not have applied but has; furthermore, for that sequence to be generated Remnant Movement should have applied to a TP of the form $[_{TP}$ t a t], which in turn would have required the full DP *Yves* to move out of [Spec, T]. On the assumption that no additional feature of *Yves* requires movement to the left periphery – as would be the case in SI constructions under the analysis of Kayne and Pollock (2001) – this is impossible if our sections 2 and 3 analysis of nominative Case-checking is correct; a full DP checks its (non-morphological) case in [Spec, TP]. It is therefore 'frozen in place' in TP; (88a) is thus exluded for two reasons: the Remnant (TP) Movement we have developed so far is not defined here and it could not yield the word order of (88a) if it were.

Example (88b) differs from (88a) in having merged -*t*- in H^0, which allows Remnant TP Movement to apply licitly; *aller demain* has moved out of TP; but again the sequence *va-t Yves* could only have been generated if *Yves* had also moved out of [Spec, T], which is impossible in SCLI – though possible in SI – for the reasons just stated. In sum, neither (88a) nor (88b) can be generated on our analysis. In addition, in (88b) the PF requirement that -*t*- be adjacent to a stress-bearing suffix cannot be met: although *Yves* can evidently bear stress, it cannot become part of a morphological word (i.e., *Yves* and full DPs cannot be PF suffixes).

Sentence (88c) has -*t*- in H^0. Remnant TP Movement can thus apply licitly; the clitic head of the clitic phrase in [Spec, T] has adjoined to $AgrS^0$, as it must; but nothing else has moved out of TP, so the complement of the finite verb is still part of TP when it is attracted to [Spec, HP], and that part of the sentence therefore stands in between the finite verb and -*t*-; as a consequence, one half of the morphological requirements on -*t*- cannot be met: it should be a morphological enclitic on a (finite) verb, i.e., right adjacent to it, but cannot be in (88c) which consequently crashes at PF.

The monstrous ungrammaticality of (88d) and (88e) forces us to refine the meaning of the predicate 'adjacent' as used in (85) – "-*t*- is a morphological enclitic; therefore, as a tense morpheme, it must be right adjacent to a finite verb at PF". Clearly if such examples are to be excluded, string adjacency will not suffice and some structural notion must be involved; we will say, then, that -*t*- can form a prosodic word with a finite verb if and only if it is not separated from it by more than one sentence boundary. Granted this interpretation, such examples

will be correctly excluded; the derivation of sentences built on the same numeration will thus have to involve previous topicalization of the sentential complement or the relative and its antecedent followed by the familiar Remant Movement, yielding the grammatical *Où Pierre croit-il que je suis* (where Peter thinks he that I am) and *Où sa femme mettra-t-elle les livres qu'il lit?* (where his wife will-put-she the books that he reads).[44]

As for the ungrammatical (85f), it would be derived by topicalization of *parler à qui*, Remnant AgrSP Movement to HP and *wh*-movement; what goes wrong here is that (85b), the second morphological requirement on *-t-* cannot be met; the derivation yielding (88f) therefore crashes at PF, once more. Finally, consider the outrageously ungrammatical (89b, d, f):

(89) a. Les a-t-il lus?
them has he read
b. *A-t-les il lus?/*A-t-il les lus?
has them he/he them read
c. Y partira-t-il bientôt?
there will-go he soon
d. *Partira-t-y il bientôt?/Partira-t-il y bientôt?
will-go there he/he there soon
e. En a-t-il parlé?
of it has he spoken
f. *A-t-en il parlé?/A-t-il en parlé?
has of it he/has he of it spoken

There is a straightforward account for why SCLI cannot strand non nominative clitics, as such sentences show; suppose that SCLI and CI in Modern French[45] never involve head movement of the verb to the Comp area; then for (89b, d, f) to be accceptable clitics like *les*, *y*, and *en* would have to topicalize out ot XP before XP moves to spec H^0; but of course we know that clitics can never topicalize out of their Case checking position (see section 3), so the relevant examples in (89) are excluded for the same reason the totally inconceivable sentences in (90) are:

(90) a. *Le, j'ai lu — it, I have read
b. *Y, il partira bientôt — there, he will-go soon
c. *En, il a parlé — of-it he has spoken

In summary, the two morpho-phonological properties of *-t-* in (85) combine to require that the constituents following the finite verb in T/XP topicalize out of T/XP to a position in between T/XP and $AgrS^0$; the same two properties converge to require T/XP to move to [Spec, HP] and exclude Remnant AgrSP Movement; if CI and SCLI can never be instances of V-movement to the Comp area in Modern French, the analysis also straightforwardly accounts for why non-subject clitics cannot be stranded in those two constructions.

7.3 -ti *in CI and SCLI*

On the analysis just summed up, the fact that the whole AgrSP cannot be attracted to [Spec, HP] is a consequence of (85b). Suppose that (some variety of) French had a [+question] morpheme merged in H^0 like *-t-* that did not have any such deficient property; everything else being equal, we would then expect AgrSP attraction to [Spec, H^0] to be possible; that morpheme does exist, as the facts in (91) show:

(91) a. Elle viendra-ti?
she will-come-*ti*?
b. Pourquoi il vient-ti pas?
why he come-*ti* not
c. Je réussirai-ti?
I will-succeed-*ti*
d. Tu viendras-ti?
you will-come-*ti*
e. On est-ti prêt?
we are-*ti* ready
f. Ce serait-ti enfin la fin?
that will-be-*ti* at last the end

Sentences like (91) – common in Québec French (where *-ti* surfaces as *-tu*) and in a variety of regional (both rural and urban) dialects in France – share most of SCLI and CI's defining properties; in particular they are restricted to root contexts – cf. **Dis moi quand elle viendra-ti?* – but they contrast minimally with (92) in allowing preverbal nominative clitics:

(92) a. *Elle viendra-t-elle?
she will-come she
b. *Pourquoi il vient-il pas?
why he come-he not
c. *Je réussirai-je
I will-succeed-I
d. *Tu viendras-tu
you will-come-you
e. *On est-il prêt?
we are-we ready
f. *Ce serait-il enfin la fin?
that will-be-it at last the end

In our system the root–non-root sensitivity that (91) shares with standard French SCLI and CI means that Remnant Movement to HP in the Comp domain must have applied; we can now say descriptively that in the sociolects and dialects that have (91) the sequence *-t*(+*i*) indeed works like the H^0 morpheme of

Standard French but because, unlike *-t-*, it does have the sufficient amount of vocalic structure for it to be a stressable syllable it has no need for a(n extra) clitic to its right, which is why (91) are well-formed at PF.

Of course the question arises of what the vowel *i* in *-ti* is. To answer that question we capitalize on Poletto's (2000) analysis of the complex system of nominative clitics in the NIDs; more precisely, we hold that *i* is comparable to the invariable subject clitics present in many Veneto, Lombard, and Emilian dialects; the paradigm of the Lugano variety in (93) (from Poletto 2000: 12) illustrates an invariable SCL pattern:

(93)	a.	A vegni mi.	Inv. SCl come I	'I come'	Lugano
	b.	A ta vegnat ti.	Inv. SCl SCL come you	'you come'	
	c.	A vegn luu.	Inv. SCl come he	'he comes'	
	d.	A vegnum.	Inv. SCl come	'we come'	
	e.	A venguf.	Inv. SCl come	'you come'	
	f.	A veng lur.	Inv. SCl come they	'they come'	

On the view that *i* in the dialectal *-ti* construction of French is *-t-* + *i*, *i* an invariable subject clitic analogous to the Lugano *a*,[46] we can furthermore use Poletto's (2000: 20) (much simplified) structural hierarchy in (94) to account for (91):

(94) $[_{FP1}$ Invariable SCLs $[_{FP2}$ number SCLs/person SCLs $[_{FP3} \ldots]]]$

We say that the input structure of such sentences is something like (95).

(95) a. $[_{HP} [_{H^0}$ -t] $[_{FP1}$ i $[_{FP2}$ elle $[_{FP3} \ldots]]]]$
b. $[_{HP} [_{H^0}$ -t] $[_{FP1}$ i $[_{FP2}$ il $[_{FP3} \ldots]]]]$
c. $[_{HP} [_{H^0}$ -t] $[_{FP1}$ i $[_{FP2}$ je $[_{FP3} \ldots]]]]$
d. $[_{HP} [_{H^0}$ -t] $[_{FP1}$ i $[_{FP2}$ tu $[_{FP3} \ldots]]]]$

and that (Remnant) Movement to [Spec, H^0] applies to FP2; of course, since *-t-* (+*i*) continues to be an enclitic tense marker, it must abide by the morphophonological requirement in (85a) – "*-t-* is a morphological enclitic; therefore, as a tense morpheme, it must be adjacent to a finite verb on its left at PF" – and consequently, all phrases following the finite verb must move out FP2 before FP2 is attracted to Spec *-t-*; this explains why the '*-ti* Complex Inversion' construction of Regional and non-Standard French also strands negation, participial clauses and infinitives, as in, say, *Elle a-ti compris?* (she has-*ti* understood), *Tu voudrais-ti pas m'aider?* (You would-like-*ti* not me help), etc.[47]

7.4 Valdôtain SCLI and CI

Valdôtain SCLI and CI constructions share the sensitivity of their French counterparts to the root non-root distinction (cf. Roberts 1993a: 324) and should

therefore be amenable to essentially the same Remnant Movement analysis to the Comp area; they also conspicuously differ from French in that, in compound tenses – i.e. when auxiliaries *have* and *be* are present – all varieties of Valdôtain SCLI require a preverbal clitic, in addition to the standard French-like obligatory postverbal clitic; similarly, Valdôtain CI in compound tenses may have its initial DP subject followed by pre and post auxiliary clitics:

(96) SCLI:

a. **N**'èn-**neuy** mïndja
we have we eaten — Ayas
(Roberts 1993a: (7b))

b. **T**'o **heu** vu ton laon
you have you seen your uncle — St Nicholas
(Roberts 1993a: (8b))

c. Cen que **dz**'i **dzo** fe
what that I have I done — Aosta
(Roberts 1993a: (9a))

(97) CI: Ton ommo **l**'est-**e** dza torna?
your man he is he already come back — Aosta
(Roberts 1993a: (41))

In simple tenses the postverbal clitic is obligatory and has the same form as in complex tenses, but no preverbal clitic need appear, depending on whether the corresponding affirmative sentence has a preverbal clitic or not;[48] so, for example, the present tense forms of first and second plural persons of the verb 'go' in St Nicholas do not require a preverbal clitic and they show none in the following SCLI sentences:

(98) a. Yòi allèn-nò
where go we?
(Cf. French *Où allons-nous?*) — St Nicholas
(Roberts 1993a: (11a))

b. Yòi allôde-vò
where go you
(Cf. French *Où allez-vous*?) — St Nicholas
(Roberts 1993a: (11b))

The same holds true of the following CI sentences:

(99) a. Martin mindze-të de seuppa?
Martin eats he of soup
'Martin mange-t-il de la soupe?' — Aosta
(Roberts 1993a: (38a))

b. Pequè lo mèinô medze-t-i la pomma?
why the child eats he the apple
'Pourquoi l'enfant mange-t-il la pomme?' St Nicholas
(Roberts 1993a: (40a))

If we put aside complex tenses for a while, those facts would seem to be very similar to Standard and/or dialectal French facts and can be dealt with in essentially the same terms; so an overt or covert *-t-* morpheme will be claimed to have merged in H^0 in the Comp domain of Valdôtain as well, attracting the counterparts to the French functional projections undergoing the same computation. On the assumption that the morpho-phonological properties of Valdôtain *-t-* are comparable to those of French we expect a post-*t-* clitic pronoun to be obligatory in Valdôtain as well, despite the fact that it is otherwise a null-subject language in affirmative sentences. We thus derive in a principled way Chenal's (1986) observation quoted in Roberts (1993a: 351) that in interrogatives "la présence du pronom sujet est obligatoire partout" ('the presence of a pronominal subject is obligatory everywhere').

As in Dialectal French, the postverbal clitic of Valdôtain may sometimes be an invariable form, as the following Châtillon examples (= Roberts' (1993a, (51)) unambiguously show:

(100) a. **Me** minjo **ty** ina pomma?
Je mangerai-ti une pomme?
'Shall I eat an apple?'
b. **Y'**at **te** vi lo barba?
Vous avez-ti vu l'oncle?
'Have you seen your uncle?'

Cases like these clearly can, most probably should, be derived from a French-like structure analogous to (95) as sketched in the previous section.

Aside from the question of complex tenses, nothing in what precedes directly covers examples like (101), in which both a preverbal and a variable postverbal clitic appear:

(101) Dze medzo-dzò an pomma? St Nicholas
I eat I an apple
(Roberts (1993a: (8a))

Sentence (101) is unexpected because it looks like the word-for-word analogue of the ill-formed French example (102):

(102) *Je mangerai-je une pomme? (Same as (101))

We know what excludes (102): there are two nominative subject clitics and only one $AgrS^0$ position, which means one nominative clitic too many since at least

one uninterpretable (nominative) case feature will fail to be checked in such sentences. If, as claimed above, that is the correct way of looking at (102), we are forced to assume that one of the two clitics in (101) is not a 'real' nominative clitic. Let us indeed claim that the preverbal *dze* in (101) has migrated into the TP domain, where it either checks its case like an ordinary DP or, more likely, has no case to check at all, just like the St Nicholas third person singular, second and third person plural endings; granted this, the spell-out parse of the St Nicholas affirmative sentence *Dze medzò* (I eat) would be something like (103), and it thus contrasts minimally with (104), the spell-out parse of Standard French *je mange*:[49]

(103) $[_{TP}\,[_{ClP}$ pro dze] $[[_{T^0}$ medzò] . . .]]]

(104) $[_{AgrS^0}$ je$_i$ $[_{TP}\,[_{ClP}$ pro t$_i$] $[[_{T^0}$ mangerai] . . .]]]]

This difference in structure now accounts for the contrast between (101) and (102): if the [+interrogative] (null *-t-*) H^0 morpheme is merged in the left periphery of (103) and (104), TP will be attracted to [Spec, HP] in both cases, but although this will yield the well-formed *Mangerai-je?* in French, no acceptable structure will be derived from (103) since principle (85b), one of the two defining morphological properties of French and Valôtain interrogative H^0 – "*-t-* is a deficient morpheme at PF in that it cannot in and of itself bear word final stress; it must therefore be left adjacent to a term that can play the part of an additional stress bearing suffix" – will not be met.[50] The (much simplified)[51] input structure to (101) must rather be (105),

(105) $[_{AgrSP}$ pro$_i$ $[_{AgrS^0}$ dzò] $[_{TP}\,[_{ClP}$ t$_i$ dze] $[[_{T^0}$ medzò] . . .]]]

in which *dzò* is the $AgrS^0$ counterpart of *dze* in TP; (105), contrary to (103), will yield a well-formed PF output after merging of H^0 and TP attraction to [Spec, H^0]; note in passing that in (105) *dzò* 'agrees' with *dze* because it 'agrees' with a (raised, phrasal) pro subject, which itself agrees with *dze*.

We can now come back to complex tenses and to the question of why *ëtre* ('be') and *avèi* ('have') in Valdôtain always require a subject clitic although their morphology is rich, as St Nicholas paradigms like (106) (= (1c) in Roberts (1993a)) show:

(106)

Dz'i medjà	(I have eaten)
T'ô medjà	(you . . .)
L'a medjà	(he . . .)
N'èn medjà	(we . . .)
Vèi medjà	(you . . .)
L'an medjà	(they . . .)

Despite the morphological variability of auxiliary verbs, complex tenses always have 'SCL1 Aux SCL2 . . .' sequences in SCLI, as (107) (= (8b) in Roberts (1993a)) shows:

(107) **T'ô-heu** vu ton laon
you have you seen your uncle
French 't'as tu vu ton oncle?'

In the spirirt of (105), we say, fairly naturally I believe, that (107) is derived as sketched in (108):[52]

(108) $[_{HP}\ H^0[[_{AgrSP}\ pro_j\ [_{AgrS^0}$ **heu**$]\ [_{TP}\ [_{ClP}\ t_j$ **T'**$]\ [[_{T^0}$ ô$]\ [t_j$ vu ton laon$]]]]$
Topicalize $[t_j$ vu ton laon$]$ to TP $\Rightarrow$
$[_{HP}\ H^0[[_{AgrSP}\ pro_j\ [_{AgrS^0}$ **heu**$]\ [t_j$ vu ton laon$]_i\ [_{TP}\ [_{ClP}\ t_j$ **T'**$]\ [[_{T^0}$ ô$]\ t_i]]]$
Attract [+question] to Spec $H^0 \Rightarrow$
$[_{HP}\ [_{TP}\ [_{ClP}\ t_j$ **T'**$]\ [[_{T^0}$ ô$]\ t_i\ ]]_k\ H^0[[_{AgrSP}\ pro_j\ [_{AgrS^0}$ **heu**$]$ [vu ton laon$]_i\ t_k]$

Finally, to account for the necessary presence of the preverbal clitic in ***T'ô*** in (107) we use of Roberts' (1993a) idea that auxiliaries *ëtre* and *avèi* are not theta-assigners (see also Pollock (1989: section 4.1)) in the following way. Suppose the person endings of Valdôtain finite verbs, where they exist, are only 'residually' able to identify a pro subject in the sense that they also need to assign it a theta-role to do so. Since auxiliaries by definition do not have any (external) theta-role to assign they necessarily require a lexical clitic in TP.

7.5 Keeping the house in order

Before concluding, let us briefly go back to French and spell out in more detail some consequences of our analysis of SCLI and CI for the syntax of simple affirmative sentences.

Suppose a subject-clitic phrase is merged in some sentence and that no H^0 is merged in the left periphery; we would then expect totally ungrammatical sentences like (109a) to surface with the spell-out parse in (109b):

(109) a. *Il Pierre a téléphoné. he Peter has phoned
b. $*[_{AgrS^0}\ il_i\ AgrS^0]\ [[_{ClP}\ Pierre_i\ t_i]$ a téléphoné]]

What excludes such structures? Granted (109b) we shall say, fairly naturally, that (109a) is a Principle C violation. If so, what is the spell-out structure of (110)?

(110) Il a téléphoné ('He has phoned')

It would be unlikely to suggest that it is (111) since that structure should be a Binding Theory violation too, with the null pronominal violating Principle B.

(111) $*[_{AgrS^0}\ il_i\ AgrS^0]\ [[_{ClP}\ pro_i\ t_i] \ldots]$

Let us say rather that its spell-out parse is (112):

(112) $[_{AgrSP}\ pro_i\ [_{AgrS^0}\ il_i\ AgrS^0]\ [[_{ClP}\ t_i\ t_i] \ldots]]$

and claim that in such configurations the nominative clitic *il* – similarly *je*, *tu*, etc. – count as agreement markers and are thus immune from the strictures of Principle B. The null (phrasal) pro in their specifier of (112) is to be seen in the same light as null (phrasal) pro the reanalyzed clitics of the NIDs license. We note in passing that what undergoes Remnant Movement in SCLI is TP, as the parse of (113) in (114) shows:

(113) A-t-il téléphoné?
'Has he phoned?'

(114) $[_{HP}\,[_{TP}\,[_{DP}\,t_i]$ a $t_j]_k\,[_{H^0}$ -t-$]\,[_{AgrSP}\,[$pro il$_i$ $]$ AgrS$^0]$ [téléphoné$]_j\,t_k]]]$

In short, although Kayne and Pollock's (2001) claim that all sentences undergoing Remnant Movement have a null (pro or trace) subject is too strong if our analysis of CI is correct, it nonetheless seems true of SCLI and SI in Standard French (and Valdôtain).

Let us now ask whether a simple sentence like (115) has a complex clitic phrase as its subject. Suppose it does; the clitic phrase would then evidently have to have a null clitic as its head, as shown in (116);

(115) Pierre a téléphoné.
'Peter has phoned.'

(116) $[_{TP}\,[_{ClP}$ Pierre$_i$ pro$_i]$ [a téléphoné]]

Two possibilities arise at this point. The first is that clitic pro could attempt to check its null, though arguably morphological nominative, case by moving up to AgrS^0, as (117) shows.

(117) $*[_{AgrS^0}$ pro$_i$ Agr$^0]\,[_{TP}\,[_{ClP}$ Pierre$_i$ $t_i]$ a téléphoné]

But (117) will yield a Principle C violation, as above; that violation could only be alleviated if the lexical DP itself could move to spec pro. We shall say that in Standard French this still yields an ungrammatical configuration because pro cannot be reanalyzed as an agreement marker; if the basic intuition underlying all work on the null subject parameter in Romance is correct, only an *overt* lexical head can be so reanalyzed;[53] therefore moving *Pierre* to [Spec, AgrSP], as in (118), will still run afoul of Binding Theory's Principle B, unlike what happens in (112) and the like.

(118) $*[_{AgrSP}$ Pierre$_i\,[_{AgrS^0}$ pro$_i$ Agr$^0]\,[_{TP}\,[_{ClP}\,t_i\,t_i]$ a téléphoné]]

By the same token (119) will also be excluded,

(119) $*[_{AgrSP}$ Pierre$_i\,[_{AgrS^0}$ il$_i$ Agr$^0]\,[_{TP}\,[_{ClP}\,t_i\,t_i]$ a téléphoné]]

if, as we have just sugggested, it is only when pro stands in the specifier of a nominative clitic that the clitics reanalyze as agreement markers, immune to Binding Theory; therefore a fine sentence like *Pierre, il est venu* (Peter, he has come) is necessarily a Clitic Left Dislocation in standard French, in which *Pierre* has vacated its input position and moved to a position much further up in the IP or CP domains. It could be, of course, that that constraint on the reanalysis of clitics as agreement markers is lifted in the more innovative sociolects or dialects of French (which Anne Zribi-Hertz's 1994 dubs 'français avancé') as it is in the NIDs. We would then expect bare quantifiers, negative quantifiers, quantified DPs, etc. to replace *Pierre* freely in (119), as they in fact do in many NIDs and in Valdôtain – cf., e.g., Poletto's (2000: 142) Friulian example *Nisun al mi capiss* (no one he me understands), Chenal's (1986: 401) example *Gneun l'ayet inco vu de bataille parë* (no one he had yet seen a battle like it) cited in Roberts (1993c) – and as they typically do not do for speakers of Standard French even in the most colloquial varieties they can speak.[54]

The second possibility is to assume that clitic pro was allowed to stay in its input position. We could then say that it (exceptionally) checks its case in [Spec, TP]; but then it would be impossible for the DP *Pierre* in its specifier to check its own case, on the standard view that the uninterpretable feature of T is deleted once it enters a checking relation with an appropriately marked specifier. In short, on that derivation too the input showed in (116) will fail to yield a converging LF output.

We see, then, that a simple statement like (115) cannot have a Clitic Phrase in its subject position; therefore such sentences have a 'simple' DP subject:

(120) $[_{TP}\ [_{DP}$ Pierre] a téléphoné]

We thus reach the same conclusion as Kayne (1972); in that article the nominative clitics in the various Clitic Phrases were obligatorily deleted if the rules that derived CI did not apply. We are saying the same thing, although, evidently, the technical tools we have been using to express that basic intuition are very different from the rule-based algorithms Kayne made such fruitful and innovative use of 28 years ago.[55]

8 Conclusion

This chapter has capitalized on the rich body of empirical findings that the work on clitics, SCLI, and CI conducted in Generative Grammar over the last thirty years has made available to the linguistic community at large; it has also made crucial use of many of its insights and generalizations. Indeed, none of its new suggestions could have been made without that previous work, whence the quotation from Condorcet at the beginning of the chapter.[56]

Its novel contribution lies chiefly in the claim developed in sections 5 and 6 that SCLI and CI require pre-spell-out computations to the Comp area and that

those computations can be profitably reinterpreted as Remnant Movement to the specifier of a functional projection in that layer of the sentence, specific to root interrogative clauses, which we have (arbitrarily) called HP.

On the analysis proposed here IP – AgrP or TP – movement to HP is driven by the need to check an interrogative feature on the H^0 head of the left periphery of questions; thus, IP movement to HP is an ordinary instance of displacement as characterized in minimalist work; put in slightly different, more neutral, terms, one may say that H attracts IP to its specifier to 'type' it as a question.

As we have repeatedly stressed, it is not the whole IP that is attracted to HP, but rather *Remnant* IP. We have developed a morphological, language-specific account of *the raison d'être* of this crucial property in section 7.2. It is argued there that the necessity to topicalize various constituents out of the phrase later moving to HP stems from the need to comply at PF with the morphological properties of the (overt or covert) H^0 head; more specifically, we have claimed that the *-t-* morpheme of SCLI and CI in French and Valdôtain is merged in H^0 and is both a morphological enclitic and a tense morpheme. As such it must be right-adjacent to a finite verb at PF. In addition, *-t-* has been claimed to be a prosodically 'deficient' morpheme; as such it must be (structurally) adjacent to a term that can be a stress-bearing suffix; this requires it to be left-adjacent to nominative clitics at PF; on this account, then, it is the independent requirements on the LF and PF interfaces of syntactic derivations that combine to yield the correct spell-out strings of SCLI and CI constructions.

On the highly plausible view that the left periphery of the clause is the locus of the discourse–syntax interface where notions like topic, focus, presupposition, and ground acquire syntactic import – see Rizzi (1997) – our 'HP' will ultimately have to find a principled position in the hierachy of projections that define that conceptual domain, a task we have not undertaken here.[57] Still, our HP and the properties we have given it should be evaluated on their own ground, on the basis of the empirical and theoretical generalizations it makes possible. In that perspective it is worth noting that if we are right, all question related verb movements in French are cases of Remnant Movement. In particular, Stylistic Inversion only differs from SCLI and CI in that its Remnant IP targets a different layer of the Comp domain, Kayne and Pollock's 'GP' – see, e.g., the derivation in (32) above – rather than the HP layer specific to root questions which attracts Remnant IP in SCLI and CI. The unitary approach to the verb related computations to the CP domain thus made possible by our analysis can be regarded as a step forward.[58]

A specific view of the syntax–morphology interface is crucial to the system we have developed; it claims that morphology does not reorder the strings that the syntactic computations feed to PF, although, evidently, it reanalyzes them;[59] if so the alternations in clitic ordering mentioned in section 6.4., for example, must be a consequence of syntactic computations, as Bošković (2001) also argues for Slavic clitics in other contexts, extremely convincingly in our view. Like him, we have been defending the view that language-specific morphological properties can act as filters on the output of syntactic computations, although the two modules are completely blind to one another. If our tentative language-specific,

morphological, account of the restrictions on remnant movement in French SCLI and CI is on the right track, this is one important suggestion of this chapter. It must be pointed out, however, that the arguments put forward in sections 5 and 6 in favor of the Remnant Movement approach to SCLI and CI are not conceptually dependent on this aspect of the analysis. It remains to be seen whether those facts and arguments do in fact require our Remnant Movement approach conceptually, as we have claimed. It is the task of the reader to check that they do.

NOTES

This chapter is a short, (it is hoped) pedagogical version of the second chapter of Poletto and Pollock (2004). Although this version is signed only by Pollock, many of the ideas and analyses are due to Cecilia Poletto and/or interaction with her. Thanking her here is thus a very inadequate measure of my debt. As will soon become apparent my debt to Richard Kayne's work is equally great; both commented extensively on a previous version of the chapter and thus helped me avoid many pitfalls. Many thanks also to the audience at a talk I gave on an early version of this chapter in Geneva in June 2000 and to Ur Shlonsly, Eric Laenzlinger, Yves Charles Morin, and two anonymous reviewers for critical remarks and suggestions. As usual, none of these people should be blamed for any foolish ideas or mistakes that the reader may find here.

1 As is well known, SI is not restricted to questions at all, as relatives and clefts like (i) and (ii) show:

(i) L'homme à qui a parlé Marie s'appelle Jean.
'The man to whom has spoken Mary is called John.'

(ii) C'est Jean à qui a parlé Marie.
'It is John to whom has spoken Mary.'

This is why the 'trigger' for SI is a *wh*-phrase in the left periphery, not some question feature as in SCLI and CI; on the (dispensable) notion 'trigger', see Kayne (1972), and Kayne and Pollock (1978, 2001).

2 Valdôtain is a Franco Provençal dialect spoken in the Italian Val d'Aoste, which, although in Italy, is part of the traditional Franco-Provençal area that covers French-speaking Switzerland except the Jura Canton and the French Rhône–Alpes area. All the Valdôtain examples in this chapter are from Roberts (1993a).

3 SCLI, SI, and CI are mono-clausal since they do not involve any extra layer of sentential subordination, unlike the *est-ce que/qui* questions in (i) which, despite their interpretation, are arguably derived from clefts (see Obenauer 1981, 1994):

(i) a. (Quand) est-ce que {Yves, cet homme} va téléphoner?
(when) is-it that {Yves, this man} will phone
b. (À qui) est-ce que {Yves, cet homme} va téléphoner?
(to whom) is-it that {Yves, this man} will phone
c. Qui est-ce qui a téléphoné?
who is it that has phoned

On *est-ce que/qui* questions, see also Munaro and Pollock (2005).

4 Also appears as chapter 3 of Belletti and Rizzi (1996).
5 Those crucial facts were first noted and analyzed in Kayne (1972).
6 And 'residual V2' constructions in the sense of Rizzi (1996), as in (i) (from Kayne (1972: 81)):

(i) a. À peine (Jean) était-il parti que Marie est entrée.
hardly (John) had-he left that Mary walked in
b. Sans doute (Cette fille) reviendra-t-elle.
no doubt (this girl) will-come back she
c. (Cette fille) reviendrait-elle que je ne serais toujours pas content.
(this girl) would-come back she that I still would not be happy
'Even if that girl came back I still wouldn't be happy.'

Similarly, the regional *-ti* construction of French (on which see section 7.3) has non interrogative – e.g., exclamative – uses, as in (ii):

(ii) C'est-ti pas malheureux! 'Isn't that shameful!'

7 Like quite a few other Romance languages – cf. Poletto (2000) – French has both subject clitics and direct object, indirect object, locative, and partitive clitics. Most of the tests used in this section would treat all types on a par. That nominative clitics should be distinguished syntactically from the others is shown by a variety of further tests, the most prominent of which being coordination (cf. Kayne 1975, 1994; Poletto 2000): while one may fail to repeat subject clitics in coordinations like (i), it is impossible to omit non-subject clitics in the same way, as (ii) shows:

(i) Il a mangé de la viande et a bu du bon vin.
'He has eaten meat and has drunk good wine.'

(ii) a. Il les a lus et *(les) a commentés.
he them has read and *(them) has commented
b. Il en a acheté et *(en) a expédié par la poste.
he of them has bought and *(of them) has sent off by post

In addition, of course, object clitics, unlike subject clitics, do not 'invert' with the verb in SCLI and CI:

(iii) a. Les as-tu lus?
them have you read
b. (Pierre) Les lui a-t-il portés?
(Peter) them to him has-t-he taken
c. *As les tu lus?/*As tu les lus?
have them you read/Have you them read
d. *(Pierre) A les lui-t-il portés/*A-t-il les lui portés?
(Peter) has them to-him he brought/Has he them to him brought

On the reason for this difference see sections 6 and 7; our analysis of subject clitics will not rest on the tripartition between strong, weak, and clitic pronouns argued for in Cardinaletti and Starke (1999), which the reader is nevertheless strongly encouraged

to read. When compared to many northern-Italian dialects, French is a relatively unsophisticated language since it does not (overtly) distinguish between invariable and deictic clitics and number and person clitics the way many NIDs do; on this see Poletto (2000: chapter 2). French does show a person–non-person distinction in strong subject pronouns, however; see Kayne and Pollock (2001) and section 3; that there is more than meets the eye in French subject clitic sequences is shown by the facts discussed in notes 35 and 43.

8 That *ce* and *on* are nominative clitics is shown by SCLI sentences like *Est-ce vrai?* (is this true?), *est-on arrivé?* (is one arrived?), and by the ungrammaticality of **c'est-il vrai?* (this is-it true) **On nous attend-il?* (one (for) us waits he) (see Kayne (1975: 89) and section 7.3). That they do not share all the properties of the other nominative clitics is shown by the fact that they do not yield acceptable CI sentences in Standard French **Depuis quand cela est-ce connu?* (since when this is-this known) **A qui Marie et moi doit-on parler?* (to whom Marie and me must-one speak) – vs. *Depuis quand cela est-il connu?* (since when this is-it known) *A qui Marie et moi devons-nous parler*? (to whom Marie and me must we speak). On this see note 36.

9 *Elle*, *nous* and *vous* are ambiguous and function as clitics in SCLI constructions like *Partirez-vous? partirons-nous?* (will-go you/we), but can also be strong forms, as *nous* is in (14d); when so analyzed they permit modification, are felicitous answers to *wh*-questions, as in *Qui viendra? Nous*, *vous*, *lui* (Who will come? you/we/him). When *nous* and *vous* are clitics, they cannot be modified, conjoined etc. (see (14a, b), (15b). Strong pronouns, unlike clitics, can be used as deictic pronouns (always capitalized in the rest of this article). Two other important properties of strong pronouns in French must be born in mind: (a) they have no morphological Case distinctions; (b) they never take (obligatory) liaison (see (vi) below). So, except for *elle*, strong pronominal subjects can in principle always be distinguished phonetically from their nominative clitic counterparts.

10 The properties listed here under (i–vi) hold of all clitic forms, not only of nominative clitics, although nominative clitics differ syntactically from non-nominative ones in other respects (see note 7); as noted in Kayne (1975) the two sets of clitics also differ prosodically: while it is somewhat marginally possible to have (iB) as a well-formed continuation of (iA) in a dialogue, the same is not true of non-nominative clitics, as the sharp ungrammaticality of (ii) shows:

(i) A: Il va arriver en retard.
'He is going to be late.'
B: Qui ça il?
who that he
'Who do you mean he?'

(ii) A: Pierre {les a rencontrer, lui a donné un livre, en parlera, y part demain}
Pierre{them has met, to him has given a book, of it will-speak, there goes tomorrow}
B: *Qui ça {les, lui}; *De quoi en; *Où ça y
who that {them, to him}; of what *en*; where that there}

We interpret this contrast as showing that nominative proclitics are not prosodic suffixes, unlike non-nominative proclitics: they can bear main stress and thus need

not form a prosodic word with a following element, unlike *les*, *lui*, *en* and *y*; because no such prosodic 'prop' is present in (iiB) the strings are ill-formed at PF, unlike (iB). In addition, on our analysis of case checking in section 3, (iB) is syntacticvally acceptable – i.e. it converges at LF – because *il* being a metalinguistic quote in (1B), it is exempted from having to check its uninterpretable nominative feature; alternatively it could be that *il* does check it by adjoining to some covert $AgrS^0$ head-specific to such elliptical contexts.

11 See Pollock (1998).

12 This section is essentially a partial rephrasing of Kayne and Pollock (2001: section 6).

13 For considerable elaboration of this idea see Cardinaletti and Starke (1999). See also notes 26 and 27.

14 Postverbal strong pronouns in SI must be deictic (see Kayne 1972, note 2) and Kayne and Pollock (2001: section 6)). Example (24) are often considered (very) awkward, but everybody agrees they contrast sharply with the totally unacceptable (26).

15 The liaison *-s* of *VOUS* and *NOUS* in (27c, d) must not be pronounced. If it is, those examples become irrelevantly acceptable, with *nous* and *vous* then (the stressed variants of) nominative proclitics.

16 Principle (30) is to be related to the fact that various instances of clitic pro in French, Italian, and English are also limited to third person; see Kayne (2000). The silent clitic 'pro' referred to in (30) should be carefully distinguished from the phrasal 'pro' of null subject languages which has no such restriction. On phrasal pro see Cardinaletti (1997) and below.

17 See also Kayne (1994), (2000: chapter 9), Pollock (1998), and Sportiche (1993b) on clitic doubling in other contexts.

18 On this view SI sentences crucially involve remnant (IP) movement (see Kayne and Pollock 2001); on Remnant Movement, see Den Besten and Webelhuth (1987). On remnant IP movement, see also Pollock et al. (1999), Poletto and Pollock (1999, 2004), and sections 6 and 7 in this chapter.

19 Despite the fact that *-ant* forms and finite verbs behave similarly with respect to the placement of adverbs (cf. Kayne 1975: section 1.3 and Pollock 1989: 408).

20 Structure (38) could in fact be analyzed as in (i) if one adopted (ii) the 'static' version of principle (30), as we shall do in section 6 (cf. (70)):

(i) $[_{TP}$ [{Eux, lui, elle}] $[_{T^0}$ ayant] . . .]]

(ii) Only strong third person pronouns can remain in [Spec, TP].

On that analysis *eux*, *lui*, *elle*, etc. simply check their (non-morphological) case feature by entering the usual checking relation with finite T^0 and they do not move to any higher functional projection; as shown in (i) they are not part of a clitic phrase; rather they make up a 'simple' subject DP; on the reason for this see section 7.5.

21 On this analysis acceptable infinitives like (i) (= (36) in the text above)

(i) {Eux, nous, vous, toi, moi} passer l'examen? Jamais!
'them, us, you, you, me} to take the-exam, never'

cannot have a pro subject in [Spec, Infl]; this comes as no surprise if the subject of infinitives is the null-pronominal anaphora PRO of Chomsky (1981). PRO cannot

occur in gerunds because if it did it would have null case, which it bans (cf. Chomsky and Lasnik (1993)) and pro cannot occur in infinitives since it cannot have null Case. In the text's example below *Ayant compris le problème, je suis allé au cinéma* ('Having understood the problem, I went to the movie') the phrasal pro-subject checks its case in [Spec, TP] and the coreferential clitic *je* (similarly *tu*, *il*, *nous*, etc.) checks its own morphological case in $AgrS^0$ in the main clause; so in gerunds of this type *je*, *tu*, *nous*, etc. can be interpreted as coreferent with an empty pronominal, despite Kayne's principle (30).

If this is correct, the lexical subjects of examples like (i) must have a different Case and check it in a crucially different way; it would be tempting to say that such infinitives have a vocative subject (=[{*moi?*, *toi? lui?*} [PRO *passer l'examen*]] . . .) and tie their existence to this. Gerunds should then exclude such vocative structures, for reasons unclear. As Cecilia Poletto suggests (p.c.), perhaps vocatives are too high for the gerunds to activate, a property which might be related to the more marked character of Aux to Comp constructions in infinitives than in gerunds. See Poletto and Pollock (2004).

22 The reason is that the LF form thus produced will contain an uninterpetable case feature; if clitics are only heads – see section 4 and note 27 – the input of (33) would have to contain two subject clitic phrases, which is independently banned by other UG constraints (e.g., one of those two clitic phrases would have its EPP features unchecked).

23 On the idea that clitics are heads, see, e.g., Kayne (1975, 1983, 1994: chapter 6), Rizzi and Roberts (1989), Cardinaletti and Starke (1999), and many others.

24 See Sportiche (1988), Larson (1988b), and Koopman and Sportiche (1991b).

25 This analysis thus rests crucially on the existence of a 'split' in the IP field between TP and AgrSP, as argued originally in Pollock (1989) and much subsequent work in the same vein leading over the years to a refined exploration of the functional structure of the sentence, culminating in the detailed cross linguistic investigation of Cinque (1999). Chomsky (1995c) has proposed a significant step in the other direction and argued that what we have been calling AgrS should be eliminated from the inventory of functional categories, mostly because AgrS has no autonomous interpretive import; assuming that LF interpretability does constrain the existence of functional categories, what we call AgrS in the text could be replaced by a higher substantive functional head, a move not entertained by Chomsky (1995c) but consistent with his guidelines (cf. also Pollock 1997). The distribution of full DP/strong pronouns and clitic pronouns in gerunds in French is in itself an argument for the existence of (at least) two distinct positions in the higher functional field of the sentence, each with its specific case checking properties. On the need for more than these two functional positions see also Cardinaletti and Roberts (1990), notes 35 and 43 below, and Poletto (2000). Aside from the very many arguments in its favor in the comparative-syntax literature over the last fifteen years or so, the split between TenseP and AgrSP has been argued for by Guasti and Rizzi (2002) and Neidle and MacLaughlin (2002) on two other totally different bases, namely, language acquisition and the syntax of American Sign language, respectively; in itself the convergence of these different fields of linguistic research provides strong confirmation for the Split-Infl hypothesis.

26 If this account of (47) is correct, the acceptability of (i),

(i) a. Pierre, paraît-il, aime la linguistique.
'Peter, it seems, likes linguistics.'

b. Lui, paraît-il, aime la linguistique
'Him, it seems, likes linguistics.'

must mean that the strong pronouns and full DP of such sentences have been extracted from their [Spec, TP] position to a position to the left of AgrSP (on this, see Belletti 1990), which can host indefinites and quantified DPs and is thus *not* a clitic left dislocated position (compare (8′)); similarly *wh*-phrases like *quand*, *à qui*, *comment*, etc. in sentences like (ii) must also have moved from their [Spec, Force] position to some superordinate position in the CP field; the unacceptability of (iii) means, then, that *que* cannot move up to that position:

(ii) a. Quand, à ton avis, partira Jean?
when in your opinion, will-go John
b. À qui, à ton avis, a-t-il téléphoné?
to whom in your opinion, has he phoned
c. Comment, selon toi, Marie va-t-elle s'excuser?
how in your opinion Mary will-she apologize

(iii) *Que, à ton avis, a fait Jean?
What, in your opinion, has done Jean

Sentence (iii) might itself then be profitably tied to Bellunese pairs like (iv) – on which see Pollock et al. (2003):

(iv) a. A-tu magnà che?
have-you eaten what
b. *Che a-tu magnà?
what have-you eaten

27 In extremely formal style it is possible to say *Mes amis z-ont compris*, *Eux z-ont compris*; such cases of liaison are never obligatory, even in highly conservative French; the style that has such exceptional cases of plural liaison is in fact plain snobbish, and it evidently relies on very different structural conditions.

In bare phrase-structure terms (cf. Chomsky 1993, 1995c), all lexical items, including strong pronouns like *eux*, *lui*, *moi*, etc. are heads in the numeration. What distinguishes them from pronominal clitic heads is that they 'project' to a phrase, which clitic heads cannot do as a matter of course; they can only if they merge with a designated class of lexical items – coreferential pro/strong pronouns/full DP – yielding a clitic phrase in the sense of Kayne (1972) and Sportiche (1993b). That inability they share with articles, among others grammatical items; articles too fail to 'project' a maximal projection unless they take a NP (or AP) complement; put slightly differently, articles are part of the 'extended projection' of the noun, just as clitics are part of the verb's extended projection, in Grimshaw's (1991) sense. It appears, then, that liaison – like reduced pronounciation in English – is sensitive to that property and ignores the fact that the structural relationship between a nominative clitic and the following verb or clitic phrase probably differs from that of an article and its AP or NP complements; (this refinement of) the text analysis (still) leaves unexplained the obligatory liaison in *Eux z-autres*, *Vous z-autres*, unfortunately. On the status and

position of articles in the functional projections of the DP, which these inadequate remarks do not do justice to, see Giusti (2000) and her many references.

28 The structural hierarchy we have argued for here is at variance with that proposed in Cardinaletti (1997); we have in effect reversed the order of embedding of the two functional positions hosting clitics and full DP/strong pronouns which she suggests (see e.g. her (73), p. 53); the contradiction may well only be apparent, however, and it is tempting to claim that in the simple affirmative sentences she examines strong pronouns and full DPs (though not clitics) eventually move from the low position countenanced here up to a higher functional layer, perhaps akin to the Topic-like position to which they alone move in SI on Kayne and Pollock's (2001) analysis. On this see also note 26.

29 As Poletto (2000) demonstrates, the NIDs provide empirical arguments in favor of overt, pre-spell-out movement in SCLI; let me repeat two of her arguments here; first, in the dialect of Rodoretto di Prali it is possible to coordinate SCLI constructions and *wh*-structures with an overt complementizer, as in (i) (cf. Poletto (2000: chapter 3, (21)):

(i) L'achetà-tu ou qu' tu l'achette pa? Rodoretto di Prali
it buy-you or that you buy not

On the well-supported assumption that coordination is always coordination of two identical phrases *l'achetà-tu* must have activated the Comp field whose presence in the second conjunct is overtly signaled by *qu-*; therefore SCLI in Rodoretto di Pralese must involve overt computation to the CP field.

Second, in Fassano – the dialects spoken in the Fassa valley – SCLI is only possible when the verb has crossed the position of a 'new information' particle that has been shown to be a CP particle in Poletto (2000: 46–49)):

(ii) a. Olà vas-t pa? Fassano
where go you Ptcl
b. Olà pa tu vas
where Ptcl you go
c. *Olà pa vas-t?
where Ptcl go you
d. *Olà tu vas pa?
where you go Ptcl

In (iia), SCLI has taken place and both the verb *vas* and the subject clitc *-t* precede the Comp particle *pa*; in (iib) SCLI inversion has not taken place – as is possible in many varieties, including colloquial French (cf. *Où tu vas?* = 'Where you go?') – and *pa* precedes the subject clitic and the verb; (iic) shows that *pa* cannot precede the verb and the clitic when SCLI has taken place and (iid) that the particle cannot follow them when it has not. Evidently, (ii) can be explained neatly if SCLI is a computation that overtly displaces the verb and the subject clitic to the Comp field, more precisely, to a position higher than *pa*. On further arguments of this sort, see also Poletto and Pollock (2004).

30 In colloquial French *pas* does not block head movement in imperatives, as shown by the fact that at that stylistic level (i) is acceptable for many speakers, including the author:

(i) Donne le lui pas!
give it him not

Sentence (iia) is also fine in a slightly less colloquial style and alternates with the 'standard' (iib)

(ii) a. Le lui donne pas!
it him give not
b. Ne le lui donne pas!
Neg it him give not

Example (i) should clearly be interpreted as missing *ne* altogether; speakers that accept (iia) have an invisible *ne* which, like its overt counterpart, blocks head movement. Sentence (i) then shows that for speakers of colloquial French, *pas* can be generated as sentential negation, presumably in the 'low' position described by Zanuttini (1997) for some NIDs. We return to imperatives from a different perspective in section 6.4.

31 Because they show gender and number distinctions, which expletives typically do not – although the NIDs show that expletive pronouns can be morphologically masculine or feminine.

32 This analysis of (63) thus derives the effects of Kayne's (1983) principle (59), repeated here under (i), without having to posit it belongs in UG.

(i) Given a chain C with case K, K can be realized morphologically on at most one element of C.

33 Those facts were originally noted in Morin (1979), who gave contrasts like the following (see also Kayne (1983: 219)):

(i) a. Pourquoi lui seul a-t-il été prévenu?
why he only has-he been told
b. *Pourquoi toi seul as-tu été prévenu?
why you only have-you been told

To my ear (ia) becomes less acceptable if *elle* replaces *il* and if *seule* is dropped:

(ii) a. ?Pourquoi elle a-t-elle été prévenue
why she has-she been told

Weak but clear contrasts as that between (ia) and (iia) have a garden-path flavor; when it is not in a CLLD position, preverbal position *elle* seems to be preferably interpreted as a clitic pronoun, which its morphology makes possible (see note 9); the later occurrence of the postverbal clitic in CI makes this impossible for the reasons discussed in section 4, whence the garden-path problem; this is why presence of the modifier *seule* helps: it makes the analysis of *elle* as a clitic impossible (see section 4), so no parsing problem arises; adding *autres* or *trois* to preverbal *nous/vous* in (65c, d) does not make them totally acceptable in my French, probably because to my ear ?{*Nous, vous*} {*autres*, *seuls*, *trois*} {*avons*, *avez*} *apporté un livre* remain less than perfect;

in this they differ from their gerund counterparts: {*Nous autres*, *moi seul*, *toi seul*, *vous deux*} *ayant passé l'examen . . .* , are fine and contrast minimally with *{*Nous*, *moi*, *toi*, *vous*} *ayant passé l'examen* (cf. discussion of (36d)); such contrasts will follow from principle (70) below if strong first and second person pronouns *can* remain in [Spec, TP] when modified by *autres*, *seuls*, and numerals.

34 On the unacceptability of (69c, d) see n. 15.

35 The idea that only third person pronouns can remain in [Spec, TP] goes in the same direction as the descriptive generalizations on clitic doubling in Poletto (2000: chapter 6). Although we have no conceptual explanation for why there is a special slot for first and second person pronouns in the structural hierachy of the clause, it does appear that some such property also holds for object clitics. Zanuttini (1997: 18) observes that first and second person object clitics occur in front of a preverbal negative marker while third person pronouns occur after it, as shown in (i) (Cairese, a Val Bomida dialect):

(i) a. U n li sent nen.
SCL not him hears not
'He does not hear him.'
b. U mi-n sent nen.
SCL me-not hears not
'He does not hear me.'

On this basis it would be tempting to say that (some principled reformulation of) (70) should carry over to all first and second person pronouns, independently of their subject or object status. See Poletto and Pollock (2004).

36 Compare (69a, b) and, say, *Ma femme et moi avons téléphoné* ('My wife and I have phoned'), *Ta femme et toi avez téléphoné* ('Your wife and you have phoned'), etc. We therefore do not need to appeal to Kayne's (1983) thematic criterion account of the contrast between (68) and (69) which rested on his (74), repeated in (i):

(i) A first or second person pronoun must be an argument.

Criterion (i) is falsified, as Friedemann (1997: 164) notes, by examples like (72b, d); Kayne's (1983) idea that the post-verbal clitic in CI – though not in SCLI – was an expletive also rested on contrasts such as that between (i) and (ii).

(i) Depuis quand est-ce vrai? since when is this true

(ii) *Depuis quand cela est-ce vrai? since when this is this true

which he analyzed as a theta-criterion violation with *ce* and *cela* both arguments. Friedemann (1997: 164) notes that some speakers accept (ii), others perceive a clear contrast; for the latter class our analysis may have to state that although *ce* and *on* are nominative heads in a clitic phrase, they only accept a null pro in their specifier, unlike *il* which accepts *cela*, bare quantifiers like *tout*, quantified DPs like *chaque homme*, etc. as well as (phrasal) pro; examples and contrasts like (iii):

(iii) a. {Cela, tout} est-il bien attaché?
{that, all} is-it well fastened

b. {Cela, tout} va tomber parce que c'est mal attaché
{that, all} will fall because that is badly fastened
c. *{Cela, tout} va tomber parce qu'il est mal attaché
{that, all} will fall because it is badly fastened

must then mean that in (iiib) *cela*, *tout* are interpreted as coreferent to (phrasal) pro in the Spec, *ce* of the subject clitic phrase in the subordinate clause:

(iv) $[_{ClP}\,[_{NP}\,\{cela,\ tout\}]_i\ pro]\ \ldots\ [_{ClP}\,[_{NP}\,pro]_i\ ce]$

As for (v), the structure of the ill-formed (iiic),

(v) $*[_{ClP}\,[_{NP}\,\{cela,\ tout\}]_i\ pro]\ \ldots\ [_{ClP}\,[_{NP}\,pro]_i\ il]$

it might be excluded because of a conflict in gender or vagueness if the *pro* specifier of *il* has to be masculine/non vague, which *cela*, *tout* are not; if so $[_{ClP}\,[_{NP}\,pro]_i\ ce]$ in (iv) is fine because *ce* imposes no such requirement on pro, perhaps because of its deictic nature.

37 Perhaps to check some modal feature, as in Belletti (1990), Rivero (1994), Rizzi (2001b), and Terzi (1999).

38 H^0 is a head that can be merged only in root sentences and it can be associated with various (uninterpretable) features, like [+question] – which then triggers the CI and SCLI phenomenology for reasons discussed later – and [+imperative]; (true) imperatives are indeed restricted to root contexts.

39 In (very) colloquial French that suppletion is not obligatory for first person dative *me* and most speakers of Standard French have probably caught themselves saying, half in jest, things like *donne le me*, *donne me le* ('Give it me/give me it'); the same does not appear to be true of the second person dative; even as a joke I don't think I could say **Mets le te dans la poche*, **Mets te le dans la poche* ('Put {it you, you it} in the pocket'). Suppletion *is* obligatory in simple imperatives like *aide moi*(**me*); see Kayne (2000: chapter 8).

40 Terzi (1999) develops a head movement account of a similar alternation in Standard and Cypriot Greek consistent with Kayne's LCA resting on two different input structures for clitic sequences; in one the consecutive dative and accusative clitics are adjoined to two different functional heads, as in the text; in the other, the two clitics are adjoined to one another and are adjoined as a unit to a single functional projection (see Terzi 1999: 102–103); V^0 movement to the C domain above the clitic sequence must first adjoin to the closest functional projection because of Chomsky's (1995c) 'shortest move'; the relevant clitic projection is then 'dragged along' by V^0 movement and so the two input structures yield the two alternative orderings of Greek imperatives. Terzi refrains from extending her analysis of Greek to French and adopts Laenzlinger's (1998) morphological approach, which capitalizes on the tonic properties of *moi/toi/lui* in e.g. *Donne le moi*, *donne moi le*, etc. The latter approach is incompatible with our view of morphology (see next section) and it does not seem to carry over very easily to the clitic sequences variations in (very) popular French in which *moi* does not replace *me*, as in *donne me le*, *donne le me*. See previous note.

41 On the non-availability of morphological accounts, see next section.

42 Laenzlinger (1998: 3.1 and 3.2.1) suggests that the *-t-* of SCLI and CI is related to the so-called *fausse liaison* or *pataques -t-* of popular French sentences like (i):

(i) a. Il ira seul -/t/-à Paris.
he will-go alone /t/- to Paris
b. Il devra-/t/-y avoir du monde.
it must -/t/-there be of people
'Lots of people will be there.'

where *pataques* *-t-* is the marker of third person agreement. This would then account for the absence of *-t-* in first and second person SCLI:

(ii) a. Partirons (*t) nous?
will-go (*t) we
b. Partirez (*t) vous?
will-go (*t) you

I find the clever *rapprochement* between the two sorts of *-t-*s unconvincing; first, as Laenzlinger (p. 112) himself notes, /-z/ in popular French is an equally acceptable *fausse liason* consonant for third person:

(iii) Il reviendra -/z/ à Paris.
he will-go back -/z/ to Paris

although it indeed is typically a first or second person agreement marker, as in *fausse liaison* examples like (iv) (= Laenzlinger's (110a)):

(iv) J'irai/tu iras/nous irons finalement -/z/- à Paris.
I/you/we will-go finally -/z/- to Paris

On Laenzlinger's analysis of SCLI and CI *-t-*, one should expect (v) to be a possible variant of (83c, d), which they clearly are not:

(v) a. *Parlera-/z/-{il, elle}?
will speak -/z/- {he, she}
b. *Parlent-/z/-{ils, elles}?
speak -/z/- {he, she}

If what accounts for (v) is that /z/ is preferably a second person marker, we would still expect (vi) to surface, again contrary to facts:

(vi) a. *Parlera-/z/-tu?
speak -/z/- you (Sg)
b. *Parlerez-/z/-vous?
speak-/z/ you (Pl)

In any case the Morgeux data show that the analysis is insufficiently general; this criticism of Laenzlinger's analysis of SCLI and CI *-t-* does not extend to his extremely interesting account of the 'epenthetic' /z/ of imperatives like *Donne* *(z) *en*. See his section 3.1.

43 We shall say that *-t-* has a null counterpart '*ø*' in first and second person pronoun SCLI sentences, as in *Quand partons-nous*, *À qui parliez-vous?* ('when leave-we', 'to

whom spoke-you') and that '-ø-' has the same morpho-phonological properties as its overt counterpart. The first person singular clitic *je* can only invert in SCLI with auxiliaries *avoir*, *être*, and *aller*, with modals like *devoir* and *pouvoir* – the latter only in its otherwise obsolete *puis* form of *'Puis-je?'* ('Can I?') (cf. **peux-je*) – and with main verbs in the future and conditional:

(i) a. Suis-je arrivé? am I arrived
b. Ai-je compris? have I understood
c. Vais-je partir? will I go
d. Dois-je partir? must I leave
e. Puis-je dormir? can I sleep

(ii) a. Arriverai-je? will-arrive I
b. Comprendrai-je? will-understand I
c. Partirai-je? will-go I
d. Dormirai-je? will-sleep I
e. Partirais-je si je savais que . . . ? would-leave I if I knew that . . .

(iii) a. ?*{Arrive-je, Arrivais-je}? arrive {Prst, Past} I
b. ?*{Comprends-je, comprenais-je}? understand{Prst, Past} I
c. ?*{Pars-je, partais-je}? go {Prst, Past} I
d. *{Dorme-je, dormais-je}? sleep {Prst, Past} I

Such contrasts recall the parallel restrictions on Subject–Aux Inversion in English (cf. Pollock 1989) and would follow on an analysis of that type if *je* moved or was merged 'very high' in the IP field, to or in a position that only 'auxiliary phrases' could cross over under Remnant Movement (see section 6) and if future or conditional verb forms moved up to that position in virtue of the fact that their future or conditional tense endings are identical to those of auxiliary *avoir* in the present tense and *imparfait*; this would then be a very surprising reflex in synchronic syntax of the bimorphemic origin of the construction 2,000 years ago, on which see Benveniste (1974) and Roberts and Roussou (1995).

44 The structural interpretation of the predicate 'adjacent' just adopted comes dangerously close to building a syntactic property into morphology. This may well indicate that the language specific morphological analysis entertained in this section is not optimal; if so, the more ambitious syntactic analysis alluded to in section 7.1 should be taken up seriously in future research; see Poletto and Pollock (2004).

45 As is well known, Old French had questions in which accusative and dative clitics did follow the verb; (i) from Foulet (1928: 116), provides relevant examples:

(i) a. Si dist: Sire, ai le ge bien fait? Old French
thus said, Sire, have it I well done
b. Conois la tu?
know her you
c. Pere, avés les vos obliées?
father have them you forgotten
d. Plairoit vos oïr un son d'Aucassin, un franc baron?
please you (to) hear a song by A . . .

Since Old French also allowed 'Germanic' questions – see, e.g., Rutebeuf's famous *Que sont mes amis devenus?* ('What have my friends become?') and for much discussion Rizzi and Roberts (1989), Cardinaletti and Roberts (1990), and Roberts (1993) – it is tempting to say that both types involved (at least final) head movement to (some high head in) the CP field, a conclusion forced on us if Kayne (1994: 44) is right in assuming that such strings as *A Jean compris?* (*'Has John understood?'*) only obtain via V^0 movement to a head in (some) Comp (layer). In this diachronic perspective a reduction of the syntactic scope of verb movement to the CP field seems to have been a long term tendency in French. Conversely, Old German and Old English had V3 (V4, etc.) structures like (ii), discussed in Cardinaletti and Roberts (1990) and Tomaselli (1995):

(ii) a. Erino portun ih firchnussu. Old German
iron doors I shatter
(Tomaselli 1995: (1b))

b. Dhes martyrunga endi dodh uuir findemes mit urchundin dhes heilegin chiscribes.
'His martyrdom and death we demonstrate with evidence of the Holy Writings.' (Tomaselli (1995: 1c))

c. After his gebede he ahof that child up. Old English
after his prayer he lifted the child up
(van Kemenade 1987: 110, (3a))

d. Thas thing we habbath be him gewritene.
these things we have about him written
(van Kemenade 1987: 110, (3b))

It would be tempting to analyze such examples as cases of Remnant Movement to the Comp area of nominative clitic voice phrases – various non-nominative clitic voice phrases could also move like this in Old English (see van Kemenade (1987) for a head-movement analogue of this idea); this only obtained when the highest CP layer was not occupied by a *wh*-phrase, negation, and the adverbial *þa* 'then'; for such cases one might hypothesize final V^0 movement to the head of forceP in the specifier of which *wh*-phrase, negation, and þa would be standing, much as in the analysis of French imperative sketched out in section 6.4; if this is the right way to look at such facts – but see Cardinaletti and Roberts (1990) for an early alternative account exploiting a double Agr structure – Romance and Germanic would seem to have taken two opposite courses, for reasons that would deserve an investigation that cannot be undertaken here.

46 On a similar view of *i* arrived at from a totally different angle – that of the *que to qui* rule – see Taraldsen (2001). In Piedmontese and Fruilian dialects, *i* is what Poletto calls a 'deictic' SCL, i.e., first and second person clitics, which jibes well with the view that at least Québec French *-tu* is historically derived from Standard French second person singular clitic *tu* (see Vinet 2000). On Poletto's analysis, deictic clitics are in the same structural position as invariable clitics.

47 This account evidently presupposes that *i* does not have any morphologival case to check (in $AgrS^0$), which should be tied to its complete lack of person features (see Chomsky 1999); one might wonder why on the *-t-(+i)* strategy just described it is impossible to remnant move only FP3 in (95), yielding ill-formed strings like (i):

(i) *Viendra-t-i elle?
will-come *ti* she

I believe that (i) should be excluded for the same reason (ii) is:

(ii) a. *I j'ai compris.
i I have understood
b. *I elle a compris.
i she has understood

To our knowledge no dialect of French allows 'Invariable SCL + Variable SCL' strings to surface; in this respect French differs from many NIDs; in the Italian dialects that do accept such sequences Poletto (2000: 23) shows that the invariable clitics move to the CP domain and have pragmatic and discourse import; suppose that it is only when they play such a derivative discourse role that invariable clitics can c-command lower level variable clitics, because they then cease being analyzed as referential entities; assume French *ti* dialects do not allow for *i* incorporation into the CP domain; *-i* therefore remains referential; since it is necessarily coreferential with the lower clitics, it will cause a Principle B violation unless the computations to the CP field create structures in which it is neither c-commanded by nor c-commands the variable clitics. This will exlude both (i) and (ii), as desired, by forcing the maximal FP2 in (95) to undergo Remnant Movement to [Spec, HP]. On similar ideas in other contexts, see section 7.5.

What was said earlier in section 3 predicts that in the *-ti* sociolects and dialects sentences like (iii) should be well-formed but (iv) excluded:

(iii) a. Lui viendra-ti?
him will-come-*ti*
b. Eux viendront-ti?
them will-come-*ti*

(iv) c. Moi viendrai-ti?
me come-*ti*
d. Toi viendras-ti?
you come-*ti*

This is because *moi* and *toi* cannot remain in FP2, unlike *lui* and *eux.* To the (limited) extent that my intuitions about those sociolects are reliable, I am inclined to believe that the prediction is correct.

It is often said that the *ti/tu* dialects and sociolects ban *wh*-extraction altogether; the facts are not crystal-clear, however; Yves-Charles Morin (p.c.) and Québec French native speakers like Monique Lemieux and Marie Thérèse Vinet (p.c.) do seem to accept as perfectly grammatical only yes/no questions like (v) and find examples like (vi) fairly outlandish:

(v) a. Il va-tu bien? Québec French
he goes-*ti* well
'How is he feeling?'
b. Je suis-tu arrivé?
I am-*ti* arrived
'Have I got there?'

(vi) a. Quand tu pars-tu?
when you go-*ti*
'When are you leaving?'
b. Comment elle va-tu?
how she goes-*ti*
'How is she doing?'
c. Où je suis-tu arrivé?
where I am-*ti* arrived
'Where have I arrived?'

However, Yves Charles Morin notes (p.c.) that in his French *-ti* dialect the counterpart of (vib) "s'améliore avec le complémenteur *que*" and gives as acceptable (vii),

(vii) Et comment qu'a va-ti, ta vache, à c'theure? Québec French
and how that it goes-*ti* your cow now
'And how is your cow doing now?'

I will therefore refrain from attempting to speculate on why (vi) and the like in Quebec French are often judged less than optimal; the remarks on Québec French *-tu* constructions in this footnote do not even scratch the surface of its complex properties, on which see Vinet (2000) and her references.

Aside from clear Topic drop cases like the famous question *Où qu'est-ti?*, *Où qu'est-ti?* (where that is-*ti*) asked by Michel Simon in an equally famous French movie in the thirties – the null topic here is a card that Michel Simon keeps moving around and that onlookers must spot if they are to win their bets – the *ti* constructions require preverbal subjects, which simply follows from the EPP on our analysis, which also claims that the *que* of (vii) and of Michel Simon's question must be the surface realization of the head of a (very) 'high' functional layer of the CP field, perhaps ForceP.

48 The different Valdôtain dialects can differ a lot in that respect; according to Roberts (1993: 320) the Châtillon and Val Ferret dialects have only one second person singular preverbal clitic in simple tenses, while the Ayas and St Nicholas dialects have three. Despite this considerable variation, all dialects require a proclitic on the auxiliary in all persons in compound tenses.

49 Structure (104) is simplified; see section 7.5.

50 Most NIDs have subject clitics (cf. Poletto 2000) yet they do not allow for the SCL1–V–SCL2 sequences of SCLI of Regional French or Valdôtain. Similarly, they do not have CI constructions. So, for example, in Friulian **Al vegnial* (he comes he) and the like are excluded although *vegnial* (comes he) is fine; in our terms that must mean that their subject clitics have not been reanalyzed as TP elements, i.e., as 'pure' agreement markers, as in Valdôtain, and that full DPs are in the specifier of the $AgrS^0$ nominative clitics (see next section); in short full DPs are too high in the structure of the clause in most NIDs for Remnant TP movement to the specifier of HP to drag them along, as Poletto (2000) already argued.

51 We have omitted the previous topicalization of the direct object *an pomma* (an apple).

52 We ignore the cycle here to make the derivations easier to read.

53 As is well known the basic assumption taken up here that the null-subject agreement markers have to be overt raises tricky problems for Italian third singular and, more generally, for Chinese-type null-subject languages, on which see Huang (1989).

54 See Poletto (2000: chapter 6) for the refinements that the NIDs require concerning what elements their nominative clitics can double.

55 In addition to their role in SCLI configurations, clitic phrases (with a non-lexical clitic head) play a major role in SI (see Kayne and Pollock 2001); the text analysis allows for that since the null-clitic pro fails to be c-commanded by the topicalized DP and the latter fails to be c-commanded by the formeer in the spell-out structures generated by derivations like (i) (= (32) in text above), at work in SI sentences like *À qui a téléphoné Jean?*

(i) $[_{IP}$ Jean-pro a téléphoné]
$\Rightarrow [_{FP}$ Jean$_i$ F^0 $[_{IP}$ t$_i$-pro a téléphoné]]
$\Rightarrow [_{GP} [_{IP}$ t$_i$-pro a téléphoné$]_j$ G^0 $[_{FP}$ Jean$_i$ F^0 t$_j$]]

56 Unfortunately, the analysis developed above has not much to contribute to the understanding of a mysterious set of robust facts uncovered in Morin (1985). Morin observes that what he convincingly analyzes as the (subjectless) verbs *voilà/voici* allow the postverbal clitic to 'agree' with the objective feminine clitic *la/les*, as in sentences like (ib, c).

(i) a. Ne la voilà-t-il pas prisonnière de ses mensonges
'Isn't she a prisoner of her own lies?'
b. Ne la voilà-t-elle pas prisonnière de ses mensonges
'Isn't she a prisoner of her own lies?'
c. Ne les voilà-t-elles pas prisonnières de leurs mensonges
'Aren't they prisoners of their own lies?'

This is in addition to the acceptable, and expected SCLI pattern of (ia), in which *il* is arguably an expletive subject clitic comparable to that of e.g. *lui semblait-il que la terre était plate*? (to him appeared-it that the earth was flat, 'did it seem to him that the eath was flat?') – despite the subjectless form *voici-voilà* affirmative sentences take at spell-out (see the account of a similar asymmetry in Valdôtain in 7.4); the same pattern of exceptional postverbal clitic agreement holds in CI sentences like (iib, c) with a verb like *gêner*:

(ii) a. Cela la gêne-t-il?
this her bother-t-it
'Does that disturb/bother her?'
b. Cela la gêne-t-elle?
this her bother-t-she
'Does that disturb/bother her?'
c. Cela les gêne-t-elles?
this them bother-t-they
'Does that disturb/bother them?'

Cases like (iib, c) make it difficult to analyze the peculiar 'agreement' pattern of (ib, c) as resulting from the (exceptional) reanalysis of *la* as an objective subject clitic occupying the specifier position of a subject clitic phrase of the form in (iii),

(iii) $[_{ClP}$ {la, les} $[_{Cl^0}$ elle(s)]]

all the more so as sentences such as, *Depuis quand cela la gêne-t-elle?* ('How long has this bothered her?') seem to have the same acceptability as (iiib), unless it could be

claimed that *qu*-phrases like *depuis quand* can move to a position further left (i.e., higher) than that to which object *wh*-phrases can move. Morin (1985: 796) notes that the acceptability of the feminine clitic in (iib, c) and the like seems to depend on the thematic roles and animacy of both subjects and objects; compare:

(iv) a. Depuis quand Pierre la gêne-t-il?
'How long has Peter disturbed/bothered her?'
b. *Depuis quand Pierre la gène-t-elle?
(same)
c. Marie, cela va-t-elle la déranger?
'Mary, is this going to disturb/bother her?'
d. ?*La pièce, cela va-t-elle la déranger?
The room, is this going to put it in disarray?

Morin (1985: 797) makes the further very important obervation that the acceptable exceptional clitic agreement of (iib, c) never extends to subject/verb agreement, whence contrasts like (v):

(v) a. *Cela les gêneront-elles?
this them bother(Fut + Pl) they
'Will that bother them?'
b. Cela les gênera-t-elles?
this them bother(Fut + Sg)-t-they
'Will that bother them?'

In short, although (v), (iia), (iva vs. b), (ivd) are straightforwardly explained by the analysis developed in this chapter, the (perfect) acceptability of (ib, c) and (iib, c) does not follow from anything we have said. On equally ill-understood contrasts in animacy with something of the same flavor in other constructions, see, e.g., Kayne (1975: 320–323, 159, and note 107).

57 See Poletto and Pollock (2004).

58 For this to be a genuine breakthrough one would need to explain why Remnant IP Movement to GP, as in SI, crucially depends on the previous topicalization of the subject while in CI and (regional *-ti*) SCLI Remnant IP Movement to HP is not subject to this requirement; see Poletto and Pollock (2004). In addition, our analysis raises the general problem of why UG should allow for two radically different types of computations, head movement and Remnant movement, yielding identical strings at spellout; see section 7.1.

59 So for instance the string *est-il* ('is he') in *Quand (Pierre) est-il venu?* (when (Peter) is he come) is crucially analyzed as a morphological unit, a prosodic word, although it is not a syntactic object in our system.

5 Conclusion

1 Introduction

Subjunctive is the traditional label for one of the possible values of the grammatical category 'mood' (in some grammatical traditions also known as conjunctive). It minimally contrasts with the mood category displayed in main assertive clauses, indicative. It usually surfaces in subordinate clauses (Greek *hypotaktiké* 'subordinated'), but independent uses of subjunctive are attested as well. In many languages this category is typically realized as a separate finite verbal paradigm with specific inflectional morphemes (see the verbal ending in (1a)), but it can also be materialized in inflectional particles (such as Greek *na* in (1b)) or in the C-system (note the Russian subjunctive complementizer *ctoby* in (1c)).

(1) a. Volen que dimiteix*i*. Catalan
want.3PL that resign.SUB.3SG
b. θélun *na* pareti**θ**í Greek
want.3PL SUB resign.3SG
'They want her/him to resign.'
c. Ja zhelaju cto-*by* ona ushla. Russian
I desire.1SG that-BY she go.PST
'I desire that she should go.'[1]

A wide range of syntactic phenomena have been argued to depend on the co-occurrence of subjunctive. However, subjunctive does not constitute a syntactically uniform object, either cross-linguistically or even within the same language. For instance, some of the subjunctive-related phenomena described for one language do not hold for other languages having subjunctive mood. Similarly, some allegedly subjunctive-related phenomena show up in a subset of the subjunctive clauses in a language, but not in all of them. These facts indicate that subjunctive may be essentially seen as an epiphenomenon derived from other lexical, syntactic, or semantic factors and that as such it does not allow us to identify subjunctive clauses as one class. We concentrate here on the syntactic properties that have beem claimed to pertain to subjunctive subordination, mainly argument clauses. The interpretive effects of this mood category are put aside, unless considered essential for the explanation.[2]

First, we will examine three phenomena that have been linked to the syntactic transparency of subjunctives as clausal domains. Next, in section 3, we will review the approaches that take subjunctive clauses to be a syntactic object different from indicative clauses, subject to specific licensing conditions. Finally, in section 4, we will concentrate on the different aspects of the functional structure of subjunctive clauses to the extent that they show specific traits vis-à-vis indicative clauses.

Most work on the syntax of subjunctives has concentrated on Romance and Balkan languages, which will also provide the empirical evidence for this survey.

2 Syntactic transparency

Subjunctive clauses have been argued to constitute more transparent domains than indicative ones with respect to a number of syntactic relations. Some of the explanations concentrate on one or more of the transparency effects, or on a certain group of languages, which makes it difficult to characterize the notion of subjunctive transparency in a unified fashion. The biggest difficulty, though, lies in the fact that the purported transparency of subjunctive clauses does not seem to be a property of subjunctives as such, but rather of a subset thereof, and that the determining factor for transparency has to be found ultimately in the lexical semantic properties of the item licensing or selecting them.

2.1 Obviation

In most Romance languages, subjunctive clauses embedded under volitional and directive predicates display obviation effects, that is, a ban on coreference between the embedded and the matrix subject, as in (2).

(2) a. *Queremos$_i$ que ganemos$_i$. Spanish
want.1PL that win.SUB.PRS.1PL
'We want to win.'
b. Queremos$_i$ que ganen$_k$.
want.1PL that win.SUB.PRS.3PL
'We want them to win.'

Picallo (1984, 1985) ascribes the coreference restriction between matrix and embedded subjects to the defective Tense specification of subjunctive clauses (see section 3.1). This defectivity enforces the establishment of a T(ense)-chain between the tense features of the subjunctive Infl node and the Infl antecedent. As a result of this, the binding domain for the embedded subject is extended and the first accessible subject for the embedded subject turns out to be the matrix subject.[3] By Principle B of the Binding Theory, the embedded pronominal Agr is forced to be free in its binding domain, thus excluding coindexation with the matrix Agr.

The restriction on the reference of the embedded subject is operative only with respect to the matrix subject, though, and it does not apply when coreference is established with an internal argument in the main clause.[4] In Picallo's account this is derived through the Case Resistance Principle (Stowell 1981), which forces extraposition of the embedded clause. As a result of this, the internal argument of the main clause does not c-command the embedded subject and they can freely corefer.

(3) Les$_i$ pidió que se callaran$_i$. Spanish
to-them ask.PST.3SG that REFL be-quiet.SUB.PST.3PL
'S/he asked them to be quiet.'

Obviation was originally taken to be a defining property of subjunctive as a whole, but it has been shown that it is a property only of a set of subordinating predicates in some languages (Romance, but not Balkan, languages possess this characteristic). While restricting obviation to the relevant set of subjunctive selecting predicates (volitionals, directives, causatives), many accounts of obviation build on Picallo's insight that the defectivity of subjunctive tense lies at the bottom of subject disjoint reference (see the reference to the analyses by Progovac and Raposo in section 3.1). Alternatively, Suñer and Padilla-Rivera derive obviation from a lexical feature specified in the relevant set of predicates. However, on the accounts of subjunctive as an operator (section 3.2), obviation effects are seen as the consequence of operator movement: though enforced by other requirements,

the displacement of the operator ends up creating a configuration where the matrix and the embedded subjects must be disjoint in reference.

It is important to note that obviation effects do not arise in operator triggered subjunctive (Polarity Subjunctive, in Stowell's terms, see section 3.3 for the distinction), as in (4):

(4) No $cree_i$ que $vaya_i$. Spanish
not believe.3SG that go.SUB.PRS.3SG
'S/he doesn't think s/he'll go.'

Farkas (1992a) follows a rather different path from the accounts reported so far and explains obviation as a case of blocking by infinitival clauses in canonical (subject) control contexts: in order to encode the subject dependency, infinitives are then selected over subjunctives, which mark the broader notion of world dependency. Another alternative account has recently been suggested by Dobrovie-Sorin (2001), who argues that subjunctive clauses in Romance languages other than Romanian do define a governing category for their subjects. The need to use an infinitival clause in a subject-control structure where both subjects are coreferent would derive from a principle that requires choosing an anaphor instead of a pronoun whenever possible (see Bouchard 1982). A potential problem for this explanation is created by operator-triggered subjunctives as in (4), because, everything else being equal, an infinitival should surface instead of a subjunctive.

However robust the core obviation cases might be, there are a number of factors that lift subject disjoint reference effects (see Ruwet 1984, 1991 for a more detailed discussion):

(i) a modal in the embedded clause

(5) $Espero_i$ que $pueda_i$ ir. Spanish
hope.1SG that can.SUB.PRS.1SG to-go
'I hope to be able to go.'

(ii) focus on the embedded subject

(6) $Espero_i$ que $gane_i$ sólo yo ahora. Spanish
hope.1SG that win.SUB.PRS.1SG only I now
'I hope to win alone now.'

(iii) passive subjects in the matrix or the embedded clause

(7) a. $Espero_i$ que sea_i autorizado a ir. Spanish
hope.1SG that be.SUB.PRS.1SG allow.PPL to to-go
'I hope to be allowed to go.'
b. Fue_i convencido de que se $marchara_i$
be.PST.3SG convince.PPL of that REFL leave.SUB.3SG
'He was persuaded to leave.'

(iv) coordinated complements

(8) ?Je veux que tu partes et que je reste. French[5]
I want.3SG that you leave.SUB.2SG and that I Stay.SUB.1SG
'I want you to go and for me to stay.'

(v) prefective aspect in the complement clause

(9) Je voudrais que je sois déjà parti! French
I want.COND.1SG that I be.SUB.1SG already leave.PPL
'I would like for me to be already gone!'

At face value, these cases pose serious problems to purely syntactic accounts of obviation effects.

2.2 *Long-distance anaphoric binding and NPI-licensing*

Subjunctive appears to be a prerequisite for simplex long-distance anaphors (i.e., logophoric use of reflexive pronouns) to be licensed in some languages like Icelandic, Italian, and French.[6]

(10) Jón$_i$ segir að Pétur$_j$ raki sig$_{i/j}$. Icelandic
John say.3SG that Peter shave.SUB.3SG self
'John says that Peter shaves himself.'

(11) Jón$_i$ veit að Pétur$_j$ rakar sig$_{*i/j}$.
John know.3SG that Peter shave.IND.3SG self
'John knows that Peter shaves himself.'[7]

However, subjunctive is a necessary, but not a sufficient condition for the licensing. Reuland and Sigurjónsdóttir (1997) point out that the Icelandic logophor *sig* in subjunctive clauses is regulated by discourse conditions (its antecedent has to bear the point of view of the utterance, whether it c-commands the logophor or not), as opposed to *sig* in infinitival clauses, where grammatical constraints are at play.

Licensing of NPIs and negative indefinites can also happen at a distance (over a clause boundary or more) if the embedded clause containing the licensee is in the subjunctive. Indicative blocks this kind of long-distance licensing. Furthermore, Kayne (1981) and Rizzi (1982) noted a subject–object asymmetry in French and Italian: while a preverbal NPI subject licensed by matrix negation gives an ungrammatical result, the structure is grammatical if it involves an NPI object in the same configuration:

(12) a. Non pretendo che tu arresti nessuno. Italian
not require.1SG that you arrest.SUB.2SG no one
'I do not require that you arrest anyone.'

b. *Non pretendo che nessuno ti arresti.
not require.1SG that noone you arrest.SUB.3SG
'I do not require that anyone arrests you.'[8]

Related facts were discussed in Kayne (1984) involving NPs headed by *de* 'of' in French, as in (13): the empty QP heading the *de*-N NP [$_{NP}$ [$_{QP}$ e] *de* N] can be licensed long-distance by *pas* across a subjunctive clausal boundary, but only if the NP is in object position. For a detailed account of these facts, see Kampers-Manhe (1992).

(13) a. Jean ne voudrait pas que tu boives de bière. French
John NE want.COND.3SG NOT that you drink.SUB.2SG of beer
'John wouldn't like for you to drink beer.'
b. *Jean ne voudrait pas que de bière lui coule dessus.
John NE want.COND.3SG NOT that of beer him spill.SUB.3SG on
('John wouldn't like it if beer were spilled on him.')

Under the assumption that the NPI in (12) has to move covertly to the matrix negation marking its scope, Picallo (1984) attributes the ill-formedness of a case like (12b) under the purported reading to the inability of subjunctive Infl to properly govern the trace in preverbal subject position. In a different vein, Progovac (1993, 1994) suggests that the domain extension of the embedded subjunctive which would be required for the NPI to be licensed by matrix negation does not take place in (12b) because the preverbal NPI subject triggers negative agreement on that Infl node, thus blocking Subjunctive Functional Deletion (see section 3.1).

Nevertheless, subjunctive as such again does not suffice for long distance licensing of NPIs and NIs, as other factors like the existence of a single T-domain between the embedded and the main clause seem to be involved. For a detailed discussion, see Giannakidou and Quer (1997) and for reinterpretations of that proposal, see Giannakidou (1997, 1998).

2.3 Raising

Subject raising out of subjunctive clauses has been described and analyzed for Balkan languages like Romanian and Greek, illustrated here by (14) and (15), respectively.

(14) Studenţii trebuiau [t să plece]. Romanian[9]
students-the must.3PL SUB leave.3PL
'The students must have left'

(15) Ta pedhia arxisan na trexun. Greek[10]
the children start.PST.3PL SUB run.PRS.3PL
'The children started to run.'

Subjunctives, unlike infinitives, display finite morphology with subject agreement. Raising from a finite clause poses theoretical problems, as it contradicts the generalization that raising to subject is allowed only for case reasons out of non-finite clauses.[11] Subjunctive morphology can independently license lexical subjects in the embedded clause, as can be observed in the counterpart to (14):

(16) Trebuia [ca studenţii să plece]. Romanian
must.3SG that students-the SUB leave.3PL
'It must have been the case that the students left.'

This has been taken to be sufficient evidence to exclude raising to subject out of subjunctive clauses in Balkan languages (Philippaki-Warburton 1987). However, some proposals have been made that do analyze these types as instances of raising. Dobrovie Sorin (2001), for example, reduces both raising and control in Balkan subjunctive clauses to anaphoric binding. Roussou (2001) also brings them together by arguing that the functional domain of subjunctive CPs lacks the projections of both Fin (in the C system) and AgrS (in the IP system). Drawing on Manzini and Roussou's (1998) framework, she suggests that the 'raised' DP in the matrix clause is actually sitting in a topic position and that the main AgrS attracts the thematic feature of the embedded predicate, which triggers morphological agreement between the matrix and the embedded predicate. This replicates in more recent terms the traditional view that complements to raising verbs are defective in some sense, i.e., IPs instead of CPs. An important fact to take into account in this connection is that the presence of an overt complementizer blocks raising out of the subjunctive clause, as illustrated in (17):

(17) Toţi doctorii s-au nimerit (*ca) să Romanian
all doctors-the REFL-have.3PL happen.PPL that SUB
fie de acord.
be.3PL of agreement
'All the doctors happened to agree with each other.'

3 Syntactic licensing of subjunctive clauses

The dependent character of subjunctive clauses has been reinterpreted in different ways: as a result of dependent Tense, of the need for operator licensing, or of narrow scope properties of the mood itself. Some of the properties of subjunctives reviewed in section 2 have been argued to derive naturally from the kind of analysis put forth.

3.1 Subjunctive as defective Tense

The tense properties of subjunctive forms are argued to be defective, as they rely on the full tense specification of the matrix. This surfaces in the restrictions on

sequence of tense in subjunctive dependents that do not show up in indicative dependents. This can be observed in the Catalan examples (18): while a CP complement in the indicative allows for both present and past tenses (18a), the past form is excluded in a subjuntive clause embedded under a present tense (18b).

(18) a. Sabia que telefona/ Catalan
know.IMPF.1SG that phone.IND.PRS.3SG
telefonava.
phone.IND.IMPF.3SG
'I knew that s/he calls/that she used to call.'
b. Desitja que telefoni/ *telefonés.
desire.PRS.3SG that phone.SUB.PRS.3SG phone.SUB.IMPF.3SG
'S/he wishes that s/he calls/called.'[12]

Relying on these basic facts, Picallo (1984, 1985) develops the hypothesis that even displaying morphological tense oppositions such as [± Past] – though they do not always do so – subjunctive forms do not have an independent temporal interpretation. In this respect, they are defective if we compare them with indicative forms, whose tense is contentful. This characteristic prevents them from appearing independently in assertive root clauses, as in (19).

(19) a. *Daniel haya llamado. Spanish
Daniel call.SUB.PERF.3SG
'Daniel has called (SUB).'
b. *Ahir plogués. Catalan
yesterday rain.SUB.IMPF.3SG
'Yesterday it rained (SUB).'

The core of Picallo's proposal consists in characterizing subjunctive Infl as [–Tense, +Agr], whereas its indicative counterpart would be [+Tense, +Agr]. The defectivity of subjunctive Infl forces it to rely on the content of the superordinate Infl for its tense interpretation, which materializes in an anaphoric-like link between the temporal features of the subjunctive and those of the root Infl.[13] Given that in root contexts there is no tense specification available, the subjunctive tense in sentences like (19) remains unbound and leads to ungrammaticality, in the same fashion as unbound nominal anaphors.[14]

The tense dependency of subjunctive is argued to give rise to several transparency effects affecting the subordinate clause: disjoint reference between the embedded and the matrix subjects (obviation), long-distance anaphoric binding and NPI-licensing across a CP boundary, subject raising from a finite domain, etc. (see section 2).

The syntactic dependency of subjunctive Infl and the phenomena deriving from this property are analyzed as the result of different mechanisms. Picallo (1985) claims that a T(ense)-chain is established between the tense features of the subjunctive Infl node and those of the antecedent Infl. The extension of the binding

domain of the embedded clause to the matrix one is seen as the consequence of such a T-chain formation. Under this view, what establishes a transparent domain for binding are the tense properties of subjunctives rather than the agreement ones. Progovac (1993, 1994) argues that domain extension with subjunctives takes place under a more general condition at LF: according to her, subjunctive Infl/Comp projections become invisible (or rather, delete) at LF up to recoverability, under the assumption that they are unnecessary for interpretation. She discusses three phenomena that would be sensitive to functional deletion; long distance licensing of negative polarity items, long distance reflexivization, and disjoint reference effects between embedded and matrix subject. However, functional deletion is not contingent on the existence of subjunctive in a given grammar. In fact, a language like Serbian–Croatian, without a subjunctive paradigm, displays the effects of domain extension under volitional predicates.

Despite the general treatment of subjunctive clauses as transparent domains, it has been widely acknowledged that different sets of embedded subjunctives have to be distinguished as not all of them have the described properties. A clear divide exists between subjunctive complements to volitional and directive predicates (*want*, *order*) and subjunctive complements to factive and epistemic predicates (*regret*, *believe*). In her proposal, for instance, Progovac restricts the application of functional Infl/Comp deletion to clausal complements of volitional predicates, because they select a Comp without a truth value and an Infl without independent tense. The complements to factive predicates, on the other hand, cannot undergo functional deletion because they realize a C with a truth value, which would not be recoverable if deleted. Raposo (1985), though taking the same basic facts as Picallo as departure point, does not reduce them to the indicative–subjunctive opposition, but to the selectional properties of the embedding predicates. He identifies two basic classes: E-predicates (including epistemics and declaratives) and W-predicates (comprising volitionals, non-factive emotives, and verbs of influence, permission and necessity). The former would select a [+Tense] operator in their C, while the latter would not select it, leading to a [–Tense] specification of their C. Only in the first case would opacity be triggered by the presence of the [+Tense] operator. If absent, the subjunctive tense must be bound by the tense specification of the matrix indicative, giving rise to transparency effects.[15]

Nevertheless, Raposo (1985) clearly dissociates mood choice from the temporal interpretation of the complement: whereas W-predicates typically select for subjunctive mood, there are also E-predicates that take subjunctive when negated or questioned, but still do not give rise to transparency effects[16] (see (20), where coreference between matrix and embedded subjects is allowed).

(20) O Manuel$_i$ não acredita que (ele)$_i$ ganhe a corrida. Portuguese
the Manuel not believe.3SG that he win.SUB.3SG the race
'Manuel does not believe that he will win the race.'[17]

Suñer and Padilla-Rivera (Suñer and Padilla-Rivera 1985, 1987, 1990; Padilla-Rivera 1990; Suñer 1990) have extensively argued against the claim that subjunctive clauses lack tense in Spanish. They show that strict temporal dependencies arise exclusively in the complements of subjunctive-selecting predicates and they attribute this fact to the presence of a [–Precedence] feature that bars non-agreeing sequences of tense like [–past . . . +past], as exemplified in (18b), or [+past . . . –past], as in (21).

(21) Quería que telefonearas/ *telefonees. Spanish
want.IMPF.3SG that phone.SUB.IMPF.2SG phone.SUB.PRS.2SG
'S/he wanted you to phone.'

They point out, though, that the feature [–Precedence] is not exclusive of predicates that select subjunctive: the sequence of tense restrictions triggered by this feature also surfaces in the complement of indicative-selecting predicates like *prometer* 'to promise'. In addition, they dissociate subject obviation, an alleged transparency effect, from subjunctive as a category and attribute it to the lexical feature [WILL]. Zaring (1985) essentially aligns with Suñer and Padilla-Rivera's position on tense restrictions in subjunctive complements and proposes a feature system that distinguishes Portuguese inflected infinitives (which are tenseless but display agreement) from subjunctive by means of a [±Indicative] feature: subjunctive would not simply be [–Tense, +Agr] (the feature composition of inflected infinitives), but rather [–Tense, +Agr, –Indicative].

3.2 Subjunctive as operator

Subjunctive clauses (or rather, a subset thereof) have been claimed to possess an idiosyncratic complementizer with operator-like properties. The idiosyncratic tense and binding properties of subjunctive dependents are made to follow from the syntax attached to the special C.

Kempchinsky's (1986, 1987, 1990) main insight is that subjunctive complements to verbs of volition, influence, and command are in some sense like embedded imperatives. In her proposal, the main predicate selects an imperative operator in the subordinate C which has to be identified by the subjunctive I head. This identification requirement is satisfied at LF in languages like Spanish by covert I-to-C movement, as schematized in (22).

(22) $[_{CP}\ [_{C^0}\ C\ [_{I^0}\ I\ [V]_i\ ]_j\ ]\ [_{IP}\ NP\ [_{I'}\ e_j\ [_{VP}\ e_i\ \ldots\ ]]]]$

Through this movement the subjunctive Infl head ends up co-indexed with one of the arguments of the main predicate, and this would constitute the explanation for the subject–obviation effects. The restrictions on the sequence of tense are argued to stem from the presence of the imperative operator, which imposes a future interpretation on the embedded eventuality.

In languages like Romanian, which display an overt subjunctive C, such an identification requirement would not be operative, and I-to-C movement would not take place. Similarly, subjunctive-taking verbs that do not belong to the volitional or directive type do not select such an imperative operator, and consequently I-to-C movement does not apply. As a result, no subject obviation or sequence of tense effects arise.

Avrutin and Babyonyshev (1997) view the Russian subjunctive complementizer *ctoby* (see (1c)) as an operator that must raise by head movement up to the matrix V in order to be able to bind the two event variables of the matrix and embedded predicates. In order to reach the appropriate c-command configuration, the complex formed by V-to-I-to-C movement (claimed to be universal, either overtly or covertly) adjoins to the V head in the main clause. From that position, it binds the main and embedded event variables, thus imposing a temporal ordering between the two eventualities. Given that the matrix V also undergoes V-to-I-to-C movement, at LF the embedded C–AgrS–T–V complex ends up adjoined to the matrix C–AgrS–T–V one. In this configuration the main AgrS c-commands the embedded AgrS. Under the assumption that the two heads are co-indexed when main and embedded subjects are coreferential, they induce a Principle B violation, which would constitute the explanation for the obviation phenomena. They have to stipulate that the C selected by epistemic predicates, though identical in form to the one selected by volitionals, does not raise to the matrix V because their subjunctive complements do not show sequence of tense restrictions or obviation effects.

3.3 Subjunctive as a dependent nominal

The parallelism drawn between subjunctive clauses and nominal indefinite expressions originates in the observation that subjunctive tense is not referential and needs independent licensing. This is different from stating that it simply picks up reference in the main clause anaphorically and it allows us to account for the existing past shifted, future shifted, and simultaneous readings of embedded subjunctives.

Tsoulas (1994, 1995) draws the parallel between indefinite nominals and infinitive/subjunctive clauses on the basis of wh-extraction patterns: wh-movement out of an indefinite NP or an infinitival/subjunctive clause gives a better result than extraction out of a definite NP or an indicative CP (compare (23) and (24)).

(23) a. De qui veux-tu voir une photo? French
of who want.PRS.2SG-you to-see a picture
'Who do you want to see a picture of?'

b. *De qui veux-tu voir la photo?
of who want.PRS.2SG-you to-see the picture
'Who do you want to see the picture of?'

(24) a. Que te demandes-tu qui a exigé que
what REFL ask.PSR.2SG-you who have.PRS.3SG require.PPL that
Sóphie écrive?
Sóphie write.SUB.3SG
'What do you wonder who required that Sóphie write?'

b. *Que te demandes-tu qui a dit qu' Alex
what REFL ask.PSR.2SG-you who have.PRS.3SG say.PPL that Alex
a vu?
have.PRS.3SG see.PPL
'What do you wonder who said Alex saw?'

Tsoulas proposes that indefiniteness in the clausal domain amounts to temporal indefiniteness, which derives from the impossibility to assign a truth value to the embedded proposition. Subjunctive complements to factive verbs are analyzed as the correlates of specific indefinites, which also block extraction.

As an indefinite Tense, subjunctive has to be licensed by a sentential operator in the relevant syntactic configuration (head-to-head dependency, c-command). Under the view that subjunctive CPs are the clausal analogues of NPIs or indefinites, they have to appear in the scope of the a certain type of operator in syntax (intensional, non-veridical, etc.). By contrast, indicative clauses have to escape from the scope of such operators (anti-polarity or positive polarity effects).

Manzini (2000) gives a syntactic interpretation of Tsoulas's proposal by positing that subjunctive is an indefinite T that has to be licensed in a head-to-head dependecy bound by an intensional operator such as negation, a question operator, or conditional *if*. Subjunctive morphology constitutes the spell-out of such a T-dependency; otherwise the mood that surfaces is indicative. The main motivation for this type of approach is the sensitivity of subjunctive dependecies to island and parasitic gap-like configurations. Long distance reflexivization and obviation effects are argued to rest on the presence of the syntactic dependency established by the subjunctive.

The apparent scopal behavior of mood morphology has also been interpreted as a consequence of the polar status of the subjunctive morphology itself. Giannakidou (1994, 1995) establishes a direct link between the semantic licensing of subjunctive and (negative) polarity items: both are legitimate in non-veridical contexts. By contrast, indicative behaves as a positive polarity item that escapes non-veridical triggers. The scopal behavior of indicative/subjunctive had been also proposed in Kampers-Manhe (1991) for French relative clauses.

The polarity approach to mood has been pursued in a number of syntactically oriented studies. The foundations of such approaches can be sought in Stowell's (1993, 1995a, 1995b) theory of tense. Stowell's basic insight that sequence-of-tense phenomena have to be understood as a consequence of the polar properties of tense morphology is argued to be applicable to mood morphology as well. In such an account, mood has an impact on the derivation to LF, as scope might have to be determined covertly: while subjunctive clauses must remain in

the scope of its licenser, yielding a narrow-scope effect, indicative CPs have to undergo LF movement in order to get out of the scope of an intensional operator. Brugger and D'Angelo (1994, 1995) develop these ideas by stating that the (Italian) subjunctive is an intensional-operator polarity item, whereas indicative is an anti-intensional-operator polarity item, and explore the interaction of the polarity properties of tense and mood. Laka (1990, 1995) pursued similar ideas on the licensing of indicative and subjunctive clauses, but she placed the burden of the explanation on the polarity properties of C, arguing for the existence of a negative complementizer that has to remain in the scope of its licenser.

This sort of approach also has to distinguish two types of subjunctives: those lexically selected by a (strong intensional) predicate and those licensed by a clausal operator like negation. Stowell (1993) calls them Intensional Subjunctive and Polarity Subjunctive, respectively. The two types show opposite behavior with respect to the following properties, which are argued to follow from the polar properties of tense and mood morphology:

(i) Possibility of displaying past morphology under a matrix present tense (compare (25) with (18b) above).

(25) No recorda que s'hi assemblés. Catalan
not remember.3SG that REFL-DAT resemble.SUB.IMPF.3SG
'S/he doesn't remember whether s/he looked alike.'

(ii) Alternation with indicative clauses (compare (26) with (25) and (27)).

(26) No recorda que s'hi assemblava.

(30) No crec que hi vagi.
not believe.1SG that LOC go.SUB.PRS.1SG
'I don't think I'll go.'

(31) *No vull que hi vagi.
not want.1SG that LOC go.SUB.PRS.1SG
'I don't want to go.'

4 Functional syntax of subjunctive forms

Different answers have been given to the question of where mood features reside in clause structure. Such answers have different implications for clausal architecture and syntactic derivation. In the following sections we will discuss some of these answers.

4.1 The locus of subjunctive: I vs. C, I-to-C movement

Subjunctive surfaces most frequently in the verb complex, either as a specific verb-ending or as an inflectional particle. However, the core cases of subjunctive dependents are triggered through lexical selection by a superordinate predicate. Given that lexical selection is a local head-to-head relationship, the embedded C must be involved somehow in the establishment of the dependency. This can be directly observed in languages that have special C forms for subjunctive dependents, such as Romanian (*ca*), Albanian (*që*), and Salentino (*ku*).

(32) a. Ion vrea ca să manince. Romanian[18]
John want.3SG that (SUB) SUB eat.3SG
'John wants him/her to eat.'

b. Jani do që të hajë. Albanian
John want.3SG that (SUB) SUB eat.3SG
'John wants him/her to eat.'

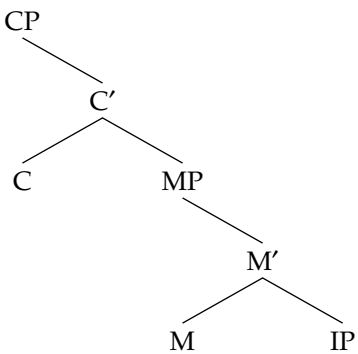
For languages that do not display specialized Cs overtly, the same divide has sometimes been postulated. In a language like Greek, subjunctive marking is superficially ambiguous between an inflectional element and a C-like element. This has led researchers to provide arguments for both positions: Philippaki-Warburton and Veloudis (1984), Philippaki-Warburton (1987), and Rivero (1994) analyze the subjunctive marker *na* as an Infl particle, whereas Agouraki (1991), Dobrovie-Sorin (1994b), and Tsoulas (1995) defend its C status. As a C-like element, the subjunctive particle is sentence initial, preceding negation and clitics, and can head embedded clauses in the absence of any other C-element. As an I-like element, it must be adjacent to the verb cluster, it must be repeated under

conjunction and it can cooccur with *Wh* phrases. An analysis featuring I-to-C movement (either overt or covert) constitutes a third kind of approach that reconciles both points of view by explaining the ambiguity and at the same time straightforwardly accounts for the long-distance selection problem, namely how is subjunctive selected by a matrix element despite the intervening heads? In some analyses this view is cast in terms of feature movement (see Svenonius 1994, for instance).

4.2 Mood Phrase

In the context of the proliferation of verbal functional categories beyond IP and CP, MoodP has been proposed in order to host mood features and to account for some of the subjunctive-related phenomena. It is mostly represented as an intermediate projection between the IP and the CP domains (Terzi 1991, 1992, 1997; Rivero 1994; Philippaki-Warburton 1991); see (33). The need to check a subjunctive feature on this head may trigger overt movement to such a high position, which in some accounts explains the C-like properties of a subjunctive verb complex. Terzi makes crucial use of the [Spec, MP] position as a host for the PRO subject in control structures. Her reasoning is that M, by not bearing finiteness features, can check the Null Case that the PRO subject bears. In doing this, she is forced to establish a different structure for non-control structures, where the verbal complex moves all the way up to C, from where a pro subject is licensed in [Spec, MP].

(33)



By contrast, Kempchinsky (1998), making use of the MP projection, suggests that subjunctive complements to volitionals are not CPs but MPs.

4.3 Subject licensing and Control

Languages such as Greek and Romanian display obligatory control with finite subjunctive clauses in the same environments where other languages resort to non-finite subordination structures. Iatridou (1993) pointed out that in Greek some predicates trigger real control, as the embedded V must display the same

agreement specification as the matrix one (34), no lexical subject can appear in the embedded clause (35) and the embedded V cannot have independent tense (36). For her, lack of Tense implies lack of nominative Case: the embedded subject must then be a PRO licensed by Null Case.

(34) O Janis kseri na kolimbaj/ *kolimbao. Greek
the John know.3SG SUB swim.3SG swim.1SG
'John knows how to swim/Janis can swim.'

(35) *O Janis kseri na kolimbaj i Ana.
the John know.3SG SUB swim.3SG the Anna
'John knows how to swim Anna.'

(36) *O Janis kseri na kolimbuse.
the John know.3SG SUB swim.IMPF.3SG
'John knows how to swim (PAST).'

However, in cases of optional control, lexical embedded subjects are possible despite the tense restrictions (1b). Terzi (1992, 1997) interprets this as indicating that we are dealing with a different structure where V-to-C movement and a *pro* subject are involved. Roussou (1991) sets volitionals apart from control predicates and argues that they do have a full CP structure and AgrS; in her account, subject coreference derives from associating the matrix and the embedded AgrS.

(37) O Janis theli na kolimbisi/*-e (i Ana). Greek
the John want.3SG SUB swim.PRS/PST.3SG the Anna
'John wants to swim/Anna to swim.'

Varlokosta and Hornstein (1992) also distinguish two types of subjunctive clauses on the basis of the presence or absence of temporal reference in the embedded clause. Whereas *pro* would be the empty subject in the former case, in the latter PRO can be identified as the subject category, because it forbids split antecedents, it only permits sloppy readings under ellipsis, and it requires a *de se* interpretation. This same divide is exploited by Krapova (2001), who defends the existence of two different types of subjunctive.

At the same time, other analyses maintain that *pro* is uniformly the empty subject category of subjunctives, while control must derived from other factors. Philippaki and Catsimali (1999) defend this point of view by showing that predicate adjectives, NP-modifiers, and intensifiers of the embedded subject are necessarily marked with Nominative morphology in Greek. In addition, examples can be constructed featuring an NP-subject to the right of the embedded V but still to the left of a constituent in the subordinate clause. Finally, the PROarb that is typical of languages that have control is not attested in subjunctive complements. They take this as conclusive evidence that PRO should be banned from control subjuntives in Greek.

Dobrovie-Sorin (2001) follows a different path on this issue by explaining both control and raising as instances of anaphoric binding.

4.4 Subject inversion

Subject (stylistic) inversion in French is allowed only in contexts where there is some kind of operator present, such as a *Wh* or a relative operator. Subjunctive clauses, being one of such subject postposing contexts, are claimed to involve a covert operator that licenses the inversion (Kayne and Pollock 1978).

(38) Je veux que parte Paul. French
I want.1SG that leave.SUB.3SG Paul
'I want Paul to leave.'

However, this type of alleged inversion is not allowed in all subjunctive clauses, as Kampers-Manhe (1998) points out: it is limited to ergative, passive, and certain unergative verbs, it is only allowed when the matrix is of a certain type (volitional, verb of fear, etc., but not factive–emotive or a negated epistemic), and with a definite subject no inversion is possible if a VP-final constituent co-occurs. In her analysis, that the subject DP be within focus is claimed to be a requirement for the inverted order to be grammatical in combination with the defective properties of subjunctive tense under volitionals: with these verbs there is no Tense feature in C, which determines that the Case feature on the T head is weak and consequently it does not need to be checked overtly, so the DP subject can stay in situ. What this analysis amounts to is that the postverbal subject remains in its base generated position under the required conditions.

4.5 C-deletion

In some Romance varieties, such as Italian,[19] the overt C introducing an argument clause can be absent in certain subjunctive CPs.[20] An example of this phenomenon, called Complementizer Deletion or C-deletion (CD), is reproduced under (39):[21] (39a) is the CD case corresponding to (39b).

(39) a. Credo lo faccia. Italian
think.1SG it do.SUB.PRS.3SG
b. Credo che lo faccia.
think.1SG that it do.SUB.PRS.3SG
'I think he does it.'

Beyond a slight register difference (CD is perceived as somewhat more formal), both variants are interpreted as equivalent, thus rendering CD completely optional. However, there are four clear restrictions on the application of CD.

(i) It occurs only in the presence of subjunctive morphology in the embedded verb (compare (39a) with (40)).

(40) Ha detto *(che) è partito. Italian
have.3SG say.PPL that be.IND.3SG leave.PPL
'S/he said he has left.'

Some speakers, though, accept CD with an embedded future or conditional tense as well:[22]

(41) a. Credo sarà interessante.
believe.1SG be.IND.FUT.3SG interesting
'I think it will be interesting.'
b. Credo funzionerebbe meglio.
believe.1SG work.COND.3SG better
'I think it would work better.'

(ii) CD is only possible if the embedded CP occurs in its argument position, and not when it is in a left dislocated or focalized position:

(42) a. (Che)* fosse partito, lo credeva.
that be.SUB.3SG leave.PPL it believe.IMPF.3SG
'That he had left, he believed it.'
b. (CHE)* FOSSE PARTITO credeva.
that be.SUB.3SG leave.PPL believe.IMPF.3SG
'THAT HE HAD LEFT, he believed.'

(iii) Not all verbs allow for CD. Typically, epistemic and volitional predicates admit it, but factives do not, as in example (25).

(43) Si rammarica *(che) sia partito.
REFL regret.3SG that be.SUB.3SG leave.PPL
'S/he regrets that he has left.'

Some adjectives and nouns taking sentential complements can also display CD to a certain degree:

(44) Sono certo tu lo possa fare.
be sure you it can.SUB.2SG to-do
'I'm sure you can do it.'

(iv) It should be differentiated from Aux-to-Comp movement (Rizzi 1982), as a lexical subject cannot intervene between the raised finite form and the participle:

(45) *Credeva fosse Gianni arrivato.
believe.IMPF.3SG be.SUB.3SG John arrive.PPL
'S/he thought John had arrived.'

This phenomenon, originally noted in Rizzi (1982), has received different kinds of analysis. Scorretti (1991) interpreted CD as the optional absence of the CP projection in the complement clause of certain predicates, much as in the non-finite complements of raising verbs. Apart from the problem deriving from the optional selection of CP/IP by the same matrix element, this analysis fails to explain CD and the embedded V2 phenomenon in Germanic languages under the same light. By contrast, Poletto (2001) capitalizes on the observation that the set of Italian verbs allowing CD basically coincides with the class of bridge verbs permitting embedded V2 in German and Mainland Scandinavian and develops an account based on V-to-C movement for CD. The Italian CD phenomenon derives, according to her, from the presence of a [–realis] feature in a low C position that attracts the V if the lexical complementizer is absent. Such a feature can only be checked by an overt complementizer or by the relevant verbal morphology (i.e., subjunctive, plus future/conditional in the corresponding varieties). The relevant set of predicates would select such a feature in the embedded C domain. Additional evidence for her position is constructed on the basis of adverb placement vis-à-vis CD in Cinque's (1999) framework, as well as subject placement in CD cases.

Giorgi and Pianesi (1997) reject the V-to-C analysis for CD on different grounds. The fact that most Italian verbs that allow CD coincide with bridge verbs that display embedded V2 in Germanic does not constitute a strong argument for adopting the essentials of the analysis for embedded V2. There are even some CD verbs in Italian that correspond to non-bridge verbs in Germanic. Moreover, under a V-to-C analysis the ungrammaticality of a subject between the fronted verb and the past participle as in (45) is unexpected, because [Spec, AgrSP] should in principle be available. However, a consistent group of speakers reject a preverbal subject in CD cases, which does not follow from an alternative analysis where the subjunctive verb stays in AgrS:

(46) %Credeva Gianni fosse arrivato. Italian
believe.IMPF.3SG John be.SUB.3SG arrive.PPL
'S/he thought John had arrived.'

Giorgi and Pianesi follow a different path and argue that CD is the consequence of selecting a lexicalized syncretic category Mood/Agr in the complement clause. Agr stands for the phi-features and nominative Case, and Mood for the feature corresponding to the subjunctive complementizer, which is different from the one introducing indicative clauses. The split between speakers concerning the grammaticality of CD cases with preverbal subjects like (46) can be reduced to the properties attributed by both groups to [Spec, Mood/Agr]: an A-position for those accepting the preverbal subject, and an A'-position for those rejecting it. Under this analysis, no subject position is available between the raised verb and the participle, which explains the ungrammaticality of cases like (45). Movement of the verb to the Mood/Agr head is overt because the Agr features are strong. Alternatively, the relevant features can also be scattered in two separate

projections MoodP and AgrP; in such a situation the verb raises only to Agr overtly and the complementizer is lexically realized; the verb will only move covertly to check the [+mood] feature. They derive the impossibility of CD with factive or interrogative predicates from the assumption that a feature like [+fact] or [+Wh] cannot be lexicalized by a subjunctive verb, and the scattered projection is forced, whereby the complementizer lexicalizes as *che* and *se* respectively.

5 Conclusion

From this brief survey of the different syntactic phenomena arising in subjunctive clauses it becomes clear that they do not constitute a uniform class; not only cross-linguistically but also within languages. Most studies have concentrated on subjunctive argument clauses, where lexical and semantic factors play an important role. Some of the theoretical proposals discussed here would have to be adapted or simply changed in order to be able to account for other subordination domains in the subjunctive, such as relative clauses and adjunct clauses. In any event, the study of the syntax of subjunctives has led to formulating interesting questions about the interface of syntax with the lexicon and semantics.

NOTES

1 Example (c) is from Palmer (2001: 218).

2 On the interpretation of subjunctive clauses, see Farkas (1992b), Giorgi and Pianesi (1998), and Quer (1998).

3 Notice, though, that this is not always the case, as a DP subject can require a disjoint subject in the CP complement to the N, as in (i):

(i) *el seu_i desig que $viatgi_i$ Catalan
the his/her desire that travel.SUB.PRS.3G
'his/her desire to travel'

4 There is a consistent exception to this pattern: ergative predicates taking a clausal subject in the subjunctive also display subject-obviation effects with respect to the oblique argument in the matrix clause, as in (i):

(i) Li_i agrada que *$viatgi_i$ /$viatgin_k$. Catalan
to-him please.3SG that travel.SUB.3SG travel.SUB.3PL
'He likes to travel/for them to travel.'

Picallo (1985) explains this unexpected pattern by assuming that such predicates do not assign structural case to their subject, therefore they are not forced to extrapose by the Case Resistance Principle.

5 Example taken from Ruwet (1991).

6 For Icelandic, see, for instance, Thráinsson (1976, 1990), Maling (1984), and Sigurðsson (1990); for Italian, see Napoli (1979) and Giorgi (1984); for French, Pica (1985).

7 Icelandic examples from Reuland and Sigurjónsdóttir (1997).
8 This example is markedly grammatical under the irrelevant double negation reading 'I do not require that no-one arrests you'.
9 Example taken from Rivero (1989).
10 Example taken from Alexiadou and Anagnostopoulou (1999).
11 Alexiadou and Anagnostopoulou (1999) propose that the agreement in the embedded subjunctive is not the reflex of Case checking but rather EPP checking.
12 Examples adapted from Picallo (1985: 47–48).
13 For the idea that subjunctive clauses are tenseless or, rather, that tense in subjunctive clauses is anaphoric, see Luján (1980), Anderson (1982), Pica (1984), Everaert (1984), Jakubowicz (1984), and Johnson (1985), among others.
14 Cases of independent subjunctive forms in non-assertive root contexts such as (i) will not be discussed here. They often involve some element in C (an overt complementizer, V-to-C movement, etc.) indicating directive force, which seems to suggest that a covert modal is binding the tense variable of the subjunctive verb.

(i) Que marxi! Catalan
that leave.SUB.PRS.3SG
'Let him/her leave!'

15 A further elaboration of this proposal is presented in Ambar (1992) for Portuguese. She distinguishes morphological Tense, a feature of Infl, and semantic Tense, a feature of C. Unlike epistemic predicates, volitionals select a clause without semantic Tense, which would derive the characteristic properties of their complements.
16 See also Rivero (1971, 1977), Salamanca (1981), and Meireles and Raposo (1983).
17 Example taken from Raposo (1985: 103).
18 Examples from Roussou (2001).
19 C-deletion has usually been described and analyzed for Italian. Spanish, for instance, displays essentially the same phenomenon, although the distribution does not always coincide with the Italian one. One such difference is that Spanish typically allows C-deletion with a factive matrix verb:

(i) Lamento la hayan molestado. Spanish
regret.1SG her have.SUB.3SG bother.PPL
'I'm sorry they bothered her.'

For a discussion of the Spanish facts, see Suñer (1990).
20 Poletto (2001) also discusses C-deletion in adjunct disjunctive clauses, which correspond to König's (1986, 1988) alternative concessive conditionals. For the corresponding facts in Catalan and Spanish, and the semantic interpretation of such structures, see Quer (1998: chapter 5).
21 Example taken from Poletto (2001: 268).
22 Examples from Poletto (2001: 267).

4 Conclusion

1 Introduction: the Repeated Morph Constraint

A number of authors have observed that languages exhibit a resistance against accidental repetition of morphemes (Perlmutter 1971; Stemberger 1981; Menn and MacWhinney 1983; Yip 1998; Plag 1998, and references cited there). This resistance is reminiscent of the Obligatory Contour Principle in phonology (Leben 1973; Goldsmith 1979, and much subsequent work), which requires adjacent phonemes to be contrastive. In this chapter we will explore which phenomena at the sentence level can be understood in terms of the avoidance of repeated morphs, an issue first addressed within a generative context by Perlmutter (1971). This will require us to establish which strings can be taken to involve accidental repetition of morphemes and which strategies are available for avoiding them.

Suppose M_1 and M_2 are identical in the relevant sense and happen to be adjacent, as in (1a). Perhaps in the majority of cases, grammars simply live with this repetition and allow M_1 and M_2 to surface unchanged. In cases where the string is ruled out, four possibilities arise. (i) If the grammar does not provide an

alternative realization for either M_1 or M_2, structures in which these morphemes surface in adjacent positions are ungrammatical (the language is characterized by (1b)). (ii) Repetition of identical morphemes can be circumvented if the grammar allows haplology: deletion of one of the offending morphemes (the language is characterized by a combination of (1b) and (1c)). (iii) A further option is to associate either morpheme with a different realization, typically based on a subset or a superset of its features (the language is characterized by a combination of (1b) and (1d)). (iv) Finally, the grammar may make available a so-called portmanteau morpheme, which spells out the features of both M_1 and M_2 (the language is characterized by a combination of (1b) and (1e)). Repair strategies always affect functional elements; repetition of lexical heads is tolerated.

(1) a. . . . M_1 M_2 . . .
b. * . . . M_1 M_2 . . .
c. . . . M_2 . . . . . . M_1 . . .
d. . . . M_1 M_2' . . . . . . M_1' M_2 . . .
e. . . . M_3 . . .

Which of these strategies is exploited varies from language to language and from case to case. We should also note that there are other conceivable strategies, such as the insertion of a dummy morpheme between M_1 and M_2. Few, if any, cases of this type are attested. An anonymous reviewer suggests that there is a tendency in Spanish to introduce an expletive negation when the second term in a comparative construction begins with *que* (see (2a), where this tendency is marked by a question mark). This might be a case in point, although insertion of expletive negation is not obligatory and can also appear without morpheme iteration (see (2b)). We will not investigate this issue any further here.

(2) a. Más vale que te vayas que ?(no) que te quedes.
more helps that you go that (not) that you remain
'It is much better that you go than that you stay.'
b. Más vale maña que (no) fuerza.
more helps skill than (not) strength
'Skill is more helpful than strength.'

From the fact that many grammars tolerate repeated morphemes we can conclude that an inviolable condition that blocks accidental repetition cannot exist. On the other hand, there seem to be clear cases in which structures are ruled out precisely because they show accidental repetition. This tension can be resolved in at least three ways. First, one could develop a conspiracy theory in which the rules of syntax and morphology are such that in specific cases accidental repetition happens to be avoided, even though the grammar does not contain any conditions ruling it out. At best, grammars that avoid accidental repetition could be favored by an extra-grammatical, psycholinguistic, repeated-morph constraint (see Menn and MacWhinney 1983 and Bonet 1995 for examples of this approach).

Second, one could assume that the grammar contains conditions that rule out fairly specific cases of accidental repetition and that trigger adjustments of the type in (1c) through (1e). These 'low-level' filters could also be seen as psycholinguistically motivated (see Radford 1977 for an approach in this spirit). Third, one could adopt an optimality-theoretic approach to grammar (see Prince and Smolensky 1993). On this view, a maximally general condition against repeated morphemes would be part of the grammar, but its effects would depend on its interaction with other constraints. In other words, if a particular language allows structures that violate the constraint, these structures would be favored by constraints ranked higher in the grammar of that language (see Grimshaw 1997a and Ackema 2001 for examples of such an approach).

In the sections that follow, we will state a number of descriptive generalizations involving the repeated-morph constraint. These will be formulated in terms of the second approach for reasons of presentational convenience. No theoretical claims should be attached to this choice.

What constitutes an accidental repetition of morphemes depends on what we mean by identity of morphemes, 'repetition', and 'accidental'. (i) Many authors assume that identity is to be understood in terms of phonological form, although it could be that similarity in form rather than strict identity triggers haplology or suppletion. We will argue that, in addition to this, a sequence of morphemes expressing identical features may do so. (ii) The question about repetition concerns the context in which haplology and suppletion are triggered. The standard assumption is that M_1 and M_2 must be adjacent, which is compatible with all cases discussed here. (iii) Accidental repetition is to be distinguished from intentional repetition. In the case of reduplication in morphology, for example, two adjacent morphemes may end up having the same form by rule, thus exemplifying intentional repetition (the reduplicative morpheme is phonologically incomplete and takes its form, partially or wholly, from its host). Haplology and suppletion, however, involve accidental repetition: the relevant morphemes happen to have the same form and happen to surface next to each other. This raises the non-trivial question why grammars should distinguish the two cases. Menn & MacWhinney suggest a partial psycholinguistic answer, but a more comprehensive solution remains elusive.

In section 2 we discuss phenomena from several languages that illustrate strategies by which repetition of phonologically identical morphemes is avoided. In section 3 we turn to cases of haplology and suppletion involving morphemes that express identical features but are different in form. We offer some conclusions in section 4.

2 Four strategies

2.1 Tolerance and avoidance

It is easy to demonstrate that repetition of identical morphemes is not ruled out across the board. For example, in felicitous contexts, prepositional phrases may

be used as 'honorary NPs'. If so, they can be the complement of a preposition that is identical to their head, as shown by the Dutch example in (3).

(3) (Context: They will probably hang the painting the right way up, but since it is abstract art, you can't be sure. If they hang it upside down, all hell will break loose.)
De meeste journalisten hopen dan ook [$_{PP}$ **op** [$_{PP}$ **op** z'n kop]].
the most journalists hope then also on on its head
'Indeed most journalists are hoping for upside down.'

Dutch also has a preposition that seems to combine freely with prepositional complements, even if these are not honorary NPs. It turns that the selected PP can be headed by the same preposition, *voor* 'for'. This is illustrated in (4a). Repetition of prepositions is not restricted to complementation. Dutch has verbs that are accompanied by a prepositional particle and if such a particle is stranded by verb movement, it can end up adjacent to the head of an extraposed PP, giving rise to examples like (4b, c).

(4) a. Dit is een goede wijn [$_{PP}$ **voor** [$_{PP}$ **voor** de televisie]].
this is a good wine for for the television
'This is a good wine for in front of the television.'
b. Ik zoek het [$_{V}$ **op** t_{V}][$_{PP}$ **op** de kaart].
I search it on on the map
'I look it up on the map.'
c. Ik lees me [$_{V}$ **in** t_{V}][$_{PP}$ **in** dit onderwerp].
I read me in in this topic
'I read up on this topic.'

However, in other cases repetition of phonologically identical morphemes leads to ungrammaticality. Thus, the Dutch demonstrative pronouns *die* and *dat* 'that' cannot be followed by a relative clause introduced by the same pronoun. It seems unlikely that this is due to syntactic or semantic factors, given that relative clauses introduced by *die* and *dat* may follow the non-homophonous demonstratives *degene* and *hetgene*, while the demonstratives *die* and *dat* allow modification by prepositional phrases with a comparable semantics. The full paradigm is given in (5) and (6). A similar point is made for German and English by Pullum and Zwicky, as cited in Menn and MacWhinney (1983).

(5) (Context: Which filmstar do you like best?)
a. die met dat rooie haar
that with that red hair
'the one with the red hair'
b. degene met dat rooie haar
the-one with that red hair
'the one with the red hair'

c. **??die** **die** dat rooie haar heeft
that that that red hair has
d. degene die dat rooie haar heeft
the-one that that red hair has
'the one with the red hair'

(6) (Context: Which house do you consider most romantic?)
a. dat met een strooien dak
that with a thatch roof
'the one with a thatch roof'
b. hetgene met een strooien dak
the-one with a thatch roof
'the one with a thatch roof'
c. **??dat** **dat** een strooien dak heeft
that that a thatch roof has
d. hetgene dat een strooien dak heeft
the-one that a thatch roof has
'the one with a thatch roof'

The hypothesis that (5c) and (6c) are ruled out because of repetition of identical morphemes is corroborated by the grammaticality of relative clauses that modify the *wh*-operators *wie* and *wat*:

(7) a. Wie die je in Zuid Afrika ontmoet hebt vond je aardig?
who that you in South Africa met has found you nice
'Who that you met in South Africa did you consider nice?'
b. Wat dat je gelezen hebt vond je mooi?
what that you read has found you beautiful
'What that you have read did you consider beautiful?'

Note that the ban on repetition of identical morphemes is conditioned by adjacency. No ungrammaticality results if the demonstrative is separated from the homophonous relative pronoun by a nominal complement.

(8) a. die filmster die dat rooie haar heeft
that filmstar that that red hair has
'that filmstar with the red hair'
b. dat huis dat een strooien dak heeft
that house that a thatch roof has
'that house with a thatch roof'

Interestingly, the filter that excludes repetition must be sensitive to syntactic environment as well as phonological form, since the demonstratives *dat* and *die* may freely follow homophonous relative operators:

(9) a. De jongen **die die** fiets gestolen heeft is minderjarig.
the boy that that bicycle stolen has is under-age
'The boy who stole that bicycle is under age.'
b. Het meisje **dat dat** boek gekocht heeft is gek.
the girl that that book bought has is mad
'The girl who bought that book is mad.'

Indeed, in a carefully constructed example involving the complementizer *dat*, the demonstrative *dat*, the relative *dat* and an autoreferential DP, it is possible to create a sequence of six repeated morphemes:

(10) Ik denk **dat dat** '**dat**' **dat dat** '**dat**' op pagina 2 volgt weggelaten
I think that that that that that that on page 2 follows omitted
kan worden.
can be
'I think that the 'that' which follows the 'that' on page 2 should be omitted.'

The situation can be summed up by the following descriptive rule (small capitals indicate syntactic elements, material between forward slashes, their phonological realization):

(11) */pronoun/ /relative operator/ if
(i) /pronoun/ and /relative operator/ are adjacent,
(ii) /pronoun/ is identical to /relative operator/, and
(iii) PRONOUN is the antecedent of RELATIVE OPERATOR

2.2 Deletion

The strategy chosen in the Dutch examples above is one of avoidance of repetition. As Menn and MacWhinney point out, an alternative strategy would be deletion. Thus, if two free adjacent morphemes normally receive the same phonological realization, one of them would fail to be spelled out. In Mandarin Chinese, for example, the perfective marker *le* and the particle *le* which marks a new situation trigger deletion when adjacent (Yip 1998 and references cited there):

(12) Bing dou hua **le** (***le**).
ice all melt Perf CHANGE-OF-STATE
'The ice melted.'

A similar rule of deletion is triggered in French by adjacency of comparative *que* and the homophonous complementizer (Radford 1977, 1979):

(13) Je préfère que tu restes, plutôt **que** (* **que**) tu t'en ailles.
I prefer that you remain rather than that you go-away
'I prefer that you stay rather than that you go away.'

A further example from French involves the deletion of superlative *le* in a position immediately following the homophonous determiner (Radford 1977, 1979). (An anonymous reviewer suggests that (14b) may not involve haplology, but rather, raising of the comparative expression *plus beau*, which lacks an article, to a prenominal position where it acquires superlative semantics. It would take us too far afield to explore this possibility here.)

(14) a. le paysage le plus beau
the landscape the most beautiful
'the most beautiful landscape'
b. **le** (* **le**) plus beau paysage
the the most beautiful landscape

The phenomenon is also found in Spanish clitic clusters. Grimshaw (1997a) points out that at least in some dialects a sequence of a reflexive and an impersonal clitic, expected to surface as *se se*, in fact surfaces as a single clitic. Although the empirical claim is somewhat controversial, it would – if correct – show that haplology extends to clitic clusters.

(15) **Se** (***se**) lava.
one oneself washes
'One washes oneself.'

We will discuss one notorious case of syntactic haplology in some more detail. The Dutch weak pronoun *er* can have four different functions. It can be an expletive; the fronted argument of a preposition; a locative meaning 'there'; and a fronted noun associated with a numeral or a quantificational modifier. We illustrate these uses of *er* below, where we adopt Odijk's (1993) marking of *er*'s functions by X, P, L, and Q, respectively. (See Bech 1952, Van Riemsdijk 1978a, Bennis 1980, 1986 and Model 1991 for additional discussion.)

(16) a. dat er_X iemand in het bos loopt
that there someone in the forest walks
'that there walks someone in the forest'
b. dat Jan er_P gisteren pas weer [$_{PP}$ aan *e*] dacht
that John there yesterday only again on thought
'that John only thought about it again yesterday'
c. dat Jan er_L al jaren woont
that John there already years lives
'that John has lived there for years'
d. dat Jan er_Q [$_{DP}$ vijf *e*] heeft
that John there five has
'that John has five of them'

Since weak pronouns are not generally in complementary distribution in Dutch, one would expect sentences with up to four occurrences of *er* to be possible.

In fact, however, in most sentences of the relevant type only a single *er* is spelled out, which somehow manages to combine multiple roles. The following examples, taken from Odijk (1993), illustrate sentences in which *er* combines two functions:

(17) a. Kwamen er_{XQ} slechts twee?
came there only two
'Did only two (persons) come?'
b. Hij heeft er_{QP} slechts twee over gelezen.
he has there only two about read
'He read only two (articles) about it.'
c. Hij kocht er_{QL} slechts twee.
he bought there only two
'He bought only two (books) there.'

There are in principle two approaches to these data, both based on the fact that weak pronouns tend to cluster in a position between the regular subject position and the VP. A syntactic approach could postulate a single position for *er* in the cluster, which could then bind several empty pronominal elements in the clause. The various functions of *er* would then be associated with these elements. The alternative, haplological, approach assumes that the cluster can contain multiple occurrences of *er*, each with a single function. However, adjacent occurrences of *er* are subject to deletion, giving rise to the appearance of shared functions in the remaining pronoun.

The first approach cannot be correct as it stands since it does not allow any multiple occurrences of *er*, whether adjacent or not. This is clearly too strong, given that quantificational *er* can co-occur with expletive, locative, and prepositional *er* (although other co-occurrences are excluded):

(18) a. Er_{XL} hebben er_{Q} [$_{DP}$ twee *e*] een jaar gewoond.
there have there two a year lived
'Two (of them) lived there for a year.'
b. Er_{X} hebben er_{Q} [$_{DP}$ twee *e*] een bon gekregen.
there have there two a ticket got
'Two (of them) received a ticket.'
c. Er_{XP} hebben er_{Q} [$_{DP}$ twee *e*] [$_{PP}$ over *e*] gepraat.
there have there two about talked
'Two (of them) talked about it.'

(19) a. dat hij er_{L} zich er_{Q} [$_{DP}$ twee *e*] heeft aangeschaft
that he there self there two has bought
'that he has bought himself two (of them) there.'
b. dat er_{X} zich er_{Q} [$_{DP}$ twee *e*] tot top-athleten ontwikkelden
that there self there two to top-athletes developed
'that two (of them) developed into top athletes'

c. dat er_P zich er_Q [$_{DP}$ twee *e*] [$_{PP}$ over *e*] ontfermden
that there self there two about took-care-of
'that two (of them) took care of it'

The second, haplological, approach is advocated in Bennis (1980, 1986). The main advantage of this proposal is that it allows multiple occurrences of *er* as long as they are non-adjacent. However, a deletion rule is by itself not sufficient to accommodate all the data. In particular, a syntactic analysis seems required to explain the ungrammaticality of any structure that combines locative and preposition *er*. This is illustrated in (20a), which tries to spell out er_L and er_P separately, and (20b), which tries to combine the two functions in a single pronoun.

(20) a. *dat Jan er_P zich er_L [$_{PP}$ aan *e*] ergerde
that John there self there on annoyed-got
b. *dat Jan er_{PL} [$_{PP}$ aan *e*] dacht
that John there on thought

As argued by Odijk (1993) on the basis of largely comparable data, a hybrid analysis of *er* is required, which combines syntactic restrictions with haplology. Here we briefly present a variant of his proposal.

Data like (18) and (19) show that the position occupied by er_Q in the pronominal cluster must be distinguished from the one occupied by er_X, er_L, and er_P. In particular, it seems to be located to the right of this more general position. This conclusion makes it necessary to adopt a rule of deletion triggered by adjacent occurrences of *er*. The point is that, whenever the two positions are filled in the absence of intervening material, only a single *er* surfaces:

(21) a. Hebben er_{XLQ} [$_{DP}$ twee *e*] een auto gekocht?
have there two a car bought
'Did two (of them) buy a car there?
b. *Hebben **er_{XL}** **er_Q** [$_{DP}$ twee *e*] een auto gekocht?
have there there two a car bought
c. Hebben er_{XQ} [$_{DP}$ twee *e*] een bon gekregen?
have there two a ticket received
'Did two (of them) receive a ticket?'
d. *Hebben **er_X** **er_Q** [$_{DP}$ twee *e*] een bon gekregen?
have there there two a ticket received
e. Hebben er_{XPQ} [$_{DP}$ twee *e*] [$_{PP}$ over *e*] gepraat?
have there two about talked
'Did two (of them) talk about it?'
f. *Hebben **er_{XP}** **er_Q** [$_{DP}$ twee *e*][$_{PP}$ over *e*] gepraat?
have there there two about talked

The co-occurrence restriction on er_L and er_P can be understood if they compete for a single position. But why does this explanation not affect the expletive

function? In other words, why can a single *er* realize er_X, as well as er_L or er_P, despite the fact that separate realization of er_X and er_L or er_P is prohibited? The ungrammaticality of (22a) and (22c) demonstrates that haplology cannot be involved in the explanation of the grammatical examples.

(22) a. *Er_X gebeuren er_L ongelukken.
there happen there accidents
b. Er_{XL} gebeuren ongelukken.
there happen accidents
'Accidents happen there.'
c. *Er_X denken er_P mensen [$_{PP}$ aan *e*].
there think there people on
d. Er_{XP} denken mensen [$_{PP}$ aan *e*].
there think people on
'People think of it.'

We suggest that the key to understanding the distribution of expletive *er* lies in an interpretive rule which states that an occurrence of *er* is assigned the expletive function if it occurs in the IP or CP domain (we remain neutral on what this function exactly entails). Thus, *er* is never inherently expletive, but acquires this property on the basis of its context. This explains why an expletive function is unavailable in (23a), where *er* can only be locative. By contrast, (23b) is ruled out because *er* must be exclusively locative (given the choice of subject), while the interpretive rule forces an additional expletive function.

(23) a. *dat zich er_X ongelukken voordoen
that self there accidents happen
b. *Er_L woont Jan.
there lives John

On this view, the lexicon contains two entries for *er*, quantificational er_Q and a referential variant that subsumes er_P and er_L. That this is a reasonable assumption is supported by the fact that er_P and er_L have a strong counterpart, *daar*, but er_Q does not:

(24) a. dat Jan er_P/$daar_P$ [$_{PP}$ over *e*] gepraat heeft
that John there/there about talked has
'that John has talked about it'
b. dat Jan er_L/$daar_L$ woont
that John there/there lives
'that John lives there'
c. dat Jan er_Q/*$daar_Q$ [$_{DP}$ vijf *e*] heeft
that John there/there five has
'that John has five (of them)'

Pure expletive *er* is merged in a position to which the interpretational rule applies. However, since this merged expletive is not related to an interpretable empty position, its semantic content must be suppressed, much like the semantics of *do* in *do*-support constructions. The data in (22) now fall into place. In general, suppression of semantic content is avoided where possible. Thus, in constructions that allow verb movement, *do*-support is ruled out. Similarly, where a variant of *er* is available that allows movement into a position to which the interpretational rule applies, merger of *er* is blocked since the movement option avoids suppression of semantics. In the resulting structure *er* fulfills both the expletive function and the function it is associated with in its base position.

There is one remaining issue. As it turns out, the expletive and quantificational functions of *er* are incompatible:

(25) a. Er_X bestaan er_Q $[_{DP}$ twee *e*].
there exist there two
'There exist two (of them).'
b. *Er_{XQ} bestaan$[_{DP}$ twee *e*].
there exist two

This restriction may be related to the fact that, cross-linguistically, expletives are derived from referential rather than quantificational elements. Apparently, quantificational semantics is incompatible with the expletive function.

In summary, the distribution of Dutch *er* can be captured by the following generalizations:

(26) a. There are two positions hosting *er*, one which licenses referential *er* (er_L and er_P) and one which licenses quantificational er_Q. The referential position c-commands the quantificational one, while both are located between the IP and VP domains.
b. The expletive function is assigned to all variants of *er* that occupy a position in the IP or CP domain, by movement or base generation.
c. */er_1/ /er_2/ if
(i) /er_1/ and /er_2/ are adjacent, and
(ii) ER_1 and ER_2 are pronouns
c'. /er_1/ /er_2/ → /er/ (triggered by (c))
d. Pure expletive *er* is derived by suppression of semantic content.
e. Quantificational semantics cannot be suppressed.
f. Movement is preferred over suppression of semantic content.

The generalizations in (26a) and (26c, c') are directly taken from Odijk (1993), while (26b), (26d), and (26e) provide an alternative to his analysis of expletive *er*, which circumvents some technical difficulties. For our present purposes, it is important to acknowledge the properties of the rule of haplology in (26c, c'). Like the earlier rule in (10), it is conditioned by adjacency and must refer, not only to phonological identity, but also to syntactic category. The latter is easily

demonstrated by the examples in (27), in which no deletion takes place despite the adjacency of phonologically identical morphemes *er*:

(27) a. dat de duik**er er** twee heeft opgedoken
that the diver there two has updived
'that the diver recovered two (of them)'
b. dat Jan lang**er er**over doet dan Marie
that John longer thereon does than Mary
'that John takes longer than Mary'

Another property shared with the earlier rule is that the deletion applies to specific lexical items only. Identical weak pronouns are generally allowed to surface in adjacent positions:

(28) dat **ze ze** gisteren gezien hebben
that they them yesterday seen have
'that they have seen them yesterday'

2.3 Suppletion

A fourth strategy in dealing with cases of accidental repetition is to map one of the morphemes to a phonological form that can normally not be used to realize it. Menn and MacWhinney (1983) list a number of cases of this type that suggest that the phenomenon is particularly common in clitic clusters. For instance, a sequence of an indirect and a direct object third person proclitic in Spanish is expected to surface as *le lo* but does in fact take the form of *se lo*. The example in (29) is taken from Bonet (1995) (see also Perlmutter 1971).

(29) A Pedro, el premio, se/***le lo** dieron ayer.
to Peter the price se/3.Dat 3.Acc gave-3.Pl yesterday
'They gave the price to Peter yesterday.'

Notice that, if these cases are to be conditioned by adjacency of identical forms, identity must be defined in terms of onset identity, a considerably looser notion than the strict identity assumed for the cases discussed so far. An alternative account, explored in the next section, could rely on *le* and *lo* sharing the phi-features third person singular.

The phenomenon is not restricted to clitic clusters, however. Radford (1977, 1979) notices that in German a sequence of comparative *als* and temporal *als* is realized as *denn als*.

(30) Goethe ist bekannter als Schriftsteller denn/***als als** Naturwissenschaftler.
Goethe is better-known as writer than /as as scientist
'Goethe is better known as a writer than as a scientist.'

In many cases the alternative realization of the affected morpheme cannot reasonably be derived from the expected phonological form. Rather, it is an independently existing word in the language with a feature make-up that is either a subset or a superset of that expressed by the expected form. Below we will discuss two examples of suppletion in a little more detail. The first involves non-realization of a feature, while the second is a case in which the phonological form that is used spells out more features than are motivated by the syntax/semantics.

Ackema (2001) observes that the Dutch coordinating complementizer *of* 'or' and the homophonous complementizer used to introduce embedded questions cannot surface adjacently. This is illustrated by the case of coordinate reduction in (31b). As shown by (31c) and (31d), the strategy employed in this case of accidental repetition is not haplology but suppletion. The second complementizer surfaces as indicative *dat* 'that'. (Example (31b) is also acceptable for some speakers.)

(31) a. Vroeg je nou of die plaats vrij is of vroeg je nou of-ie bezet is?
asked you now if that seat free is or asked you now if-it taken is
'Did you ask whether that seat is free or whether it is taken?'

b. *Vroeg je nou of die plaats vrij is **of** ~~vroeg je nou~~ **of**-ie bezet is?
asked you now if that seat free is or asked you now if-it taken is

c. Vroeg je nou of die plaats vrij is of ~~vroeg je nou~~ dat-ie bezet is?
asked you now if that seat free is or asked you now that-it taken is

d. *Vroeg je nou of die plaats vrij is of ~~vroeg je nou~~ Ø-ie bezet is?
asked you now if that seat free is or asked you now it taken is

Ackema argues that these data fall out from a ban on adjacent identical complementizers (or rather functional heads). For our present purposes we can formulate the relevant filter as in (32).

(32) */complementizer$_1$/ /complementizer$_2$/ if
(i) /complementizer$_1$/ and /complementizer$_2$/ are adjacent, and
(ii) /complementizer$_1$/ is identical to /complementizer$_2$/

In addition, the grammar of Dutch is such that violation of this principle is avoided by a rule that suppresses realization of the Q feature in the second complementizer. The result of this is that only the feature indicating subordination will be realized, yielding the phonological form *dat*:

(33) [SUB Q] → [SUB] (triggered by (32))

Several aspects of this analysis are independently motivated. First, the adjacency condition is corroborated by the fact that material stranded by coordination reduction blocks suppletion (see (34a)). Second, the relevance of the syntactic category of the adjacent morphemes can be inferred from the grammaticality of (34b), in which the second *of* functions as an honorary NP (it has auto-referential

semantics). Third, phonological identity is a precondition for suppletion: if the coordinating complementizer is focussed, suppletion cannot take place (see (34c)).

(34) a. Vroeg hij nou zachtjes of die plaats vrij is of hard of/*dat-ie
asked he now softly if that seat free is or loudly if/that-it
bezet is?
taken is
'Did he ask softly whether that seat is free or loudly whether it is taken?'
b. Ik vraag me af **of** '**of**' een voegwoord is.
I ask me Prt if if a complementizer is
'I wonder whether 'if' is a complementizer.'
c. Hij vroeg **OF** **of** die plaats vrij is **OF** **of**-ie/*dat-ie bezet is.
he asked either if that seat free is or if-it/that-it taken is
'He asked either whether that seat is free or whether it is taken.'

The data in (35) provide an interesting complication not discussed by Ackema. Although these examples have been claimed to be ungrammatical by Koster (1978d), many speakers of Dutch find them acceptable and, moreover, do not distinguish between the cases of accidental repetition in (35a, b) and the cases of non-repetition in (35c, d).

(35) a. Hij zei **dat** [$_{CP}$ **dat** Jan komt] het feest wel zal opluisteren.
he said that that John comes the party no-doubt will enhance
'He said that John's coming will certainly enhance the party.'
b. Hij vroeg **of** [$_{CP}$ of Jan komt] veel uit zal maken
he asked if whether John comes a-lot out will make
'He asked whether it will matter a great deal whether John will come or not.'
c. Jij vroeg of [$_{CP}$ dat Jan komt] een probleem is.
you asked if that John comes a problem is
'You asked whether John's coming would be a problem.'
d. Hij zei dat [$_{CP}$ of Jan komt] niet zeker is.
he said that whether John comes not sure is
'He said that it is uncertain whether John will come.'

Sentence (35a) can easily be accommodated as a case of tolerance (see section 2.1) since *dat* cannot be input to the rule in (33). Example (35b), however, is predicted to be ungrammatical. It should be realized as (36), which is ungrammatical on the intended reading.

(36) *Hij vroeg of [$_{CP}$ dat Jan komt] veel uit zal maken.
he asked if that John comes a-lot out will make
'He asked whether it will matter a great deal whether John will come or not.'

A potential solution would be to say that suppression of features may not obliterate semantic contrasts. The subject position is not selected and can therefore

either contain an indicative or interrogative CP, which are of course associated with different readings ('whether . . .' versus 'the fact that . . .'). Ackema's data involve selected interrogatives, which apparently reconciles suppression of the interrogative feature with recoverability. That selection does not do so generally raises questions about the nature of recoverability, which, however, are beyond the scope of this chapter.

Ackema derives various apparently stipulative properties of (32) and (33) from optimality-theoretic competition. In this respect, the paper builds on Grimshaw (1997a), who provides an account of suppletion in certain Italian clitic clusters. Bonet (1995) observes that a sequence of an impersonal and a reflexive clitic, expected to surface as *si si* or *si se*, is in fact realized as *ci si*, where *ci* is a form that normally functions as the first person plural pronoun:

(37) a. Lo si sveglia. Italian
him one wakes-up
'One wakes him up.'
b. Se lo compra.
self it buys
'He/she buys it for himself/herself.'
c. ***Si si** lava.
one self washes
'One washes oneself.'
d. Ci si lava.
we self washes
'One washes oneself.'

It seems, then, that Italian has a ban on adjacent identical clitics:

(38) */clitic$_1$/ /clitic$_2$/ if
(i) /clitic$_1$/ and /clitic$_2$/ are adjacent, and
(ii) /clitic$_1$/ is identical to /clitic$_2$/

The same filter could be responsible for the fact that the dative clitics *lo* and *la* become *glie* before accusative clitics beginning with *l*. Of course, this would require that identity is defined as onset identity.

As in the case of dative clitics, the strategy adopted for avoiding violation of (38) by *si si* sequences is one of suppletion. What distinguishes replacement of *si* by *ci* in Italian from replacement of *of* by *dat* in Dutch is that the suppletive form in Italian is richer in content than the form it replaces. Bonet (1995) argues that the impersonal clitic *si* is highly underspecified: it only contains the feature plural, as indicated by the fact that it triggers plural adjectival agreement (Cinque 1988). If this analysis is correct, whatever form replaces *si* will be associated with a more specific feature content. In particular, Bonet captures the situation in Italian by a rule that inserts the feature first person, prior to phonological

realization of the clitic. The resulting form is *ci*, which normally expresses first person plural:

(39) [D PL] → [D 1 PL] (triggered by (38))

Three remarks are in order. First, the first person feature in *ci* should not feed semantic interpretation. This leaves open two options: either the rule is syntactic and relies on subsequent suppression of the relevant feature at LF, or the rule applies in the PF branch of the grammar (as suggested by Bonet). Second, it remains to be explained why the suppletive form is *ci* rather than any other of the available clitics. Bonet gives a partial answer to this question, based on economy. Grimshaw (1997a) discusses the problem in detail, providing an optimality-theoretic analysis. She argues that *ci* is chosen because it is minimally marked, while at the same time realizing as much of the target semantics as possible. Third, it is an open question why the first rather than the second *si* receives a suppletive realization. Although this is expressed by Bonet's rule, it remains unexplained.

3 Repeated features

3.1 Syntactic identity

The rules we have formulated so far must operate at the PF interface: while their effects are phonological, the environment in which they are triggered is characterized in both morpho-syntactic and phonological terms. For example, Dutch does not exclude the sequence /er/ /er/ in general, but only if it corresponds to a repetition of the pronoun *er* in syntax. Thus, the sequence /duiker/ /er/ in (27) is well-formed. This state of affairs raises the question what exactly triggers haplology in this case, repetition of phonological forms or of syntactic features. In some cases phonology seems the only possible trigger (for example, the case of Dutch complementizer suppletion), but in others the situation is arguably less clear. A complicating factor is that elements often have the same form because they express the same features.

Given that the spell-out rules relate morpho-syntactic objects to their phonological form, one would expect to find cases in which deletion or suppletion is triggered by syntactic features even though the morphemes affected are not phonologically identical in isolation. Thus, even if M_1 and M_2 in (40a) are usually spelled out differently, the fact that they both express the feature F may trigger avoidance (40b), haplology (40c), suppletion (40d) or insertion of a portmanteau form (40e).

(40) a. . . . $[_{M1}$ . . . F . . .] $[_{M2}$ . . . F . . .] . . .
b. *. . . M_1 M_2 . . .
c. . . . M_2 . . . . . . M_1 . . .
d. . . . M_1 M_2′ . . . . . . M_1′ M_2 . . .
e. . . . M_3 . . .

In this section we discuss some phenomena that can be analyzed in these terms. Of course, the existence of such cases does not imply that the cases discussed so far must be reanalyzed in terms of repetition of syntactic features.

3.2 *Deletion*

A suitable phenomenon for introducing the issue is provided by the deletion of possessive markers in Romanian in the context of preceding definite determiners (see Dobrovie-Sorin 1987, Grosu 1988, Cornilescu 1995, and others). Indefinite articles in Romanian precede the noun, while definite articles follow it. This implies that definite, but not indefinite, articles will be adjacent to the particle that introduces post-nominal possessives. As it turns out, the possessive marker is deleted if it surfaces next to the definite article, as in (41b). No deletion occurs if the article and possessive marker are separated by an adjectival modifier (cf. 41c) or a demonstrative (cf. 41d).

(41) a. un prieten al băiat-ul-ui
Indef.M friend Poss.Sg.M boy-Def.M-Dat.M
'a friend of the boy'

b. prieten-**ul** (***al**) băiat-ul-ui
friend-Def.M Poss.Sg.M boy-Def.M-Dat.M
'the friend of the boy'

c. prieten-ul nebun al băiat-ul-ui
friend-Def.M crazy Poss.Sg.M boy-Def.M-Dat.M
'the crazy friend of the boy'

d. prieten-a asta a băiat-ul-ui
friend-Def.F this.F Poss.Sg.F boy-Def.M-Dat.M
'this girlfriend of the boy'

Although this phenomenon is often analyzed in purely syntactic terms, Ortmann and Popescu (2001) argue convincingly that it is in fact conditioned by adjacency rather than hierarchical structure. A particularly strong argument to this effect is provided by coordinated possessives, which, in the relevant context, require deletion of the possessive marker that introduces the leftmost conjunct but not of any other possessive markers. This is particularly hard to understand in terms of syntactic structure.

(42) a. o casă [a băiat-ul-ui şi a fet-ei]
Indef.F house Poss.Sg.F boy-Def.M-Dat.M and Poss.Sg.F girl-Dat.F
'a house of the boy and of the girl'

b. cas-**a** [(***a**) băiat-ul-ui şi a fet-ei]
house-Def.F Poss.Sg.F boy-Def.M-Dat.M and Poss.Sg.F girl-Dat.F
'the house of the boy and of the girl'

Ortmann and Popescu analyze possessive deletion in terms of phonologically conditioned haplology. Indeed, as they point out, the definite determiner and the

possessive share at least one phoneme in contexts that trigger deletion. In Romanian, as in French, possessives agree in number and gender with the nominal constituent they modify. As a result, a noun ending in a masculine singular definite determiner will take a possessive phrase starting with a particle expressing the same features, etc. The contexts that require deletion of the possessive marker are presented in (43).

(43)

	Definite determiner	Possessive
Masculine singular	*u<u>l</u>/<u>l</u>e*	*a<u>l</u>*
Feminine singular	*<u>a</u>*	*<u>a</u>*
Masculine plural	*<u>i</u>*	*a<u>i</u>*
Feminine plural	*<u>l</u>e*	*a<u>l</u>e*

The deletion of the possessive marker cannot have a purely phonological trigger, since indefinites whose stem ends in *ul* do not require deletion of a following *al* possessive. Ortmann and Popescu therefore propose a ban on any shared phonological material in adjacent functional heads.

Although the determiner and possessive forms consistently share a phoneme, they are clearly not generally phonologically identical; consequently, it is not immediately clear that we can generalize from the cases discussed in the previous section to Romanian possessive deletion. Indeed, given that the determiner and possessive marker share phi-features, it seems more plausible to attribute the deletion to a ban on accidentally repeated syntactic features:

(44) */determiner/ /possessive/ if
(i) /determiner/ and /possessive/ are adjacent, and
(ii) DETERMINER and POSSESSIVE agree in number and gender.

This ban triggers the rule below:

(45) /possessive/ → Ø (triggered by(44))

In other words, Romanian possessive deletion takes place under systematic syntactic identity but only partial phonological identity, which favors an account in terms of repeated syntactic features.

As Ortmann and Popescu's work demonstrates, there is a reasonable interpretation of the Romanian data based on accidental phonological repetition. A case in which such an approach seems much less plausible, if not downright impossible, is presented by Old French pro drop. The facts are as follows. Old French is a verb-second language and pro drop is sensitive to word order. It is possible in exactly one context, namely, in main clauses in which subject–verb inversion would occur if the subject were overt, as pointed out by Foulet (1928). Thus, it is possible in declarative main clauses in which a constituent other than the subject is fronted and in yes–no questions, but it is unattested in embedded clauses and

subject-initial declaratives. This is illustrated by the data in (46a, b), from Adams (1987). Examples (46c, d) are constructed examples of unattested patterns.

(46) a. Einsi corurent __ par mer tant que il vindrent à Cademelée.
thus ran-3.Pl by sea until they came-3.Pl to Cadmée
'In this way they ran by the sea until they came to Cadmée.'
b. Oserai __ le vous demander?
dare-1.Sg it you ask
'Dare I ask it of you?'
c. *Einsi corurent li Grieu par mer tant que __ vindrent à Cademelée.
thus ran-3.Pl the Greeks by sea until came-3.Pl to Cadmée
d. *__ corurent einsi par mer tant que il vindrent à Cademelée.
ran-3.Pl thus by sea until they came-3.Pl to Cadmée

The simplest generalization that describes these data is that a weak pronoun is omitted precisely when it is adjacent to the inflectional ending it agrees with (for obvious reasons, focused pronouns cannot be deleted). This suggests an account in terms of accidentally repeated syntactic features. The relevant filter is given in (47).

(47) */affix/ /pronoun/ if
(i) /affix/ and /pronoun/ are adjacent, and
(ii) AFFIX and PRONOUN agree.

Violation of this filter is avoided by deletion of the pronoun:

(48) /pronoun/ → Ø (triggered by (47))

This is a reformulation of the analysis offered in Ackema and Neeleman (2003), who characterize the domain of rule application somewhat differently. Crucially, the conditioning environment cannot be purely phonological, given that pronouns and inflectional endings in Old French do not show any similarity in form. Hence, if haplology is at stake here, it is best captured in terms of repeated syntactic features. (As shown by Ackema and Neeleman, the argument carries over to Arabic pro drop.)

The main earlier treatment of Old French pro drop (Adams 1987) is based on government and relies on the following assumptions; (i) the position of pro must be identified by a governing head; (ii) the content of pro must be identified by co-indexation with the proper features; (iii) the proper governor for pro is I^0 but not C^0; (iv) I^0 governs to the right; (v) I^0 can govern from its derived position in C^0 in verb-second structures; and (vi) pro cannot be fronted to satisfy the verb second constraint. Several of these conditions are unexpected, even in GB theory. More importantly, however, they amount to a rather complex way of deriving what is in essence a simple generalization, namely that pro drop relies on adjacency of an agreeing affix.

3.3 Suppletion

Having seen a possible case of deletion in order to avoid accidental repetition of syntactic features, one may expect the same avoidance mechanism to give rise to suppletion. A possible case of this is found Dutch verb-second structures. In general, agreement in Dutch is insensitive to word order, but second person singular verb forms surface as first person singular whenever verb second gives rise to inversion:

(49) a. [$_{CP}$ dat [jij dagelijks met een hondje over straat loopt]]
that you daily with a doggy in-the street walk-2.Sg
b. [$_{CP}$ Jij [$_{C'}$ loopt [t_{DP} dagelijks met een hondje over straat t_V]]].
you walk-2.Sg daily with a doggy in-the street
c. [$_{CP}$ *Dagelijks [$_{C'}$ loop**t** [**jij** t_{AdvP} met een hondje over straat t_V]]].
daily walk-2.Sg you with a doggy in-the street
d. [$_{CP}$ Dagelijks [$_{C'}$ loop [jij t_{AdvP} met een hondje over straat t_V]]].
daily walk.1.Sg you with a doggy in-the street

As in the case of Old French pro drop, the obvious generalization is that spell-out is sensitive to adjacency of the second person singular affix and the agreeing subject. Ackema and Neeleman (2003) develop an analysis roughly along these lines, based on a characterization of the Dutch verbal paradigm in terms of the features Prt, Add, and Pl, which represent participant in the speech act, addressee, and plural (see also Kerstens 1993; Harley and Ritter 1998). The paradigm may then be characterized in terms of the following spell-out rules:

(50) a. [V PRT] → /v/ (first person singular)
b. [V PRT ADD] → /v/-/t/ (second person singular)
c. [V PL] → /v/-/en/ (plural)
d. [V] → /v/-/t/ (third person singular, elsewhere form)

Given this verbal paradigm, the condition that rules out (49c) can be stated in terms of accidental repetition of the ADD feature:

(51) */affix/ /pronoun/ if
(i) /affix/ and /pronoun/ are adjacent, and
(ii) AFFIX and PRONOUN agree in ADD.

Violation of this filter is avoided by suppression of the ADD in spell-out:

(52) ADD → Ø (triggered by (51))

The resulting phonology realizes only the PRT feature and therefore has the form of the first person singular. The analysis is supported by the fact that, although there is in general no adjacency requirement on a subject and a preceding

fronted verb, the reduced form of the second person singular must immediately be followed by the subject. (See Paardekooper 1961 and Hoekstra 1996 for related discussion and observations.) We should acknowledge here that there is some variation among speakers with respect to the relevant judgments. Some speakers reject (53b), where the subject contains a DP-internal modifier, but no speakers accept (53b').

(53) a. Volgens mij gaat zelfs hij op de heetste dag
according to-me go-3.Sg even he on the hottest day
van 't jaar naar het park.
of the year to the park
'According to me even he goes to the park on the hottest day of the year.'

a'. Volgens mij gaat op de heetste dag van 't
according to-me go-3.Sg on the hottest day of the
jaar zelfs hij naar het park.
year even he to the park

b. Volgens mij ga zelfs jij op de heetste dag
according to-me go.1.Sg even you on the hottest day
van 't jaar naar het park.
of the year to the park
'According to me even he goes to the park on the hottest day of the year.'

b'. *Volgens mij ga op de heetste dag van 't
according to-me go.1.Sg on the hottest day of the
jaar zelfs jij naar het park.
year even you to the park

Indeed, if the fronted verb and the following second person singular subject are not adjacent, the preferred form of the verb ends in *t*:

(54) ?Volgens mij gaat op de heetste dag van 't jaar zelfs jij naar
according to-me go-2.Sg on the hottest day of the year even you to
het park.
the park

The example is not perfect, which Ackema and Neeleman attribute to a parsing difficulty.

Although we have presented the loss of second person marking under inversion as a possible case of suppletion, it could also be analyzed in terms of deletion, given that the suppletive first person singular form does not carry an ending. However, in realizational models of morphology deletion corresponds to non-spell-out of all features. Hence, if the syntactic agreement affix were deleted, the resulting phonological form would be the elsewhere form, which ends in *t*. This is obviously not the correct result. Be this as it may, there are comparable

phenomena in other languages that must involve suppletion rather than deletion, because there is an overt form that unambiguously spells out the features unaffected by suppression. A well-known case is the agreement alternation with preverbal and postverbal subjects in Modern Standard Arabic (Fassi Fehri 1993; Benmamoun 2000a, 2000b; Ackema and Neeleman 2003). As the data below show, plural agreement is suppressed in VSO order, but gender agreement is maintained. Only in VSO order is the subject adjacent to the verbal ending (data from Fassi Fehri):

(55) a. Daxal-at n-nisaaʔ-u makaatib-a-hunna
entered-Fem the-women-Nom office-Pl-Acc-their-Fem
'the women entered their office.'
a′. *Daxal-**na** **n-nisaaʔ-u** makaatib-a-hunna
entered-Fem-Pl the-women-Nom office-Pl-Acc-their-Fem
b. N-nisaaʔ-u daxal-na makaatib-a-hunna
the-women-nom entered-Fem-Pl office-Pl-Acc-their-Fem
b′. *N-nisaaʔ-u daxal-at makaatib-a-hunna
the-women-Nom entered-Fem office-Pl-Acc-their-Fem

Of course, both the Dutch and the Modern Standard Arabic data have received syntactic analyses (see Zwart 1997a and references mentioned there for a syntactic approach to the Dutch data, and Huybregts 1991 and Fassi Fehri 1993 for a syntactic approach to agreement weakening in Arabic). It would take us too far afield to compare these to the suggestions made here.

3.4 Portmanteau morphemes

In the case of haplology based on phonological identity, one can either say that one of the two morphemes fails to be realized phonologically (deletion) or that the remaining phonological form spells out two morphemes (coalescence). It is not easy to find empirical arguments distinguishing the two approaches and it may even be the case that different instances of phonologically motivated haplology require different analyses (see De Lacy 1999 for related discussion in morpho-phonology).

If we turn to avoidance of accidental repetition of syntactic features, however, the two strategies can be told apart. In the case of deletion, the remaining phonological form will be identical to the spell-out one of the two morphemes receives in isolation. In the case of coalescence, it may well be that the form that surfaces differs from the form of either morpheme in isolation. In other words, avoidance of accidental repetition of syntactic features may give rise to a portmanteau morpheme.

The case we will look at involves Huastec weak pronouns, as discussed by Edmonson (1987). Huastec is an absolutive–ergative language with a separate paradigm for absolutive and ergative pronominals. This language displays the following phenomenon. In intransitive structures, pronouns show up in the

absolutive (see 56a). In transitive structures, a third person singular object pronoun may be omitted, in which case a subject pronoun shows up in the ergative form (see 56b). However, when both pronouns should be overtly realized, we do not find the expected repetition of pronouns, but rather a portmanteau morpheme indexing both the ergative and absolutive arguments (see 56c, d). (TS = thematic suffix; Com = completive inflection; Inc = incompletive inflection).

(56) a. ʔIn k'alel. I.Abs go.TS-Inc
'I go.'
b. ___ ʔa hapiyal.
you(all).Erg open.TS-Inc
'You (all) open it.'
c. ***ʔIn ʔa** kʷaθaʔ.
me.Abs you(all).Erg hit.TS-Com
'You (all) hit me.'
d. Tin kʷaθaʔ.
you(all).me hit.TS-Com
'You (all) hit me.'

The analysis of the Huastec data could involve a filter ruling out adjacent weak pronouns. Violation of this filter is avoided by assigning the two morphemes a single phonological realization:

(57) */pronoun$_1$/ /pronoun$_2$/ if /pronoun$_1$/ and /pronoun$_2$/ are adjacent

It is not immediately clear from the Huastec data that what Edmonson analyzes as weak pronouns could not instead be agreement affixes, given that they tend to surface adjacent to the verb. However, that we are dealing with a syntactic portmanteau morpheme is supported by two facts. First, pronouns can be separated from the verb by certain modifiers (see (58)). Second, in sentences containing full DP arguments, the pronominals can be omitted (although doubling is also allowed).

(58) Tin leh ¢'ik'-aʔ-Ø ʔan ʔa:m t-u ʔoko:b.
it.me very bite.TS-Com the spider on-A1 arm
'The spider really bit me in my arm.'

3.5 Tolerance and avoidance

Before we summarize the main findings of this paper, let us briefly discuss the two remaining strategies of dealing with accidental repetition of syntactic features, namely tolerance and avoidance. It will be clear that tolerance is by far the most common strategy. Agreement, for example, is not normally affected by adjacency. As to avoidance, we have not found any examples of this. In cases where repetition is not tolerated, languages consistently seem to provide

an alternative realization. We have no explanation for this, but speculate that functional factors may disfavour avoidance strategies in such cases.

4 Conclusion

Strategies for avoidance of accidental repetition involving free morphemes can invariably be formulated as filters that mention both phonological and syntactic properties of the relevant structure. The minimal phonological condition is adjacency, but often partial or complete identity of form plays a role as well. The minimal syntactic condition specifies the syntactic category of the elements in question, but often shared features are mentioned as well. Given these characteristics, the conclusion is unavoidable that avoidance strategies form part of the PF interface. Moreover, this interface must provide a mapping from morpho-syntactic to morpho-phonological representations. It cannot be the case that the phonological form of syntactic terminals is jointly merged with their syntactic and semantic properties.

It is highly unpredictable in which cases avoidance strategies are employed and, where they are employed, which strategy is chosen. The fact that avoidance is language-specific, construction-specific and morpheme-specific suggests to us that it must be seen as part of the lexicon of the language. In the view of PF sketched above, it is natural to view the lexicon as a list of minimal mapping rules associating, among other things, syntactic terminals with phonological forms (see Jackendoff 1996, Halle and Marantz 1993, and many others). If so, some lexical mapping rules may be context-sensitive, giving rise to avoidance of accidental repetition in specific cases.

For most cases of haplology involving free forms, a purely syntactic analysis is unsatisfactory, primarily because it cannot express the generalizations that seem to underlie the data. It cannot but treat the relevance of adjacency as an epiphenomenon.

Praise for *The Blackwell Companion to Syntax*, Volumes I–V

"When I first started studying linguistics in 1960 it was possible for an assiduous student to read almost everything in the field. The success of the discipline has meant that those happy days are, happily, gone forever. Syntax is now so big that no one can read even a fraction of what is on offer. There have been two unfortunate results: first, today's syntacticians keep rediscovering old facts, often reinventing eccentric wheels; second, they keep complaining that other linguists ignore their work. The usual excuses are that the material we ought to have referred to is distributed, seemingly at random, among hundreds of books and articles; life is finite; institutional pressures are unrelenting; and it is hard enough keeping up with work done in one's own framework on one's own area of special interest, without trying to see what rival theorists in adjacent areas might have had to say on the matter at hand, however relevant in the long term their contribution might be.

Such excuses will no longer do. *The Blackwell Companion to Syntax* provides a comprehensive overview of the progress and achievements made in syntax over the last 35 years. A galaxy of international stars under the leadership of two distinguished linguists, Martin Everaert and Henk van Riemsdijk, has constructed an unparalleled and monumental survey of empirical facts and theoretical insights covering the entire field. Whether you are interested in parasitic gaps, Icelandic logophors, or quantifier scope ambiguity, you will find here the essential background to your own contribution. This is a major achievement and the Companion will rapidly become essential reading for all serious linguists."

Neil Smith, University College London

"*The Blackwell Companion to Syntax*, unique in character and designed with great skill and care, is sure to be a rich source of high-quality information on critically important topics, and an invaluable research tool for the study of language."

Noam Chomsky, Massachusetts Institute of Technology

"For any serious researcher interested in theoretical linguistics, this incredible companion will remain an important and extremely useful source of reference for years to come."

Yukio Otsu, Keio University, Tokyo

"The flow of linguistic theory is shaped by the empirical puzzles of the rocks and the banks of the river bed. Any particular rock will have different effects at different points in the river. This Companion assembles the empirical puzzles and that is an enormously valuable service: it enables readers to understand why particular puzzles were of interest at particular stages in the development of theory and it assembles the puzzles into a compendium, in the belief that puzzles need solutions at every point in the development of theory, even if the shape of the solutions changes significantly at different stages of theoretical development.

The compendium of puzzles will be a great resource for young investigators, joining the river at some point and wanting to know what was upstream as they find their way downstream."

David Lightfoot, Directorate for Social, Behavioral and Economic Sciences, National Science Foundation, Arlington, VA

"Looking for a topic to work on? Grab *The Blackwell Companion to Syntax* and read some articles there. Or you may try to think of a topic not covered (if that is possible). Either way, this five-volume set should be within your reach if you want to be an active researcher."

Akira Watanabe, University of Tokyo

"In a rapidly moving field, it is essential to have an accessible repository of the empirical generalizations that fueled the theoretical debates. These generalizations have not only a historical value. It is often the case that the latest theoretical constructs tend to focus on the most recent empirical issues being discussed and ignore the previous ones. In this respect, this book provides a constant reminder of what needs to be incorporated in the current debate. It can be considered the empirical memory of the field."

Joseph Aoun, University of Southern California

"*The Blackwell Companion to Syntax* will be an indispensable source for theoretical, descriptive, and applied linguists alike. Much of the syntactic knowledge accumulated since the *Aspects* is not easily accessible and some of it may even be in the world of oblivion for many linguists. Younger scholars may have difficulties to understand some of the work done in a by now obsolete theoretical framework. Others may want to have easy access to the analytic knowledge of earlier work in their daily research activities. Since the knowledge presented in the Companion is largely independent of the various stages of syntactic theorizing, it can profitably be used by researchers working on syntactic problems whatever their theoretical background may be. The contributions of the present encyclopedia have been written by top scholars in the field covering practically all important issues addressed in syntax during the last forty years or so. It will certainly serve as an essential research tool for a great number of linguists for many years to come."

Ferenc Kiefer, Hungarian Academy of Sciences, Budapest

"*The Blackwell Companion to Syntax* is a very important accomplishment. Everaert and Van Riemsdijk have brought together a large group of internationally reputed researchers, each of whom analyzes a particular empirical domain that has played a central role in the development of syntactic theory. It is a valuable reference and pedagogical tool. I have no doubt that this work will benefit not only undergraduate and postgraduate students of linguistics but anyone interested in syntax and in the remarkable intellectual history of the field."

M. Carme Picallo, Universitat Autònoma de Barcelona

"This is the most impressive collective endeavor in the field of syntax ever attempted. It summarizes the (basic) descriptive results obtained for a great many syntactic phenomena in the last fifty years of research in generative grammar. It is an indispensable work of reference for students and researchers alike."

Guglielmo Cinque, University of Venice

"Since the beginnings of generative grammar, our knowledge of the syntactic aspects of the human language faculty has increased exponentially, with every investigation giving rise to ever deeper investigations and to cross-linguistic research. Every time I write a paper, prepare my lectures, or advise students on their research, I am confronted with the problem of accessing a vast body of syntactic knowledge. With 77 case studies written by leading syntacticians, *The Blackwell Companion to Syntax* is certain to help address this fundamental problem."

Christopher Collins, Cornell University and New York University

"The past 30 years have seen an explosion in the breadth and depth of linguistic research, as focused theoretical perspective has sharpened empirical investigations. The Companion is a time capsule for the results of empirically significant projects, ensuring that the results of the past are not lost in the future. Any scholar who opens the volumes will find there a wealth of wide-ranging, scholarly, and theoretically informed discussion of just about every syntactic phenomenon currently known to the field – from double nominatives to topicalization; from the spray/load alternation to SOV languages. The insightful and rich chapters come from some of the extraordinary researchers of the time period. If the next generation of scholars does not utilize this marvelous resource, it will not be the fault of the editors and authors, and they can be sure that current researchers will profit immediately from this outstanding project."

Jane Grimshaw, Rutgers University

The Blackwell Companion to Syntax

Volume V

Blackwell Handbooks in Linguistics

This outstanding multi-volume series covers all the major subdisciplines within linguistics today and, when complete, will offer a comprehensive survey of linguistics as a whole.

Already published:

The Handbook of Child Language
Edited by Paul Fletcher and Brian MacWhinney

The Handbook of Phonological Theory
Edited by John A. Goldsmith

The Handbook of Contemporary Semantic Theory
Edited by Shalom Lappin

The Handbook of Sociolinguistics
Edited by Florian Coulmas

The Handbook of Phonetic Sciences
Edited by William J. Hardcastle and John Laver

The Handbook of Morphology
Edited by Andrew Spencer and Arnold Zwicky

The Handbook of Japanese Linguistics
Edited by Natsuko Tsujimura

The Handbook of Linguistics
Edited by Mark Aronoff and Janie Rees-Miller

The Handbook of Contemporary Syntactic Theory
Edited by Mark Baltin and Chris Collins

The Handbook of Discourse Analysis
Edited by Deborah Schiffrin, Deborah Tannen, and Heidi E. Hamilton

The Handbook of Language Variation and Change
Edited by J. K. Chambers, Peter Trudgill, and Natalie Schilling-Estes

The Handbook of Historical Linguistics
Edited by Brian D. Joseph and Richard D. Janda

The Handbook of Language and Gender
Edited by Janet Holmes and Miriam Meyerhoff

The Handbook of Second Language Acquisition
Edited by Catherine J. Doughty and Michael H. Long

The Handbook of Bilingualism
Edited by Tej K. Bhatia and William C. Ritchie

The Handbook of Pragmatics
Edited by Laurence R. Horn and Gregory Ward

The Handbook of Applied Linguistics
Edited by Alan Davies and Catherine Elder

The Handbook of Speech Perception
Edited by David B. Pisoni and Robert E. Remez

The Blackwell Companion to Syntax, Volumes I–V
Edited by Martin Everaert and Henk van Riemsdijk

The Handbook of the History of English
Edited by Ans van Kemenade and Bettelou Los

Preface

Generative grammar has always set its aims high. From its inception in the 1950s, the ambition has been to go beyond observational and descriptive adequacy to reach explanatory bliss. Important work would be about 'conditions on transformations' rather than on 'some properties of *wh*-movement in English', about the 'transformational cycle' rather than on verb clusters.[1] This is what science should be like. And while earlier attempts at achieving a semblance of an explanatory theory were often clumsy and inadequate, these past forty or so years have shown that truly fundamental questions can now be asked and addressed.[2] This emphasis on theory has not, of course, altered the fact that linguistics is a thoroughly empirical science, but data and analyses are seen as what they are: tools to help us understand the structure and properties of the human language faculty. It is the fate of tools that when the product is finished they are put away. When some (as it turns out controversial) data from Italian had suggested that the notion of bounding node should be parameterized, we then forgot about the Italian data and happily proceeded with the idea of parameters.[3] Numerous other examples could be added.

More generally, the data and analyses that at some point in the history of generative grammar played an important, sometimes even a crucial, role have a tendency to fade into the background rather quickly.[4] This effect is particularly strong when the piece of theorizing they helped to establish becomes obsolete, but it is even true when the theoretical insight persists over time. As time went on, and as generative grammar (using the term in the broad sense, including all its theoretical diversity), in its explosive success, expanded to dozens of countries, hundreds of universities and colleges, and many hundreds of researchers, the muckheap of once useful but then discarded empirical material continued to grow. Old hands in the field may still be served by a good memory, helping them to dig out some of these rejects if they seem useful at some later stage, but successive new generations of young linguists simply don't have access to the wealth of data, generalizations, and analyses that might be terribly important to their research if only they knew about them.

But it is not only a problem for younger generations. Researchers who like to keep track of developments, particularly (but not only) in those subfields that are not directly related to their own research, or who work in closely related disciplines such as, for instance, psycholinguistics or sociolinguistics, find it increasingly difficult to keep track. Current handbooks are often concerned with current theorizing, but only marginally with the history of the various versions of the theory and even less with the empirical generalizations underlying those theories. As a consequence, an ever smaller percentage of the potentially useful empirical material is treated in standard textbooks, and hence the rest is not part of the knowledge that researchers and students in the field may be expected to possess.

It might be objected that the articles in which all this wisdom is stored are, after all, still around in the journals, in the books, in the libraries. But given their theoretical focus, the titles are often unrevealing as far as the empirical domain is concerned, keywords are notoriously absent or unreliable, relevant data are scattered over several articles, and, most importantly, the presentation of the data in these articles is subservient to the theoretical claims that are made and hence not presented in succinct, didactically useful ways.[5] So searching for the relevant materials, even if you know what to look for, is often hard. For young researchers, such a search task is doubly difficult because very often the descriptive generalizations are presented in a jargon and formalism that were characteristic of the theoretical framework at the time, sometimes decades ago. Who thinks to look up the term 'backward equi' when looking for data relevant to what we now call exceptional case marking (ECM)?[6]

Having a good, theoretically oriented mind is not enough. You cannot gain an understanding of the abstract properties of Universal Grammar without having any ideas about interesting empirical areas that might provide the crucial evidence (or counter-evidence) for your claims. But these flashes of empirical insight can only come if you have enough knowledge in your head to start the neurons firing away. And you can only have that knowledge if you have been taught about a certain range of phenomena in a variety of languages, or if you have had access to a repository of such materials to work through by yourself. The problem is that such courses are rarely taught, the reason being more often than not that the relevant data are not available in a form that is didactically usable.

This is the lacuna that we are hoping to fill with *The Blackwell Companion to Syntax*. In these five volumes, we offer you 77 case studies of syntactic phenomena that should, at least partly, fill the gap and constitute an important research tool for the working linguist and for teachers and students of syntax (and its interfaces). In bringing these chapters together, we were guided by a working definition of what a syntactic case study was supposed to be. The following properties were thought to be central: *a well-delimited empirical area (both as to the construction(s) involved and as to the languages in which the phenomena are found) whose analysis has, at one time or another in the history of generative grammar, played an important role in the theoretical debates at that time*. More often than not, we will find that such results are relatively robust in the sense that they will stand and

be interpretable regardless of various innovations or adaptations of the version of the theory in which they first saw the light.

The so-called 'verb-raising' construction in Continental-West Germanic languages (chapter 75) will serve as an example. Much has been published on this subject, a reasonable degree of consensus exists about the most important properties of the construction, its analyses have been frequently used to support theoretical proposals, etc. Nevertheless, the existence of this complex of facts is hardly known outside the small group of specialists in this field, the main properties cannot be presupposed as common knowledge, and no one in the field can be properly held responsible for ignoring the verb-raising construction. In a situation like that, the chapter's presentation will be oriented toward combining views and formulating them in such a way that they will be accessible to researchers from various approaches to the theory of grammar.

In addition, of course, the delimitation had to be such that the empirical subdomain in question could be treated in manageable chapters. It would have been unthinkable to include a case about relative clauses: even a thick monograph would not do such a topic justice. But the subtopic of free (headless) relative clauses (chapter 27), a topic that in the late 1970s and the 1980s generated a considerable literature, is a typical example of what we had in mind.

What about the theory? We wanted to make the empirical generalizations, the insights into the properties of constructions, the main focus of each chapter. But wherever useful and possible, of course, reference can be and is made to the theoretical issues that the phenomena in question were or even are relevant to. This introduces a certain bandwidth, and indeed some of our authors stress the empirical side more strongly while others swerve more easily into theoretical discussions. With a project this size it has been impractical to impose more uniformity than we have achieved here. It was, frankly, not always easy to convince our authors to take time away from their primary theoretical research to write the chapters we asked them to. And it was also on occasion hard to curb the attention that they tended to give to theoretical issues and their own role in those theoretical developments. More generally, wherever possible we suggested that theoretical issues be addressed in robust, sustainable ways, not in terms that would reflect the fads and the terminological peculiarities typical of a specific brief period in the short history of generative grammar.

It does not take a great deal of knowledge of the field to realize that an enterprise such as the present one is a highly open-ended affair. Even if we had achieved complete coverage at the time of appearance, new cases would soon present themselves. But complete coverage is unattainable in the first place. It is always possible to come up with other potential cases, not represented in the present work. Even now we already have a number of ideas about cases that might be added and which may at some point be added to the present collection. Nevertheless, we believe that the coverage that the present collection achieves is very considerable. So much ground is covered that already it seems doubtful that future graduate students of linguistics could be expected to work through all of this material. If a student manages part of it and has the rest at his or her disposal

as an encyclopedia of linguistic phenomena, we feel certain that his or her research will greatly benefit. As teachers we are frequently confronted by a big question mark in the faces of students or even fellow faculty members when we use terms like 'contraction', 'subdeletion', or 'freezing effect'. And when asked "Where can I read up on this?" we are often faced with our own bad memory and the virtual impossibility of pointing toward one representative text that will concisely and competently explain what kind of phenomena are hiding behind these terms. This, we feel sure, is now a problem of the past.

If, as we are convinced, this *Companion* will become an important research tool in linguistics, a pressing need will also be felt for additional case studies to be added. While it may well be possible to project further volumes in the future, or an updated or extended version of the present publication, it has been clear to us from the start that the best way to make this an incremental enterprise is to publish these cases electronically. This would allow the possibility of reviewing cases now published, adding new cases relatively easily, and allowing discussion fora, etc. When that happens, the way to expanded coverage of the field will be paved. For the moment we refer you to www.syntaxcompanion.org to keep you informed on developments in this area.

One point to make about the references: every individual chapter has a reference section; the consolidated reference list is in volume V, and in the XML CD version the links are to the consolidated list rather than to the end-of-chapter lists. So in the chapter references you may find entries with a, b, etc. after the date even if there is only entry with that author and date in that chapter, because there is more than one entry in the whole five volumes with the same author and date. For example, even if there's only one Chomsky 1995 cited in any one chapter, it will appear as Chomsky 1995a or 1995b or 1995c, because there are three Chomsky 1995 entries in the consolidated references for the whole five volumes, identified as a, b, and c.

As editors of this encyclopedia of case studies, we have had to make many choices. In doing so we were greatly helped by the project group at NIAS, the Netherlands Institute for Advanced Study in the Humanities and Social Sciences, at Wassenaar, in the dunes lining the Dutch coast, in 1996/1997. The definition of what we would consider a typical case study was intensively discussed and ultimately fixed by that group: Reineke Bok-Bennema, Norbert Corver, Denis Delfitto, Joe Emonds, Martin Haiden, Itziar Laka, Eric Reuland, Tim Stowell, Sten Vikner, and, to some extent, Ian Roberts. We were also fortunate to have good input and feedback from Hagit Borer, Jan Koster, and Edwin Williams, our special outside consultants. The original list of cases was also compiled by that group. First sample chapters were produced during that year. And we brainstormed a lot about who would be the ideal author for which chapter. Nevertheless, we accept full responsibility for all the choices that were made.

We do wish to emphasize, however, that it has never been our intention to suggest that the present collection could be interpreted as a kind of canon, in the literary sense of the word (to the extent that literary scholars are still prepared to advocate such a notion). What we say above about the open-ended character of

an enterprise such as this should underline the fact that nobody could pretend that it is at all possible to establish such a canon, even if one tried to.

The first plans for this project were made in 1993. That is when we decided to apply to NIAS to see if we could get together a team of colleagues with whom to discuss the scope, the objectives, and the realization of the present work. The application was approved. We gratefully acknowledge the generous support, financial, logistic, and otherwise, of NIAS and, in particular, Dick van de Kaa and Wouter Hugenholtz, respectively the rector and the director of the institute. The group convened in the splendid isolation of NIAS in the academic year 1996/1997. There, we were happy to be able to work together with the colleagues mentioned above. Ilke van den Ende joined us as a student trainee. We were also happy to be able to organize two workshops at NIAS during that year. A third was held in Los Angeles at USC with the help and support of Hagit Borer and Tim Stowell in 2001. We wish to thank the participants at these workshops for their contributions, and LOT (the Dutch National Graduate School of Linguistics) as well as NWO and KNAW (the Netherlands Organization for Scientific Research and the Dutch Royal Academy of Sciences respectively) for financial support for these workshops. We also wish to thank the BSGM Foundation for an additional grant to the NIAS group. Last but not least we wish to thank those who have assisted us with the administration and correspondence, with the copy-editing and the HTML-conversion and the maintenance of the website: Jenny Doetjes, Bart Hollebrandse, Rob Goedemans, and Hannah de Mulder. Without them we literally and figuratively could not have managed. Thanks are due to NWO and the Utrecht Institute of Linguistics OTS (Language in Use project) for grants that made this assistance possible.

Finally we would like to thank all those at Blackwell who, over the years, have helped us realize this project – Ada Brunstein, Philip Carpenter, Sarah Coleman, Tami Kaplan – and the copy-editing team – Fiona Sewell, Anna Oxbury, Peter Kahrel – for doing such a wonderful job.

Utrecht and Tilburg
Martin Everaert and Henk van Riemsdijk

NOTES

1 Cf. Chomsky (1973); Evers (1975b).
2 See, for example, Chomsky (2004).
3 Cf. Rizzi (1982b).
4 The reverse also holds true. Certain empirical domains have never figured prominently in theoretical debates, and remain, thus, uncharted territory from a descriptive point of view.
5 We should add that publications like *Linguistics Abstracts Online* will, in future, solve part of the problem we note.
6 Cf. Postal (1974).

5 Conclusion

1 Introduction

Modality is a semantic concept and covers, *inter alia*, notions such as possibility, necessity, probability, obligation, permission, ability, and volition. Modality can be expressed syntactically by modal verbs, imperatives, verbal inflection, modal adverbs, and modal particles. This chapter is restricted to modality expressed by modal auxiliaries such as CAN, MUST, MAY, WILL, WANT, and NEED.[1]

A great deal of research on the syntax of modal auxiliaries has concentrated on the distinction between epistemic and root interpretations. Roughly, epistemic interpretations are a class of interpretations involving a speaker-oriented or, in the case of embedded clauses, matrix-subject oriented qualification or modification of the truth of a proposition, while root interpretations involve the will, ability,

permission, or obligation to perform some action or bring about some state of affairs (cf. Lyons 1977 and Palmer 1986 for a fine-grained classification and description of modal interpretations). Sentences are often ambiguous between the two readings. In many Germanic and Romance languages the same set of modals can have both the epistemic and the root interpretations. An example is given in (1):

(1) John must be home at six o'clock.
Epistemic: '(Given what I, the speaker, know), I conclude that John will be home at six o'clock.'
Root: 'John is obliged to be home at six o'clock.'

An important question is whether this systematic semantic ambiguity entails the existence of two different syntactic structures. One of the first answers to this question (Ross 1969a) is that modals with an epistemic interpretation are one-place predicates, taking the entire proposition as their complement, whereas root modals are two-place predicates, i.e., they involve relations between the subject and the rest of the clause:

(2) Epistemic: must (John be home at six o'clock)
Root: must (John, be home at six o'clock)

I take this idea as a starting point, as a great deal of work has been invested to translate it into syntactic terms.

There are different ways to represent the alternation between monadic and dyadic modality syntactically. A first option would be to try to reduce the modal alternation to similar alternations with verbs like *break* and *smoke*. However, it will be shown in section 2 that these are alternations of a fundamentally different type.

A second way to represent the alternation in terms of argument structure is to analyze root modals as control structures and epistemic modals as subject raising structures. This is the most common generative analysis of the root–epistemic ambiguity (Hofmann 1966; Ross 1969a; Perlmutter 1970b and numerous studies since then). However, as shown in section 3, there are a number of serious problems for this analysis.

Third, the modal alternation could be the result of generating modals in different base positions, a higher, possibly functional, position for epistemic modals and a lower, possibly lexical, position for root modals. This analysis is not entirely without problems either, as sections 3.1–3.3 show.

A fourth way to analyze the modal alternation is to assume that epistemic modals, but not root modals, undergo movement at LF. This possibility is discussed in section 3.4. On this approach, the monadic nature of the modal verb in epistemic interpretations is not established until LF.

A different perspective on the possibility of generating modals in different head positions is to look at how different types of complement of modals influence modal interpretation. This perspective is chosen in section 4.

2 Argument structure of modals

2.1 Transitive–intransitive alternations

As is well known, English modals have a defective inflection paradigm and a distribution different from that of main verbs (see section 3). Therefore, the question whether the dyadic–monadic alternation is reducible to other transitive–intransitive alternations does not seem to be relevant for English. It is a relevant question, however, for languages in which modals have many properties in common with main verbs, such as Dutch and German. This section shows that in such languages the modal alternation is not reducible to transitive–intransitive alternations either.

Transitive–intransitive alternations are found cross-linguistically with main verbs like *break* and *smoke* (3a–d). A common analysis of such alternations is that each of these verbs has only one lexical entry, which corresponds to the transitive variant. The intransitive variant is derived by a lexical operation that reduces transitive predicates to intransitive predicates by removing the external argument.

(3) a. John broke the window.
b. The window broke.
c. John smoked the eel.
d. The chimney smoked.

In fact, *break* and *smoke* represent two different types of alternation: *break* is a transitive–unaccusative alternation and *smoke* a transitive–unergative alternation (cf. Abraham 2000). The two can be distinguished by using classic tests described in Burzio (1986) and Hoekstra (1984b). In Dutch, the unaccusative alternant selects the auxiliary BE in the perfect tense (4b) and its adjectival participle can modify a noun that corresponds to the surface subject of the unaccusative (4c). The unergative alternant selects the auxiliary HAVE (4e) and its participle cannot modify a noun that corresponds to the surface subject of the unergative (4f).

(4) **Transitive–unaccusative**
a. Jan breekt de ruit.
John breaks the window
b. De ruit is/ *heeft gebroken.
the window is/ has broken
c. de gebroken ruit
the broken window
Transitive–unergative
d. Jan rookt een paling.
John smokes an eel
e. De kachel heeft/ *is gerookt.[2]
the stove has/ is smoked
f. *de gerookte kachel
the smoked stove

If the root–epistemic ambiguity of modals were to involve reduction of dyadic predicates to monadic ones, then these tests would show that modals belong to the same class as *roken* 'smoke', as (5a–c) illustrate. In the perfect tense HAVE is selected and the participle cannot modify a noun corresponding to the surface subject of the intransitive alternant:

(5) **Root–epistemic**
   a. Jan mag eten.
      John may eat
      'John is allowed to eat.'
   b. Eten heeft/ *is altijd gemogen.
      eat has/ is always may-Part
      'It has always been allowed to eat'
   c. *het gemogen eten
      the allow-Part eating

However, the monadic alternant of the modal (5b) does not have an epistemic interpretation, which shows that the epistemic–root ambiguity is not an instance of the transitive–unergative alternation either. Moreover, for the epistemic interpretation to be possible, the external argument does not need to disappear, as (1) shows. We can thus conclude that the epistemic–root ambiguity can neither be reduced to the transitive–unaccusative alternation nor to the transitive–unergative alternation.

2.2 *The raising–control analysis of the epistemic–root ambiguity*

A consequence of treating root modals as dyadic predicates is that they involve a control structure, if something like the theta-criterion holds. If a root modal assigns a theta-role to the surface subject DP and if a DP must receive exactly one theta role, it cannot be the case that root modals involve raising structures. If they did, the raised subject would receive a theta-role from both the embedded predicate and the modal. Therefore, root modals can be analyzed only as dyadic predicates if they involve control structures, which implies that PRO in the complement of the modal receives the external theta-role of the embedded verb, while the matrix subject receives its theta-role from the modal directly.

(6) a. $[[_{DP}$ John] must $[_{DP}$ ~~John~~] work from nine to five]]. Raising & epistemic
   b. $[[_{DP}$ John$]_i$ must [PRO$_i$ work from nine to five]]. Control & root

The control–raising analysis rather elegantly captures the idea that root modals are dyadic predicates while epistemic modals are monadic predicates. However, many problems for this analysis have been noted in the literature. First, assuming a PRO-subject in the infinitival complement of the modal is problematic because

infinitival complements without *te* 'to' usually cannot have PRO as their subject, as the Dutch example in (7a) illustrates.[3]

(7) a. Jan voelde [zich/ *PRO wegzakken in de modder].
John felt himself/ PRO sink in the mire
'John felt that he was sinking in the mire.'
b. Jan voelde dat hij wegzonk in de modder.
'John felt that he was sinking in the mire.'
c. Jan at [$_{SC}$ zich/ *PRO ziek].
John ate himself/ PRO sick
'John ate so much that he got sick.'

The infinitival complement in (7a) requires a reflexive as its subject if it is to express the same meaning as (7b). If this infinitival complement can be analyzed as a small clause (SC), the impossibility of PRO in (7a) is an instance of the broader generalization that SC-complements cannot have a PRO subject, as (7c) illustrates (cf. Stowell 1981).

A possible way out would be to argue that modals do not take small clauses as their complements, but larger constituents, e.g., CP or TP. For the Germanic languages there does not seem to be much evidence, however, that this is the case. C-elements such as complementizers are impossible in the complement of a modal, as is embedded *wh*. If infinitival *to* is a T-element, its obligatory absence in most modal contexts shows that the complement of a modal is not a TP either. Higher adjuncts such as evidential and modal adverbs cannot be part of the complement of a modal, which also suggests that complements of modals are smaller than CP.

However, it cannot be concluded from the situation in Germanic that it is generally impossible for modals to have a CP or TP complement. As Tomić (2002) argues, Macedonian has a set of modals that take subjunctive CP-complements. Incidentally, these Macedonian constructions should not be confused with cases in which modals in Germanic seemingly take a CP-complement, as in (8a). There is reason to think that CP in this construction is not a complement but an adjunct (cf. Bennis 1986). As with adjunct clauses, CP in this construction is opaque for extraction, as the Dutch example in (8b) illustrates.

(8) a. Het kan niet [$_{CP}$ dat Nederland de Portugese ploeg
it can not that the Netherlands the Portuguese team
vanavond verslaat].
tonight beats
'It is impossible that the Dutch will beat the Portuguese team tonight.'
b. *Welke ploeg kan het dat Nederland ~~welke ploeg~~ vanavond
which team can it that the Netherlands which team tonight
verslaat?
beats

A second problem for the analysis of root modals as dyadic control predicates is provided by sentences in which the matrix subject cannot be interpreted as the person being obliged or permitted to do something (Feldman 1986; Klooster 1986; Brennan 1993; Barbiers 1995):

(9) a. This letter must be in London before five o'clock.
'It is necessary/obligatory that this letter be in London before five o'clock.'
b. Al deze kranten mogen weg.[4]
all these newspapers may away
'It is permitted to throw away all of these newspapers.'

In these sentences, the modal clearly is a monadic predicate taking the entire clause as its argument, but (9a) can and (9b) must have a root interpretation. Obviously, it is the addressee of utterances like (9a, b) that has the obligation or permission to do something, but the crucial point is that this addressee cannot be expressed syntactically here. In addition, it has often been observed that root modals (in fact, modals in general) cannot be passivized.[5] This is unexpected if they are dyadic verbs, since dyadic verbs which assign an external theta role satisfy an important condition for passivizability (Burzio 1986). However, it should be noted that modals share this inability to occur in the passive with other stative transitive verbs; it may be that the crucial factor blocking passivization here is stativity.[6]

A third problem for the control analysis of root modals involves the behavior of expletive subjects (Thráinsson and Vikner 1995; Warner 1993). In some languages, e.g., English, expletive subjects occur with raising verbs but not with control verbs (10a, b), the explanation being that expletives cannot receive a theta-role but would get one in a control structure. If root interpretations always involved control structures, expletive subjects are predicted to be incompatible with root interpretations, contrary to fact, as (10c) illustrates.[7]

(10) a. There seems to be a man in the room.
b. *There tried someone to call you.
c. There must be a solution to this problem on my table this morning.

A fourth problem emerges when we look at languages with morphological case. Wurmbrand and Bobaljik (1999) claim that in Icelandic modals with a root interpretation behave like raising predicates with respect to quirky case. When a verb requiring quirky case on its subject is embedded under a raising verb, the surface subject may appear with quirky case (11a). When such a verb is embedded under a control verb, the surface subject must appear with nominative case (11b). Regardless of the interpretation, the subject of modal clauses always occurs with quirky case when the embedded verb requires this (11c–d).[8]

(11) a. Harald/%Haraldur virðist ekki vanta peninga. Icelandic
Harold-Acc/Harold-Nom seems not lack money
'Harold seems not to lack money.'

b. Haraldur/*Harald vonast til að vanta ekki peninga.
Harold-Nom/*Harold-Acc hopes for to lack not money
'Harold hopes not to lack money.'
c. Haraldi/*Haraldur ætlar að líka vel í Stuttgart.
Harold-Dat/*Harald-Nom intends to like well in Stuttgart
'It looks like Harold will like it in Stuttgart.'
d. Umsaekjandann verður að vanta peninga.
the-applicant-Acc must to lack money
'The applicant must lack money.' (In order to apply for this grant)

A fifth problem involves modals taking a non-verbal complement. Barbiers (1995, 2002; cf. also section 4) shows that Dutch modals can take a non-verbal complement, e.g., a PP or AP complement.[9] Modals with a PP or AP complement are subject raising constructions. Yet, they can only get non-epistemic interpretations.

Finally, Wurmbrand and Bobaljik (1999) show that A-reconstruction for scope, i.e., the subject taking scope under the modal, is possible for both root and epistemic modals in German. As is well known, A-reconstruction is possible with raising verbs but not with control verbs (cf. May 1985, among many others). The crucial example is given in (12a), which shows that a root interpretation is compatible with wide scope of the modal.[10] Butler (2003) makes the same point for English (12b).

(12) a. Ein Österreicher muß das nächste Rennen gewinnen (damit Österreich die Führung im Weltcup übernimmt). German
an Austrian must win the next race (in order for Austria to have the most gold medals)
i. 'It is necessary that an Austrian (whoever it is) win the next race.'
Scope: modal > subject
ii. #'There is an Austrian and it is necessary that he win the next race.'
Scope: subject > modal
b. Some philosophers must go to those seminars.
i. 'There are some philosophers which are required to go to those seminars.'
Scope: subject > modal
ii. 'It is required that some philosophers go to those seminars (as a condition of our being given money to run them).'
Scope: modal > subject

In sum, the observations presented in this section pose serious problems for a control analysis of modals with a root interpretation, but not for a raising analysis. We have also seen that root modality comes in two types. In the first type, subject-oriented root modality, the surface subject has the permission, obligation, ability to perform some action, or achieve a certain state. In the second type, non-subject oriented modality, the event or state denoted by the embedded verb is

allowed, permitted, or made possible, but the permission, obligation, or ability is not attributed to the surface subject. Consequently, it is not possible to distinguish root and epistemic modality in terms of theta role assignment to the surface subject. Moreover, the evidence presented in the previous section suggests that modal auxiliaries are raising verbs, which do not assign a theta role to the surface subject. The question whether the two types of root interpretation can and should be distinguished syntactically is still open. If all modals are raising verbs and if in the subject-oriented interpretation the surface subject gets a theta role from the modal, subject-oriented root interpretations pose a serious problem for the theta criterion.

2.3 *Prepositional arguments of modals*

To conclude this section, I add some well-known observations on the argument structure of modals that any theory should capture. In Dutch, the source of permission or obligation can be realized as a PP introduced by the preposition *van* 'of' (13a–c). The imperative clause in (13d) shows that it is really the modal that licenses the presence of a *van* PP.

(13) a. Jan moet van zijn vader naar huis gaan.
John must of his father to home go
'His father forces John to go home.'
b. Jan mag van zijn vader naar huis gaan.
John may of his father to home go
'His father permits John to go home.'
c. Jan hoeft van mij niet naar huis te gaan.
John needs of me not to home go
'I do not force John to go home.'
d. Ga (*van mij) maar naar huis.
go (of me) just to home
'Just go home.'

Although these modals apparently have a theta-role to assign to the source argument, they are not able to license their case, witness the occurrence of *van* 'of', the same preposition that shows up to license case on arguments of nouns.

The source argument cannot be licensed by modals expressing ability or will:

(14) a. ??Jan kan van mij naar huis gaan.
John can of me to home go
'I allow John to go home.'
b. *Jan wil van mij naar huis gaan.
John wants of me to house go

The status of (14a) is not so clear. The impossibility of a *van* PP with *willen* 'want' in (14b) is presumably due to the fact that the source argument is already

expressed by the subject. Whereas the source of permission and obligation is distinct from the possessor of permission and obligation, the source and possessor of will coincide. This also suggests that the modal auxiliary *willen* is not always a raising verb, a claim which is supported by the minimal pair in (15a, b). In addition, passivization and use as a prenominal modifier is possible with *willen* (15c, d).

(15) a. Jan/*Het wil dat Piet gaat.
John/It wants that Pete goes
'John wants Pete to leave.'
b. Het/*Jan schijnt/kan dat hij gaat.
it/John seems/can that he goes
'It seems/is possible that he is leaving.'
c. Dat wordt door veel mensen gewild.
that is by many people wanted
'Many people want that.'
d. een gewild object
a wanted object

Another intriguing case of PP arguments licensed by modality is found in so-called modal passives. When a PP with *voor* 'for' is combined with a modal passive, the modal passive can have only an ability interpretation. On the other hand, when a PP with *door* 'by' occurs, only an obligation interpretation is available (see 16a, b) (cf. Bennis 1990).

(16) a. een voor Jan op te lossen probleem
a for John up to solve problem
'a problem that can be solved by John'
b. een door Jan op te lossen probleem
a by John up to solve problem
'a problem that must be solved by John'

In addition to raising questions about the relation between argument structure and modality, the modal passive construction in (16) shows that syntactic constructions may yield modal interpretations in the absence of any modal verb. This seems quite generally to be the case cross-linguistically: BE TO INFINITIVE and HAVE TO INFINITIVE combinations have a modal meaning in many languages.

3 The structural position of modals

An alternative way to shed some light on the epistemic–root distinction is to investigate the structural position of modals. It turns out, however, that their position is rather difficult to establish; a simple and universal picture seems

virtually impossible given the empirical facts. At least four types of distinction should be taken into account:

(i) the distinction between modal auxiliaries and modal main verbs;
(ii) the distinction between epistemic and root modality;
(iii) fine-grained distinctions within the class of epistemic interpretations and within the class of root interpretations;
(iv) the distinction between the position where a modal is interpreted and the position where a modal is pronounced.

The evidence currently available strongly suggests that cross-linguistic parameterization involves all four distinctions.

3.1 Different positions for modal auxiliaries and modal main verbs

The distinction between modals behaving like auxiliaries and modals behaving like main verbs has engendered a great deal of discussion. A well-known view is that modals in English are auxiliaries generated in Infl or Aux (cf. Roberts 1985) because they have a defective inflectional paradigm and behave like other auxiliaries in that they can undergo residual V2 and do not trigger DO-support in negative clauses. On this view, modals in languages like German and Dutch are main verbs projecting their own VPs, as their properties are largely (though not completely) identical to those of main verbs.

However, the distribution and properties of modals in Dutch suggest that Dutch modals can be used both as main verbs and as auxiliaries. Evidence that they can be used as main verbs was provided in the previous section. It was shown there that the volition modal *willen* 'want' behaves like a transitive verb when it selects a CP complement. Obligation and permission modals optionally select a PP argument that expresses the source of permission or obligation, but ability and volition modals do not. Non-verbal complements of modals in languages such as Dutch, German, Afrikaans, Frisian, and Norwegian provide a further piece of evidence for the claim that modals can have their own argument structure (see section 4).

The main-verb use of modals can also be distinguished from their use as auxiliaries by looking at inflection. Unlike English modals, Dutch modals have a participial form. When used as a main verb embedded under a perfective auxiliary, the modal occurs as a participle (17a). When used as an auxiliary, the modal appears as an infinitive instead of a participle (17b). This so-called Infinitivus-pro-Participio effect (IPP) is typical for auxiliaries, witness the contrasts in (17c, d) and (17e, f).

(17) a. Jan had dat best gekund/*kunnen.
John had that best could-PCP/can-INF
'John would very well have been able to do that.'

b. Jan had dat best kunnen/*gekund doen.
John had that best can-INF/could-PCP do-INF
'John would very well have been able to do that.'
c. Jan is thuis gebleven/*blijven.
John is home stayed-PCP/stay-INF
'John stayed home.'
d. Jan is blijven/*gebleven werken.
John is keep-INF/kept-PCP work-INF
'John kept on working.'
e. Jan had niet hoeven/*gehoeven te komen.
John had not need-INF/needed-PCP to come
'It was not necessary for John to come.'
f. Jan had gezegd/*zeggen te komen.
John has said-PCP/say-INF to come
'John had said that he would come.'

Facts such as (17a) are a problem for the hypothesis that modals always have a verbal complement which may be a phonologically silent or a lexically empty verb (Vanden Wyngaerd 1994; van Riemsdijk 2002), as this hypothesis predicts the IPP effect to occur in such cases as well. The absence of the IPP effect cannot be ascribed to the fact that the verbal complement is not pronounced, given cases such as (18) where the IPP effect is obligatory despite the absence of an audible verbal complement.

(18) Jan had de kamer mogen/*gemogen maar niet hoeven opruimen.
John had the room may-INF/may-PCP but not need-INF clean
'John was allowed to clean the room but he did not have to do it.'

It therefore seems to be necessary to specify in the lexicon that in languages like Dutch, modals are syntactically ambiguous between main and auxiliary verbs. This does not complicate the grammar in any way, as such specification is independently needed for other verbs. For example, the verbs *beloven* 'promise' and *dreigen* 'threaten' can be used both as main verbs (19a, c) and as epistemic auxiliaries (19b, d). Interestingly, as auxiliaries they do not just lack a participial form, they cannot occur in the perfect tense at all (19a, b).[11] In addition, in its auxiliary use *beloven* 'promise' cannot license an indirect object (19a, b). The possibility to be used as an epistemic auxiliary seems to be idiosyncratic, i.e., there does not seem to be a way to predict that *beloven* 'promise' and *dreigen* 'threaten' can be used as auxiliaries while *zeggen* 'say' en *verraden* 'betray' cannot (19e).

(19) a. Jan heeft (ons) beloofd/*beloven te komen.
John has (us) promised-PCP/promise-INF to come
'John promised (us) to come.'

b. Het belooft/*heeft beloofd/*heeft beloven (*ons) een mooie dag te worden.
it promises/has promised-PCP/has promise-INF (us) a fine day to become
'It promises (*us) to be a fine day.'
c. Jan heeft gedreigd/*dreigen op te stappen.
John has threatened-PCP/threaten-INF to leave
d. Het dreigt/*heeft gedreigd/*heeft dreigen te gaan regenen.
it threatens/has threatened-PCP/has threaten-INF to go rain
'There's a threat of rain.'
e. *Het zegt/verraadt een mooie dag te worden.
it says/betrays a beautiful day to become

To conclude this section, there are two reasons to distinguish main verb and auxiliary modals. The first is the difference between English on the one hand and languages such as Dutch and German on the other. The second is the language-internal behavior of modals in languages like Dutch. In English, the syntactic distribution and behavior of modals patterns with other auxiliaries. In Dutch, modals can both be used as main verbs and as auxiliaries. Since English, German, and Dutch modals are all ambiguous between epistemic and root interpretations, the auxiliary–main verb distinction does not correspond to this ambiguity.

Language internally, the main verb–auxiliary distinction does not correspond to the root–epistemic distinction either. In (20a), the modal is used as a main verb but it has an epistemic interpretation. In (20b), it is used as a main verb with a root interpretation.

(20) a. Dat Jan te laat gekomen is, dat kan haast niet.
that John too late come is, that can almost not
'It is almost impossible that John was too late.'
b. Jan had best naar huis gemogen.
John had best to home may-PCP
'John would have been allowed to go home.'

3.2 Different positions for epistemic and root modals

Although modals across and even within languages may differ with respect to their categorial status, it is clear that this distinction alone does not determine the structural position of modals. A complication is that languages may have two base positions for modals. Picallo (1990) claims that this is the case in Catalan. There is a higher IP position above clausal negation that corresponds to epistemic interpretations, and there is a lower VP position below clausal negation corresponding to root interpretations. Evidence that Catalan has two different base positions for modals, one for epistemic and one for root modals derives, among

other things, from the interpretation of adjacent modals and the interaction of modal interpretations with the position of perfective auxiliaries. According to Picallo, in the Catalan sentence in (21) only the first modal can have an epistemic interpretation.

(21) En Pere due poder tocar el piano. Catalan
the Pere must can play the piano
i. 'It must be the case that Pere is able/allowed to play the piano.'
ii. *'It must be the case that it is possible that Pere would play the piano.'

Although this may be true for Catalan, the restriction does not hold universally, as the Dutch sentence in (22a) (from Barbiers 1995: 194) and the Icelandic sentence in (22b) (from Thráinsson and Vikner 1995: 76) show:

(22) a. Het moet hem nog wel eens willen tegenzitten.
it must him once in a while want against-sit
'It is said that things go against him once in a while.'
b. Það mun vilja rigna meðan þið eruð þar. Icelandic
it will want rain while you are there
'It will tend to rain while you are there.'

There's a more robust generalization that seems to support the idea that epistemic modals are generated higher than root modals, namely the fact that root modals can be embedded under epistemic modals but not vice versa (but see the next section for a different interpretation of these facts). This is illustrated for Catalan in (23) (from Picallo 1990: 294). The modal *deure* 'must' can only have an epistemic interpretation and therefore causes ungrammaticality when embedded under a root modal. The generalization also holds for Dutch (Barbiers 1995: 194), Danish, and Icelandic (Thráinsson and Vikner 1995: 98).

(23) *En Joan pot duere tocar el piano. Catalan
the Joan may must play the piano

Picallo's second piece of evidence involves the interaction between modal and perfective auxiliaries. Perfective auxiliaries in Catalan can precede root modals but not epistemic modals, while both root and epistemic modals can precede perfective auxiliaries (Picallo 1990: 293). This follows if root modals are generated lower than epistemic modals. The restriction also holds for Dutch (Barbiers 1995: 197–198).[12]

(24) a. *En Pere havia degut venir. Catalan
the Pere had must come
b. En Joan ha pogut anar a Banyoles.
'Joan has been allowed to go to Banyoles.'

3.3 Different positions for necessity and possibility modals, and further distinctions

Cormack and Smith (2002) argue that necessity/obligation modals are generated in a position higher than negation and possibility/ability modals in a position lower than negation. This captures the facts in (25).[13]

(25)	a.	Alfred shouldn't eat nuts.	(deontic)
		'It is advisable for Alfred not to eat nuts.'	should > not
		*'It is not the case that it is advisable for A. to eat nuts	*not > should
	b.	Bob shouldn't be late.	(epistemic)
		'It is predictable that Bob will not be late.'	should > not
		*'It is not the case that it is predictable that Bob will be late.'	*not > should
	c.	Edwin can't climb trees.	(deontic)
		*'Edwin is able not to climb trees.'	*can > not
		'It is not the case that Edwin can climb trees.'	not > can
	d.	Jean can't have left.	(epistemic)
		*'It is possible that Jean has not left.'	*can > not
		'It is not the case that it is possible for Jean to have left.'	not > can

Cormack and Smith's analysis has two important consequences. First, since both necessity and possibility modals precede negation at the surface, it must be the case that possibility modals raise across negation at PF. Second, since possibility modals scoping under negation can have an epistemic reading whereas necessity modals scoping over negation can have a root interpretation, there cannot be a syntactic explanation for the cross-linguistic impossibility for root modals to take scope over epistemic modals. Indeed, Cormack and Smith (2002: 155) claim that *root > epistemic is a conceptual constraint. A point in favor of this claim is that modal main verbs in English cannot have root > epistemic scope either.

A culmination of distinctions between modal interpretations and corresponding syntactic positions can be found in Cinque (1999). Cinque proposes the syntactic hierarchy in (26).

(26) $\text{Mod}_{\text{Epistemic}} \ldots > \text{Mod}_{\text{Necessity}} > \text{Mod}_{\text{Possibility}} > \text{Mod}_{\text{Volition}} > \text{Mod}_{\text{Obligation}} > \text{Mod}_{\text{Ability/Permission}}$

It is clear that Cormack and Smith and Cinque agree that necessity modals are higher than possibility modals and that obligation modals are higher than ability modals. Three positions that Cinque adds involve volition modals and a distinction between epistemic and alethic modality. Evidence for the syntactic position of volition modals comes from Italian sentences such as (27a, b) (Cinque 1999: 80), where the only possible scope relations are possibility > volition and volition > ability/permission, respectively.

(27) a. Gianni potrebbe voler uscire. Italian
'John could want to go out.'
b. Gianni vorrebbe poter cantare.
'John would want to be allowed to sing.'

As for the second distinction, alethic modality semantically involves purely logical necessity or possibility, whereas epistemic modality involves speaker's deductions or opinions. Syntactically, epistemic modals are in a position higher than Tense, whereas alethic modals are lower than Tense. As evidence for the first point, Cinque provides, *inter alia*, the Una example in (28a).[14] According to Baker's (1985a) Mirror Principle, if X is a functional head generated higher in the structure than the functional head Y, X will occur in a position peripheral to Y when a complex word is derived by successive cyclic movement of the verb to the respective functional heads. Since *darib* in (28a) is to the right of the future-tense morpheme, it must originate in a higher position. Evidence that alethic modals are lower than Tense comes from the Hawick Scots sentence in (28b) (from Brown 1992). In this sentence *can* is in the scope of the future tense marker *will* and can be interpreted either in the ability or in the possibility sense.

(28) a. Er bin-kwan-de-darib. Una
she go-Fut-3Sg-PROBAB
'She might go.'
b. He will can do it. Hawick Scots

In Cinque's theory, every head in (26) provides a Spec position for a corresponding modal adverb. This predicts that different types of modal adverb observe the same hierarchy as the heads in (26). For evidence, see Cinque (1999: chapter 4).

3.4 Different positions at PF and LF

As we have seen in the preceding section, the position in which a modal is pronounced should be distinguished from the position in which it is interpreted. This can be done in various ways, depending on the set of assumptions adopted. Cormack and Smith (2002) argue that a modal is inserted in the position where it is interpreted, while the position of pronunciation may be different as a result of PF movement. A second possibility is that modals are not generated in the position where they are interpreted, but that they reach their interpretive position by LF-movement.

It is common to assume that modal auxiliaries are quantifiers. Necessity/obligation modals can be shown to involve universal quantification over possible worlds, whereas possibility/ability/permission modals are existential quantifiers over possible worlds. If modals are quantifiers, they should be able to raise at LF. McDowell (1987) argues that this is the case for epistemic modals. Epistemic modals would differ from root modals in that they raise to a clause initial position

at LF where they take scope over the entire proposition. According to McDowell, the incompatibility of epistemic modality with yes/no and *wh*-questions supports this analysis, as the epistemic operator and the *wh* or question operator compete for the same position within COMP. Whereas McDowell's claim may be correct for the incompatibility of epistemic necessity with yes/no questions (cf. 29b), epistemic possibility and yes/no questions are clearly not incompatible; see (29c, d). Moreover, Brennan (1993) shows that epistemic modals occur in *wh*-questions quite freely (see 29e, f).

(29) a. Jan moet wel een moedertaalspreker van het Fins zijn.
John must AFF a native speaker of the Finnish be
'(John speaks Finnish fluently, so) John must be a native speaker of Finnish.'
b. *Moet Jan wel een moedertaalspreker van het Fins zijn?
must John AFF a native speaker of the Finnish be
Intended meaning: 'Is it necessarily true that John is a native speaker of Finnish?'
c. Kan Jan een moedertaalspreker van het Fins zijn?
can John a native speaker of the Finnish be
'Is it possible that he is a native speaker of Finnish?'
d. Could the keys be on John's table? (Brennan 1993)
e. What may he have done?
f. Where must the murder weapon be hidden, in your view?

Butler (2003) is another attempt at capturing the scope of modals in terms of LF-raising. He argues that there are two scope positions for modals, one at the periphery of vP giving rise to root interpretations and one at the periphery of CP giving rise to epistemic interpretations. Both vP and CP are phases, hence propositional, and Butler's proposal thus captures Kratzer's (1977) insight that modals are propositional operators.

As Brennan (1993) shows, the interpretation of symmetric predicates embedded under a modal supports the claim that epistemic modals are in a higher position at LF than root modals. Brennan's example of a symmetric predicate is given in (30). The predicate is symmetric because (30a) implies (30b) and vice versa. When embedded under an epistemic modal, symmetry is retained (30c). When embedded under a root modal, symmetry is destroyed. This follows if only root modals are low enough to establish a relation between the subject and the embedded predicate.

(30) a. The governor shook hands with all the prisoners.
b. All the prisoners shook hands with the governor.
c. The governor may shake hands with all the prisoners. Epistemic
'It is possible that the governor will shake hands with all the prisoners.'
'It is possible that all the prisoners will shake hands with the governor.'
d. The governor may shake hands with all the prisoners. Root
'The governor is allowed to shake hands with all the prisoners.'
≠ 'All the prisoners are allowed to shake hands with the governor.'

The scopal interaction between modals and other quantifiers could be taken to provide further evidence for the higher position of epistemic modals at LF (von Fintel and Iatridou 2003). Whereas quantifiers show scope ambiguities with root modals (31a), they do not show such ambiguities with epistemic modals (31b, c).

(31) a. Most of our students must get outside funding –
   i. for the department budget to work out. must > most
   ii. the others have already been given university fellowships. most > must
   b. #Every student is the tallest person in the department.
   c. #Every student may be the tallest person in the department.
   i. every student x (may x be the tallest)
   ii. may (every student be the tallest)

The first interpretation of (31c) would make sense but is not available; the second interpretation does not make sense but is available. This shows that a quantified subject cannot raise over an epistemic modal whereas it can raise over a root modal. These facts would follow if the position of epistemic modals at LF is higher than the position to which the quantifier raises. However, von Fintel and Iatridou argue that this is not the right analysis, since even low possibility modals do not allow a quantifier to take wide scope. They conclude that a quantifier cannot bind its trace across an epistemic modal at LF.

4 The complement of modals

The syntactic representation of the epistemic–root distinction can also be studied from the perspective of the modal's complement. Relatively little attention has been paid in the literature to the influence of the modal's complement on modal interpretation. This section provides an overview.

4.1 Non-disambiguating complements

At first sight it might seem plausible to expect that modals with a root interpretation require verbs assigning an agent role as their complements. An agent may seem to be necessary to carry the permission, obligation, ability, or will to perform the action denoted by the embedded verb. Passive, unaccusative, stative complements and complements with a perfect might then be expected to force epistemic interpretations. In passives, the agent role is demoted, in unaccusatives there is no agent role, stative verbs denote a state of affairs, not an action that can be performed by an agent, and in perfectives the event denoted by the verb has already been completed. However, these types of complement all allow root interpretations:

(32) a. This room must be cleaned immediately. Passive
'You must clean this room immediately'
b. Je mag niet weglopen. Unaccusative
you may not away-walk
'You're not allowed to walk away.'
c. You must know the answer before five o'clock. Stative
'You're required to know the answer before five o'clock.'
d. You must have cleaned your room before five o'clock. Perfective
'You're obliged to have cleaned your room before five o'clock.'

4.2 Complements that force an epistemic interpretation

Complements denoting a state or event that cannot change (anymore) force an epistemic interpretation (Barbiers 1995, 2002). There are two types of complement for which this is the case:

(33) a. Stative complements which contain an individual-level predicate, provided that the subject has fixed reference.[15]
b. Perfect complements, but only if the completion stage of the event has taken place in the past.

An example of both cases is given in (34):

(34) a. John must be a native speaker of Finnish.
#'John has the obligation to be a native speaker of Finnish.'
b. They must have cleaned this room yesterday.
#'They must have had the obligation to clean this room yesterday.'

These two observations do not seem to have any consequences for the syntactic analysis of modal ambiguity, as disambiguation is the result of semantic properties of the complements. Nevertheless, the two types of complement in (34) are useful diagnostics to establish whether an epistemic interpretation is possible in a certain construction. An anonymous reviewer correctly points out that this test is not watertight, however. If an *if*-clause is added to sentences like (34), root interpretations are available (35).

(35) a. John must be a native speaker of Finnish if he wants to apply for the position.
b. They must have cleaned this room yesterday if they want to go to the zoo today.

4.3 Complements that force root interpretations

For an epistemic interpretation to be available, it is necessary that the complement contain an infinitival verb. This can be seen in languages in which modals

allow non-verbal complements, such as Dutch. Such constructions can have only root interpretations, as the examples in (36) show (from Barbiers 1995: 153).

(36) a. Jan mag (dan) weggaan (hij zal ooit terugkeren).
John may (then) away-go (he will once return)
i. 'John has permission to leave.
ii. 'It may be true that John is leaving (but some day he will return).'
b. Jan mag (dan) weg (hij zal ooit terugkeren).
John may (then) away (he will once return)
i. 'John has permission to leave.'
ii. *'It may be true that John is leaving (but some day he will return).'

As was noted in section 3, the claim that such constructions involve non-verbal complements is controversial. Vanden Wyngaerd (1994) proposes that they involve PF deletion of an infinitival verb. Van Riemsdijk (2002) argues that the lexicons of languages that allow 'non-verbal complements' contain empty verbs that are licensed by modals. While there is good evidence that this claim is correct for Swiss German, the impossibility of an epistemic interpretation in cases like (36b) is a strong argument against an empty verb analysis for Dutch. For more arguments, cf. Barbiers (1995, 2002).

5 Conclusion

In the past forty years, generative syntactic research on modal auxiliaries has focussed on the syntactic correlate of the semantic epistemic–root distinction. The original idea that epistemic modals are monadic predicates while root modals are dyadic has proved to be too simple, as monadic instances of root modals have been shown to exist as well. The influential analysis that takes epistemic modals to be raising predicates and root modals to be control predicates has turned out to be problematic too, given that monadic root modals behave like raising predicates on a number of tests. In current analyses, the leading idea is that epistemic modals are interpreted in a position higher in the clause than root modals. So far, it appears that there is not any conclusive evidence to decide whether this higher position is the result of base generation or LF-movement. Recent research also suggests that finer positional distinctions are necessary, such as a distinction between necessity and possibility modals, obligation and ability/permission modals, alethic and epistemic modals. Issues for future research include cross-linguistic parameterization, such as the difference between main verb and auxiliary modals, and the question why the epistemic–root ambiguity occurs only with modal auxiliaries, not with modal adverbs.[16]

NOTES

I thank Werner Abraham, Frits Beukema, Wim van der Wurff, and an anonymous reviewer for useful comments on previous versions of this chapter. All remaining errors are mine.

1 Caps indicate English modals and their equivalents in other languages.
2 I use an underlying object different from the one in (4d) to avoid complications caused by the fact that BE is also the perfect auxiliary of the passive in Dutch.
3 Note that this is true at the observational level. The theory-internal hypothesis that PRO cannot occur in governed positions is irrelevant for the problem under discussion.
4 See Barbiers (1995, 2002) for arguments that this construction does not involve ellipsis; see van Riemsdijk (2002) for the opposite view; see also sections 3.1 and 4.
5 The verb in the complement can be passivized if it has an external argument. The point at issue here is that the modal verb itself cannot be passivized.
5 The construction can also be found in Afrikaans, German, Norwegian, Yiddish, and West-Frisian.
6 An indication that modal auxiliaries are stative is the fact that they cannot occur in the progressive (i), like other stative verbs (ii), but unlike dynamic verbs (iii).

(i) *Jan is aan het kunnen schaatsen.
John is to the can-INF skating
#'John is being able to skate.'

(ii) *Jan is het antwoord aan het kennen
John is the answer to the knowing

(iii) Jan is aan het schaatsen.
John is to the skating
'John is skating.'

7 In Danish, root modals do not seem to allow non-arguments such as expletives, weather IT and idiom chunks as their subjects. Nevertheless, Thráinsson and Vikner (1995: 63–66) claim that in Danish both root and epistemic modals involve raising structures. They account for the impossiblity of non-arguments as subjects of root modals by assuming that root but not epistemic modals assign an 'additional' theta-role to the surface subject. This 'additional' theta role is subject to an 'additional' theta criterion that precludes the assignment of more than one additional role to an argument. This explains why embedded predicates that assign an additional theta role as well, such as BECOME and GET block the root interpretations. According to Thráinsson and Vikner, in Icelandic the epistemic–root distinction does straightforwardly correspond to raising and control structures. A less attractive aspect of this analysis is that it assumes different mechanisms for theta role assignment, and cross-linguistic parameterization of the availability of additional theta-role assignment.
8 Examples in (11) from Wurmbrand and Bobaljik (1999).
9 The construction can also be found in Afrikaans, German, Norwegian, Yiddish, and West-Frisian.

10 Example from Wurmbrand and Bobaljik. Pragmatic context is provided to favor the wide-scope reading of the modal.
11 I owe this observation to Gertjan Postma.
12 Barbiers (1995) follows Picallo's assumption that epistemic modals are generated in a higher position than root modals, but develops an analysis on the basis of a split-VP-hypothesis, in which what is usually taken to be little v is identified as a D-head. According to this analysis, root modals are generated below D and epistemic modals, on top of DP. The restrictions on double modals and the interaction between perfective auxiliaries and modal interpretation follow straightforwardly from this analysis. It is further shown that there are a number of parallels between modals with a nominal DP-complement and modals with a verbal DP-complement.
13 Importantly, Cormack and Smith distinguish three types of negation: echoic, polarity, and adverbial (i.e., VP) negation. The observations in (25) all involve scope relative to polarity negation.
14 Una is an Irian Jaya language; the example is from Louwerse (1988).
15 Names are DPs with fixed reference. In the unmarked case, the referent of a name is constant across time and across different possible worlds (but see section 4.4 for irrealis contexts).
16 I owe the latter question to an anonymous reviewer.

4.3.1 Quantitative clitics as PPs
4.3.2 Quantitative clitics as DPs
4.3.3 Quantitative clitics as NPs
4.4 Quantitative *er* in Dutch
5 Conclusion

1 Introduction

Quantifiers and other expressions of quantity can appear in a wide range of different constructions. In this case, we focus on constructions containing existential quantifiers, namely, cardinals and so-called 'vague numerals' such as *many, few,* and *some*, because they are the ones that appear with quantitative clitic pronouns (such as French *en*). Other quantifiers, such as universal *all* and *both*, and distributive *every* and *each*, are treated only when relevant to the discussion. Other quantity expressions including semi-lexical elements such as *lot* in *a lot of people*, measure nouns such as *bottle* in *a bottle of wine*, and the like also co-occur with quantitative clitic pronouns but are not treated here for reasons of space.[1]

The problems raised by constructions containing a quantifier are of different natures. We cluster them into three main issues: the headedness of the quantified phrase, the status of the partitive PP often co-occurring with it, and the analysis of clitic pronouns such as French *en*, Italian *ne*, Dutch *er*, and Czech *jich*, which can bind (part of) a quantitative phrase.

Since quantified phrases constitute a special kind of noun phrase, it is important to establish whether they are noun phrases in the technical sense (DPs in current terms) or the projection of a different category. In this respect it must be decided whether the quantifier in all or some of the constructions in (1) is a modifier of the following noun or whether it is the head of the construction:

(1) a. three/many boys
b. all/both boys
c. some boys
d. each boy

If we insert a 'determiner', such as an article, a demonstrative, or a possessive in (1), we obtain different results with different quantifiers, as shown in (2–5):

(2) a. the/these/his three boys
b. *three the/these/his boys
a′. the/these/his many boys
b′. *many the/these/his boys

(3) a. *the/*these/*his all boys
b. all the/these/his boys
a′. *the/*these/*his both boys
b′. both (*the)/these/his boys

(4) a. *the/*these/*his some boys
b. *some the/these/his boys

(5) a. *the/*these/*his each boy
b. *each these/his boys

From the results in (2–5), we could roughly divide quantifiers into three groups: (i) quantifiers that can be preceded but not followed by a determiner, such as *three* and *many* in (2); (ii) quantifiers that can or must be followed by a determiner, such as *all* and *both* in (3); and (iii) quantifiers that can never co-occur with any determiner, such as *some* in (4) and *each* in (5).

The basic question is whether it is more correct to unify the structural positions in which one and the same quantity expression can appear in (1) and (2–5) and try to derive the different word orders arising in the presence of a determiner, from different properties of each quantifier, or whether it is more correct to propose that the quantity expressions in (1) are in one and the same structural position while they occupy different positions in (2–5). This latter option would have the result that lexical items, such as *three* and *many* in (1a) and (2a, a'), would be analyzed as occurring in different structural positions, while (1b) could be unified with (3b, b').

Quantifiers can also co-occur with a 'partitive PP' introduced by *of*:

(6) a. three/many of the boys
b. all/both of the boys
c. some of the boys
d. each of the boys

In the late 1960s and 1970s, the debate was primarily concerned with the question as to whether constructions such as those in (1) and (6) are derived from one and the same structure or not. In the early 1980s, the research on the functional structure of noun phrases re-opened a number of issues in this field of inquiry.

The third question concerns the nature of the clitic pronouns found in co-occurrence with certain quantifiers in Romance (French, Italian, Catalan), Germanic (Dutch), and Slavic (Czech, Slovak, Serbian–Croatian, etc.). Here, the main problem is to establish whether the source of (7a) is (7b) or (7c), in other words, whether the 'quantitative clitic' *en* in (7a) resumes the indefinite noun *garçons* in (7b), the partitive PP *de ces garçons* in (7c), or even a different constituent.

(7) a. J' en ai vu deux.
I EN have seen two
b. J' ai vu deux garçons.
I have seen two boys
c. J' ai vu deux de ces garçons.
I have seen two of these boys

This chapter is organized as follows. In section 2 we see the different logical options that arise in relation to the internal structure of quantified phrases and how it has been addressed in the literature. Section 3 presents a development of

the proposal presented in Cardinaletti and Giusti (1992). In section 4 we turn to quantitative clitics.

2 The structure of quantified constructions

Among the many issues that arise on the structure of the noun phrases in (1–6), we first want to address some questions related to the categorial status of quantified phrases. The literature on this has often treated the questions in (8) as tightly related to each other:

(8) a. What is the head of a nominal construction containing a quantifier such as those in (1–6)?
b. What is the categorial status and the structural position of the quantifier in each of (1–6)?
c. Is there a difference in categorial status and/or structural position between
i a quantifier that is neither preceded nor followed by a determiner as in (1);
ii a quantifier preceded by a determiner as in (2a, a');
iii. a quantifier followed by a determiner as in (3b, b')?
d. Is there a syntactic relation between (1) and (6), and if so of what kind?

We show that while (8a) and (8b) are conceptually related, (8c) and (8d) are independent from the others.

In principle, question (8a) has two possible answers, namely, those in (9):

(9) a. The head of the quantified noun phrase is the noun.
b. The head of the quantified noun phrase is the quantifier.

The literature up to the late 1980s did not distinguish between lexical and functional categories. In that framework, the quantity expression is taken to be either a modifier of the noun (determiner or adjective) or something external to the noun phrase (namely, a full noun phrase itself). In sections 2.1–2.2 we review the major issues in the literature of the 1970s and 1980s.

In the last decade, the discussion on the lexical–functional distinction opens up a new way of looking at the matter, so that question (8b), concerning the categorial status of quantifiers, enters into play. In this perspective, (9b) divides into the two possibilities in (10):

(10) a. The quantifier is a functional head of the noun phrase.
b. The quantifier is an autonomous lexical head embedding the noun phrase.

In other words, it is logically possible both that the quantifier is a functional head and that it is a lexical head embedding the noun phrase as its complement. This issue is discussed in sections 2.3 and 3.

Quite independently of its head or maximal status, the question arises as to the merging point of the quantifier. In this respect three alternatives arise:

(11) a. The quantifier is merged higher than D.
b. The quantifier is merged lower than D.
c. The quantifier is merged in D.

In sections 2.3 and 3 we show that there is no simple answer to (8c) and that the word orders arising with the combination of quantifiers and determiners are epiphenomenal and must be explained by the independent interaction of general UG properties with the categorial status that each language assigns to lexical items expressing quantity. None of the choices in (9–11) entails a straightforward answer for (8c), which must be treated separately, although interacting with one of the two lines of analysis proposed above. Here the possibilities grow exponentially, and it would be puzzling to consider them in detail here. Every proposal that we consider in this chapter treats this question one way or the other. Finally, any of the choices above can interact with the three possible answers to question (8d) given in (12):

(12) a. The *of* PP in (6) has the same status as the bare noun appearing with the same quantifiers in (1).
b. Both the *of* PP in (6) and the bare noun in (1) can appear with the quantifier and are inserted at different merging points.
c. Both the *of* PP in (6) and the bare noun in (1) can appear with the quantifier and are in complementary distribution.

The question in (8d) has been the focus of the literature in the 1970s. Unfortunately, the in-depth insights that this literature had reached by the end of that decade has been neglected by the subsequent work, which often made unmotivated assumptions on this issue.

In the course of the last four decades of studies in generative grammar, almost all the possibilities mentioned in (8–12) have been explored. We present some of what we consider the most significant proposals on these issues chronologically, highlighting the empirical advantages and drawbacks of each in turn. In section 2.1 we consider proposals formulated in the Extended Standard Theory (EST). In section 2.2 we briefly observe the advance of the theory in the GB framework. In section 2.3 we present some proposals that are formulated in the more recent framework of the functional structure of noun phrases.

2.1 EST proposals

In the 1960s and 1970s, phrase-structure rules did not distinguish between adjectives and so-called 'determiners' such as demonstratives and quantifiers. All of them were considered maximal elements in Specifier positions, adjoined to N^n levels according to the linear order in which they appear in expressions.

The first proposals about the syntax of quantified noun phrases address the question whether it is possible to derive simple quantified noun phrases such as those in (1) and quantified noun phrases containing a partitive PP such as (6) from one and the same deep structure. Jackendoff (1968) motivates the generally

held hypothesis that there is a common deep structure for (1) and (6), later found as granted in Chomsky (1970: 200). Following later work by Selkirk (1977), we call this line of reasoning the Hidden Partitive Hypothesis (HPH). A decade later, this hypothesis is successfully challenged by Selkirk (1977) and clearly abandoned by Jackendoff (1977) himself in favor of the Simple Noun Phrase Hypothesis (SH). At the same time, Milner (1978b) dedicates an in-depth study to these constructions in French. The properties of French, in particular the partitive article *des*, which can occur in the absence of a quantity expression, and the quantitative clitic *en*, allow him to give motivated answers to most of the questions mentioned in (8–12). For reasons of space, we are able to reproduce only very few of Milner's arguments on these issues, and refer the interested reader to his monograph.

2.1.1 The Hidden Partitive Hypothesis (HPH)

The main aim of Jackendoff (1968) is to offer an alternative to previous proposals according to which quantified noun phrases derive from quite different deep structures. One proposal, attributed by Jackendoff to Chomsky, elaborated by Partee (1962), and given without discussion in Chomsky (1970: 200), considered *some of the* as a structured Det, thereby losing the constituency of the PP *of the men*. A second proposal, attributed by Jackendoff to Postal and elaborated by Dean (1966), derived *some of the men* from a complex NP *some men of the men* with deletion of the first instance of *men*. (We turn to a similar proposal in section 3.) A third proposal, elaborated in the framework of generative semantics by Lakoff (1965) and Carden (1967), considered the construction as derived from a relative clause whose predicate was the quantifier.

Jackendoff (1968) divides quantity expressions into three groups. Group I contains nouns expressing quantity, such as *a group*, *a herd*, and *a wagonload*; group II contains quantifiers such as *some*, *each*, *few*, *all*, *both*, and also *which*; group III includes only cardinals and so-called (vague) numerals such as *a few*, *many*, *one*, and *three*. The three groups have in common that the partitive PP co-occurring with the quantity expression must contain a mass or a plural noun phrase (13), and that it cannot be quantified itself (14):

(13) a. *a group of the man
b. *each of the garbage can
c. *three of the book

(14) a. *a group of some men
b. *some of all the men
c. *one of few of the beetles

Jackendoff further points out that the quantity expressions in groups I and III can be preceded by an article (15a, c), while those in group II cannot (15b), and notices a restriction on definite articles that can only appear once in the construction, unless the noun phrase embedded in the PP contains a relative clause (16–17):

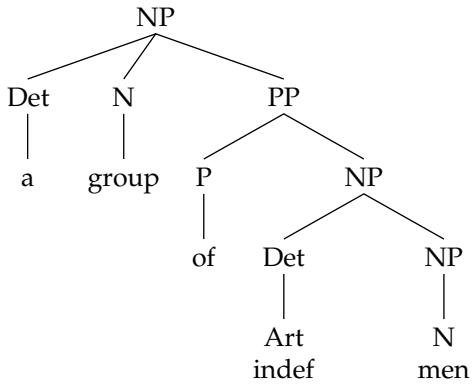
(15) a. the group(s) of men
b. *the some men
c. the three men

(16) a. the group of men
b. a group of the men
c. *the group of the men
d. the group of the men that had already left

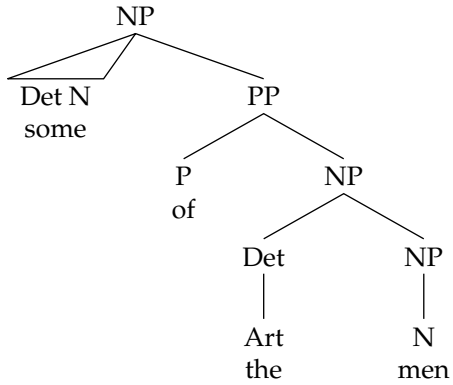
(17) a. the three men
b. three of the men
c. *the three of the men
d. the three of the men you met yesterday

The structural analysis in (18–20) captures the similarities among the three groups by assuming nominal status for all three kinds of quantity expression. The differences between group I (18) and group III (20), on the one hand, and group II (19), on the other hand, is captured by proposing that group II quantifiers are Det and N at the same time, since they do not co-occur with articles and, at the same time, entertain a grammatical relation with the following PP.

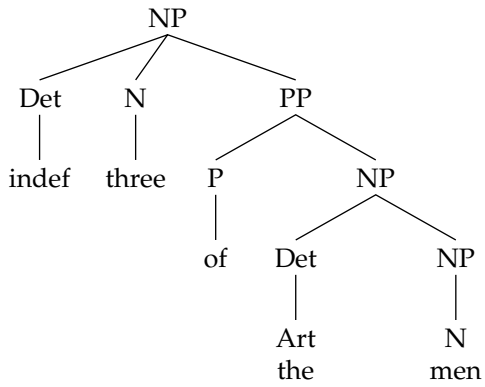
(18)



(19)



(20)



Supporting evidence for the N-status of group I quantifiers in (18) is that they are also used as common nouns. The N-status is extended to group III quantifiers in (20) without much motivation. The fact that group III quantifiers do not co-occur with adjectives (cf. **the good three of the men*) is not considered counter-evidence for their N-status since even group I nouns do not occur with adjectives in their quantifying use:

(21) a. a big group of men comes/*come every day
b. a group of men comes/come every day

In (21a) the quantity noun *group* is modified by an adjective. In this case the only possibility for it is to function as a regular N with a complement (*of men*), triggering singular agreement on the verb. If a noun like *group* is not modified by an adjective, as in (21b), it can either function as a regular noun, as in (21a), or be considered a quantity expression. In this latter case, agreement on the verb is triggered by the plural noun *men*, which in this case is the head of the construction. Finally, Jackendoff (1968: 428) proposes an *of*-deletion transformation for groups II and III in order to attribute structures (19–20) also to the cases where no overt preposition appears, as in *some men* and *three men*. This transformation does not apply to group I.

2.1.2 The Simple Noun Phrase Hypothesis (SH)

Selkirk (1977) shows that simple quantified constructions and those embedding a partitive phrase are different and that the latter cannot be transformationally derived from the former. She argues in favor of what she calls the Simple Noun Phrase Hypothesis (SH), according to which the two phrases have a different structure. The SH but not the HPH can account for a large number of facts that are reviewed in section 3. The strongest argument in favor of the SH is the different result of PP extraposition in (22):

(22) a. Two reviews have been reprinted of Helen's first symphony.
b. *Two of those reviews have been reprinted of Helen's first symphony.
c. Those reviews have been reprinted of Helen's first symphony.

The reason for the ungrammaticality of (22b) should not be directly attributed to the definiteness of the noun phrase since (22c) is perfectly acceptable, but to a violation of the cycle. The cycle appears not to be violated in (22a). This, according to Selkirk, suggests that the noun phrase in (23b), parallel to (22b), is structurally more complex than the one in (23a), parallel to (22a).

(23) a. Two reviews of Helen's first symphony have been reprinted.
b. Two of those reviews of Helen's first symphony have been reprinted.

A similar argument is given for French by Milner (1978b: 71). While extraction out of the partitive PP is ungrammatical in (24), extraction out of the constituent that follows the quantifier in (25) is possible. This implies that the XP in (25) cannot be the PP that we find in (24). Notice that this also holds of (25b) in spite of the presence of the preposition *de* (see section 3.3.3).

(24) *C'est de Zola que j'ai lu [deux [$_{PP}$ des livres [$_{PP}$ t]]].
it is of Zola that I have read two of-the books

(25) a. C'est de Zola que j'ai lu [deux [$_{XP}$ livres [$_{PP}$ t]]].
it is of Zola that I have read two books
b. C'est de Zola que j'ai lu [beaucoup [$_{XP}$ de livres [$_{PP}$ t]]].
it is of Zola that I have read many of books

The conclusion that the quantitative phrase (namely the noun (phrase) immediately following the quantifier) is different from the partitive phrase is confirmed by the fact that they cannot be coordinated, as shown in (26).

(26) a. J'ai reçu beaucoup de voisins et d' amis.
I have received many of neighbors and of friends
b. J'ai reçu beaucoup de mes voisins et de mes amis.
I have received many of my neighbors and of my friends
c. *J'ai reçu beaucoup de mes voisins et d' amis

Milner (1978b: 81ff.) suggests that the quantitative phrase is an N', while the partitive phrase is a N". This is also shown by the fact that personal pronouns, which are certainly full nominal phrases (of category N" in terms of the theory of the time), can appear only as partitive phrases and not as quantitative phrases:

(27) un de nous/vous/eux
one of us/you/them

A further argument against the HPH is discussed in Belletti (1979: 1546). The two sentences in (28) have different semantic properties:

(28) a. Ho letto cinque libri che mi avevi prestato.
b. Ho letto cinque dei libri che mi avevi prestato.
have.1Sg read five (of the) books that to-me had.2Sg lent

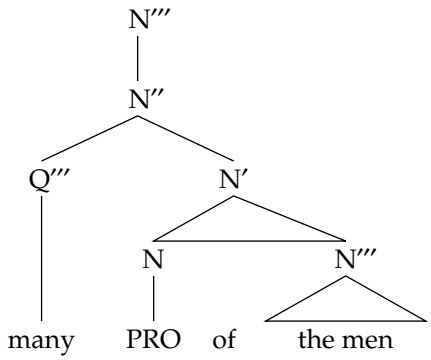
In (28a), the books that have been read are five and coincide with the books that have been lent. In (28b) the books that have been read are a subset of the books that have been lent, which are presupposed to be more than five.

2.1.3 The first element of the partitive construction

In EST terms it is straightforward to consider the quantifier as an article in the quantified construction. If the two constructions in (1) and (6) do not have a common deep structure, the status of the first part of the partitive construction remains open.

Jackendoff (1977: 110ff.) adopts the SH and introduces a PRO in the partitive construction, as shown in (29).

(29)



Milner (1978b: 83ff.) provides the following arguments to analyze the first part of the partitive construction (the quantifier *many* in *many of the men* or the constituent *many men* in *many men of those* . . .) as a full noun phrase (N″). In French it has the form of a pronoun, not of a determiner, in the pairs *quelque/quelques-uns* ('some') and *chaque/chacun* ('each'). The same is true in Italian, as shown in (30b):

(30) a. ogni/qualche ragazzo vs. *ognun/*qualcun ragazzo
each/some boy
b. *ogni/*qualche di loro vs. ognuno/qualcuno di loro
each/some of them

In certain contexts, the N″ is explicit, as in (31):

(31) [$_{N''}$ Quatre peintures] de celles qui avaient été volées ont été
four pictures of those that-Agr had been stolen have been
retrouvées.
recovered

The first element can be the pronoun *celui*, or the interrogative *lequel*, as in (32):

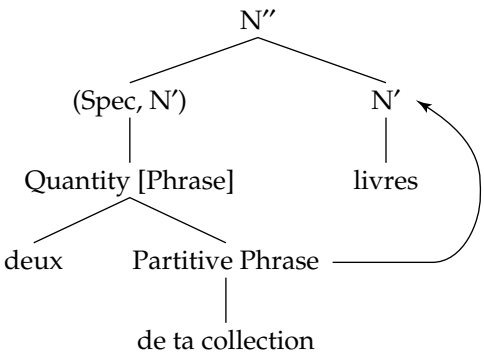
(32) a. Celui des livres de Zola que j'ai lu.
the one of-the books of Zola that I have read
b. Lequel de ces livres avez-vous lu?
which of these books have you read?

The quantitative clitic *en* can co-occur with a partitive phrase, as in (33):

(33) a. J'en ai pris un kilo de celles-ci.
b. J'en ai pris dix de celles-ci.
c. J'en ai pris beaucoup de celles-ci.
I EN have taken a kilo/ten/many of these

Structure (34), proposed by Milner (1978b: 124, ex. 3.11), captures the different nature of the quantitative and the partitive complements of a quantity expression, the fact that both are in a selectional relation to it, and the fact that they can co-occur (on this also see section 3). A right-adjunction movement adjoins the Partitive Phrase to N′ to derive the correct word order. In (34), the Partitive Phrase is realized by a collective noun phrase, but the analysis is explicitly extended to the classical quantitative and partitive noun phrases discussed in (31–33).

(34)



The crucial difference between (29) and (34) is that in the former the partitive is base-generated under N′ as a complement of N, while in the latter this position is derived by rightward movement which adjoins the complement of the quantifier under N′. In our proposal, presented in section 3, we keep the relationship between Q and the partitive PP while doing away with rightward adjunction.

2.2 GB proposals

Government-and-Binding approaches are driven by the search for general principles of UG that constrain movement of constituents and the occurrence of anaphoric elements. Phrase-structure issues are no longer crucial in this period and remain in the background. In this perspective, the syntax of quantitative and partitive constructions in French, Italian, and Dutch becomes a focus of general interest due to the fact that these languages display a quantitative clitic pronoun that clearly is a subpart of the phrase. As a consequence, these languages show how the extraction of the partitive clitic is constrained by the general principles of Government and Binding giving rise to crucial asymmetries (cf. Belletti and Rizzi 1981; Burzio 1986). The core cases are given in (35–37), from Belletti and Rizzi (1981):

(35) a. Tre settimane passano rapidamente.
three weeks elapse rapidly
b. *Tre ne passano rapidamente.
three NE elapse rapidly
c. Tre [*e*] passano rapidamente.
three elapse rapidly

(36) a. Gianni trascorrerà tre settimane a Milano.
Gianni will spend three weeks in Milan
b. Gianni ne trascorrerà tre a Milano.
Gianni NE will spend three in Milan
c. *Gianni trascorrerà tre [*e*] a Milano.
Gianni will spend three in Milan

(37) a. Gianni è rimasto tre settimane a Milano.
Gianni remained three weeks in Milan
b. *Gianni ne è rimasto tre a Milano.
Gianni NE remained three in Milan
c. *Gianni è rimasto tre [*e*] a Milano.
Gianni remained three in Milan

The examples in (35) shows that extraction of *ne* is impossible from a preverbal subject; an empty category is found instead. In (36) *ne* is obligatory if it binds an empty category in object position. The selected direct object in (36) contrasts with the adverbial phrase in (37).

The [e] ~*ne* alternation given in (35–37) is captured by Belletti and Rizzi (1981) by means of general requirements of proper binding (cf. the Proper Binding Condition proposed by Fiengo 1974). In the case of subjects, *ne* does not c-command its trace, hence the ungrammaticality of (35b). In the case of objects, *ne* c-commands its trace, hence the grammaticality of (36b). In the case of adjuncts, *ne* extraction causes a subjacency violation, hence the ungrammaticality of (37b). As for the distribution of the null category inside the quantified noun phrase,

Belletti and Rizzi take it to be PRO (as originally proposed in Kayne 1979: Appendix): PRO is allowed in subject position (35c), but forbidden in object and in adjunct position, where it is governed by the verb, (36c) and (37c).[2]

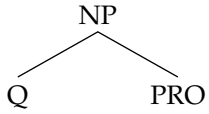
This analysis is supported by data from Czech, where the genitive clitic *jich* can be extracted from both subjects and objects (Toman 1986: 131).

(38) a. Tehdy jich nêpolik podepsalo ten dopis. Czech
then of-them some have signed that letter
b. Tehdy jich Petr nalezl pêt.
then of-them Petr found five

Czech is a language with second-position clitic pronouns. According to current analyses, the clitic position is higher than the subject position. This means that a clitic pronoun c-commands its trace even when it is extracted out of a subject.

The internal structure assumed by Belletti and Rizzi (1981) for quantified phrases is (39). However, nothing of their proposal hinges on it. The categorial status of PRO in (39) is not explicitly stated. It is clear from the discussion that it is an N′ (see section 4.1 for further discussion). According to Rizzi (1979), the phonosyntactic processes that rule the occurrence of the competing forms *un/uno* in (40) can be derived from the presence of an empty category immediately following *uno*:

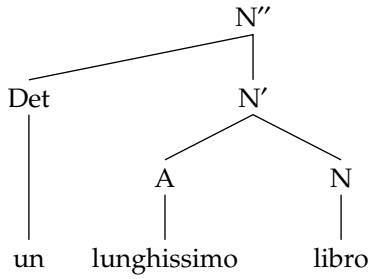
(39)



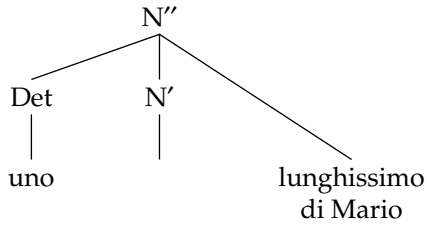
(40) a. un(*o) lunghissimo libro
b. un(*o) libro lunghissimo
a book very-long
c. un*(o) lunghissimo
'a very long one'

Rizzi proposes a different level of attachment for prenominal and postnominal adjectives: The former are attached to N′, and trigger truncation (41a), while the latter are attached to N″ and cannot trigger truncation (41b). The same structure applies for the possessive phrase *di Mario* ('of Mario') in (41b):

(41) a.



b.



Rizzi does not address the issue of the position of a partitive phrase in this construction. However, we may suppose that, since it triggers the same effect as a possessive phrase (cf. *uno/*un di quei ragazzi* 'one of those boys'), it is attached to N″ and not to N′, contrary to Jackendoff's (1977) structure (29) and Milner's (1978b) structure (34). We will turn to the categorial status of the empty category bound by *ne* in section 4.

2.3 *The functional structure of quantified noun phrases*

At the end of the 1980s, the study of the internal structure of noun phrases became a focus of research based on a wider set of languages, including Hungarian (Szabolcsi 1987), Hebrew (Ritter 1988), and Romanian (Grosu 1988). The major topic of this research is the investigation of functional heads inside the noun phrase, which is parallel in many crucial respects to the structure of the sentence. A related trend of research follows Cinque (1994, already circulating in 1990), in taking adnominal adjectives to fill functional specifiers in the noun phrase structure. Both issues are central to the internal structure of quantitative and partitive phrases, since in the approaches reviewed earlier, the distinction between determiners and adjectives was not clear, and quantifiers were considered as part of this large class of prenominal modifiers.

Due to the theoretical and chronological gap between EST and post-GB proposals, most of this literature is negligent of the results arrived at in the 1960s and 1970s on the structure of quantitative and partitive phrases, and many questions are reconsidered without building on the knowledge arrived at in the EST studies.

2.3.1 *The DP Hypothesis*

Abney (1987: 271) places quantifiers in D, i.e., in a head position. In order to derive their co-occurrence with possessors in Hungarian (42) (see also Szabolcsi 1987) and their (almost) complementary distribution with possessors in English (43), Abney proposes the constraint in (44), which applies to English, but not to Hungarian:

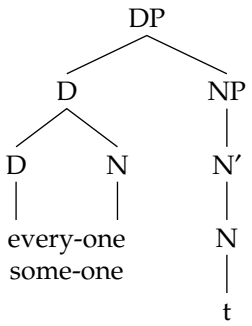
(42) a. Peter minden kalapja
b. Peter ezen/azon kalapja
c. Peter valamennyi kalapja
d. Peter mindket kalapja
e. Peter semelyik kalapja

(43) a. John's every wish
b. *John's this/that wish
c. *John's each wish
d. *John's both wishes
e. *John's neither wish

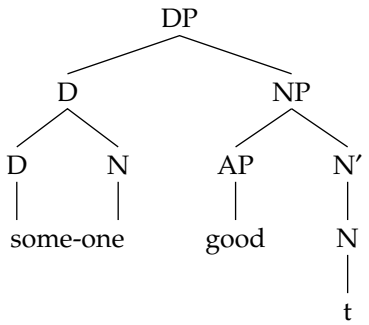
(44) Agr in D does not co-occur with lexical determiners.

One further piece of evidence in favor of the common position of D and Q in one and the same head is the possibility of N-to-D movement which adjoins a noun such as *one* to a Q such as *every* or *some* in (45a) (Abney's 1987: 286, ex. 309b), and the relative position of the AP in (45b) (Abney's 1987: 287, ex. 312), which would otherwise be mysterious in English (cf. *some good guy*, where the adjective precedes the noun). Structure (45) is intended to account for *everything* and *something* as well, and to parallel data in other languages.

(45) a.



b.



However, the analysis in (45) cannot account for parallel Italian data. According to Cinque (1994), in Italian a common noun such as *cosa* in (46a) often moves across an adjective to an intermediate functional head. This movement leaves the adjective unaffected. Incorporation of the noun *cosa* into the quantifier *qualche* as in (46b), however, not only changes the gender features on the whole construction, but also triggers what appears to be an overt marking of partitive Case on the adjective, namely the preposition *di* (also see section 3.4).

(46) a. una cosa buona
a thing good.Fem
'a good thing'
b. qualcosa di buono
something of good.Masc
'something good'

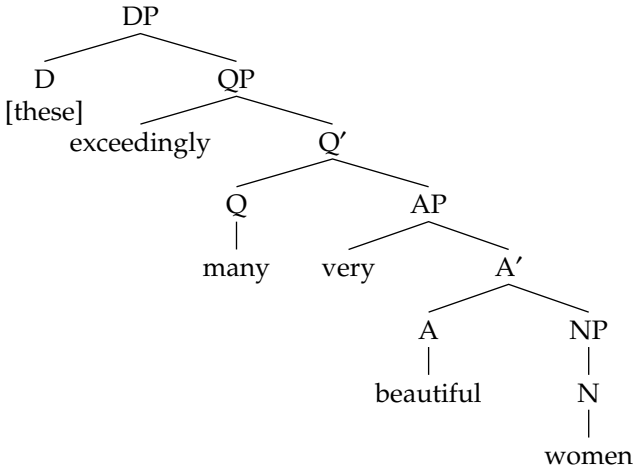
Furthermore, only predicative adjectives can appear in this construction, as shown by the ungrammaticality of (47a). This is not expected in an analysis like (45):

(47) a. *qualcosa di mero/principale / *Questa cosa è mera/principale.
something of mere/main this thing is mere/main
b. qualcosa di buono / Questa cosa è buona.
something of good this thing is good

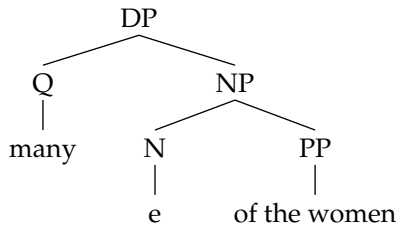
The Italian examples and their English glosses suggest that pronominal quantifiers occurring with predicative adjectives, like *someone* and *something* in English, cannot be analyzed as the simple result of N-to-D movement. We delay a more principled analysis to section 3.4, in which we take into account the apparent different behavior of *qualcuno* ('somebody') pointed out to us by R. Zamparelli (p.c.).

Later in the same chapter, Abney (1987: 339ff.) takes different kinds of quantifier into account and proposes that they are adjectives of a special kind and therefore occupy a (head) position lower than D and a position higher than descriptive adjectives in structure (48) (Abney's 1987: 287, ex. 312). The position of *many* in (48) is also assumed for cardinals and other quantifiers and supported by a parallelism between comparative adjectives and quantifiers which also co-occur with a partitive PP. Abney (1987: 344) takes this PP to be the complement of an empty N that can only be the complement of Q in structures like (49) or of comparative A in structures like (50) (Abney's 1987: 344, ex. 413).

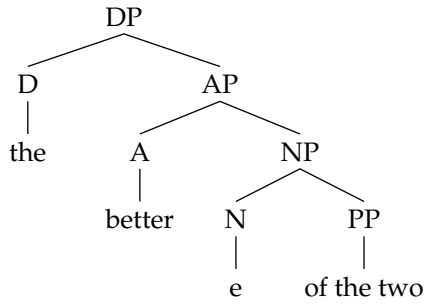
(48)



(49)



(50)



The parallelism between comparative and superlative structures on the one hand and partitive structures on the other is not new in the literature (also cf. Bresnan 1973b and Milner 1978: 121). However, Milner (1978b) already noticed that the partitive phrase is the complement of the degree word and not of the adjective. Furthermore, it does not form a constituent with the NP:

(51) a. *Books of those you lent me, I've read only the best.
b. *Books of those you lent me, I've read only some.

A second problem that can be found with (50) is quite reminiscent of Jackendoff's (1977) structure in (29). The assumption is that the partitive PP can be selected only by an empty N. This assumption is at the same time quite implausible (empty elements should not, in principle, have selectional features) and incorrect, as shown in (52). The partitive phrase can co-occur with lexical nouns as in (52a, b), and cannot occur when the quantifier is preceded by a determiner (irrespectively of the (c)overt status of the preceding N), as in (52c, d):

(52) a. the best books of those you lent me
b. many books of those you lent me
c. *the many books of those you lent me
d. *the many of the books you lent me

Undoubtedly, the analysis in (48) would have the advantage of unifying noun phrases such as *many children* parallel to (1a) with noun phrases such as *the many children* parallel to (2a, a'). But the apparent advantage is marred by the fact that it raises more problems than it solves. We see in section 2.3.3 that there is

cross-linguistic evidence to propose that *many children* and *the many children* are structures of different sorts.

2.3.2 The QP Hypothesis

Although not interested in the internal structure of quantified noun phrases, Sportiche (1988) is the first work in the generative literature to propose that a quantifier is external to the noun phrase. Sportiche claims that the universal quantifier is adjoined to NP. This proposal, interacting with the hypothesis that the subject is generated VP-internally (Koopman and Sportiche 1985, later published as 1991b), allows him to provide a derivational analysis of floating quantifiers, as shown in (53):

(53) a. $[_{IP}\ [_{NP}$ Les enfants] ont $[_{VP}\ [_{NP}$ tous $[_{NP}$ t]] vu ce film]].
b. $[_{IP}\ [_{NP}$ The children] have $[_{VP}\ [_{NP}$ all $[_{NP}$ t]] seen this film]].

In (53) the discontinuous word order of the quantified noun phrase is derived by movement of the NP subject from the VP internal position to [Spec, IP], leaving the quantifier in its D-structure position.

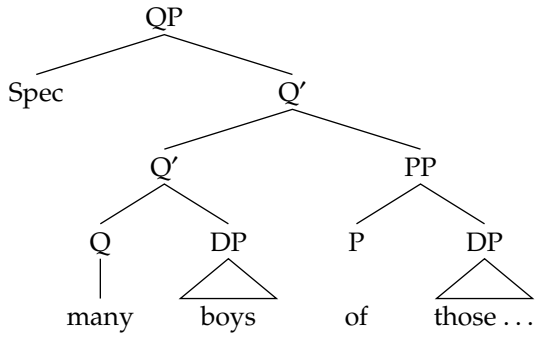
In the spirit of the DP hypothesis, Giusti (1990) and Cardinaletti and Giusti (1992) propose that the quantifier is a head, higher than DP. This allows them to analyze quantitative *ne* in Italian as binding a full DP (see section 4.3.2), parallel to other instances of clitics, such as accusative *lo* ('him'), *la* ('her'), *li* ('them-masc'), *le* ('them-fem'), which co-occur with universal quantifiers:

(54) a. Ne_i ho visti $[_{QP}$ molti $[_{DP}\ t_i]]$.
NE have.1Sg seen many
b. Li_i ho visti $[_{QP}$ tutti $[_{DP}\ t_i]]$.
them have.1Sg seen all

Example (54) also reinforces Sportiche's (1988) idea that floating is the side-effect of independent movement, interacting with the QP structure. It also shows that with respect to clitic extraction, universal and existential quantifiers behave alike.

For existential quantifiers, Cardinaletti and Giusti (1992) propose the structure in (55), where the Q is conceived of as a diadic element with two internal arguments: the indefinite DP (which we call quantitative DP) and the partitive PP.

(55)



This analysis is motivated by the fact that the selectional properties of Q determine both the features on the (quantitative) DP and the occurrence of the partitive PP. For example, universal quantifiers such as *tutti* ('all') and *entrambi* ('both') select a definite DP as in *tutti i ragazzi* ('all the boys'), and do not select a partitive PP as in **tutti dei ragazzi* (all of the boys).[3] Existential quantifiers such as *molti* ('many') and *alcuni* ('some') and distributive quantifiers such as *ogni* ('every') and *ciascun*(*o*) ('each') can select both a quantitative DP and a partitive PP, as in *molti ragazzi di quelli che conosco* ('many boys of those I know') and *ogni ragazzo di quelli che conosco* ('every boy of those I know'). This is analyzed in detail in section 3.

In this trend of research, Shlonsky (1991) for Hebrew and Giusti (1991a) for Italian independently propose that quantifiers are heads, higher than DP, and that the DP embedded under Q' can move out of the QP. Although the argument is based on universal quantifiers, which do not usually appear with quantitative and partitive phrases, we present it in some detail since it is extended to quantifiers that co-occur with quantitative and partitive phrases later in this chapter. Shlonsky (1991) motivates his proposal on the basis of a marking of agreement that appears on the head Q in Hebrew when the DP is moved, leaving Q in situ, cf. (56):

(56) a. $[_{QP}$ kol $[_{DP}$ ha-yeladim]] yašnu.
all the children slept

b. $[_{DP}$ ha-yeladim]$_i$ yašnu $[_{QP}$ t'$_i$ $[_{Q'}$ kulam $[_{DP}$ t$_i$]].
the children slept all

Notice that [Spec, QP] not only serves as an escape hatch, but can also be the final landing site for DP, obtaining a post nominal position for Q: see (57).

(57) a. $[_{QP}$ kol $[_{DP}$ ha-yeladim]] ʔohavim le-saxek.
all the children love to-play

b. $[_{QP}$ $[_{DP}$ ha-yeladim]$_i$ $[_{Q'}$ kulam $[_{DP}$ t$_i$]]] ʔohavim le-saxek.
the children all love to-play

Following a suggestion by Sportiche (p.c.), Giusti (1991a) extends Shlonsky's analysis of DP-to-[Spec, QP] movement in Hebrew to personal pronouns in various languages, such as French (58), English (59), and optionally Italian (60).

(58) a. *$[_{QP}$ tous $[_{DP}$ eux]]
b. $[_{QP}$ $[_{DP}$ eux] $[_{Q'}$ tous $[_{DP}$ t]]

(59) a. *$[_{QP}$ all $[_{DP}$ them]]
b. $[_{QP}$ $[_{DP}$ them] $[_{Q'}$ all $[_{DP}$ t]]

(60) a. $[_{QP}$ tutti $[_{DP}$ loro]]
b. $[_{QP}$ $[_{DP}$ loro] $[_{Q'}$ tutti $[_{DP}$ t]]

Giusti (1994) further shows that the same phenomenon is present in different languages and with other kinds of quantifiers. For example, in Hebrew it is also found with existential quantifiers, as in (61):

(61) a. [$_{QP}$ meat [$_{DP}$ yeladim]]/[$_{QP}$ meat [$_{DP}$ yeladot]] ʔohavim le-saxek.
few boys/ few girls love to-play
b. [$_{QP}$ [$_{DP}$ yeladim] [$_{Q'}$ meatim [$_{DP}$ t]]/[$_{QP}$ [$_{DP}$ yeladot [$_{Q'}$ meatot [$_{DP}$ t]]
boys few-Masc.Pl/ girls few-Fem.Pl
ʔohavim le-saxek.
love to-play

In Romanian, DP-movement to [Spec, QP] is found with both universal and existential quantifiers, provided that the DP is not heavily modified, as shown in (62):

(62) a. am văzut pe [$_{QP}$ [$_{DP}$ copii-i] [$_{Q'}$ toţi [$_{DP}$ t]]].
[I] have seen Acc children-the all
b. am văzut [$_{QP}$ [$_{DP}$ copii] [$_{Q'}$ mulţi [$_{DP}$ t]]].
[I] have seen children many

The hypothesis that Q is a head, embedding a DP (in contrast with determiners and adjectives, which are internal to DP) and projecting a Specifier position, can account in a principled way for the data in (56–62), which would otherwise appear quite idiosyncratic.

A final piece of evidence in favor of the structure in (55) is that in some marginal cases like (63) *many* occurs on the left of a determiner, parallel to *all* in (64), and differently from *many* in (2a').

(63) a. many a good student[4]
b. many another man

(64) a. all the good students
b. all the other men

The structure in (55) can also give a unified analysis to simple quantified noun phrases such as *many children* and structures like (63–64), with the additional, quite costless assumption of a null indefinite determiner in the D position in the complement of an existential Q, as in (65a). Structure (65b) shows absence of number agreement between the quantifier and the DP, which displays a singular indefinite article.[5] In (65c), the complement of a universal quantifier displays a definite determiner:

(65) a. $[_{QP}\ [_{Q}$ many$]\ [_{DP}\ [_{D}\ \emptyset]\ \ [\ldots[_{NP}$ men$]]]]$
b. $[_{QP}\ [_{Q}$ many$]\ [_{DP}\ [_{D}$ a$]\ \ \ [\ldots[_{NP}$ man$]]]]$
c. $[_{QP}\ [_{Q}$ all$]\ \ \ \ [_{DP}\ [_{D}$ the$]\ [\ldots[_{NP}$ men$]]]]$

Universal quantifiers can also co-occur with a null determiner in English (66a), but not in many other languages, e.g., Italian (66b):

(66) a. $[_{QP}\ [_{Q}$ all$]\ \ \ [_{DP}\ [_{D}\ \emptyset]\ [\ldots[_{NP}$ men$]]]]\ \ \ $ are mortal
b. $[_{QP}\ [_{Q}$ tutti$]\ [_{DP}\ [_{D}$ gli$]\ [\ldots[_{NP}$ uomini$]]]]$ sono mortali

The null determiner in English (66a) is the null determiner found in generic noun phrases independently of the presence of the quantifier (cf. Matthewson 2001). This null determiner is not found in Italian (see Longobardi 1994 and Chierchia 1998 for analyses of this fact).

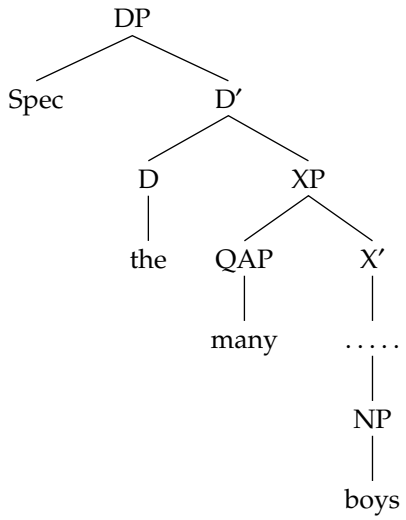
To summarize the results of this section, the QP-hypothesis claims that Q is a head external to the DP and that Q projects a full QP level. This hypothesis accounts for the facts in (67) which builds a diagnostics for the Q status:

(67) **A diagnostics for quantifiers:**
Q can precede definite as well as indefinite articles.
Q can co-occur with pronouns.
Q allows leftward movement of the DP to an immediately adjacent position which builds a constituent with Q and can straightfowardly be analyzed as [Spec, QP].
Different classes of Q correlate with the (in)definiteness of the embedded DP. This phenomenon will be accounted for in terms of selectional properties of Qs in section 3.
Q can occur in discontinuous position in a number of languages, contrary to other nominal modifiers and determiners.

2.3.3 The AP Hypothesis

The QP hypothesis does not deal with the case of quantifiers that can be preceded by a determiner as in (2a') *the many boys*. It requires an additional hypothesis that analyzes some quantity expressions as merged in adjectival position inside the DP, as in (68) (cf. Giusti 1991a, 1993). We will call this the AP-hypothesis. The AP-hypothesis, combined with the QP-hypothesis in (55), predicts that not all quantifiers can be quantity adjectives and vice versa. For example *all*, *some*, and *both* are not adjectives and cannot occur after a determiner. This explains the ungrammaticality of (3a), (4a), and (5a).

(68)



It is often assumed in the literature that the quantifiers that can occur after a determiner are weak quantifiers (in the sense of Milsark 1977). But this is not completely true. *S'm*, the weak counterpart of *some*, cannot appear after a determiner in (69a), or as a predicative adjective in (69b):[6]

(69) a. The many/three/several/*some/*s'm students that I know are all lazy.
b. ?The students that I know are many/three/several/*some/*s'm.

If we consider the distribution of quantity adjectives from a cross-linguistic perspective, it appears accidental that quantity adjectives in English are a subset of weak quantifiers. In German (70b) and Dutch (70c), for example, the counterparts of the English strong quantifier *most* in (70a) are only adjectival in nature:

(70) a. Most children are nice.
b. Die meisten Kinder sind nett. German
c. De meeste kinderen zijn aardig. Dutch

Meisten in (70b) and *meeste* in (70c) clearly display the adjectival inflectional morphology and must be preceded by a (definite) determiner. This is also found with German universal quantity adjective *ganzen* ('all') in (71a) and can be the case of *beiden* ('both') in (71b) and *vielen* ('many') in (71c):

(71) a. Die ganzen Kinder sind da.
the all children are here
b. Die beiden Kinder sind da.
the both children are here
c. Diese vielen Kinder sind da.
these many children are here

Ganz(*en*) is not a Q, it can have adjectival or adverbial status (meaning 'entirely', 'completely'). *Beide*(*n*) and *viele*(*n*) are ambiguous between Q and A status and can be found in different constructions. When *beide* and *viele* are Qs, they have the inflectional morphology of a determiner.[7] This idiosyncrasy in the possibility for a lexical item expressing quantity to be a quantifier, a quantity adjective, or both, is expected under the hypothesis that these elements can have different categorial status, independent of the meaning of a given element. In each language a given element is assigned either status or both. What is striking is that the syntactic behavior directly depends on the categorial status of the element, not on its semantic value.

The combination of the QP and the AP hypotheses also predicts the co-occurrence of two quantifiers in one and the same noun phrase, as in (72). It is, however, sufficiently restricted as to predict the ungrammaticality of some logically possible combinations as in (73).[8]

(72) a. tutti questi duecentoquaranta compiti da correggere
b. all these two hundred and forty tests to check
c. tutti questi molti(ssimi)/pochi(ssimi) compiti da correggere
d. all these (very) many/few tests to check
e. entrambi questi due ragazzi
f. both these two boys
g. some twenty tests to check
h. no two tests

(73) a. *twenty some children
b. *two no tests
c. tutti questi (*alcuni) compiti da correggere
d. all these (*some) tests to check

Notice that the reason for the ungrammaticality of (73) is not necessarily the semantic incompatibility of the two quantifiers. It is rather the fact that in English, *some* and *no* are not quantity adjectives and cannot appear inside a DP in adjectival position. The same is true for Italian *alcuni*. Notice also that the appearance of a quantity adjective inside the partitive PP in (74) does not give rise to a violation of the partitive constraint, contrary to what is found with quantifiers in (75) (cf. (14) above, n. 21, and Casadio 1995: n. 3):

(74) a. molti di questi duecentoquaranta compiti da correggere
b. many of these two hundred and forty tests to check
c. tre delle poche mele che ho
d. three of the few apples that I have

(75) a. *molti di duecentoquaranta compiti da correggere
b. *many of two hundred and forty tests to check
c. *tre di poche mele (che ho)
d. *three of few apples (that I have)

At the end of the previous sections we listed a number of phenomena arising with quantifiers. We will now observe that they do not arise with quantity adjectives.

When quantifiers are in object position in Italian, they allow for the extraction of a clitic pronoun from the DP, as shown in (54). This possibility does not arise with other modifiers of the noun, since modifiers are internal to the DP and cannot be left in place by DP extraction. Quantity adjectives give the same result as other adjective in (76a–b).

(76) a. *Ne/*Li ho comprati (gli) interessanti [t].
NE/them have.1Sg bought (the) interesting [t]
b. *Ne/*Li ho comprati i tre [t].
NE/them have.1Sg bought the three [t]
c. Ne ho letto i tre racconti [$_{PP}$ t].
CL have.1Sg read-Masc.Sg the three short stories

Notice that *ne*-extraction is allowed over a definite article in (76c) where *ne* binds a constituent (a genitive PP). A further argument on this line is provided by the discussion on the Serbo-Croatian data in (84–85).

Quantifiers can embed an empty DP in subject position and in the complement of a PP, as in (77) (for the interpretation of the empty noun phrase, see section 3.3.4):

(77) a. Tre/ alcuni/ tutti/ entrambi sono arrivati ieri.
b. Three/ some/ all/ both are arrived yesterday.
c. Ieri ho parlato con tre/alcuni/tutti/entrambi.
d. Yesterday I spoke to three/some/all/both.

This is not found with other modifiers of the noun phrase:

(78) a. *Simpatici sono arrivati ieri.
b. *Nice arrived yesterday.
c. *Ieri ho parlato con simpatici.
d. *Yesterday I spoke to nice.

The contrasts in (72–76) and (77–78) show that all types of quantifier show comparable behavior in occurring with a clitic pronoun and/or an empty noun phrase. Their behavior is crucially different from adjectives, as shown by (76) and (78).

Existential quantity adjectives (numerals and vague numerals) do not select a partitive PP (see section 3.1), as shown by the contrast in (79a, b), contrary to existential quantifiers, as in (79c). This is not predicted if the cardinal is one and the same element in all the cases in (79).

(79) a. *questi tre dei partecipanti
these three of-the participants

b. questi tre partecipanti
c. tre dei partecipanti

Romanian provides us with an interesting minimal pair. Dual universal quantity can be expressed either by a quantifier: *amîndoi*, or by a quantity adjective: *ambii*.[9] The syntactic hehavior of these two elements is particularly significative. *Amîndoi* is parallel to *toţi* ('all') in embedding a full definite DP, while *ambii* is in all respects a prenominal adjective.[10] In (80) we observe that the enclitic article is on the noun (80a) or on the prenominal adjective (80b), but never on the quantifier (80c). This shows that the quantifiers *amîndoi* and *toţi* are not part of the functional projection of the noun phrase: they immediately embed a DP.

(80) a. Au venit amîndoi / toţi băieţii frumoşi. Romanian
have arrived both / all boys-the nice
b. Au venit amîndoi / toţi frumoşii băieţi.
have arrived both / all nice-the boys
c. *Au venit amîndoii / toţii băieţi (frumoşi).
have arrived both-the / all-the boys nice

Quite the opposite holds of the quantifier *ambii*, which is always inflected for the enclitic article (81b, c). Other prenominal adjectives such as *biet* ('poor') must also bear the definite article in definite descriptions. Parallel to *biet*, *ambii* precedes other prenominal modifiers, as in (81b).

(81) a. *Au venit ambi/bieţi băieţii (frumoşi). Romanian
have arrived both/poor boys-the nice
b. Au venit ambii/bieţii (frumoşi) băieţi
c. Au venit ambii/bieţii băieţi (frumoşi)
have arrived both-the/poor-the boys nice

If floating and clitic-extraction are the result of DP movement, as claimed by Sportiche (1988) and Giusti (1990), among others, it is predicted that only *amîndoi/toţi*, but not *ambii*, occur in floating constructions. The same holds for clitic extraction, given that the clitic starts in a DP position. The two predictions are borne out, as can be seen in (82):

(82) a. Băieţii frumoşi au venit amîndoi/toţi/*ambi(i). Romanian
children-the nice have arrived both /all /both
b. I-am văzut pe amîndoi/toţi/*ambi(i).
[I] them have seen Acc both /all /both

As seen in (62) above, Romanian allows a postnominal position of the quantifier, parallel to Hebrew (57) and (61). If this is due to movement of the DP to [Spec, QP], we expect that only *amîndoi/toţi*, but not *ambii* can occur in postnominal

position, as shown in (83). Example (83b) shows that *ambii* behaves like the prenominal adjective *bieţi* in that it is not able to co-occur with a pronoun:

(83) a. noi amîndoi / toţi
we both / all
b. *noi ambi(i) / bieţi(i)
we both-(the) / poor-(the)

Slavic languages provide a different set of phenomena that distinguish quantifiers and quantity adjectives, as discussed in Giusti and Leko (1996, 2001) for Serbian–Croatian. Since pronouns can be inflected for genitive in these languages, they can occur as the complement of existential quantifiers. This is not the case with quantity adjectives, which agree with the noun and do not assign Case to it (see section 3.3.1).

In (84a) *mnogo* ('many') appears with a genititve DP, *studenata*, or a strong pronoun, *njih*. In (84b) the pronoun is clitic and must be extracted out of the QP. The presence of the pronoun is obligatory in (84):

(84) a. Vidio sam mnogo studenata / njih. Serbian–Croatian
saw.1Sg Cl.Aux many students.Gen.Pl / them.Gen.Pl
b. Vidio sam ih mnogo.
saw.1Sg Cl.Aux them.Cl.Gen.Pl many
'I saw a lot of them.'

Neither possibility is available with a quantity adjective which agrees with the following noun for accusative Case (assigned by the verb) and other phi-features in (85a). In (85b) it is shown that a quantity adjective cannot occur with a pronoun, irrespective of its strong or clitic nature. It can only occur in an elliptical construction:

(85) a. Vidio sam mnoge studente / Serbian–Croatian
[I] saw Cl.Aux many.Acc.Pl students.Acc.Pl /
*njih.
them.Gen.Pl
b. Vidio sam (*ih) mnoge (*njih).
[I] saw Cl.Aux them.Cl.Acc.Pl many.Acc.Pl

A comparable argument can be build for German. In (86) we make a parallelism between quantifiers such as *alle* and *beide*, which can occur with a pronoun, and the adjective *ganze*, which cannot:

(86) a. wir alle (we all) German
b. wir beide (we both)
c. *wir ganze(n) (we both)

Notice that the obligatory presence of a definite determiner preceding a quantity adjective is found only in languages that display the definite article. In a Slavic language such as Bosnian–Croatian–Serbian, which does not display a definite article, quantity adjectives may appear with no definite article. They therefore provide a good case to dispense with a possible criticism to our test of clitic extraction in (72–76), showing that it is not the presence of the determiner that blocks clitic extraction but the fact that the clitic binds the whole DP, which excludes a quantifier but includes a quantity adjective.

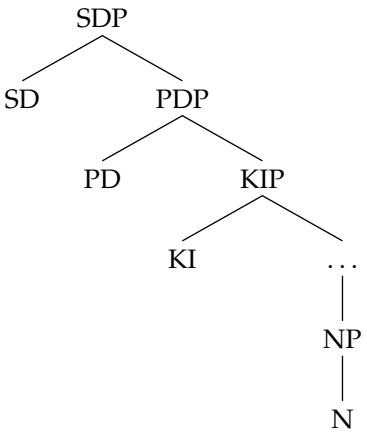
To summarize, we have proposed that only some quantifiers can occur in adjectival position. We call them quantity adjectives. The possibility to be merged in such a position is due to their categorial status which must be listed in the lexicon. This claim is supported by their syntactic hehavior. In (87) we find a set of phenomena which can build a diagnostics for quantity adjectives, which can be now contrasted with the diagnostics for quantifiers given in (67).

(87) **A diagnostics for quantity adjectives:**
Quantity adjectives are preceded by a determiner (in languages that have a definite article).
Quantity adjectives cannot occur with a pronoun.
Quantity adjectives do not allow extraction of the part of the DP that does not contain it.
Quantity adjectives cannot appear in discontinuous position (in languages in which adjectives cannot do so).
Quantity adjectives do not select a partitive PP.

2.3.4 A recent attempt at unification

Given the discussion so far, the unification of *many* in *many boys* (see (1a)) and *the many boys* (see (2a')) cannot be considered as the null hypothesis and needs argumentation. Such an argumentation is given by Zamparelli (1995), who endorses a general proposal about the structure of noun phrases designed to capture, by means of the X-bar theoretic schema in (88), the different interpretive properties of several types of determiners as classified in the semantic tradition of Milsark (1977) and Barwise and Cooper (1981). The structure in (88) provides different positions for different kinds of determiner. SD (strong determiner) is the position where strong quantifiers, such as *both*, *most*, *every,* and *each*, and determiners, such as demonstratives and the definite article, are inserted. PD (predicative determiner) is the position where the indefinite article *a* and weak quantifiers such as cardinals and vague numerals are inserted. KI (Kind) is the projection that denotes the kind in the semantic interpretation.

(88)



Although in (88) both strong and weak quantifiers are inserted in head positions, Zamparelli's proposal is to be considered in the line of research that treats quantifiers as a special type of adjective. He follows the semantic tradition of Milsark's (1977), according to which strong quantifiers are determiners while weak quantifiers are modifiers, and the syntactic hypothesis of Abney (1987) and Bernstein (1993b) that (at least some) prenominal adjectives are merged into functional heads of the extended projection of the noun.

The immediate appeal of (88) is that it derives the well-known semantic properties of quantifiers in the syntax. The ambiguity between the strong and weak reading of existential quantifiers (cardinals and vague numerals) is accounted for by assuming that some quantifiers can be inserted either in PD (in which case they are weak) or in SD (in which case they are strong). Other quantifiers can only be inserted in SD and cannot be lowered to PD.[11]

Another advantage of (88) is that it establishes a correlation between each layer and a different type of clitic element in Italian: SDP is the clitic displaying Agr features such as the accusative *lo*, *la*, *li*, *le*; PDP is the uninflected clitic *lo* which resumes a predicate; while KIP corresponds to the quantitative clitic *ne* (thereby predicting that *ne* can be extracted only from weak quantifiers; see also section 3.3.1).

Zamparelli assumes that the complete structure in (88) is always projected when the noun phrase is in argument position. We restrict our review of Zamparelli's hypothesis to such a case. In (89) we observe a noun phrase in object position. In (89a) we see the structure of a weak noun phrase, in (89b) that of a bare plural, and in (89c) the structure of a strong noun phrase.

(89) a. I am looking for $[_{SDP}$ SD $[_{PDP}$ two $[_{NP}$ . . . nice people]]].
b. I am looking for $[_{SDP}$ SD $[_{PDP}$ $PD_{[plural/mass]}$ $[_{NP}$ . . . nice people]]].
c. I am looking for $[_{SDP}$ every $[_{PDP}$ $PD_{[sing]}$ $[_{NP}$ . . . nice man]]].

In (89a) the weak interpretation is obtained by not moving the quantifier to SD. SD is empty and is licensed by the verb. In (89b) the same holds for SD, but PD

is also empty and needs to be licensed. This is obtained, stipulatively, by assuming that the empty SD requires a [plural/mass] feature in PD, and it is licensed by virtue of this requirement. In (89c) we see the case of a strong quantifier that occupies the SD position and licenses the empty PD, to which it assigns a [sing] feature.

This proposal predicts the co-occurrence of an element in SD and an element in PD. An example of such a case is the by now notorious case of (2a′), which is attributed the structure in (90a). However, Zamparelli's proposal cannot account for the unacceptability of (90b), which should have the same structure:

(90) a. $[_{SDP}\ [_{SD}$ these$]\ \ [_{PDP}$ many $[_{NP} \ldots$ men$]]]$
b. *$[_{SDP}\ [_{SD}$ every$]\ [_{PDP}$ a $\ \ [_{NP}$ man$]]]$

In order to overcome this problem, Zamparelli (1995: 118) proposes the principle of redundancy in (91).

(91) Two functional words F_i, F_j within the same DP give an impossible representation if the meaning of F_i entails the meaning of F_j or vice-versa.

Principle (91) rules out the insertion of two quantifiers with the same function. In (90b) *every* would be redundant with the weak quantifier *a*. However, (91) is contradicted by the Ladin construction 'one a N' discussed in Benincà and Haiman (1992) and reported in (92), where the two elements apparently have the same interpretation and nevertheless do not exclude each other:

(92) a. Da øna na skwadra (esoŋ pasa a trɛj). Badiot
from one a team ([we] passed to three)
'From a team we grew to three.'
b. (L'ɛrt kuntsɛtuala), una na rama dl ɛrt visiva. Gardena
(the art conceptual), one a branch of-the art visual
'conceptual art, one branch of visual art.'

Notice that the data in (92) are in many respects parallel to the case of English *many a good student* presented in (63). And they can be straightforwardly captured by the analysis in (55) and (65) given above. Furthermore, (89a) claims that weak quantifiers in PD co-occur with an empty determiner in SD. This appears to be consistent with what we know about English, but cannot be maintained for Italian. In English (93), both the quantifier *many* and the descriptive adjective *good* can introduce the DP. In Italian (94), the quantifier *molti* but not the adjective *bravi* can introduce a DP in subject position:

(93) a. Many students have passed the exam.
b. Good students have passed the exam.

(94) a. Molti studenti hanno superato l'esame.
b. *Bravi studenti hanno superato l'esame.

The contrast between (93) and (94) shows that at least in Italian it is impossible to claim that *molti* is an adjective preceded by a null determiner, given that null determiners are banned in the IP-subject position. The analysis proposed in sections 2.3.2–2.3.3 does not have this problem and can unify the analysis for Italian and English by considering *many* in (93a) and *molti* in (94a) as quantifiers which embed a quantitative (indefinite) DP.

Finally, in contrast with our proposals in (55) and (68) above, Zamparelli's structure (88) cannot derive the case in which a quantifier precedes a strong (definite) determiner that is in turn followed by a weak quantifier, as in (95) and parallel structures cross-linguistically.

(95) a. all these very many children
b. both these two children

To accommodate for this, Zamparelli proposes that *tutti*, and supposedly also *both* and *half*, are external to the noun phrase structure and adjoined as a constituent to SDP, parallel to what is proposed by Sportiche (1988). But this fails to capture the parallelisms among quantifiers noticed earlier in (65), while other determiners behave differently, as in the unacceptable (76a, b).

3 A refinement of the QP Hypothesis

In section 2.3.2 we observed that the QP hypothesis represented in (55) is flexible enough to account for a range of different selectional properties found with different classes of quantifiers. We now focus on the different properties of different classes of quantifiers and refine the structure proposed in (55), making it compatible with current assumptions on phrase structure.

The assumption of the lexical–functional distinction, implicit in the literature since Grimshaw (1991), leads us to attribute lexical status to an element with selectional properties. We therefore take Q in (55) to be a lexical category that selects a full extended projection, namely, the noun phrase marked as DP. This was already proposed in Giusti (1993). Being a lexical head, Q first projects its argument structure, then projects its own functional structure, which is much more reduced than that of a full noun phrase.

In this section we support the claim that existential Qs are diadic elements that select two complements: a quantitative DP to which they assign partitive Case, and a partitive PP. Distributive Qs select the same two complements and, contrary to existential Qs, they also select a distributive Operator (OP). Universal quantifiers only select a DP and do not assign Case to it.

In section 3.1, the partitive PP, introduced by *di* in Italian, is contrasted with an adjunct partitive PP that can also be introduced by *di* in certain cases but is normally introduced by *tra/fra* ('among'). In section 3.2, the quantitative DP is shown to be the source of quantitative *ne*. Since quantitative *ne* is obligatory in some cases, we conclude that its source position is the internal argument of Q,

which is always projected in the structure. In section 3.3, we see the structure of the three classes of quantifiers and how it can derive many of the phenomena discussed above. In section 3.4, we discuss 'intransitive' quantifiers such as *qualcuno* ('someone') and *qualcosa* ('something').

We assume a version of the Uniformity of Theta Assignment Hypothesis of Baker (1988a: 46) according to which, when a lexical item is shown to select an argument, the null hypothesis (and in fact the only available one) is that this argument is always projected in the structure.[12] The line of hypothesis followed here is that if there are reasons to believe that a quantifier selects a constituent, this constituent is always projected in the structure, even if non-overt. This allows us to explain a number of apparently unrelated facts.

3.1 The partitive PP and other partitive phrases

As we have seen in section 2.1.2, the literature in the late 1970s established that the quantitative noun phrase and the partitive prepositional phrase are different constituents. The evidence was based on the following observations. The two constituents behave differently with respect to the movement of the noun phrase of various kinds (22), (24), and (25), cannot be coordinated (26), and have different semantics (28). Furthermore, the presence of the partitive PP is bound to the presence of a quantifier, as shown in (34).

For Italian, Cardinaletti and Giusti (1992) show that the two phrases embedded under Q are not mutually exclusive, but can co-occur when the DP is realized by a noun (phrase) (96a) and by the clitic pronoun *ne* (96b) (see (31) and (33) for French):

(96) a. Ho letto molti libri di quelli che mi avevi consigliato.
have.1Sg read many books of those that to-me had.2Sg recommended
b. Ne ho letti molti [$_{DP}$ *t*] di quelli che mi avevi consigliato.
NE have.1Sg read many of those that to-me had.2Sg recommended

The null hypothesis concerning the quantitative DP is that it also occurs when the noun is non-overt, as in (97). Following Cardinaletti and Giusti (1992), we propose that (97) contains a null DP. In this way, the only difference between (97) and (96b) would be the different licensing procedure of the empty category.

(97) Molti [$_{DP}$ e] di quelli che mi avevi consigliato erano interessanti.
many of those that to-me had.2Sg recommended were interesting

The null hypothesis concerning the partitive PP is that it occupies one and the same position in (96), where it co-occurs with other nominal material (*libri/ne*), and in (97), where it does not. The partitive PP is selected by the quantifier and is not a complement of the noun phrase (contra Jackendoff's 1977 structure (29) above, and Abney's 1987 structure (50)), as has been argued in the discussion on (51–52). Italian left-dislocation constructions provide clear cases supporting this

claim. Cinque (1991) shows that a PP such as *in medicina* in (98a) is a complement of N, since it cannot be used predicatively (98b). In (98c, d) it is shown that this PP must be dislocated together with the noun:

(98) a. Conosco due studenti in medicina.
[I] know two students in medicine
b. *Questi due studenti sono in medicina.
these two students are in medicine
c. Di studenti in medicina, ne conosco due.
of students in medicine, NE know.1Sg two
d. *Di studenti ne conosco due in medicina.
of students NE know.1Sg two in medicine

The partitive PP behaves in the opposite way, suggesting that it is not a complement of N:

(99) a. Ho visto due studenti di quelli del tuo corso.
have.1Sg seen two students of those of-the your class
b. Di studenti, ne ho visti due di quelli del tuo corso.
of students NE have.1Sg seen two of those of-the your class
c. *Di studenti di quelli del tuo corso ne ho visti due.

We also exclude that the partitive PP is (optionally) adjoined to the noun phrase. At least in Italian, the partitive PP cannot appear with noun phrases of any type. As shown in (100), it cannot occur with definite and universally quantified DPs:[13]

(100) a. *I libri di quelli che mi avevi consigliato.
b. *Tutti i libri di quelli che mi avevi consigliato.
all the books of those that [you] to-me had recommended

An optional, adjunct, partitive exists and is introduced by the preposition *tra/fra* ('among'), as shown in (101). It is compatible with all kinds of DPs, including quantified constructions:

(101) a. Ho letto solo questi libri di linguistica tra/fra quelli
have.1Sg read only these books of linguistics among those
che mi avevi consigliato.
that [you] to-me had recommended
b. Tutti i libri di linguistica tra/fra quelli che mi avevi
all the books of linguistics among those that [you] to-me had
consigliato mi sono piaciuti.
recommended to-me pleased
c. Ho letto molti libri di linguistica
have.1Sg read many books of linguistics
tra/fra quelli che mi avevi consigliato.
among those that [you] to-me had recommended

The adjunct partitive, introduced by *tra/fra* or even *di*, can appear in sentence-initial position. Also in this case, it is compatible with all kinds of DPs.

(102) a. Tra/fra i libri di linguistica, ho letto
among the books of linguistics, [I] have read
quelli che mi avevi consigliato.
those that [you] to-me had recommended
b. Di (quei) libri, ho letto solo questi.
of (those) books have.1Sg read only these

The adjunct partitive PP can co-occur with the selected partitive PP, showing that it is a different kind of constituent (103). Crucially, the adjunct partitive can only be introduced by *tra/fra* and not by *di* if it is adjacent to the noun phrase (104):

(103) a. Fra i libri di storia in programma, ne ho letti
among the books of history in the syllabus, NE have.1Sg read
[molti di quelli che avevi consigliato].
many of those that [you] had recommended
b. Dei libri di storia in programma, ne ho letti
of the books of history in the syllabus, NE have.1Sg read
[molti di quelli che avevi consigliato].
many of those that [you] had recommended

(104) a. Ho letto molti libri di storia di quelli che mi avevi
have.1Sg read many books of history of those that to-me had.2Sg
consigliato tra quelli in programma
recommended, among those in the syllabus.
b. *Ho letto molti libri di storia di quelli che mi avevi consigliato di quelli in programma.

As noticed by Milner (1978b) for French and by Cardinaletti and Giusti (1992) for Italian, the selected partitive PP and the quantitative DP must contain the same lexical noun. In fact, while (105a) is marginal due to the redundancy of the information conveyed, (105b) is ruled out, even if it is not redundant at all, and clearly contrasts with the synonymous (106), where the adjunct partitive PP occurs:

(105) a. Ho letto molti libri dei libri della biblioteca.
have.1Sg read many books of the books in the library
b. *Ho letto molti romanzi dei libri della biblioteca.
have.1Sg read many novels of the books in the library

(106) a. Ho letto molti romanzi tra i libri della biblioteca.
have.1Sg read many novels among the books of-the library
b. Dei/tra i libri della biblioteca, ho letto molti romanzi.
of/among the books of-the library, have.1Sg read many novels.

We call this property the non-distinctness requirement and discuss it in section 3.3.4.

Up to now, we have established that the partitive PP is selected by the quantifier, it is different both from an adjunct partitive PP that can occur with any kind of noun phrase and in left-dislocation structure, and from the quantitative DP, which is also an argument of the quantifier.

The partitive PP refers to the set out of which the quantifier picks its restriction, which is a subset of it (see Cresti 2003: 83). For universal quantifiers the set and the subset coincide, and this is why no partitive PP is selected by universal *tutti* in (100b), by universal *entrambi* in (107a), and by the coordinated Q *tutti e due* (lit., 'all and two') in (107b), which can only take a definite DP (108).

(107) a. *Entrambi dei ragazzi sono arrivati.
both of the boys have arrived
b. *Tutti e due dei ragazzi sono arrivati.
all and two of the boys have arrived

(108) a. Entrambi i ragazzi sono arrivati.
both the boys have arrived
b. Tutti e due i ragazzi sono arrivati.
all and two the boys have arrived

As is clear from the gloss of (107), English does not have this phenomenon. There are two ways of interpreting the contrast between Italian and English. One is to attribute different (unpredictable) argument structures to quantifiers across languages; the other, to propose that an *of* phrase in English is ambiguous between the selected partitive PP and the adjunct partitive PP (often introduced by *tra/fra* but also introduced by *di* in Italian left-dislocation constructions, cf. (102b) and (103b)). We believe that the second way is more in the spirit of the generative enterprise. We therefore propose that the PP in *all of the boys* and *both of the boys* is an adjunct.

3.2 The quantitative DP

The quantitative DP realizes the restriction of the existential quantifier. We now show that it is always projected and, if empty, it is subject to licensing conditions.

In the discussion of (35–37) we observed that extraction of *ne* can take place from internal argument positions, while it is impossible from other positions. The syntax of *ne*, therefore, provides an excellent test to distinguish between internal and external argument positions. In (35–37), it was also shown that where *ne* is not allowed, an empty category is found. However, the interpretation of that empty category is bound to some requirements discussed in Cardinaletti and Giusti (1992) and reviewed here.

In preverbal subject position, the empty category can refer to any kind of noun:

(109) a. Tre/molte settimane passano rapidamente.
three/many weeks elapse rapidly
b. Tre/molte [e] passano rapidamente.
three/many elapse rapidly

(110) a. Tre/molti ragazzi hanno telefonato ieri.
three/many boys have telephoned yesterday
b. Tre/molti [e] hanno telefonato ieri.
three/many have telephoned yesterday

Rephrasing Belletti and Rizzi's proposal (see section 2.2), Cardinaletti and Giusti (1992) analyze the occurrence of the empty category in terms of the licensing conditions of Rizzi (1986a): an empty category must be formally licensed (i.e., governed by a proper head) and identified (i.e., its feature content must be recovered). The empty category embedded in a quantified noun phrase, *pro*, is always formally licensed by the quantifier. As for the identification requirement, the quantifier does not carry all the features necessary for a referential interpretation of *pro*, since it displays number and gender but crucially not person features. The empty category can be identified either by the quantitative clitic when c-commanded by it, as in (36b), or by the quantifier if it is co-indexed with an element that provides it with person features. We take this element to be AgrS for quantified noun phrases in subject position, (109b–110b).

In (109–110), we observe that in preverbal subject position cardinals and quantifiers give similar results. If we contrast (109–110) with (111), however, we observe that an empty category in the postverbal subject position is only allowed with quantifiers that display overt agreement for number and gender features, namely existential quantifiers such as *molti*, *uno*, and *una*, but not cardinals such as *tre*.[14]

(111) a. Ieri hanno telefonato tre / molti ragazzi.
yesterday have telephoned three / many boys
b. Ieri hanno telefonato *?tre/molt*i* [e].
c. Ieri ha telefonato un*o* / un*a* [e].
yesterday has telephoned one-Masc.Sg / one-Fem.Sg

Since in postverbal subject position the quantifier would not be enriched with phi-features, the empty category gets an arbitrary interpretation, limited to human beings (cf. Rizzi 1986a; Cinque 1988: n. 36). This explains the contrast in (112). Similarly, (113b) can only mean that some human beings make the nests and the sentence is marked as infelicitous.[15] In (113c) we see that the prenominal subject position is acceptable, as expected, given (109b) above:

(112) a. Hanno telefonato molti [e].
have telephoned many [people]
b. *Hanno abbaiato molti [e].
have barked many [dogs]

(113) a. (Questo tipo di nido), lo fanno molti uccelli migratori.
(this kind of nest), it make many migrating birds
b. #(Questo tipo di nido), lo fanno molti [e].
c. Molti [e] fanno questo tipo di nido.
many do this type of nest

The same restriction holds for quantifiers in object position:

(114) a. Ieri ho incontrato molti [e] per la strada.
yesterday have.1Sg met many [people] on my way
b. *Ieri ho letto molti [e] in biblioteca.
yesterday have.1Sg read many [things] in the library

Another argument in favor of the assumption that the internal argument of Q is always present is the observation that Q not always agrees for number (115a, b) and/or person (115c) with the following PP:

(115) a. Una [e] delle ragazze pensa che ...
one.Fem.Sg of-the girls thinks that
b. Uno [e] di noi pensa che ...
one.Masc.Sg of us thinks that
c. Molti [e] di noi pensano che ...
many of us think that

Number and person are syntactic features that are structurally realized as functional heads external to the lexical NP (Ritter 1991). While the lexical NP must be non-distinct in the DP and the PP arguments of Q (cf. sections 3.1 and 3.3.4), the functional structure associated to them can be different. Notice that the features of the whole quantified noun phrase in (115) are those of the quantitative DP (third person features). The verb never agrees with the partitive PP, as shown in the ungrammatical cases in (116):

(116) a. *Una [e] delle ragazze pensano che ...
one.Fem.Sg of-the girls think.3Pl
b. *Uno [e] di noi pensiamo che ...
one.Masc.Sg of us think.1Pl that
c. *Molti [e] di noi pensiamo che ...
many of us think.1Pl that

The internal argument of a distributive quantifier is always third person singular:

(117) a. Ciascuna ragazza pensa / *pensano che ...
each.Fem.Sg girl thinks / think.3Pl that
b. Ciascuna [e] delle ragazze pensa / *pensano che ...
each.Fem.Sg of-the girls thinks / think.3Pl that

c. Ciascuna [e] di noi pensa / *pensiamo che ...
each.Fem.Sg of us thinks / think.1Pl that

In (117a), the internal argument of the quantifier is overt, its features are third person singular, agreeing with the features on the quantifier. In (117b, c), the internal argument of the quantifier is covert and the partitive PP is realized. Since *ciascuno* can only take countable nouns, and *ragazze* is such a noun, the partitive PP is necessarily plural. The predicate agrees with the quantifier (and the covert DP), which is singular.

The argument of a universal quantifier such as *tutti* can have first and second person features, as in *tutti noi/voi*. As expected, an empty pronoun in the complement of a universal quantifier can also have these features, as in (118).

(118) a. Tutti/Tutte [e] pensiamo che ...
all.Masc/all.Fem think.1Pl that ...
b. Entrambi/Entrambe [e] pensiamo che ...
both.Masc/both.Fem think.1Pl that ...

The first and second person features are licensed by agreement with the verb. Person agreement also takes place in postverbal subject position. Sentence (119b) is felicitous, contrasting with (113b) above. (120) is felicitous in a context in which birds can speak in first person (plural):

(119) a. (Questo tipo di nido), lo fanno tutti gli uccelli migratori.
(this kind of nest) it make all the migrating birds
b. (Questo tipo di nido), lo fanno tutti.
(this kind of nest), it make.3Pl all
c. Tutti fanno questo tipo di nido.
all make.3Pl this kind of nest

(120) (Questo tipo di nido), lo facciamo tutti.
(this kind of nest) it make.1Pl all
We all make this kind of nest

Notice that (119b) and (120) can also be analyzed as a floating construction, with the quantifier *tutti* being left in place by movement of its complement *pro* to IP-subject position.

In other syntactic positions where neither agreement with the predicate nor floating takes place, such as the object position, universal quantifiers, on a par with existential quantifiers, can co-occur only with an arbitrary *pro* with third person [human] features, as in (121a). Sentences (121b) and (121c) are infelicitous due to the fact that a [+human] interpretation of the empty category is incompatible with the verbs *vendere* and *riflettere*.

(121) a. Ho visto tutti [e] per la strada.
have.1Sg seen all on the street
b. #Ho venduto tutti [e].
have.1Sg sold all
c. #Ho riflettuto su tutti [e].
have.1Sg thought about all

In conclusion, interpretive considerations lead us to assume that the internal argument of the quantifier is the DP, not the PP.

The different interpretations that arise in the presence and absence of *ne* in (35–37) and (109–114) can be captured only if a different empty category is assumed. The trace of *ne* can resume any kind of noun phrase. The preverbal subject position allows the licensing of a null subject in Italian that can resume any kind of noun phrase. In other positions, Italian only allows the human reference of arbitrary *pro*. In section 4 we give other reasons to suppose that quantitative *ne* is never the clitic counterpart of the partitive PP *di loro*.

3.3 A bare phrase structure for QP

Up to now we have established that all quantifiers select a quantitative DP that realizes their restriction, and that some quantifiers also select a partitive PP that realizes the set out of which such a restriction is picked.

As for existential quantifiers, this was already represented in structure (55). However, (55) is incompatible with recent approaches to phrase structure, such as the bare phrase structure hypothesis of Chomsky (1995c) and the anti-symmetry hypothesis of Kayne (1994). In this line of research, (55) can be rephrased as follows. Starting with the QP structure in (122a), the head Q and the DP are raised to a projection above QP which we call AgrQP (122b). In [Spec, AgrQP], the DP checks Case and phi-features. The head Q is further raised to F, as shown in (122c):

(122) a. $[_{QP}$ PP $[_{Q'}$ Q DP]]
b. $[_{AgrQP}$ DP Q $[_{QP}$ PP $[_{Q'}$ ~~Q~~ ~~DP~~]]]
c. $[_{FP}$ $[_{F'}$ Q $[_{AgrQP}$ DP ~~Q~~ $[_{QP}$ PP $[_{Q'}$ ~~Q~~ ~~DP~~]]]]]

The same structure and derivation hold for distributive quantifiers such as *ogni/ognuno* and *ciascun/ciascuno* ('each'). In addition to the DP and the PP, distributive quantifiers select a distributive operator (OP), which we take to be directly merged in [Spec, FP] for the sake of simplicity:[16]

(123) a. $[_{QP}$ PP $[_{Q'}$ Q DP]]
b. $[_{AgrQP}$ DP Q $[_{QP}$ PP $[_{Q'}$ ~~Q~~ ~~DP~~]]]
c. $[_{FP}$ OP $[_{F'}$ Q $[_{AgrQP}$ DP ~~Q~~ $[_{QP}$ PP $[_{Q'}$ ~~Q~~ ~~DP~~]]]]]

In the discussion of (100) we observed that universal quantifiers do not select a partitive PP. The initial structure is (124a). To capture the fact that with these

quantifiers the restriction coincides with the set, we propose that the DP moves to [Spec, QP], which is the locus of the projection of the set, as in (124b). The quantifier also moves to AgrQP for checking reasons. In (124c), the DP moves to [Spec, AgrQP] in order to check phi-features, and the head Q is further raised to F.

(124) a. $[_{QP}\ \ [_{Q'}$ Q DP]]
b. $[_{AgrQP}$ Q $[_{QP}$ DP $[_{Q'}$ ~~Q~~ ~~DP~~]]]
c. $[_{FP}\ [_{F'}$ Q $[_{AgrQP}$ DP ~~Q~~ $[_{QP}$ ~~DP~~ $[_{Q'}$ ~~Q~~ ~~DP~~]]]]]

We now consider in detail the checking properties of these parallel structures and some of their consequences.

3.3.1 Partitive case

In configurations (122b) and (123b), the DP complement of existential and distributive quantifiers checks partitive case in [Spec, AgrQP]. Two observations support this proposal: the genitive morphology on the clitic that binds the quantitative DP (Italian *ne*, French *en*) and the preposition *di*/*de*, generally realizing genitive case, which occurs with the quantitative DP in certain cases (see section 3.3.3). Consider an existential quantifier in (125).

(125) Di ragazzi, ne ho visti molti.
of boys, NE have.1Sg seen many

Partitive *ne* does not surface with distributive quantifiers. In this case, however, we maintain the assignment of partitive case by the quantifier and relate the ungrammaticality of (126) to the presence of the distributive OP(erator) in [Spec, FP], which blocks extraction of the quantitative DP:

(126) a. *Ne ho visti/o ogni/ognuno/ciascuno.
NE have.1Sg seen each
b. *Di ragazzi (ne) ho visto ognuno/ciascuno.
of boys NE have.1Sg seen each

Partitive case does not surface with universal quantifiers either. These quantifiers never co-occur with the clitic pronoun *ne*, neither does their DP complement ever appear with the preposition *di*, as shown in (127).[17]

(127) a. *Ne ho visti tutti.
NE have.1Sg seen all
b. *Di ragazzi (ne) ho visto/i tutti.
of boys NE have.1Sg seen all

We interpret the inability to assign partitive as the result of the semantics of universal quantifiers that do not have the function to relate a subset to a set. As

a matter of fact, the subset expressed by the restriction and the set out of which the restriction is picked coincide for universal quantifiers.

Since the quantifier is traditionally considered as a modifier of the noun phrase, the proposal that it assigns Case is not straightforward and deserves some further discussion.[18] In our proposal, the quantifier is assumed to be a lexical head with its own selectional features. From this point of view, nothing prevents it from assigning Case to its complement DP.

It has often been noticed in the literature that in some languages it is possible to find a correlation between definiteness/specificity and Case. Belletti (1988), for example, claims that transitive and unaccusative verbs can assign partitive case to their internal argument position, provided that the internal argument is indefinite. Enç (1991) argues that in Turkish, specificity is marked on noun phrases in object position with accusative case, while non-specific noun phrases in object position have no case marking at all. Kornfilt (1996) argues that in Turkish some instances of ablative case can be analyzed as the realization of (abstract) partitive case. Furthermore, Kiparsky (1998) also shows that (in)definiteness of the arguments and aspect of the predicate are strictly related and the assignment of a particular case marking is often only one side of the strategy, the other side being the surfacing of an aspect marker on the predicate.

Our proposal that the apparent genitive case morphology that we find on the quantitative DP in different constructions realizes partitive case is consistent with this line of research. We do not enter the discussion here whether partitive is a structural or an inherent Case (see Belletti 1988). However, in our proposal partitive case is assigned structurally by quantifiers of the existential and distributive class, and not by other quantifiers. We keep to the observation that (abstract) partitive case is universally found across languages and realized in various ways according to the morphological systems of noun phrases and even verb phrases in different languages.

3.3.2 Agreement

Case checking and phi-feature checking often go together, as is the case for subject DPs. While checking partitive case, the quantitative DP agrees with the quantifier, which is endowed with number and gender features. This results in the three patterns in (128):

(128) **Agreement patterns arising with quantifiers:**
- a. plural agreement in the case of [+count] nouns in the complement of cardinals and vague numerals (*three books*, *many books*, *some books*);
- b. singular agreement in the case of [+count] nouns in the complement of the cardinal *one* (*one book*), the vague numeral *some* (*some book*), and distributive quantifiers (*each book*);
- c. singular agreement with all [–count] nouns (*some wine*).

As a matter of fact, agreement between the quantifier and its internal argument is not overt in all contexts. In the Hebrew examples in (56a) and (57a) the quantifier

is invariable when it precedes its complement. But when the complement is moved out, it agrees with it, as in (56b) and (57b).

A different situation is provided by the Turkish examples in (129), where the quantitative DP has no number features.[19]

(129) a. Iki kız-ı tanıyordum.
two girl-Acc knew.1Sg
b. Iki kız tanıyordum.
two girl knew.1Sg
'I knew two girls.'

Enç (1991) shows that in Turkish, the quantifier can take a specific DP in accusative (129a) or a non-specific DP marked with no case morphology (129b). In neither case the number of the quantifier percolates onto the DP. The reference of the DP is plural nonetheless, as shown in the left-dislocated structure (130):

(130) Kız lar dan iki sin i tanıyordum.
girl Pl Abl two Agr Acc knew.1Sg

Notice that in (130) the quantifier displays case and agreement morphology since its internal argument is non-overt, parallel to Hebrew (56b) and (57b) above.

3.3.3 Partitive case realized by di/de

In French, the preposition *de* surfaces with a certain class of quantifiers including *beaucoup*, *peu*, and *combien*, which are invariable:

(131) a. J'ai vu beaucoup *(de) filles.
I have seen many of girls
b. J'ai vu plusieurs (*de) filles.
I have seen many (*of) girls

We suggest that quantifiers like *beaucoup*, having no inflectional morphology, cannot enter an agreement relation with the quantitative DP. The partitive case checked by the DP in [Spec, AgrP] must be realized by the preposition *de* (for a different analysis, see Battye 1987).

In the examples at (63) we saw an instance of non-agreeing quantifiers in English, which looks like an exception to condition (128a). The lack of agreement in these cases is reminiscent of the cases of *beaucoup* in (131). These quite exceptional English cases can be analyzed in a way similar to French *beaucoup*. Although in Italian we do not have invariable quantifiers like *beaucoup*, we observe a comparable situation in (132). The preposition *di*, which optionally occurs with the predicative adjectives stranded by *ne* cliticization, as in (132a) (cf. section 4.2), becomes obligatory with a non-overt quantifier, as in (132b):

(132) a. Ne conosco due (di) simpatici.
NE know.1Sg two (of) nice
a. Ne conosco Ø *(di) simpatici.
NE know.1Sg [some] (of) nice

The presence of the overt quantifier makes the case visible in (132a), where *di* is optional. The non-overt quantifier, on the contrary, cannot make the partitive case visible in (132b), where *di* is required.

An empty quantifier can also be assumed in the case of the so-called partitive determiner in Italian and French (see Casadio 1995 and Chierchia 1997a):

(133) a. Ho letto Ø dei libri.
b. J'ai lu Ø des livres.
I have read of-the books
'I read some books.'

The fact that the quantifier is empty makes it necessary for partitive case to be spelled out as *di/de*. *Di/de* take the agreeing form *dei/des* in order to spell-out all phi-features. This is not necessary in other contexts, where the presence of the clitic *ne* guarantees that phi-features are spelled out, as testified by agreement on the past participle (cf. *Di/*dei ragazzi*, *ne ho visti* 'of/*of-the boys NE have.1Sg seen').

Another case in which the preposition *di/de* is required in Italian and French is when the quantitative DP is left- or right-dislocated.[20]

(134) a. Di ragazzi, ne ho visti molti.
b. Ne ho visti molti, di ragazzi.
of boys, NE have.1Sg seen many

(135) a. De filles, j'en ai vu plusieures.
b. J'en ai vu plusieures, de filles.
of girls, NE have.1Sg seen many

In (134) and (135) the quantifier is present but the relation to the left-dislocated DP is not local. This is the reasons for the obligatory insertion of *di/de*. As above, the preposition makes partitive Case visible.

3.3.4 The lexical non-distinctness requirement on DP and PP

In the discussion at (105) we observed that the lexical N in the quantitative DP is non-distinct from the lexical N in the partitive PP. We took this to be the result of the fact that the DP realizes the restriction (variable) of the quantifier and the PP realizes the set (range) out of which this restriction is picked. The lexical items that realize the restriction and the set must be lexically identical for reasons that are not logically necessary since the same requirement does not hold for adjunct partitive PPs (cf. (106)).

(136) a. Ho letto molti *libri* dei *libri* che mi avevi
b. *Ho letto molti *romanzi* dei *libri* che mi avevi
have.1Sg read many books/*novels of-the books that to-me had.2Sg
consigliato.
consigliato.
recommended

The fact that this property appears quite generally across languages leads us to assume that the lexical non-distinctness requirement is a UG principle. According to this requirement, the variable and the range must be non-distinct in their lexical content, which we take to be structurally realized at the NP-level. The variable and the range can differ in their functional structure, where phi-features (basically number), Case, and referential features are projected. As for number features, this has been shown in (115) and (116). As for Case features, we have claimed that the quantitative DP checks Case according to the properties of the quantifier. The partitive PP is selected by the quantifier, but it receives an oblique case assigned by the preposition. As for the referential properties, the variable does not refer, by definition, while the set, which is generally definite,[21] can be D-linked or non-D-linked in the sense of Pesetsky (1987a).

The non-distinctness requirement is a particular kind of co-indexing, which certainly plays a role in the licensing of silent elements in DPs and PPs.[22] We now consider some possible cases of empty categories in quantified noun phrases. When the DP is null and the PP is overt, the NP inside DP is interpreted as non-distinct from the overt NP inside the PP (*libro*); the number is recovered by agreement with the quantifier (plural in (137a), singular in (137b)); (partitive) case is independently assigned by the quantifier:[23]

(137) a. molti [e] dei libri/ di quei libri
many of-the books/ of those books
b. uno [e] dei libri/ di quei libri
one of those books/ of those books

When the DP is overt and the PP is null, the NP inside the PP is interpreted as non-distinct from the NP inside the DP. The number is plural for count nouns or singular for mass nouns, due to the partitive constraint or any version of it (see n. 21). The referential properties of the PP must be either recovered from the context (*many books* can mean 'many books among those that are relevant in the context'), or left undetermined (*many books* can mean 'many books in general'). In the former case, we take the empty partitive PP to be D-linked. In the latter case, we take the empty partitive PP to be non-D-linked.

When both the DP and the PP are null, neither NP is realized and the lexical features must be recovered from the context. As a consequence, the interpretation is different depending on the position occupied by the quantified noun phrase, as also observed in section 3.2. When the QP occupies the subject position, it agrees with the predicate. IP-agreement in Italian allows a null pronoun *pro*. The partitive PP also contains a *pro* with the same features; it can be D-linked or not.

(138) a. Molti [e] [e] sono troppo costosi.
many are too expensive
b. Molte [e] [e] non sanno che . . .
many-Fem.Pl don't know that . . .

In (138a) we see the case of *molti* inflected for masculine plural features. A masculine plural referent must be available from the context. Take, for example, *libri* ('books'). In (138b) a feminine plural referent must be available from the context, e.g., *ragazze* ('girls').

When the QP occupies the object position, as in (139), as well as the postverbal subject position seen in (111–113), the interpretation is limited to human beings. This is due to the fact that in these positions the features of the NP cannot be recovered in Italian and the only possible feature to be attributed to *pro* is the arbitrary human feature (see section 3.2).

(139) a. Ieri ho incontrato molti [e] [e] per la strada.
yesterday have.1Sg met many [people] on the street
b. *Ieri ho letto molti [e] [e] in biblioteca.
yesterday have.1Sg read many [things] in the library

The arbitrary feature is incompatible with D-linking, and the PP can be interpreted only as non-D-linked.

Let us now consider the cases in which only the NP inside the PP is null, but the functional features of either complement are realized. When the DP is overt, the phrase embedded in the partitive PP usually has an empty NP. It can contain a demonstrative and can be modified by a relative clause; in all cases the NP is non-distinct from the NP in the restriction, (140a). If it contains a lexical NP, the result is a redundant construction (140b) (cf. (105)).

(140) a. molti libri di quelli [e] che mi hai consigliato
many books of those that to-me have.2Sg recommended
b. #molti libri dei libri che mi hai consigliato
many books of-the books that [you] to-me have.2Sg recommended

When the DP is realized by *ne*, the partitive PP always contains a pronoun: a demonstrative pronoun, such as *quelli* in (141a) and *questi* in (141b), a focused personal pronoun such as *loro* in (141c), or a relative pronoun such as *cui* in (141d) (also see French (33b, c)).[24]

(141) a. Ne ho letti molti di quelli (che mi hai consigliato).
NE have.1Sg read many of those (that to-me have.2Sg recommended)
b. Ne ho letti molti di questi qui.
NE have.1Sg read many of these here
c. Ne ho visti molti di LORO, non di voi.
NE have.1Sg seen many of them, not of you

d. Quei libri di linguistica, di cui Mario ne ha letti molti,
those books of linguistics, of which Mario NE has read many,
erano piuttosto interessanti.
were very interesting

The focus on the personal pronoun in (141c) guarantees that the PP *di LORO* is not right-dislocated. Right dislocation of the partitive PP is always possible. In that case the PP inside the QP structure is simply empty and interpreted with the features of the right-dislocated overt PP.[25]

When the DP is realized by *ne*, the PP cannot contain a lexical NP. The lexical NP in (142) is excluded by principle C of Binding Theory, since it is co-indexed with and c-commanded by *ne*:

(142) a. *Ne ho letti molti dei libri (che mi hai consigliato).
b. *Ne ho letti molti di quei libri (che mi hai consigliato).
NE have.1Sg read many of-the/of those books (that to-me have.2Sg advised)

In conclusion, the different realization and interpretations of the quantified phrases in (137–142) derive straightforwardly from the assumption that the two arguments of the quantifier are always projected and from the assumption of the non-distinctness requirement, which allows the interpretation of empty elements through a partial co-indexing.

3.3.5 Extraction out of QP

One of the crucial reasons for assuming that Q is a head external to the DP is the fact that these two elements can occur discontinuously, and that the DP appears to move out of a specifier of the Q projection. We observed some cases across languages in (56–62). The configuration in (122) provides such a Specifier position in [Spec, FP], as shown in (122d). The DP can further move out of the FP, as in (122e):

(122) d. $[_{FP}$ DP $[_{F'}$ Q $[_{AgrQP}$ ~~DP~~ [~~Q~~ $[_{QP}$ (PP) $[_{Q'}$ ~~Q~~ ~~DP~~]]]]]]
e. DP . . . $[_{FP}$ ~~DP~~ $[_{F'}$ Q $[_{AgrQP}$ ~~DP~~ [~~Q~~ $[_{QP}$ (PP) $[_{Q'}$ ~~Q~~ ~~DP~~]]]]]]

The trigger of overt DP-movement to and through [Spec, FP] is different across languages. It can be movement to the subject position in search of Case. This can take place only out of universal quantifiers, which do not assign Case to their complement DP. The complement of existential and distributive quantifiers cannot move to a nominative-case-assignment position, since it checks partitive case QP-internally (see section 3.3.1). This explains the contrasts in (143):[26]

(143) a. The boys have all eaten a sandwich.
b. I ragazzi hanno tutti mangiato un panino.
c. *Boys have many eaten a sandwich.

d. *Ragazzi hanno molti mangiato un panino.
e. *Boy has each eaten a sandwich.
f. *Ragazzo ha ciascuno mangiato un panino.

The ungrammaticality of (143d) cannot be reduced to the Italian property of not allowing indefinite subjects in preverbal subject position, since the same pattern is found in English (143c).

We take [Spec, FP] to be the intermediate position for movement out of the quantified phrase. Like the derivation of all other clitic pronouns, *ne*-cliticization can be decomposed into two steps: XP movement followed by X^0-movement (Sportiche 1990; Cardinaletti and Starke 1999: section 6.3). *Ne* is first moved as an XP (DP) to the specifier of AgrQP. In so doing, *ne*, which does not have intrinsic phi-features, receives the phi-features of the quantifier (see Belletti and Rizzi 1996b: 18) (for the agreement between Q and the quantitative DP, see sections 3.2 and 3.3.2 above).[27] *Ne* further moves through [Spec, FP] and through the specifier of the past participle, which triggers agreement on the past participle (see (176a)) (see Kayne 1989a).

Clitic extraction is possible only out of universal quantifiers, which do not assign Case but agree with their complement for phi-features, and existential quantifiers, which assign partitive case to their complement and agree for phi-features. The complement of the distributive quantifier cannot be extracted because of the blocking effect of the distributive operator in [Spec, FP] (see section 3.3.1).

(144) a. Li ho mangiati tutti.
them have.1Sg eaten all
b. Ne ho mangiati molti
NE have.1Sg eaten many
c. *Lo/*Ne ho mangiato ciascuno
it/NE have.1Sg eaten each

In conclusion, [Spec, FP] is a sort of A'-position that functions as an escape hatch for extractions out of quantified noun phrases and hosts material relevant for interpretive procedures which are supposed to take place at LF.[28]

3.4 'Intransitive' quantifiers

Quantified noun phrases can be 'pronominal' in two ways. Quantifiers can embed a covert DP, provided that it is licensed somehow (see section 3.3.4). A second type of 'pronominal' quantifier is that which never appears with a DP, such as *something*, *somebody* in English. In section 2.3.1 we argued against an analysis of the morphemes *-thing* and *-body* as Ns that incorporate to D in the syntax. In our framework, an analysis in terms of N to Q is to be excluded for the same reasons. In the spirit of what we have proposed so far, we consider these quantifiers as 'intransitive', i.e., as not projecting any argument at all, on a

par with (personal) pronouns. The only way these quantifiers can be modified is through predication. This analysis captures the following facts.

In English, the adjectives that modify intransitive quantifiers appear postnominally (145a, b) and can only be those that can appear in predicative position (cf. the contrast between (145a, b) and (145c, d)). Furthermore, intransitive quantifiers combine with *else*, which cannot occur as a prenominal adjective and cannot combine with *other*, which appears prenominally. See the paradigm in (146).

(145) a. I met somebody nice.
b. I bought something good.
c. *I met somebody principal/main.
d. *I must do something principal/main.

(146) a. I saw somebody/something else.
b. *I saw somebody/something other.
c. I saw some other boy/book.
d. *I saw some else boy/book.

Similar arguments can be built for Italian. The adjectives that appear with intransitive Qs can only be those that appear in predicative position (see (147a, b) and (147c); cf. also (47)). Furthermore, they are preceded by *di*, as are predicative adjectives 'floated' from quantified noun phrases with a bare Q (cf. section 3.3.3, example (132)).

(147) a. Ho incontrato qualcuno di importante.
have.1Sg met someone of important
b. Ho mangiato qualcosa di buono.
have.1Sg eaten something of good
c. *Ho visto qualcuno/qualcosa di principale.
have.1Sg seen someone/something of principal

Notice that the occurrence of *di* is obligatory with *qualcosa* (compare (147b) with **Ho mangiato qualcosa buono*), but it is optional with *qualcuno* (compare (147a) with *Ho incontrato qualcuno importante*). (We thank Roberto Zamparelli for pointing this out to us.) This is because intransitive *qualcuno* (but not *qualcosa*) is homophonous with the allomorph *qualcuno* of the quantifier *qualche*, which is found when the argument of the quantifier *qualche* is realized by the clitic pronoun *ne* or by a null DP:

(148) a. Ho letto qualche libro.
have.1Sg read some book
b. Ne ho letto qualcuno [*t*] (di quelli).
NE have.1Sg read some (of those)
c. Ho letto qualcuno [e] di quei libri.
have.1Sg read some of those books

The two instances of *qualcuno* should be kept separate. Intransitive *qualcuno* can only have [+human] referents (on a par with English *somebody* and *someone*), while the allomorph *qualcuno* of *qualche* is also compatible with [–human] referents, such as *book* in (148b, c).

The ambiguous status of *qualcuno* can explain the distribution of *di* in front of predicative adjectives. When *di* on the adjective is present, as in (147a), we have an instance of the intransitive quantifier *qualcuno*; when *di* on the adjective is absent, we have an instance of the quantifier *qualche* with an empty DP, as in (148c). The two structures are provided in (149):

(149) a. Ho incontrato qualcuno di importante.
have.1Sg met someone of important
b. Ho incontrato qualcuno [e] importante.
have.1Sg met someone important

3.5 Conclusions

In this section we have offered a proposal that can capture the various syntactic phenomena that arise with quantified constructions across languages by refining Cardinaletti and Giusti's (1992) and Giusti's (1991a) original proposals on the structure of quantified noun phrases.

We have proposed that a quantifier Q is a lexical head that projects a QP inside which its arguments are merged. Q further projects an intermediate functional projection (AgrP) where the internal argument agrees with Q and checks partitive Case (if Q has such a property). Finally, Q projects a second functional projection (FP) whose Spec is the locus of the interpretation of the entire quantified construction as well as an escape hatch for movement out of the quantified noun phrase.

4 The syntax of quantitative clitics

In this section we focus on quantitative clitics. As we have done with the structure of quantified phrases earlier, we start with a presentation of various proposals that have been made in the course of the last thirty years.[29] First, we discuss whether *ne* is a non-maximal (N′) or a maximal category. The conclusion will be that *ne* is a maximal projection. Three competing analyses of this maximal projection are considered: NP, PP, and DP. We show that the latter analysis is to be preferred over the others.

4.1 Quantitative clitics as N′

Ruwet (1972: 49–50) and Milner (1978b: 49) are the first authors who differentiate quantitative *en* from prepositional *en*. Quantitative *en* cannot be extracted out of a QP occurring in subject position, while this is possible for genitive *en*.

(150) a. Deux/beaucoup de cheminées sont penchées.
two/many of chimneys are leaning
b. *Deux/*beaucoup en sont penchées.
two/many EN are leaning

(151) a. La cheminée de l'usine est penchée.
the chimney of the factory is leaning
b. La cheminée en est penchée.

Quantitative *en* can apparently resume both a definite and an indefinite noun phrase, while genitive *en* can only pronominalize a definite noun phrase (Milner 1978b: 49–50).

(152) a. Les/des livres de Zola, j'en ai lu deux.
the/some books by Zola I EN have read two
b. Ce/*un livre de Zola, j'en ai lu la fin avec plaisir.
this/a book by Zola I EN have read the end with pleasure

On the basis of the differences between quantitative and genitive *en*, Milner (1978b) suggests that the former is an N', while the latter is a maximal projection (N").

Assuming a Simple Noun Phrase Hypothesis as in Selkirk (1977), Belletti and Rizzi (1981) treat Italian *ne* as an N' as well (cf. section 2.2). *Ne* pronominalizes the head noun and its complements, while the quantifier remains in place.

(153) a. Maria conosce tre racconti del nonno.
Maria knows three stories of grandpa
b. Maria ne conosce tre.
Maria NE knows three

A second argument for the N'-status of *ne* is discussed by Rizzi (1979) and has already been mentioned in (40). Assuming a structure like (41) where prenominal APs are under N' and postnominal APs are under N", Rizzi shows that prenominal adjectives cannot be stranded by *ne* cliticization, as shown by the contrast in (154).

(154) a. Ho letto un lunghissimo libro.
b. Ho letto un libro lunghissimo.
have.1Sg read a very-long book
c. *Ne ho letto un lunghissimo.
d. Ne ho letto uno lunghissimo.

In (154c) the adjective must be prenominal, on a par with (154a), since in both cases the quantifier has the reduced form *un*. In (154d) the adjective must be

analyzed as postnominal, since the quantifier displays the full form *uno*, which also appears when the quantifier is bare, as in *Ne ho letto uno* '[I] NE have read one'. According to Rizzi, the contrast between (154c) and (154d) can be explained by assuming that *ne* is an N' and that those elements that are external to N' can be left in place by *ne*-cliticization.

Rizzi's observations are confirmed by the behavior of other kinds of adjective. While in the case of a full NP, the AP can be either prenominal or postnominal, when *ne*-cliticization applies only postnominal adjectives can appear. This is most apparent in the case of adjectives such as *mero* in (155) and *certo* in (156). *Mero* can appear only prenominally and is ungrammatical when *ne*-cliticization applies. *Certo* has a different interpretation according to the position it occupies; in the *ne*-construction, it only has the postnominal interpretation.

(155) a. Si è fatta una mera illusione.
had.3SgFem a mere illusion
b. *Si è fatta una illusione mera.
c. *Se ne è fatta una mera.

(156) a. Hanno dato una certa notizia
have.3Pl given a certain (=particular) piece of news
b. Hanno dato una notizia certa
have.3Pl given a piece of news certain (=sure)
c. Ne hanno data una certa
NE have.3Pl given one certain (=sure)

Despite the reasons seen so far, the N'-analysis of *ne* is not without problems. At the theoretical level, *ne* would represent the only instance of X'-movement. At the empirical level, this analysis encounters problems when different classes of modifiers and arguments of the noun are taken into account.

As noticed by Cinque (1991: 122), postnominal adjectives like *principale* cannot be stranded by *ne*-cliticization. The ungrammaticality of (157c) is unexpected in the analysis in (41) above, unless we assume that *principale*, contrary to other postnominal adjectives, is generated under N'.

(157) a. Gianni ha due ragioni principali per non accettare quel posto.
Gianni has two reasons main to not accept that position
b. *Gianni ha due principali ragioni per non accettare quel posto.
c. *Di ragioni, Gianni ne ha due principali per non accettare quel posto.
of reasons Gianni NE has two main to not accept that position

Another problem for the N'-analysis of *ne* is represented by the arguments of the noun that can be left in situ under *ne*-cliticization. In addition to (153b) and (158), where *ne* stands for both the head noun and its complement, the sentences in (159) are also possible.

(158) a. Di ritratti di mio nonno, ne possiedo due.
b. Di ritratti di Picasso, ne possiedo due.
c. Di ritratti di quel collezionista, ne possiedo due.
of pictures of my grandpa/Picasso/that collectionist NE have.1Sg two

(159) a. Di ritratti, ne possiedo due di mio nonno.
b. Di ritratti, ne possiedo due di Picasso.
c. Di ritratti, ne possiedo due di quel collezionista.
of pictures NE have.1Sg two [e] of my grandpa/Picasso/that collectionist

As shown by Giorgi and Longobardi (1991), the arguments of the noun occupy different structural positions inside the NP depending on their theta-role.

(160) $[_{NP}$ Spec $[_{N'''}[_{N''}[_{N'}$ N^0 internal argument] agent] possessor]]

The apparent possibility of leaving any argument of the noun stranded could lead us to the assumption that *ne* can resume any projection of N, from N^0 to N'''. It is theoretically undesirable that a lexical item stands for different projectional levels. More seriously, the fact that *ne* can stand for the head noun mars the argument built on the non-occurrence of prenominal adjectives with *ne*, seen above in (154), (155), and (156).

4.2 Quantitative clitics as maximal projections

Both problems can be solved by assuming that the quantitative clitic pronoun *ne*, like other clitic pronouns, binds a maximal projection. This proposal is a natural consequence of the hypothesis that quantified nominals are QPs that embed a maximal projection.

The cases in which *ne* seems to bind an intermediate projection of N must be analyzed otherwise. Cinque (1991) and Cardinaletti and Giusti (1992) suggest that the material left in place by *ne*-cliticization is a modifier of the noun phrase, occurring in a postnominal predicative position. Among adjectives, only those that can occur in predicative position can appear in *ne*-constructions (cf. (155) and (156)).

(161) a. *Questa illusione è mera.
this illusion is mere
b. *Ritengo questa illusione mera.
consider.1Sg this illusion mere

(162) a. Questa notizia è certa.
this piece of news is certain (=sure)
b. Ritengo questa notizia certa.
consider.1Sg this piece of news certain (=sure)

This solves the paradox built by the data with the adjective *principale*; it cannot occur with *ne*, as shown in (157c), nor can it appear in predicative constructions:

(163) a. *Le due ragioni di Gianni per non accettare quel posto sono principali.
the two reasons of Gianni not to accept that position are principal
b. *Ritengo questo argomento principale.
consider.1Sg this topic principal

The same proposal should be made for the apparent arguments of the noun in (159) above. They must be considered modifiers of the noun, occurring in the postnominal predicative position. The prediction that they also enter predicative constructions is borne out.

(164) a. Quel ritratto è di mio nonno.
b. Quel ritratto è di Picasso.
c. Quel ritratto è di quel collezionista.
that portrait is of my grandpa/Picasso/that collectionist

The complements that cannot occur as predicates are also ungrammatical with *ne*, as noted by Cinque (1991: 121–122).

(165) a. *Quello studioso è del Petrarca.
that scholar is of Petrarca
b. *Quell'esperto è in microprocessori.
that expert is in microprocessors
c. *Quel ladro era di galline.
that thief was of chickens

(166) a. *Di studiosi, ne stimano anche uno del Petrarca.
of scholars NE estimate.3Pl also one of-the Petrarca
b. *Di esperti, ne hanno assunto uno in microprocessori.
of experts NE have.3Pl hired one in microprocessors
c. *Di ladri, ne hanno preso uno di galline.
of thieves NE have.3Pl caught one of chickens

Cardinaletti and Giusti (1992) also show that a complement clause such as *di risolvere il problema* in (167a) cannot appear as a predicate (167b) and cannot be left stranded by *ne* cliticization (see (167c) vs. (167d)):[30]

(167) a. Ci sono due modi di risolvere il problema.
there are two ways to solve the problem
b. *Questo modo è di risolvere il problema.
this way is to solve the problem

c. *Di modi, ce ne sono due di risolvere il problema.
d. Di modi di risolvere il problema, ce ne sono due.
of ways to solve the problem there NE are two

In conclusion, quantitative clitics bind a maximal projection, not an N'. In what follows we discuss the categorial status of this maximal projection.

4.3 *On the nature of the maximal projection bound by quantitative clitics*

4.3.1 Quantitative clitics as PPs

Contrary to Ruwet (1972) and Milner (1978b) (see section 4.1), Kayne (1975) takes French quantitative *en* to be a prepositional clitic. The argument for this proposal is the fact that *en*, contrary to the nominal object clitics *le/la/les* and parallel to prepositional clitics, is invariable, as shown in (168), and does not trigger past-participle agreement, as shown in (169).[31]

(168) a. Elle le/la/les voit.
she him/her/them sees
b. Il en parle tout le temps, de sa maison/de son travail/de ses problèmes.
he EN speaks all the time of his house/of his work/of his problems
c. Paul a deux sœurs/frères; j'en ai trois.
Paul has two sisters/brothers; I EN have three

(169) a. On l' a mise sur la table (la fourchette).
one it has put-Fem.Sg on the table the fork
one EN has put on the table some forks
b. Il en a parlé(*e) tout le temps, de sa maison.
he EN has spoken (*Fem.Sg) all the time of his house
c. *On en a mises sur la table (des fourchettes).
one EN has put-Fem.Pl on the table some forks
d. On en a mis sur la table (des fourchettes).

Assuming that quantified noun phrases have the underlying form *deux de soeurs*, Kayne (1975) suggests that quantitative *en* pronominalizes the complement *de soeurs*, or more precisely, its pronominal counterpart *de elles*.[32]

Belletti (1979: section 5.3) assumes a similar analysis for Italian *ne*. *Ne* stands for the partitive phrase introduced by *di*. The proposal that *ne* is a prepositional clitic has the advantage of unifying quantitative *ne* with the non-quantitative instances of *ne*, which stand for PPs introduced by *di* (170) or *da* (171). These PPs can be complements to verbs, nouns, and prepositions.

(170) a. Ne ho parlato. (ne = del progetto)
NE have.1Sg spoken (NE = of-the project)
b. Ne ho comprato un ritratto. (ne = della regina)
NE have.1Sg bought a picture (NE = of-the queen)
c. Ne sono rimasto senza. (ne = sigarette)
NE am left without (NE = cigarettes)

(171) a. Ne uscì un uomo. (ne = dalla casa)
NE came out a man (NE = from-the house)
b. Amava Maria e ne era riamato. (ne = da Maria)
loved.3SgMasc Maria and NE was loved back (NE = by Maria)
c. Ne sono finalmente fuori. (ne = da questo incubo)
NE am finally out (NE = of this nightmare)

As in French, Italian quantitative *ne* differs from accusative clitics (172a) and patterns with prepositional *ne* (172b) in that it is invariable. Example (172c) shows that *ne* is not specified for gender; (173) further shows that *ne* is invariable for number: it is compatible with both a singular and a plural left-dislocated noun phrase.[33]

(172) a. Paolo lo/la/li/le detesta.
Paolo him/her/them.Fem/them.Masc hates
b. Ne parla sempre,
NE speaks.3SgMasc
della sua casa/del suo lavoro/dei suoi problemi/delle sue amiche.
of his house/of his work/of his problems/of his girlfriends always
c. Paolo ha due sorelle/fratelli; io ne ho tre.
Paolo has two sisters/brothers I NE have three

(173) a. Di libro, ne ho letto uno.
of book NE have.1Sg read one
b. Di libri, ne ho letto uno.
of books NE have.1Sg read one

If *ne* is a PP that stands for *de elles/di loro*, it pronominalizes the partitive PP complement of Q. But we have argued that *en/ne* binds the quantitative DP and is not the clitic counterpart of the strong pronoun *de elles/di loro* which only realizes the partitive PP. In what follows, we discuss more evidence to show that a PP analysis of quantitative clitics is inadequate.

4.3.2 Quantitative clitics as DPs

Quantitative *en/ne* can co-occur with the PP complement of Q (see (33) and (96b)). This is unexpected if *ne* is a partitive PP:

(174) a. J'en ai lu beaucoup *t* de ceux que tu m'as recommandés.
I EN have read many of those that you to-me have advised
b. Ne ho letti molti *t* di quelli che mi hai consigliato.
NE have.1Sg read many of those that to-me have.2Sg recommended

Second, quantitative *ne* behaves like DPs but unlike PPs in left-dislocation structures. It obligatorily resumes a left-dislocated phrase, as happens with DPs but not with PPs, which are only optionally resumed by a clitic.

(175) a. Di ragazzi francesi, *(ne) ho conosciuti molti.
of boys French, NE have.1Sg met many
b. I ragazzi francesi, *(li) ho conosciuti.
the boys French, them have.1Sg met
c. Di questo libro, (ne) hanno parlato molto bene.
of this book, NE have.3Sg spoken very well
d. Con Maria, (ci) ho parlato ieri.
with Maria, CI have.1Sg spoken yesterday

Third, quantitative *ne* triggers agreement on the past participle, on a par with object clitics and differently from prepositional clitics, including non-quantitative *ne* (in this respect, Italian quantitative *ne* differs from French *en*, see section 4.3.1).

(176) a. Ne ho conosciut*o/i/e
NE have.1Sg met-Masc.Sg/-Masc.Pl./-Fem.Pl
molti/e.
manyMasc.Pl/many-Fem.Pl
b. Li ho conosciut*o/i.
them-Masc.Pl have.1Sg met-Masc.Sg/-Masc.Pl
c. Ne hanno parlato/*a/*i/*e
NE have.3Pl spoken-Masc.Sg/-Fem.Sg/-Masc.Pl/-Fem.Pl.
molto bene.
very well
d. Ci ho parlato/*a/*i/*e
with him/her/them have.1Sg spoken-Masc.Sg/-Fem.Sg/-Masc.Pl/-Fem.Pl
ieri.
yesterday

If accusative object clitics are DPs, the parallel behavior of (175a) and (175b) on the one hand and (176a) and (176b) on the other can be captured by suggesting that *ne* is a DP (Cardinaletti and Giusti 1992). In conclusion, *ne* is the clitic form of the quantitative DP. It is a syncretic form which stands for any number and gender, like the dative DP clitic *gli* in colloquial Italian, which stands for any gender and number (*Gli ho parlato ieri* [I] to him/to her/to them have spoken yesterday). This conclusion can be extended to French *en*. In this view, the contrasts in (168) and (172) are not arguments against a DP analysis of quantitative clitics.

The fact that French *en* does not trigger past-participle agreement (see (169)) can then no longer be considered as an argument for its PP status. It can be explained along the lines suggested by Belletti and Rizzi (1996b: 18). The difference between Italian and French with respect to past-participle agreement with quantitative clitics is the result of a parametric choice: Italian *ne* can contain phi-features, while French *en* cannot. While moving through [Spec, QP] (see n. 27), Italian *ne* can receive the phi-features of the quantifier, and the successive movement through the specifier of the past-participle projection triggers agreement on the past participle. The derivation of French *en* is the same, the only difference being that *en* cannot inherit the features of the quantifier while moving through [Spec, QP].

4.3.3 Quantitative clitics as NPs

There are, however, two respects in which *ne* differs from accusative and dative object clitics, namely, binding properties and co-occurrence with relative clauses. These properties have led Belletti (1993a: 115, n. 34) and Cinque (1991: n. 7) to analyze *ne* as an NP, not a DP. We show below that these asymmetries are only apparent, and that *ne* can be safely analyzed as DP on a par with the other (accusative and dative) object clitics.

Quoting Cresti (1993), Belletti observes that quantitative *ne* obeys principle C of Binding Theory, disallowing binding from a c-commanding DP (cf. Cresti 2003: 87).

(177) *[Gianni e Mario]$_i$ mi hanno chiesto di riceverne$_i$ almeno uno
Gianni and Mario to-me have.3Pl asked to meet.NE at least one
prima delle undici.
before eleven

In this respect, quantitative *ne* differs from DP clitics (accusative and dative), which obey principle B of the Binding Theory, (178), and behaves like non-quantitative instances of *ne*, which are PPs and are excluded in c-command contexts; compare the contrast between (179a) and (179b).[34]

(178) a. Gianni$_i$ sostiene che Maria lo$_i$ conosce.
Gianni claims that Maria him knows
b. Gianni$_i$ sostiene che Maria gli$_i$ parlerà.
Gianni claims that Maria to-him will-talk

(179) a. *Gianni$_i$ sostiene che Maria ne$_i$ parla spesso.
Gianni claims that Maria NE talks often
b. Maria deve essere innamorata di Gianni$_i$ perché ne$_i$ parla sempre.
Maria must be in love with Gianni because NE talks always

Notice, however, that quantitative *ne* is also ungrammatical in a context where it is not c-commanded by its antecedent. In this respect, (180) differs from (179b).

(180) *Maria deve essere innamorata di [Gianni e Mario]$_i$ perché vuole riceverne$_i$ almeno uno prima delle undici.
Maria must be in love with Gianni and Mario because [she] wants to meet.NE at least one before eleven

The ungrammaticality of (180) cannot be due to a violation of Binding Theory, but only to the fact that *ne* cannot pronominalize a definite DP. The same explanation holds for (177). Definite DPs can only be pronominalized by the strong form *di loro*, as shown by (181), the grammatical counterparts of (177) and (180):

(181) a. [Gianni e Mario]$_i$ mi hanno chiesto di ricevere almeno uno di loro$_i$.
Gianni and Mario asked me to meet at least one of them
b. Maria deve essere innamorata di Gianni e Mario$_i$ perché vuole ricevere almeno uno di loro$_i$ prima delle undici.
Maria must be in love with Gianni and Mario because [she] wants to meet at least one of them before eleven

If so, binding-theoretic data cannot be used to argue against the DP analysis of *ne*.[35] Incidentally, note that these data support the proposal made above that *ne* is not the pronominal counterpart of the partitive PP.

Cinque (1991: n. 7) proposes the same as Belletti on the basis of the fact that *ne* can co-occur with a relative clause, while accusative and dative object clitics cannot.

(182) a. Di libri, ne ho letti due di cui non ricordo ora il titolo.
of books NE have.1Sg read two of which [I] not remember now the title
b. *I libri di Gianni, li ho letti di cui non ricordo
the books of Gianni them have.1Sg read of which not remember.1Sg
ora il titolo.
now the title

Assuming that relative clauses are adjoined to DPs, Cinque explains the ungrammaticality of (182b) by proposing that accusative and dative object clitics are DPs, and that in the case of adjunctions, the biggest DP is pronominalized. The grammaticality of (182a) follows if quantitative *ne* is an NP (this assumption is independently necessary in Cinque's analysis since he takes quantified noun phrases to be DPs, not QPs).

There is a major objection to this reasoning. *Ne* can also pronominalize a noun phrase that contains a relative clause:

(183) Di libri di cui non ricordo ora il titolo, ne ho letti due.
of books of which not remember.1Sg now the title, NE have.1Sg read two

The proposal that *ne* is an NP cannot account for (183); in this case it is presumably a DP. We would thus end up with two different analyses of quantitative

ne: NP in (182a) and DP in (183). This has the disadvantage of attributing different categories to one and the same lexical item, as noticed in section 4.1 for the co-occurrence of *ne* with (apparent) arguments of the noun. Furthermore, in an anti-symmetric view of relative clauses, *ne* in (183) should correspond to the whole relative CP embedded under the quantifier, making the categorial status of *ne* even more problematic. Leaving open the question of the correct analysis of relative clauses, we conclude that these data cannot be used as counter-arguments to the hypothesis that quantitative *ne* is a DP.

4.4 Quantitative **er** *in Dutch*

In Dutch, quantitative *er* (184a) is homophonous to prepositional (184b), locative (184c), and expletive (184d) *er* (examples from Bennis 1986: section 3.2).

(184) a. Ik heb **er** twee gekocht.
I have ER two bought
b. Ik heb met hem [**er** over] gesproken.
I have with him there about talked
c. Jan woont **er** nog maar kort.
Jan lives there only briefly
d. **Er** kocht niemand een boek
there bought nobody a book

As for French *en* and Italian *ne*, the question arises as to whether quantitative *er* is to be analyzed as having the same categorial status as the other instances of *er*.[36] Van Riemsdijk (1978a: 197) observes that quantitative *er* differs from the prepositional *er* found in PPs such as (185) (from Van Riemsdijk 1978a: 87) in that it can never occur inside its own projection and does not have a [+WH] counterpart; see (186).

(185) a. vlak er na
right there after
b. Waar heb je op gerekend?
where have you on counted?
'What did you count on?'

(186) a. *de verwoesting van er [drie *e*]
the destruction of ER three
'the destruction of three of them'
b. *Waar heb je [drie *e*]?
where have you three?
'Of what do you have three?'

Bennis (1986: 177) further points out that quantitative *er* differs from both prepositional and locative *er* in that it is not related to a paradigm of R-pronouns;

see (187). Quantitative *er* cannot be replaced by other R-pronouns such as *hier* and *daar*.

(187) a. *Ik heb **hier** gisteren [twee *e*] gekocht.
I have here yesterday two bought
b. *Ik heb **daar** haar [veel *e*] gegeven.
I have there to-her many given

Furthermore, quantitative *er*, as opposed to prepositional, locative, and expletive *er*, cannot occur in sentence-initial position (Bennis 1986: 177).

(188) a. *Er zijn [twee *e*] verschenen.
ER are two appeared
b. *Er hebben enkele mensen haar [twee *e*] gegeven.
ER have some people to-her two given

These properties suggest that quantitative *er* is different from the other instances of *er*, which are presumably pro-PPs.[37]

Blom (1977) analyzes quantitative *er* as an N′. This proposal is also adopted by Bennis (1977) and Van Riemsdijk (1978a). Quantitative *er* does not occur with the head noun (189a), nor with prenominal adjectives (189b). It does, however, occur with relative clauses and postnominal adjectives, see (190).

(189) a. Ik heb (*er) drie boeken gekocht.
I have ER three books bought
b. Ik heb (*er) nog drie gele.
I have ER still three yellow
'I still have three yellow ones.'

(190) a. Ik heb er drie die vol zitten met luizen.
I have ER three that full sit with lice
'I have three that are full of lice.'
b. Ik kocht er een/'n groot.
I bought ER one big

On a par with the material left stranded by *ne*-cliticization in Italian, relative clauses and postnominal adjectives, as in (190), can be analyzed as predicative modifiers of the noun. As pointed out in Cinque (1991: 123), the postnominal adjective in (190b) has the same non-agreeing form that is found with predicative adjectives, (191a), not the agreeing form found with prenominal adjectives, as in (191b) (cf. **Ik kocht er een/'n grote* and (189b)).

(191) a. De tafel is groot.
the table is big
b. Een/'n grote tafel
a big table

In line with the proposal made for French *en* and Italian *ne*, we take Dutch existential quantifiers to combine with a quantitative DP and a partitive PP. *Er* pronominalizes the DP complement of the quantifier.

As in Italian, Dutch *er* can co-occur with a partitive PP, as in (192a). However, the partitive PP cannot contain an overt noun, in which case only an empty category can occur. Compare (192b, c) with Italian (142).[38]

(192) a. Ik heb er twee gekocht, van degene die je me aangeraden had.
I have ER two bought of those that you to-me advised had
b. Ik heb (*er) [twee *e* van deze boeken] gekocht.
I have ER two of these books bought
c. [Twee *e* van die boeken] heb ik (*er) gisteren gekocht.
two of those books have I ER yesterday bought

The PP introduced by *van* can also be analyzed as an adjunct partitive PP (on a par with the PP introduced by *tra* or *di* in Italian, see (101), (102), (103)). It can be separated by the quantified noun phrase and appear in the Middlefield or in sentence-initial position, as in (193) (Bennis 1986: 199; 251, n. 8). In this case, *er* is obligatory, differently from (192b, c), which contains a true partitive PP:

(193) a. Ik heb van die boeken *(er) gisteren [twee *e*] gekocht.
I have of those books ER yesterday two bought
b. Van deze boeken heb ik *(er) [twee *e*] gekocht.
of these books have I ER two bought

The adjunct partitive PP can also follow the quantified noun phrase. This is shown by the following sentence, where *er* can bind both the quantitative DP and the R-position inside the PP with *van* (Bennis 1986: 199).

(194) Ik heb er gisteren [twee *e*] [t van] gekocht.
I have ER yesterday two of bought

Sentence (194) displays the phenomenon of haplology, i.e., the peculiar property that one surface realization of *er* can bind more than one syntactic position. Quantitative *er* can be combined with expletive, prepositional, and locative *er*; see (195). It can also bind the empty category of two quantified noun phrases, one in subject position and one in object position; see (196) (Bennis 1986: section 3.2.5).

(195) a. **Expletive + quantitative**
dat er niemand [twee *e*] gekocht heeft
that ER nobody two bought has
b. **Quantitative + prepositional**
dat Jan er [twee *e*] [t over] gelezen heeft
that Jan ER two about read has

c. **Quantitative + locative**
Jan zou drie weken van zijn vakantie in Italië doorbrengen.
Jan would three weeks of his holidays in Italy spend,
maar uiteindelijk heeft hij er maar [twee *e*] *t* doorgebracht.
but eventually has he ER only two spent

d. **Expletive + quantitative + prepositional**
dat er niemand [drie *e*] [t over] geschreven heeft
that ER nobody three about written has

e. **Expletive + quantitative + locative**
dat er nog maar [twee *e*] *t* woonden
that ER yet only two lived

(196) dat er [twee *e*] [één *e*] gekocht hebben
that ER two one bought have

Although, as far as we know, it was never pointed out before, haplology is also marginally found in Italian, as shown by the following sentence: *ne* stands for both the quantitative clitic extracted from the postverbal subject, and the pleonastic clitic pronoun that obligatorily occurs with the idiomatic reflexive usage of the motion verb, namely *andarsene* ('go away').

(197) Se ne sono andati via [molti *t*].
Refl NE are gone away many
'Many of them went away.'

5 Conclusion

In this chapter we have analyzed quantified noun phrases and quantitative clitic pronouns. Our conclusions can be summarized as follows.

(i) Expressions of quantity can be realized by different lexical categories, only one of which we label Q. We have also found quantity adjectives, which behave as a separate class of modifiers of the noun. It is likely that other categories can also express quantity (e.g., Ns, although this has not been investigated here).

(ii) Qs are external to the DP contained in the quantified expression. Qs are heads that project their own maximal projection, QP.

(iii) Different classes of Qs have been identified which combine with different phrases. Existential Qs combine with a quantitative DP, which checks partitive case, and a partitive PP. Distributive Qs combine with a quantitative DP, which checks partitive case, a partitive PP, and a distributive operator (OP). Universal Qs combine with a definite DP.

(iv) These properties can be conceived of as selectional properties of quantifers. If Qs have selectional properties, they can been analyzed as lexical heads.

(v) The partitive PP selected by existential and distributive Qs must be distinguished from 'adjunct' partitive PPs, which can co-occur with any type of noun phrase, and from 'qualitative' PPs, which are NP adjuncts and can also co-occur with any type of noun phrase (see n.13).
(vi) Quantitative clitics bind a maximal, not an intermediate, projection. This projection is the quantitative DP.

NOTES

This chapter has been conceived as a work for four hands from beginning to end. However, for every legal requirement Giuliana Giusti is responsible for sections 1–3.1 and Anna Cardinaletti is responsible for sections 3.2–4. We are indebted to Roberto Zamparelli for comments and constructive criticism on a preliminary version of the chapter.

1 On the grammar of partitive constructions of this type, see Kayne (1994), Corver (1998), Den Dikken (1998a), Vos (1999), and the references quoted there.
2 Postverbal subjects of unaccusative verbs behave like objects, as expected.

(i) a. Sono passate tre settimane.
are elapsed three weeks
b. Ne sono passate tre.
c. *Sono passate tre [*e*].

With postverbal subjects of transitive and intransitive verbs, neither *ne* nor PRO is possible, the former because it is governed by the verb, the latter because of a violation of subjacency.

(ii) a. Hanno parlato tre ragazze.
have spoken three girls
b. *Ne hanno parlato tre.
c. *Hanno parlato tre [*e*].

In PPs, *ne* is ungrammatical, and the null category is very marginal:

(iii) a. Mi sono concentrato su alcuni problemi.
[I] concentrated on some problems
b. *(Di questi problemi,) me ne sono concentrato su alcuni.
(of these problems) [I] NE concentrated on some
c. ?(Di questi problemi,) mi sono concentrato su alcuni [*e*].
(of these problems) [I] concentrated on some [*e*]

Example (iiib) represents a violation of subjacency; PRO in (iiic) is marginally accepted due to the non-governing nature of the preposition. We refer to Belletti and Rizzi (1981) for details.
3 This generalization is only apparently contradicted by the English gloss. See section 3.1 for discussion.

4 Example (63) shows that number agreement between the quantifier and the DP can be suspended, depending on the selectional properties of the quantifier (cf. section 3.3.2 for the agreement properties of quantifiers and their complement). Cf. Quirk et al. (1985: 759) where it is noticed that in this case the predicate is singular, as in *many a member has protested against the proposal*. When the NP is a coordinate structure, both singular and plural agreement give marginal results (1985: 959) ?*many a boy and girl is/are left homeless*.

5 The structure in (65b) can also capture the Ladin data brought about in (92).

6 The data in (69) can be reproduced in many European languages, for example in Italian. Notice that (ib) is perfectly acceptable, while its counterpart (69b) is marginal for some English speakers:

(i) a. I molti/tre/parecchi/*gli alcuni studenti che conosco sono tutti pigri.
b. Gli studenti che conosco sono molti/tre/parecchi/*alcuni.

7 They do not display the *-n* ending, as shown here for *beide*:

(i) a. Beide Kinder sind da.
b. Both children are here.

The lack of a determiner following the quantifier *beide* in (ia) is explained by Giusti (1993: 103) as follows. The determiner incorporates into the quantifier and thereby triggers the determiner-like morphology on the quantifier. The covert presence of the determiner in (ia) is supported by the fact that when the DP is extracted out of the quantifier, as in (iia), the determiner must be overt:

(ii) a. $[_{DP}$ Die Kinder] sind $[_{QP}[_{DP}$ t'] $[_{Q}$ beide $[_{DP}$ t]] da.
b. $[_{DP}$ The children] are $[_{QP}[_{DP}$ t'] $[_{Q}$ both $[_{DP}$ t]] here.

It is reasonable to extend the same analysis to English (ib) and (iib).

8 Also see the discussion of (95).

9 Cf. Giusti (1991b, 1993, 1995) for a detailed discussion.

10 In considering the following Romanian examples, one must keep in mind that the enclitic article in Romanian appears on the leftmost lexical head in the DP; see Grosu (1988) and Giusti (1993), among others.

11 Zamparelli is not clear whether the weak–strong distinction is obtained through different merging points, through movement from PD to SD, or whether the two options are both possible and, in this case, what would make either choice operative in different cases.

12 Take, as an example, a diadic verb such as *scrivere* ('write') in (i). Even when the internal argument is not projected, it is understood as an undetermined object. The same is true for the goal argument of a diadic verb such as *regalare* ('give a present') in (ii).

(i) a. Ho scritto una lettera a Maria.
b. Ho scritto a Maria.
have.1Sg written (a letter) to Maria

(ii) a. Ho regalato un libro a Maria.
have.1Sg presented a book to Maria
'I presented Maria with a book.'
b. Ho regalato un libro.
'I gave a book as a present.'

13 R. Zamparelli (p.c.) points out that definite and universally quantified DPs can sometimes co-occur with a PP introduced by *di*, as in (i), on a par with quantified DPs, as shown in (ii):

(i) Mi piacciono (tutti) i libri [di quelli che si leggono velocemente].
to me please all the books of those that can be read quickly
'I like the books that can be read quickly.'

(ii) Ho comprato dieci libri [di quelli che si leggono velocemente].
have.1Sg bought ten books of those that can be read quickly

The PP introduced by *di* in (i) and (ii) differs, however, from the PP introduced by the same preposition in (100a). In (i), the *di*-PP does not get a partitive, but a 'qualitative' interpretation. Example (i) can be paraphrased as *Mi piacciono (tutti) i libri del tipo che si legge velocemente*, 'I like (all) the books of the type that can be read quickly'. This PP can be analyzed as a modifier of the noun *libri*, unrelated to the QP.

There are other empirical reasons to believe this. The 'qualitative' PP is compatible with any type of DP. Furthermore, the 'qualitative' PP cannot be left-dislocated on its own, but only together with the DP:

(iii) a. *[Di quelli che si leggono velocemente] ne ho comprati dieci.
of those that can be read quickly NE have.1Sg bought ten
b. Libri di quelli che si leggono velocemente ne ho comprati dieci.
books of those that can be read quickly NE have.1Sg bought ten

In this respect, it crucially differs from the adjunct partitive PP in (102).

This 'qualitative' PP, which contains a kind-denoting plural, is also found in the English expression *many of them* in contexts like (iv) (from Cresti 2003: 83), and differs from the partitive PP in the homophonous *many of them* in contexts like (v).

(iv) Late homework assignments are impossible to grade, and there are many of them.

(v) I bought a hundred books, and I have read many of them.

Cresti (2003: n. 11) points out another possible reading of English *many of them* where *of them* has the same interpretation as Italian quantitative *ne*:

(vi) John has few friends, but Mary has many of them.

We take the last instance of *of them* as the pronominal version of the quantitative DP, in which the preposition *of* realizes partitive case (see section 3.3.1). This appears not to be possible in Italian, which only realizes Partitive case with the preposition *di* when the quantifier is not overt or in a non-local relation with its complement (see section 3.3.3).

14 The sentence in (i) with *ne* is also ungrammatical. *Ne* cannot be extracted from a postverbal subject (see section 2.2):

(i) *Ieri *ne* hanno telefonato tre/ molti/ uno/ una.
yesterday NE have telephoned three/ many/ one-Masc.Sg one-Fem.Sg.

15 But, of course, (113b) can be felicitous in a context in which human beings make nests, for example, in order to attract migrating birds into their gardens.

16 The distributive operator OP could be merged as the third argument of the Q in a 'QP-shell' lower in the structure and later merged to [Spec, FP] to get scope over the rest of the quantified phrase.

17 Universal quantifiers must be assumed to be transparent and to transmit the case assigned to their projection.

18 This proposal has been previously made by Pesetsky (1982).

19 Examples (129) and (130) are both taken from Enç (1991: 6).

20 The cases in which the preposition *di* is absent, as in (i), must be analyzed as Hanging Topic constructions, where the hanging topic, which occurs in first position on the left-edge of the sentence, is marked nominative by default (Cinque 1990c):

(i) Ragazzi, ne ho visti molti.
boys, NE have.1Sg seen many

In cases in which the peripheral DP cannot be analyzed as a Hanging Topic, *di* is obligatory. This is the case in (134b) since there is no Hanging Topic on the right-edge of the sentence, and in (ii), where the quantitative DP is embedded and therefore can only be analyzed as left-dislocated.

(ii) a. Gianni, *(di) libri, ne ha letti pochi.
Gianni, of books, NE has.3Sg read few
b. Il fatto che *(di) libri, ne abbia letti pochi, . . .
the fact that of books, NE has.3Sg read few
c. Mi dispiace che *(di) libri ne abbia letti pochi.
[I] regret that of books, NE has.3Sg read few

21 The definiteness requirement of the PP is known in the literature as the 'Partitive constraint' (see Ladusaw 1982; Wilkinson 1991a; Hoeksema 1996; Barker 1998; de Hoop 1997, among others, for discussion). In our framework, this semantic property can be encoded in the argument structure of (existential and distributive) quantifiers.

22 This co-indexing should be kept distinct from Binding, since Binding applies to full DPs and rules their referential interpretation.

23 The phrase embedded in the partitive PP can contain a lexical NP, preceded by a determiner or a demonstrative, as in (137), or can contain a pronoun (a pronominal demonstrative or a personal pronoun), as in (i):

(i) a. molti [e] di quelli
b. molti [e] di loro
many of those/them

In this case, the content of the lexical NP is recovered from the context.

24 Our analysis of (141d) differs from Belletti's (1979: 1559), according to which *di cui* is left-dislocated and resumed by *ne*.

25 In Italian, it is always possible to left- or right-dislocate a PP, with no resumptive pronoun, cf. Cinque (1990c: chapter 2) for the distribution of resumptive clitics in left-dislocation constructions.

26 The following sentences, where *each* and *ciascuno* combine with a definite plural DP in subject position, should not be analyzed as 'floating' structures, but as containing a small clause whose subject is controlled by the definite plural DP and quantified by the quantifier (cf. Sportiche 1988: 440).

(i) a. The boys have each eaten a sandwich.
b. I ragazzi hanno ciascuno mangiato un panino.

27 Belletti and Rizzi (1996b) assume that agreement takes place in the specifier of QP. Given the more elaborated structure proposed in (122) above, it is natural to assume that agreement takes place in [Spec, AgrQP].

28 Parallel to Campbell's (1996b) proposal to analyze [Spec, DP] as the locus relevant for interpretation, we propose here that the [Spec, FP] projected by Q is where the semantics of the quantified noun phrases is processed at LF.

29 For previous analyses of French *en*, see, among others, Kayne (1975), Haïk (1982), and Pollock (1986).

30 Sentence (167c) can be marginally acceptable for those speakers who can reinterpret the infinitival introduced by *di* as a purpose clause usually introduced by *per*, as shown in (ia). This possibility also arises with the overt noun in (167a), as shown in (ib):

(i) a. Di modi, ce ne sono due per/?di risolvere il problema.
of ways there NE are two to solve the problem
b. Ci sono due modi, per/?di risolvere il problema.
there are two ways to solve the problem

The occurrence of the prepositional complementizer *per* guarantees that the infinitival clause is not a complement of the noun *modo*, since in Italian this preposition introduces a purpose (infinitival) clause.

31 *En* triggers past participle agreement in some French varieties (Grevisse 1986: section 910).

32 In a framework that allows deletion operations, Kayne assumes that the preposition *de* is deleted in order to get the grammatical *deux sœurs*.

33 Milner (1978b: 138) notes for French that left- and right-dislocation behave differently in this respect. Agreement in number is required in right-dislocation. His data can be reproduced in Italian.

(i) a. De cheval/chevaux, j'en ai un.
of horse/horses, I NE have one
a′. Di cavallo/cavalli, ne ho uno.
of horse/horses, NE have.1Sg one
b. De ?cheval/chevaux, j'en ai deux.
of horse/horses, I NE have two
b′. Di *cavallo/cavalli, ne ho due.
of horse/horses, NE have.1Sg two

(ii) a. J'en ai un, de cheval/*chevaux.
I NE have one, of horse/horses
a′. Ne ho uno, di cavallo/*cavalli.
NE have.1Sg one, of horse/horses

b. J'en ai deux, de *cheval/chevaux.
I NE have two, of horse/horses

b'. Ne ho due, di *cavallo/cavalli.
NE have.1Sg two, of horse/horses

34 For similar binding facts of French *en*, see Ruwet (1990) and Lamiroy (1991a, b).

35 As observed by Lamiroy (1991a: 411, n. 6) and (1991b: 43), French *en* does not show any anti-reflexive effect.

(i) Cet/un homme$_i$ en$_i$ vaut un autre.
this/a man EN is worth another
'This/a man is worth any other man.'

She concludes that *en* does not enter coreference relationships and is exempted from the Binding Theory.

36 Bennis (1986: 251, n. 10) notes that "all proposals concerning quantitative *er* explicitely or implicitely consider quantitative *er* to be homonymous with the weak form of the R-paradigm which we find with prepositional and locative *er*." However, "historically, quantitative *er* developed from a different source, a genitive form of the third person singular, *iro*."

37 The fact that quantitative *er* cannot occur in specifier positions (PP-internally, (186a), and in sentence-initial position, (188)) might suggest that it differs from the other instances of *er*, not only in categorial status but in another respect as well. Since specifier positions are excluded to clitic pronouns (Cardinaletti and Starke 1999), quantitative *er* can be taken to be a clitic pronoun, while the other instances of *er* can be weak pronouns.

38 In contrast with Italian, Dutch allows for an empty category to co-occur with a prenominal agreeing adjective, in which case *er* is ungrammatical. See (189b) and (i):

(i) Ik heb (*er) [een rode *e*] gekocht.
I have ER a red bought

Examples (189b) and (i) are possible because Dutch is similar to other Germanic languages in allowing an empty NP inside the quantified noun phrase even if it is not resumed by a quantitative clitic. Compare (i) with the parallel German example in (ii).

(ii) Ich habe ein rotes [e] gekauft.
I have a red [one] bought

1 Introduction

The foundational issues for a correct account of temporal talk in natural language appear uncontentious: we exploit an ontology countenancing temporal entities (time points, time intervals, and/or events) to serve as the referents of such phrases as *at three*, *when John arrived*, etc., and of the variables appearing in temporal quantification: *often*, *always*, *seldom*, etc. Those entities are organized in a natural sequence by the earlier-than/later-than relation, which also turns out to be useful to account for our intuitions about the meaning of tenses – e.g., 'past' contributes that the relevant event/time is before the speech/utterance time – and of such phrases as *John left after his sister entered*. The resulting temporal structures seem so natural and intuitive that linguists almost never question them. All we have to do is to use it to discover how temporal reference is managed by language.

However, another view about time in language (and time in general) has exercised scholars for years, originating from concerns expressed by philosophers. According to its proponents, we can, and actually must, dispense with temporal entities, hence with temporal reference. Our temporal talk cannot be analyzed on the model of objectual talk by positing temporal entities ordered by the earlier-than/later-than relation, which, e.g., *Thursday* or *May* can draw their reference from, or which tenses relate. The correct approach, it is maintained, requires taking the very idea of tensed thoughts/propositions seriously, meaning that the latter are intrinsically tensed and that tense cannot be explained away by means of precedence.

Though not popular among linguists, such a view has been recently revived and sharpened by Ludlow (1999), who proposes a view that strikingly differs not only from 'strictly' referential approaches, but from those based on so-called *temporal logics* too.

Preference for one over the other account has profound effects on linguistic theory. In the one case, we expect to avail ourselves of the machinery made available to semantics and syntax by the referential view, which includes objectual quantification, referential anaphora, and the referential view of indexicality. If the other path is followed, many of those tools are useless, and something new must be devised. The differences are not limited to semantics, but involve syntax. If we execute the non-referential approach by means of temporal operators for tenses, then *de re/de dicto* distinctions become crucial. Those, in turn, are usually taken to rely on syntactic operations, which interact with many other such devices, so that evidence in favor or against can be gathered and assessed on syntactic grounds. Similarly, we will see that the two views exploit different syntactic structures for temporal locating phrases such as *next May* or *the Sunday you left*.

The purpose of this chapter is to stimulate a critical attitude toward issues of temporal reference in linguistic theory, discuss the two alternative views, and start some comparative work. In a way, it is about time to do so. Ludlow's attempt at making the non-referential, tensed view play a role in the linguistic arena makes it possible to lay down, compare, and discuss the prospects of actual proposals. At the same time, the present work cannot aim at exhausting the comparative work. The difference between the two approaches in terms of available analyses and effort spent by scholars is too big to permit fair comparative assessments. We will be content if a picture emerges which highlights relative weaknesses and strengths of the two views, and if topics to be inserted in the research agenda can be found.

We will proceed as follows. In section 2 we provide a cursory review of the basic tenets of the tense-logical approaches. These have the interesting property of exemplifying many of the problems non-referential views have to address, despite the fact that they still rely on ontology of time points, intervals, and the likes. The shortcomings of tense-logical theories have been taken to provide support for fully referential views, which will be the topic of section 3, where phenomena such as the syntax of tenses, sequence of tense, and temporal locating

phrases will be discussed. Special emphasis will be placed on the Reichenbachian and on the neo-Reichenbachian view. In section 4 we turn to the non-referential, tensed view, by presenting Ludlow's proposal in some details. To facilitate comparisons, we will focus on the same set of phenomena discussed in section 3, investigating how they can be dealt with in a tensed framework.

2 Tenses as sentential operators

Tense logical approaches to time in natural language (cf. Prior 1967; Montague 1974) consider tenses as sentential operators, which apply to basic (untensed) sentences to yield other, tensed sentences. Semantically, they shift the evaluation time of a sentence to the past or to the future. In the cases we are going to consider, the evaluation time always coincides with the time of the utterance, symbolized by *u*.

Consider the following examples:

(1) a. John saw Mary.
b. P[see(John, Mary)]

(2) a. John will see Mary.
b. F[see(John, Mary)]

The logical form for (1a) is (1b), where P is the operator for past. Analogously, in the case of a future tense verb (*will see*), the operator is F. A possible model for this logic is a triple M = (T, <, V) where T is a set of moments of time, < is the binary relation earlier than on T, and V is the interpretation function which assigns a truth-value $V_t(\phi)$ to each propositional formula ϕ and to a moment of time $t \in T$. The relevant truth-conditions for the operators P and F are given in (3a) and (3b), respectively:

(3) a. $V_{M,t}(P\phi)$ = true iff there is t', t'<t and $V_{M,t'}(\phi)$ = true.
b. $V_{M,t}(F\phi)$ = true iff there is t', t<t' and $V_{M,t'}(\phi)$ = true.

That is, $P\phi$ is true at the evaluation time t with respect to a model M iff there is a time t' which is past with respect to t, and ϕ is true at t' with respect to M. Analogously, $F\phi$ is true at the evaluation time t, with respect to a model M iff there is time t' which is in the future with respect to t, and ϕ is true at t' with respect to M. Applying (3) to (1) and (2), we obtain (4):

(4) a. $V_{M,t}$ (P('John see Mary')) = true iff there is t', t'<t and $V_{M,t'}$ ('John see Mary') = true.
b. $V_{M,t}$ (F('John see Mary')) = true iff there is t', t<t' and $V_{M,t'}$ ('John see Mary') = true.

That is, *John saw Mary* is true at a time t iff there is a time t′ which precedes the time of the utterance and the untensed proposition 'John see Mary' is true at t′. On the other hand, *John will see Mary* is true when uttered at a time t iff there is a future time t′ such that p='John see Mary' is true at t′. As can be seen from (3), both F and P have an existential flavor, in that their truth-conditions require the existence of a time at which the proposition they apply to is true. Classical Priorean tense logic also includes the corresponding universal operators G and H, where Gϕ can be paraphrased as 'in the future it will always be the case that ϕ', and Hϕ as 'in the past it has always been the case that ϕ'.

Importantly, tense operators can be combined to yield more complex configurations. Such a possibility has been exploited to capture the meaning of compound tenses such as the English pluperfect, which could be seen as the composition of two past operators, PP, and of the future perfect, represented as PF.

The tense operator approach has been criticized from both an empirical and a theoretical point of view. We will consider some of these criticisms, namely those discussed by Enç (1986), and others arising from observations originally made by Kamp (1968).

If tenses are operators, we expect them to exhibit scope properties analogous to those of other operators and quantified expressions, such as DPs. Consider (5) (cf. Enç 1986: ex. 3):

(5) All rich men were poor children.

The meaning of (5) can be paraphrased as in (6):

(6) All rich men (past and present ones) were at a previous time poor children.

The logical forms for (5) are given in (7):

(7) a. $\forall x$ (rich-man(x) $\wedge$ P(poor-child(x)))
b. P($\forall x$ (rich-man(x) $\wedge$ poor-child(x)))

The verb *were* instantiates a past operator *P*. Furthermore, in (5) the universally quantified DP *all rich men* appears. Given that operators manifest scope properties, we expect the temporal operator *P* to interact with the quantified DP, each possibly taking scope on the other. Consider the case where the universal quantifier has wider scope, thus yielding (7a). The corresponding proposition is true iff for every *presently* rich man x there is a past time at which x is a poor child. This is not the meaning of (5), according to our intuitions, because it takes into account only presently rich men. If we let the tense operator take scope over the universal operator, (7b) is obtained, a proposition which is true iff there is a past time t such that every man who is rich at t is also a poor child at the same past time. Again, we are far from the meaning of (5) as expressed by (6). Thus, both scope possibilities fail to capture (5), and it seems that a standard account of the scope interactions of a tense operator with quantified expressions does not suffice

to obtain the correct result (for more recent work about the temporal properties of noun phrases, see Musan 1995).

It also has been observed that tense operators introduced by verbal morphology are not sufficient to account for some interpretive facts. Consider, for example, the following sentence (Enç 1986: ex. 13):

(8) Every fugitive is now in jail.

The operator approach assigns (8) the following meaning:

(9) Every x who is now a fugitive is presently in jail.

Example (8), however, is an assertion about past fugitives who are presently in jail. The correct truth-conditions are exemplified by (10):

(10) $\forall x$ ((P(fugitive(x))) $\wedge$ in-jail(x))

To obtain (10), it must be assumed that the past tense operator P is instantiated by the subject DP. Notice in fact that the verbal tense is present and therefore cannot be the verb which instantiates the operator. Moreover, the scope of the operator should not include the predicate and should be restricted to the subject. Generally, however, tense operators are introduced by tense morphemes related to the verbs and have the predicate in their scope. In (8) and similar cases, there is no such past tense morpheme – that is, there is no morphosyntactic evidence of its presence and there is no obvious way to constrain the scope of this operator to the DP. In principle, in fact, an operator associated with the DP could take scope over the whole sentence. In this case we would obtain (11):

(11) $\forall x$ (P(fugitive(x) $\wedge$ in-jail(x)))

Example (11) is true iff everyone who was a fugitive at a past time was in jail at the same time. Again, such a reading is not the correct one. Therefore the hypothesis according to which DPs introduce tense operators does not make the correct predictions, because the scope properties of such operators are anomalous and should be constrained by means of ad hoc conditions. Consider also that if it were correct to hypothesize the presence of an operator taking scope over the DP, we should also investigate the scope relations between two DPs, each bearing its own temporal interpretation (and, consequently, its own tense operator). In particular, when a DP is c-commanded by another one, we would expect the temporal interpretation of the former to depend on the temporal interpretation of the latter. Consider the example in (12) (modeled on Enç 1986: ex. 8):

(12) Every student will have met a president.

A possible reading of (12), which is the one relevant to our discussion, is the following: let us hypothesize a scenario where every present student either met,

or is meeting, or will meet at a future time the president in charge at that moment. Sentence (12) is true at the utterance time if there is a later time at which *every student met a president* is true. In this scenario, the DP *every student* is evaluated at the present time, whereas *a president* can be evaluated at a past, present, or future time. That is, the times relevant for the two DPs must be kept separate, so that the temporal interpretation of the DP *a president* does not depend on the interpretation of the DP *every student*, even if *a president* is in the scope of the latter. As a consequence, the expectation that tense operators introduced by DPs exhibit the scope properties of ordinary quantified expressions is not met.

To summarize, tense operators introduced by DP do not take scope over the main predicate, as shown by (10), and they do not interact with each other, as shown by our discussion of (12). If we still want to maintain the hypothesis that a DP can be associated with a tense operator, we should constrain such a tense operator to take only very local scope, because it seems to have only the DP itself in its scope. As we said in the preceding discussion, this move is possible, but requires a rather ad hoc hypothesis.

Another argument against the use of tense operators comes from the analysis of the interactions between tenses in complex sentences. Consider (13), due to Kamp (1968):

(13) a. A child was born who would be king.
b. A child was born who will be king.

(14) $P(\exists x\ (child(x) \wedge born(x) \wedge F(king(x))))$

The sentences in (13a) and (13b) differ only in the use of two different future forms in the relative clause; namely, the auxiliary *would* vs. *will*. The logical form in (14) represents the meaning of (13a). The future tense operator, introduced by the verb of the relative clause, is in the scope of the tense operator of the main verb. Formula (14) is then true iff there is a past time t at which a child was born and there is a time future with respect to t when it is true that the child is king. Thus, (14) correctly captures the meaning of (13a). On the other hand, it is not so easy to account for the meaning of (13b), the version in which the simple future, *will*, appears in the relative clause. Formula (14) does not work, for (13b) requires the time at which the child is said to be king to be in the future with respect to the utterance now, something which is not made available by (14). There is an alternative option; namely, that the future operator takes scope over the matrix clause past operator, yielding (15):

(15) $FP(\exists x\ (child(x) \wedge born(x) \wedge king(x)))$

Formula (15), however, is not a correct representation of (13b) either, since it requires a future time t and a time t', $t' < t$, such that born(x) and king(x) are both true at t'. What is needed for (13b) is the possibility for the two tenses to be independently evaluated with respect to the utterance time. Tense logic, however, cannot represent the two operators as being independent from each other.

The examples in (13) raise a problem very similar to those discussed by Enç. One major inadequacy of the tense operator approach seems to be that the interactions among the temporal properties of the constituents of a sentence are not the ones expected for tense operators. In other words, an operator-based representation is insufficient to account for the temporal interpretation of the sentences considered above.

Another problem with the tense logical approach is the possibility of compounding the basic operators F and P to yield more complex ones. On the one hand, languages like English have tenses that seem to be naturally analyzable by means of such a property. For instance, the pluperfect and the future perfect could correspond to PP and FP, respectively. On the other hand, there are compound tenses that resist a similar treatment. For example, the present perfect cannot be straightforwardly distinguished from the simple past by virtue of operator compositions.

Another problem is that nothing prevents an unlimited composition of tense operators. Any sequence is a priori possible – e.g., FPF, PPP, FPFP, etc. – even if none of them corresponds to an observable tense in any language. The composition of operators could be constrained by means of ad hoc conditions, for instance, by explicitly disallowing combinations of more than two operators. This move, however, weakens the explanatory adequacy of the temporal logic approach.

Finally, tense logical approaches have notorious problems with the treatment of temporal anaphora. Consider (16) and (17):

(16) John left the room. He was furious.

(17) John said that Mary was pregnant.

In (16) the second sentence is understood as holding at the same time as the first. Example (17), on the other hand, can either mean that Mary's pregnancy holds at the time of John's utterance, or that the pregnancy is at an earlier time. Thus, both in (16) and (17) there seems to be a dependency of the time of the second clause (*he was furious* and *Mary was pregnant*) on the time of another clause.

The operator approach cannot easily account for the facts in (16) and (17). Anaphoric phenomena, in fact, seem to require the availability of entities, such as times and events (but also ordinary individuals referring to spatial objects), which can be introduced in the discourse context, stored, and accessed for later reference. No natural notion of context is possible with tense logic, unless major changes are proposed, undermining the spirit of these logical systems (for a discussion, see Kamp and Reyle 1993). Furthermore, although tense logic does make use of temporal entities, it does so at the level of the metalanguage, in the truth-conditions for operators. Hence, there are no terms referring to temporal entities in the object language (cf. the logical forms given above). This way of encoding the temporal dimension was motivated by considerations about verbal tenses, since their intrinsic relational meaning can be captured by means of truth-conditions such as those in (3), repeated here for simplicity:

(18) a. $V_{M,t}(P\phi)$ = true iff there is t', t'<t and $V_{M,t'}(\phi)$ = true.
b. $V_{M,t}(F\phi)$ = true iff there is t', t<t' and $V_{M,t'}(\phi)$ = true.

Verbal tense, however, is not the only manifestation of time in natural languages, and there are cases in which direct reference to temporal entities seems to be needed. Apparently, this is the case of temporal anaphora, as seen, and presumably also of temporal adverbials such as *at four*, *yesterday*, and so on. There are, therefore, many cases where direct reference to times appears to be necessary.

3 Temporal entities

In the previous section we have shown that (i) the temporal properties of sentences cannot be easily accounted for by means of the scopal dependencies among temporal operators; (ii) the compositional character of temporal operators does not provide an upper limit to the number of temporal operators which can be combined to yield tenses, failing therefore to explain the limited variety of tenses found in natural languages; and (iii) tense logic does not provide an account of temporal anaphora and of certain expressions that seem to require the availability of terms referring to times. All these considerations seem to favor a referential approach – that is, an approach that allows temporal reference directly in the object language, thus permitting an analysis of tenses, and temporal adverbials as referring (or involving reference) to temporal entities. Before turning to more details about the referential approach, let me emphasize that the basic opposition between the temporal logic approach and the so-called referential one is linguistic, not ontological-metaphysical. That is, both admit the reality of times (points, intervals, or whatever) with their usual properties (precedence). The difference is in the logical language: in one case, terms referring to those entities are exploited; in the other, reference to times is relegated to the metalanguage. As we will see, there is a more radical option, which expunges times from all levels of the logical language, prohibiting reference thereto tout court.

Before we continue, let us point out that we will often cast our consideration in a truth-theoretic semantic framework, inspired by the work of Higginbotham (1991) and Larson and Segal (1995). For obvious reason, there is no space here to discuss the approach in any detail, and the interested reader is referred to the publications cited. For our purposes, it suffices to say that the theory uses a ternary relation Val, between an entity, x, a linguistic object, Σ, and an assignment sequence, Val(x, Σ, σ), signaling that x is a value for Σ under assignment σ, and that this will be the basic building block for our semantic work.

We start by considering how tenses can be accounted for in a referential approach. The simpler possibility is to have them introduce relations between temporal entities; e.g., the past tense states that the time of the event precedes the time of the speech. Or, alternatively, that the event talked about in the clause precedes the speech/utterance event. Syntactically, tense morphemes are of category T, project a constituent TP, and take VP complements. Hypothesizing that both the latter are predicates of events, we could write the following axioms for T:

(19) a. Val(e, Past, σ) iff e<u
b. Val(e, Pres, σ) iff e ° u
c. Val(e, Fut, σ) iff e>u

They say that, for a given assignment sequence σ, the value of a tense morpheme is event e iff such an event precedes the utterance (past tense), overlaps the utterance (present tense), or follows the utterance (future tense). The event is provided by the VP, and the combination of the tense with that phrase is ruled by the following axiom:

(20) Val(e, $[_{TP}$ T VP], σ) iff Val(e, VP, σ) and Val(e, T, σ)

This axiom says that event e is a value of $[_{TP}$ T $[_{VP}$ ran]] iff e is the value of the VP and of the node T. The axiom for the relevant tense, (19b), eventually constraints the event to precede the utterance.

It has been observed that this simple picture is not easy to extend to compound tenses. To this end, it might be worth considering the work done in the Reichenbachian tradition, starting from Reichenbach (1947). In this perspective, the correct temporal interpretation of tenses requires three temporal entities, not just two, adding the so-called reference time/event, r, to the already-seen event (time) and utterance (time). With this, tenses are devices ordering the three temporal entities. For example, the meaning of the present tense could be represented as u°r°e, stating that the event (time) overlaps the reference time/event, and the latter overlaps the utterance.

The Reichenbachian model has been adopted and revised by several linguists (among others, Comrie 1976a, 1985b; Vikner 1985b; Hornstein 1990; Scorretti 1991; Declerck 1986; Giorgi and Pianesi 1997). As already suggested by Reichenbach and then further discussed by Comrie (1985b) and Hornstein (1990), for both empirical and theoretical reasons it has been proposed that the relation among the three points be split into two distinct relations, one between r and u, and the other between e and r. The result is a system in which a direct relationship between e and u is never realized, but is always mediated by r. The possible relations are the following:

(21)

Type 1 relation		**Type 2 relation**	
u>r	future	e>r	perfect
r>u	past	r>e	prospective
u°r	present	e°r	neutral

As a consequence, the various tenses are the result of the composition of a relation of type 1, with a relation of type 2. For instance, according to this picture, the representation of the present tense is the result of the combination of u°r with e°r, to yield u°r°e. The representation of the present perfect is the result of the combination of u°r with e>r, to yield e>r°u. From the point of view of the final representation, this proposal exhibits an important empirical difference

with respect to the original Reichenbach one. The point, often discussed in the literature (see Comrie 1985b and Hornstein 1990), concerns the future perfect. Such a tense results from the combination of u>r and e>r. Comrie points out that in English (and in Italian as well), a sentence such as (22) is ambiguous in three ways:

(22) John will have finished his manuscript by tomorrow.

The exact temporal relation between the finishing of the manuscript and the utterance is unknown. It could be that when the sentence is uttered, John has already finished the manuscript; or that he is finishing it exactly at that moment; or that he will finish after the utterance and before *tomorrow*. This ambiguity is nicely captured by the following combination of type 1 and type 2 relations:

(23) 
As pointed out by Comrie and then by Hornstein, the revised Reichenbachian framework presents several other advantages over the original one. According to the latter, in fact, we would in principle expect the existence of languages where for each possible position of e, there is a morphologically different realization. In other words, Reichenbach predicts the existence of languages in which the meanings corresponding to u>e>r, u°e>r, e>u>r are expressed by means of different morphological tenses. Comrie points out that this does not seem to be the case.

Also, we have a way to account naturally and elegantly for the limited number of morphologized tenses, a problem that plagued the tense operator approach of the previous section. The system is based on three primitive objects plus binary relations. As such, the possibilities of combining the various forms are very limited. Finally, as pointed out by Hornstein (1990), such a system can be easily acquired, satisfying therefore an important requirement for any theory of tense. The inventory of resulting tenses is the following (the list is basically Hornstein's (1990: 117) with the addition of the distant future):

(24)

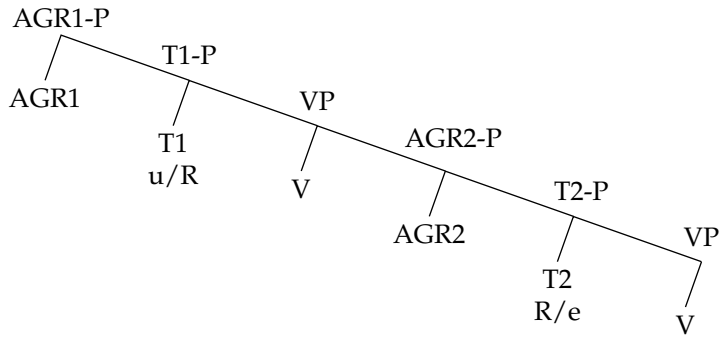
Present:	u°r ∧ e°r = u°r°e
Past:	r>u ∧ e°r = e°r>u
Future:	u>r ∧ e°r = u>r°e
Present perfect:	u°r ∧ e>r = e>r°u
Future perfect:	u>r ∧ e>r
Past perfect:	u>r ∧ e>r = e>r>u
Future in past:	r>u ∧ r>e
Proximate future:	u°r ∧ r>e = u°r>e
Distant future:	u>r ∧ r>e = u>r>e

3.1 The syntax of tense

Given the revised Reichenbachian framework reviewed in the previous section, the possibility arises that the two types of relations between temporal entities correspond to two Tense head, T1 and T2, realizing type 1 and type 2 relations, respectively. Such a distinction can be motivated by showing that the morphemes realizing T1 and T2 have different contents, in terms of features and different morphosyntactic behaviors, and that this predicts the legitimate combination of these two categories, hence of available tenses.

This possibility has been pursued in Giorgi and Pianesi (1997), where it is proposed that tenses are doubly represented in clausal structure because of the existence of two projections, T1 and T2, with T1 higher than T2. For example, a compound tense such as the Italian or English past perfect (e.g., *had eaten*) or future perfect (*will have eaten*) would correspond to (at least) the following structure:

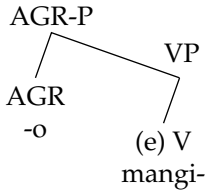
(25)



Here, T1 introduces the relation between the utterance and the reference point, whereas T2 takes care of relating the latter to the event. The lower VP is projected by the verb, whereas the higher one is projected by the auxiliary. AGR1 represents the set of phi-features, e.g., person and number, that are shared with the subject, i.e., (Spec, AGR1"). AGR2 can be specified for gender and number features, as in Italian. Giorgi and Pianesi hypothesize that there are no Ø tense heads, and that the representation for an Italian present tense form is the following:

(26) a. Mangio.
eat-1sg
I eat.

b.



No T1 or T2 node is projected, and the meaning usually associated with the present tense results from a default process directly relating the event (introduced by the verb) and the utterance, yielding u°e. The idea is that, tenses being a semi-lexical category, they are present in syntax only if morphological evidence is available. In other cases, only T1 is projected, as in the Italian simple past:

(27) a. Mangiai.
ate-1sg
I ate.

b. 
Here T1 directly relates the event (introduced by the verb) to the utterance, yielding e>u. Finally, the present perfect is as in (28). T2 is projected, and connects the event to the reference time/event, giving e>r. T1, on the other hand, is absent, since the auxiliary is in the present tense. As before, this triggers a default interpretation according to which the reference event overlaps the utterance. This way we obtain the expected result: e>r°u.

(28) a. Ho mangiato.
have-1sg eaten
I have eaten.

b. 
As can be seen, Giorgi and Pianesi assign a bi-clausal structure to complex tenses, and treat the contribution of T1 and T2 in essentially the same manner. A past tense, be it expressed by T1 or T2, places the (entity corresponding to the) variable instantiated by the complement of the tense node before another entity (the reference time/utterance event). The lower clause is responsible for relating the event (time) and the reference time/event. The upper clause handles the latter variable, relating it to the utterance. This can be captured as follows:

(29) a. Val(<x, y>, T2, σ) iff rel(x, y) where rel is >, <, or ° depending on whether T2 is past, future, or present.
b. Val(y, [$_{T2P}$ T2 VP], σ) iff Val(<x, y>, T2, σ) and Val(x, VP, σ).
c. Val(y, [$_{VP}$ Aux T2P], σ) iff Val(y, T2P, σ).
d. Val(z, T1, σ) iff rel(z, u), where rel is >, <, or ° depending on whether T1 is past, future, or present.
e. Val(z, [$_{T1P}$ T1 VP], σ) iff Val(z, T1, σ) and Val(z, VP, σ).

We have avoided using the variables e and r in (29) to stress the strong symmetry between the two tenses. Thus, when T2 is realized by a past tense morpheme, (29a) and (29b) jointly ensure that the value of T2P be an entity (the reference event) that is before the entity introduced by the VP (the event). Moreover, if T1 is a future morpheme, then the value of T1P is the entity realized by the VP, the latter turning out to be the same as the value of the embedded T2P. As before, the indexical nature of T1 tenses is handled directly by axiom (29d).

Those axioms provide a simple treatment of the second variable (the reference time/event). A more detailed account should accommodate the fact that it can draw its reference from the contexts, or be bound by a quantificational expression, as in:

(30) Ogni volta che l'ho incontrato, Mario aveva parlato con il capoufficio.
every time that I him have met, Mario had spoken with the boss
'Every time I met him, Mario had spoken with his boss.'

The variable corresponding to r can be both a temporal entity – a time point or interval – and an eventuality, according to the framework adopted. The second possibility enables us to introduce considerations about consequent states, a là Parsons (1990). The first alternative can be used to accommodate within this theory insights relying on the notion of an extended now, as in Dowty (1979). Finally, notice that in this approach the three Reichenbachian points lose any privileged status and become a side effect of the interplay between the syntactic and the semantic properties of tense morphemes, and the structures they enter into.

Other authors have elaborated on the idea of bi- (and even multi-) clausal structure for tenses. Thus Julien (2001) proposes that simple sentences involve both a TP-past and a TP-future, the former taking the second as its complement, and the latter the VP. Both T-past and T-future can have ± values:

(31) [$_{TP\text{-}past}$ T-past$_{[\pm\ past]}$ [$_{TP\text{-}future}$ T-future$_{[\pm future]}$ [VP]]]

When T-past has [+past] and T-future has [–future] the result is a simple past. Vice versa, if T-past is [–past] and T-future is [+future], we have a simple future. The present tense results from a configuration where both features have the value –, and, as in Giorgi and Pianesi, the relevant interpretation is the result of a default process. Finally, Julien admits the possibility that both features have a + value, exemplifying this possibility with the English future in the past *would*.

This structure is extended to complex tenses by duplicating the structure below the auxiliary in (31). Other proposals in this direction can be found in Cinque (1999). For a partially different view, see Stowell (1996).

3.2 Sequence of tense

Up to now, our discussion of the referential theory has been limited to tenses in matrix clauses. In complement clauses, especially when predicates of propositional attitude are involved, tenses behave in peculiar ways, giving rise in languages such as English to so-called Sequence of Tense (SOT) phenomena. Thus, an utterance of (32) can be understood as reporting either a present tense utterance of John's – e.g., *Mary is ill* – or a past tense utterance – e.g., *Mary was ill*:

(32) John said/believed that Mary was ill.

Within the approach under discussion here, the backward-shifted reading can be captured by assigning (32) the following truth-conditions:

(33) $\exists e(\text{saying}(e) \wedge \text{Agent}(e, \text{John}) \wedge \text{Theme}(e, \psi) \wedge e<u)$

Here, ψ is the ILF for the subordinate clause with the following truth-conditions:

(34) $\exists e'$ (ill(e) $\wedge$ Theme(e', Mary) $\wedge$ e'<e)

Once the two are put together we have:

(35) $\exists e(\text{saying}(e) \wedge \text{Agent}(e, \text{John}) \wedge \text{Theme}(e, []\exists e' (\text{ill}(e) \wedge \text{Theme}(e', \text{Mary}) \wedge e'<e)[]) \wedge e<u)$

What is important here is that the truth-conditions for the subordinate clause explicitly mention the episode of saying, letting the tense relate it to the embedded eventuality (the illness); see Higginbotham (1995) for more on this topic. This establishes a parallel between the role the matrix eventuality – the subject's attitude episode – plays in the subordinate clause and the role played by the utterance in the matrix. In both cases, the tokening of an expression by an agent is used as a temporal coordinate from which the tense's contribution is computed. This parallel can be further pursued, as in Giorgi and Pianesi (2001a, 2001b), to account for the lack of mere indexical readings of tenses in subordinate clauses. Thus, (36) cannot be used to mean that John said something concerning the very time (36) is uttered – that is, the speech time – nor can (32) be used to report a dictum concerning events which are located in the past only with respect to the utterer – e.g., yielding a report which is future-oriented with respect to John:

(36) Last week John said that Mary is pregnant.

It seems, therefore, that whenever there is a tokening of a linguistic expression (as in matrix clauses), or a report about such a tokening (as in subordinate contexts), the temporal coordinates of the tokener must be explicitly given and connected to the event the expression is about. In other words, the ILF representing the object of a propositional attitude must explicitly represent the attitude episode itself, and use it to locate the talked-about event:

(37) **Conditions on propositional attitudes:**
   a. A clause is the object of an attitude by a subject iff the ILF of that clause contains the subject temporal egocentric coordinate.
   b. The primary role of tense is to locate the event with respect to such a coordinate.
   c. The temporal coordinate of the subject is the attitude's episode itself.

Principle (37) correctly predicts that tenses in subordinate contexts cannot be mere indexicals, for that would amount to linking the event to the utterance, hence to the speaker's coordinate, violating (37). Moreover, it dissolves the notion of *temporal anchoring* (cf. Enc 1987) into the more general requirement that the contents of propositional attitude explicitly represent the attitude episode itself. Finally, it suggests that the assignment sequences that are used to compute the interpreted logical forms of clauses subordinated to verbs of propositional attitude had better be relativized to subjects. By this we mean that in the backward-shifted reading, the *was* of (32) is evaluated as if it were the subject's (John's) *was*, hence relating the state of illness to his coordinate – i.e., the saying/thought – rather than to the speaker's – i.e., the utterance. We do not discuss here how this idea can be implemented, for which we refer the reader to Giorgi and Pianesi (2001b). Suffice it to say that the availability of subject-oriented assignment sequences provides for the desired truth-conditions (33) and (35).

Turning to the simultaneous reading of (32), it can be given the following truth-conditions:

(38) $\exists e(\text{saying}(e) \wedge \text{Agent}(e, \text{John}) \wedge \text{Theme}(e, []\exists e' (\text{ill}(e) \wedge \text{Theme}(e', \text{Mary}) \wedge e' \circ e)[]) \wedge e < u)$

They are consistent with the discussion above and with (37): the ILF of the subordinate clause explicitly represents the subject's temporal coordinate, and the tense relates this to the event. As before, this is obtained by computing the ILF of the subordinate clause by means of a subject-oriented assignment. With respect to the other reading, however, the well-known problem arises of how to accommodate the fact that an embedded past tense of (32) behaves as if it were a present tense. Roughly speaking, the explanations provided by the literature are of two different kinds. According to one view, the embedded past tense is only 'apparent' in (32); one might argue, in fact, that it is present during part of the derivation, but then disappears at LF, because of some deletion process obtaining in past-under-past contexts. Another view maintains that the past tense

morpheme was not present during the derivation, and got inserted only as a by-product of spell-out. Both views share the idea that the LF representation for a (32) can have a Ø tense morpheme (or no tense morpheme at all), which interpretively yields – e.g., through some default mechanism – simultaneity. This approach was quite popular some times ago. More recently, it has been exploited by Ogihara (1995), though it has lost some of its appeal because it requires postulating mechanisms (deletion and/or insertion) that are not so readily available any more.

Another tradition has it that the past tense is morphologically present, but can be interpretively transparent, either because the embedded past tense enters some kind of agreement process with the matrix one, or because it acts as a scope marker for the matrix tense, or some similar mechanism. A recent proposal in this direction is that advanced by Abusch (1997). She hypothesizes that superordinate tenses can place constraints on subordinate ones, and that, vice versa, subordinate tenses inherit restrictions from superordinate ones. Thus she speaks of a local relation together with transmitted ones. In the case of a past-under-past sentence, the constraint is that at least one of these relations taken together (the local and transmitted ones) is temporal precedence. More precisely, she assumes that:

(39) a. Tenses come with a relational variable relating their index to the local evaluation time.
b. Verbs such as *believe* transmit the relation associated with their tenses to their clausal complements, through a feature-passing mechanism. Hence embedded tenses have access to all the relations associated with higher tenses.
c. The semantic of tense is a constraint on the set of all available relations. For the past, the constraint is that at least one of them be precedence.

Given this, the simultaneous reading of (32) follows: (i) the constraint on the subordinate past tense is satisfied by the inherited precedence relation, and (ii) this makes it possible to understand the embedded event as simultaneous to the saying.

Another possibility is that pursued by Stowell (1996), who draws a parallel between tenses in subordinate contexts and polarity items. In his view, the past tense is a past-polarity item, meaning that if in the scope of another past tense it behaves as *anybody* in the scope of negation; both do not contribute anything to the interpretation, so that it becomes possible to understand the illness in (32) as simultaneous to the saying. It should be noticed that the actual implementation of both proposals is somewhat underspecified. Abusch's theory of transmitted relation relies on a feature-passing mechanism that is not easy to accommodate within current generative grammar frameworks. Stowell's view, on the other hand, suffers the same shortcomings as any treatment of polarity – namely, what is the underlying syntactic mechanism? In this sense both are somewhat stipulative, as is Schlenker's (2003a) recent proposal of agreement between semantic indices.

3.3 The double access reading

Together with some syntactic facts discussed in Giorgi and Pianesi (2000), principle (37) provides an account of double access sentences (DAR) – e.g., (36). As first observed by Smith (1978), such a sentence has the peculiarity that the pregnancy state referred to in the subordinate clause is simultaneous both to the saying and to the utterance. This doesn't mean that by using (36) a speaker commits herself to the truth of the complement – that is, to the existence of a pregnancy of Mary's holding at the speaker's time. Nor is there any commitment to the truth of the complement clause at Mary's, the subject's, time. Indeed, the speaker can continue her speech by uttering:

(40) Actually, he was wrong. Mary has just been overeating for the last three months.

Scholars such as Abusch (1997) and Ogihara (1995) have argued in favor of a *de re* analysis of tenses in these cases, hypothesizing that the embedded present tense gets scoped out in (36), and that both the tense and its trace contribute to the interpretation. Scoping out is obligatory in present-under-past contexts, because the constraint on local and inherited relation for the present tense is that none of them be temporal precedence (Abusch 1997), or because the present tense is an anti-past polarity item (Stowell 1996).

Once scoped out, the behavior of the present tense is analyzed within a framework built upon Lewis's (1979) suggestions, as further elaborated by Cresswell and Von Stechow (1982). In this view, for a subject X to have a *de re* belief about an object Y is for X to ascribe Y a certain property Z. Property ascription, in turn, relies on subject X being suitably connected with object X by means of an appropriate acquaintance relation which makes the object (epistemically) available to the subject. Omitting details (which can be found in the works cited), the analysis of a DAR sentence such as (36) requires that:

(41) a. the present tense be scoped out of the embedded clause;
b. the embedded clause be interpreted as a property of times;
c. a suitable acquaintance relation be found relating the *de re* (scoped-out) interpreted time/state to the attitude's subject.

In Abusch's account, the first point follows from the already-mentioned theory of transmitted relations in intensional contexts: the constraint on the local and the transmitted relations of a present tense, in fact, is that none of them be temporal precedence. Thus, in a present-under-past sentence the tense must be scoped out. Finally, Abusch argues that a suitable acquaintance relation for (36) is one picking out the maximal interval at which Mary has a big belly (the hypothesis is that the speaker is interested in explaining Mary's symptoms), and one which, for independent reasons, picks up an interval that in the actual world overlaps with both the saying and the utterance time.

As should be clear, the offered account of the DAR relies on hypotheses involving both the syntax and the semantics. Concerning the former, it is necessary that the *de re* tense be scoped out of the embedded clause at LF, hence that a position be made available for it to land in. At the same time, the trigger for such a movement, though spelled out in terms of the constraints on local and transmitted relations, is essentially syntactic: temporal relations are cumulated down the syntactic trees through a mechanism of feature passing, which is typically syntactic (this obviously holds in general of Abusch's proposal, hence also of the discussed account of the simultaneous reading of (32)). It is not clear whether and how the syntactic theory can bear the burden of these two requirements. Invisible movement have recently come under the scrutiny of syntacticians who seem more wary than in the past about these matters. Concerning the feature-passing mechanism, it is not something that current theories of generative grammar seem so able, or even willing, to accommodate. So the basic problem of how temporal dependencies should be handled remains open.

On the semantic side, the *de re* account has a number of empirical and conceptual shortcomings. Given the constraint on the acquaintance relation, it can explain why an utterance of (36) is odd if Mary's symptoms do not persist at speech time. However, it has difficulties in explaining why the same utterance is odd if the symptoms persist but the situation has changed in relevant respects. Suppose, for instance, that Mary was indeed pregnant when John said what he did, that she delivered just a few days before the report, and that, as often happen in these cases, she still has a big belly. If this is the situation, the DAR report is odd, and the oddness seems to have to do more with the speaker's knowledge/beliefs – that is, with her propositional attitudes – than with John's. Interestingly, the converse also holds. If Mary was not pregnant at the saying time (John was wrong), is now pregnant, and has a big belly all the time (for whatever reasons), then again (36) is odd. As before, what matters is that if the speaker knows that the situation has changed, she isn't in a position to use a DAR sentence. These facts are not easily captured by the *de re* accounts just reviewed.

Finally, on the conceptual side, *de re* accounts of DAR sentences place a heavy epistemological burden on the speaker's shoulders: she must have quite detailed intuitions about the subject's original situation (mental state, one could say). On the other hand, it seems that one can use a DAR sentence without any information about what moved John into saying what he did (the big belly?). Short of saying that the speaker can postulate non-specific acquaintance relations, it is not clear how the vast majority of uses of DAR sentences can be accounted for. But non-specific acquaintance relations don't seem to be what Lewis had in mind when he introduced acquaintance relations; he seemed to mean that they should be of a very specific type.

A different approach to DAR sentences, trying to address those concerns, was proposed by Giorgi and Pianesi (2001b). They explicitly attempt to link the temporal interpretation with syntactic facts, while at the same time capitalizing on the idea that by using a DAR sentence the speaker expresses an attitude of hers. On the syntactic side, the basic observations concern the fact that in Italian, DAR

contexts typically have the indicative mood, and reject complementizer deletion (see Giorgi and Pianesi 2000, 2001a):

(42) Gianni ha detto *(che) tu eri arrabbiato.
Gianni has said (that) you were(IND) angry
'Gianni said that you were angry.'

(43) Gianni credeva/temeva (che) tu fossi arrabbiato.
Gianni believed(IMPF)/feared(IMPF) that you were(SUBJ) angry
'Gianni believed that you were angry.'

(44) Gianni ha detto che Maria è incinta.
Gianni has said that Maria is pregnant
'Gianni said that Maria is pregnant.'

(45) *Gianni temeva che Maria sia/è incinta.
Gianni feared(IMPF) that Maria is(SUBJ)/is(IND) pregnant
'Gianni feared that Maria is(SUBJ)/is(IND) pregnant.'

On the other hand, contexts that allow complementizer deletion, such as those induced by verbs like *credere* (believe) or *temere* (fear), do not allow the DAR. Thus, some connection seems to be at stake between CD and DAR. Giorgi and Pianesi's explanation is cast in a split-C framework: two distinct complementizers can be singled out in embedded clauses; namely, a lower one, called MOOD, which is related to the presence of an embedded subjunctive verb, and a higher one, C. MOOD is just the lexicalization of the mood features, which can also be realized syncretically (Giorgi and Pianesi 1997) in Infl. When the syncretic option is exerted, MOOD is absent, thence the appearance of complementizer deletion. On the other hand, C's features cannot be realized syncretically, hence C cannot be omitted. The relationship between the ban on CD and the possibility of the DAR, therefore, points to an important role to be played by C: the DAR obtains only if C is projected (irrespective of the specific tense chosen). To explain this relationship, Giorgi and Pianesi hypothesize that the complementizer C is endowed with temporal features (τ-features) entering a relation with those of the embedded T, by either movement or matching. As a result, when the ILF for the embedded clause of (36) is computed and the interpretive contribution of tenses is spelled out, the same eventive variable is present in C and in T:

(46) a. $[\ldots[_{V}$ said $[_{CP}[\tau\text{-C}\ [_{XP}\ldots\tau\text{-T}\ldots]]]]]$
b. $[\ldots[_{C,\ <e,\ x0>}\ldots[_{T,\ <e,\ x0>}\ \ldots]]]$

The C node is invariably associated with speaker orientation, so that the temporal features in C yield the 'normal' indexical value. Moreover, (37) is strengthened into a bi-conditional, to the effect that whenever a representation contains the temporal coordinate of an agent then it must express the content of an attitude by that agent.

Concerning (46a), three ILFs must be considered. The first is built from C's complement, XP in (46a); it is interpreted under a subject-oriented assignment, and reports the content of the subject's original dictum. The result is that the in-situ copy of the present tense provides for a pregnancy that overlaps with the subject's temporal coordinate. Then we have the node C itself, where the τ-features are interpreted by means of the speaker-oriented assignment. The result is that the pregnancy state overlaps with the speaker's temporal coordinates as well. Finally, we have the ILF associated with the whole dominating CP, where the former two ILFs are put together in such a way that they are required to have coordinated value: whenever the one (the ILF for XP) is true, the other (that for C) is true as well, and vice versa. This coordination of truth-values is meant to account for the observation made above about the content of the speaker's attitude: the speaker maintains that if Mary was pregnant at the subject's time then the same pregnancy obtains at her time, and vice versa.

The following features of this approach should be noticed: it generalizes the idea, already discussed in section 3.2, that the content of attitude ascriptions, as expressed by ILFs, depends on the subject's coordinate (context/mental state) since it incorporates her temporal coordinates, and explicitly extends it to the speaker, by seeing C as the locus where speaker orientation comes to play a role. This approach shares with *de re* theories the idea that the tense is moved. However, it identifies the place where movement is directed to, namely, C, and motivates such a movement with the triggering τ-features in C.

3.4 Temporal adverbials

If temporal entities (times) are part of the ontology underlying natural language, and reference to them proceeds the way it does with ordinary objects, we should be able to individuate the same range of referential phenomena observed with the latter. In particular, it should be possible to single out terms exhibiting direct reference to temporal entities, behaving as the counterparts of, say, a proper name such as *John*, or of a deictic/indexical term such as *here* or *that man*. It should also be possible to show that their semantic and syntactic properties are similar to those of 'ordinary' proper names or indexical/deictic terms.

Obvious candidates for direct reference in the temporal realm are the names of days and months used in isolation – e.g., *Thursday*, *Sunday*, and *May*. They can appear as expressions fixing the time of the event:

(47) a. I met him (on) Thursday.
b. John will arrive in May.

They can also play the role of subjects/direct objects:

(48) a. John spent Thursday at the seaside.
b. May was a beautiful month.

In all these cases, the reference of these expressions is indexical, crucially involving the use of the speaker's temporal coordinate. Thus, *Thursday* in (47a) or (48a) refers to the last such day before the utterance time; *May* in (47b) refers to the next such month after the utterance time, and in (48b) to the last one. In this sense, they constitute canonical examples of direct reference. Interestingly, they enter into syntactic configurations that have important similarities to that of proper names, as explored by Longobardi (1994). More precisely, Longobardi observed that in Italian, nominal arguments must be introduced by a category D:

(49) a. La madre di Maria è partita.
the mother of Maria is left
'The mother of Maria has left.'
b. *Madre di Maria è partita.
mother of Maria is left
'Mother of Maria has left.'
c. È venuto Camaresi vecchio.
is come Camaresi old
Old Camaresi came. (Longobardi's ex. (29c))
d. *È venuto vecchio Camaresi.
is come old Camaresi
Old Camaresi came. (Longobardi's ex. (29b))
e. Bevo sempre vino.
drink-1sg always wine
'I always drink wine.' (Longobardi's ex. (12a))

This position can be occupied by an overt determiner (cf. (49a)), by the raised nominal head, as in (49c), or by an empty determiner, as in (49e), where a mass noun appears. Longobardi explains this pattern, and, in particular, the fact that proper nouns occupy the D^0 position in syntax, by assuming that the functional category D has a feature [± *ref*] that must be checked by a corresponding feature on the noun. The feature *ref* is strong in Romance and weak in Germanic, and this explains the contrast between (49c) and (49d) on the one hand and (49a) and (49b) on the other:

(50) a. Old John came.
b. *John old came.

Moreover, *ref* is connected to the referential properties of the whole DP. A proper name such as *John* has *ref*, because it refers directly to the relevant person. Given that *ref* is strong in Romance, Italian proper names must overtly rise to D^0 from their base position (cf. (49c)), preventing adjectives from preceding proper nouns (cf. (49d)). On the other hand, the weak *ref* of Germanic allows English proper nouns to rise covertly, thus permitting the pronominal adjective of (50a). Finally, common nouns, such as *madre* (mother) in (49a) and (49b), are not object referring, and as such cannot be endowed with the *ref* feature. As a consequence, the overt article is needed.

Longobardi (1994) and Giorgi and Pianesi (1997) observe that names of days and names of months exhibit a similar behavior:

(51) a. Ho passato (il) giovedì scorso al mare.
have-1sg spent (the) Thursday last at the seaside
'I spent last Thursday at the seaside.'
b. Ho passato *(lo) scorso giovedì al mare.
have-1sg spent *(the) last Thursday at the seaside
'I spent last Thursday at the seaside.'

(52) a. (Il) Giovedì scorso è passato velocemente.
(the) Thursday last is passed quickly
'Last Thursday passed quickly.'
b. *(Lo) scorso giovedì è passato velocemente.
(the) last Thursday is passed quickly
'Last Thursday passed quickly.'

(53) Ho passato giovedì al mare.
have-1sg spent Thursday at the seaside
'I have spent Thursday at the seaside.'

(54) a. Mario ha passato domenica sola al mare.
Mario has spent Sunday only-fem at the seaside
'Mario spent only Sunday at the seaside.'
b. *Mario ha passato sola domenica al mare.
Mario has spent only-fem Sunday at the seaside
'Mario spent only Sunday at the seaside.'

These examples reproduce the pattern in (49) and can be taken as evidence that the noun *giovedì* (Thursday) can overtly raise to D^0, as proper names do in Longobardi's theory, and for similar reasons. Thus, in (49c) and (51a), with the postnominal adjective, the definite article may be dropped, showing that the noun has risen in the D^0 position. When the adjective is prenominal, however, the article must be present, as in (49d) and (51b). Finally, (54a) and (54b) reproduce the same pattern with a non-temporal adjective, *solo* (only).

This behavior isn't reproduced with an adjective such as *precedente* (previous/before), as the contrast between (51–52) and (55) exemplifies:

(55) a. Ho passato *(il) giovedì prima/precedente al mare.
have-1sg spent *(the) Thursday before at the seaside
'I spent the Thursday before at the seaside.'
b. *(Il) Giovedì prima/precedente era passato velocemente.
(the) Thursday before had passed quickly
'The Thursday before had passed quickly.'

Concerning proper nouns, Longobardi notes that the adjectives that tolerate the raising of the nominal head are those which can have a restrictive interpretation, in both prenominal and postnominal position:

(56) a. ?Mario alto è venuto a trovarmi.
Mario tall is come to visit-me
'Tall Mario came to visit me.'
b. Il Mario alto è venuto a trovarmi.
the Mario tall is come to visit-me
'The tall Mario came to visit me.'

With a restrictive interpretation of the adjective *alto* (tall), (56a) is marginal, whereas an appositive reading is completely unavailable. The sentence improves with an article, as in (56b). If this reasoning is on the right track, one may extend it to the sentences in (55), observing that they contain restrictive phrases that are obligatorily postnominal.

Proper nouns yield better results with postnominal restrictive adjectives, such as *bello* (handsome), than with postnominal (restrictive) adverbials, such as *prima* (before):

(57) Ci sono due Mari: uno bello e l' altro brutto. ?Mario
there are two Marios: one handsome and the other ugly. Mario
bello è venuto a trovarmi.
handsome is come to visit-me
'There are two Marios: one is handsome and the other is ugly. The handsome Mario came to visit me.'

(58) C' erano due Mari in fila: uno prima di me ed un altro
there were two Marios in row: one before me and another
dopo di me.
after me
'There were two Marios in the queue: one was before me and the other after me.'
a. Il Mario prima di me è venuto a trovarmi.
the Mario before me is come to visit-me
'The Mario before me came to visit me.'
b. *Mario prima di me è venuto a trovarmi.
Mario before me is come to visit-me
'Mario before me came to visit me.'

The quasi-acceptability of (57) contrasts with the strong unacceptability of (58b).

This evidence seems to stress the role of modifiers in endowing the nominal head with object referring capabilities. E.g., adjectives such as *scorso* (last) in (51–52), being indexical, provide the nominal head with directly referential capabilities – that is, they provide [+ *ref*] – so that it can raise overtly to the D^0 position

in Italian. An adjective such as *precedente* (previous/before) does not have this possibility, so that the nominal head cannot raise to D^0.

This discussion shows that direct reference (in the form of indexical reference) can be found in the temporal realm. Importantly, the expressions realizing it participate in the same syntactic pattern as those observed for objectual reference.

When the relevant expressions are used to temporally locate the event, the same pattern presented in (51–54) is reproduced:

(59) a. Ho incontrato Mario (il) giovedì scorso.
have-1sg met Mario (the) Thursday last
'I met Mario last Thursday.'
b. Ho incontrato Mario *(lo) scorso giovedì.
have-1sg met Mario the last Thursday
'I met Mario last Thursday.'
c. Ho incontrato Mario giovedì.
have-1sg met Mario Thursday
'I met Mario on Thursday.'

(60) a. (Il) giovedì scorso ho telefonato a Mario.
(the) Thursday last have-1sg telephoned to Mario
'The Thursday last I telephoned to Mario.'
b. *(Lo) scorso giovedì ho telefonato a Mario.
(the) last Thursday have-1sg telephoned to Mario
'The last Thursday I telephoned Mario.'
c. Giovedì ho telefonato a Mario.
Thursday have-1sg telephoned to Mario
'Thursday I telephoned to Mario.'

(61) a. ?Mario è venuto a trovarmi domenica sola.
Mario is come to visit-me Sunday only-sg, fem
'Mario came to visit me only on Sunday.'
b. *Mario è venuto a trovarmi sola domenica.
Mario is come to visit-me only-sg, fem Sunday.
'Mario came to visit me only on Sunday.'

The article can be dropped in (59a) and (59c), where the adjective is in the prenominal position, showing that the nominal head has raised in (59a) and (59c). The article cannot be omitted in (59b), as the order *adjective-noun* shows, since the nominal head has not risen. Furthermore, these observations can be reproduced when the adverbial is in sentence-initial position (cf. (59a) and (59c)). Finally, (61) shows that, as in (54), the relevant behavior can be obtained not only with temporal adjectives such as *scorso* (last) but also with others, such as *solo* (only).

The data in (59) to (61) confirm the conclusion drawn above, and constitute evidence in favor of the hypothesis that temporal adverbs have argument status. In particular, (59b), (60b), and (61b) show that these phrases require a filled D^0, a behavior which is typical of arguments. Hence, temporal expressions fixing the time of the event seem to be the lowest arguments in the VP shell (cf. Larson 1988b). To support this conclusion, note that the constraints seen above do not arise in non-argument position – that is, in predicative contexts:

(62) a. Sono discorsi da scorsa domenica.
are-3pl talks from last Sunday
'These talks are typical of last Sunday.'
b. Sono discorsi da domenica scorsa.
are-3pl talks from Sunday last
'These talks are typical of last Sunday.'
c. Ho dichiarato questo giorno (la) sola domenica dell'anno
have-1sg declared this day (the) only Sunday of the
in cui si possa mangiare carne.
year in which can eat-3sg meat
'I have declared this day as the only Sunday of the year in which it is possible to eat meat.'

In argument position, the lack of the determiner is due to the overt raising of the nominal head to D^0. Therefore, adjectives such as *scorso* (last) and *solo* (only) cannot appear in prenominal position (cf. (59b) and (61b)). On the other hand, predicative positions do not require DPs, and bare NPs are allowed. Hence, prenominal adjectives are possible without a determiner:

(63) Mario si è mascherato da vecchio spartano.
Mario himself is dressed-up as old Spartan
'Mario dressed himself up as an old Spartan.'

Temporal adverbials manifest the same pattern in predicative contexts:

(64) Il giorno dell' esame era (il) venerdì prima.
the day before the examination was (the) Friday before
'The day before the examination was (the) Friday before.'

Example (64), where *venerdì prima* 'Friday before' is an NP, contrasts with (55).

In conclusion, it can be shown in a non-trivial way not only that direct reference is available in the temporal realm, as expected if temporal reference is available to natural language, but also that the syntax of direct reference for temporal phrases is, in relevant respects, similar to that of direct reference to ordinary objects. Finally, these conclusions hold both for temporal expressions in subject and object positions, and for those fixing the time of the event, showing that the latter deserve to be treated as arguments rather than as modifiers.

4 A non-referential approach

After this cursory review of the merits of the referential approach – namely, the idea that the interpretive properties of tenses and temporal expression are best explained by having variables in the object language that refer to temporal entities – it might seem strange to consider theories claiming that temporal entities and temporal reference should be banned from the basic ontology and from semantics. Yet this has been an influential view, especially in philosophy, and it has recently found more than episodic links with linguistics, thanks to Ludlow (1999). The importance of this enterprise to linguistics is that it tries to show that the very basic question of whether reference to time is to be admitted or not among the tools of the theory is still an open issue, and that it must be solved both by taking seriously metaphysical concerns, and by comparing alternative theories on an empirical basis.

In this section we will present the basic tenets of Ludlow's theory, trying first to provide reasons for the move, and to discuss the theory's machinery and some of its applications to selected phenomena, often the same as those addressed in our review of referential approaches. Given that Ludlow is our sole source, we will try to be as faithful as possible to his exposition. Occasionally, however, we will integrate the analyses, paying attention to keeping to Ludlow's original intuitions.

4.1 A-series vs. B-series

Metaphysical concerns are crucial for anyone thinking that the goal of semantic theory is to investigate the 'tacit' knowledge that permits people to draw appropriate language–world connections. Such a theory is, for instance, an absolute truth theory of semantic knowledge of the kind we have been often resorting to in this chapter – namely, an axiomatic theory comprising axioms giving the referents of terminal symbols, and rules for producing the semantic value of non-terminal nodes starting from the former values. For the theory to make interesting claims, it must rely on some understanding of what is out there in the world, hence it cannot escape some amount of metaphysical commitment. By the same token, Ludlow argues that linguistic inquiry can in turn contribute to further investigation on metaphysical issues.

As far as time is concerned, two metaphysical positions have stimulated the ingenuity of scholars. According to the first (Russell, Reichenbach, Einstein, etc.), time is a sequence of unchanging tenseless events, whereby "future events, past events, and present events are all equally real" (Ludlow 1999: 1). This view is known as the *B-series* theory of time (McTaggart 1908), or the untensed conception (Mellor 1981), and is the one underlying referential approaches to time in language. It is opposed by the *A-series* or *tensed* doctrine, which retorts that "it is fundamental to the notion of time that events, or perhaps propositions, have genuine temporal status" (Ludlow 1999: 2). As a consequence, the metaphysical

status of past and future events might be different, corresponding to different properties.

The B-series conception maintains that the basic relations are the familiar ones which can be construed from the notion of *precedence*, and allow us to talk about an event/time as being *earlier-than*, *later-than*, or *simultaneous-with*, another event/time. These notions suffice to analyze and explain away change, which is taken not to be metaphysically real, but to have only a psychological status. In other words, change is apparent: events/times are given, and all we can say is that some of them precede and/or are simultaneous with some others. We do have the 'feeling' of change, but, as observed, this is not metaphysically real and has no direct counterpart in the underlying ontology; in this sense, the B-series is objective.

The alternative account replies that change *is* metaphysically real: a past event is ontologically different from a future event, and this requires that the relation of precedence be abandoned in favor of the basic notions of *past*, *present*, and *future* (thus avoiding constructing the latter from the former). The consequence is that time entities with their usual ordering are not part of the underlying ontology, and the whole repertory of referential semantics, with its resources (direct reference, quantification, the traditional views about indexicality) cannot be used to account for temporal talk. For the same reasons, the A-series view is not friendly to traditional tense logics. As observed in section 3, though the latter eschew explicit talk about temporal entities from the object language, they have it in the metalanguage. The A-series conception opposes this move too; there are no time points (or intervals) in the ontology, so they cannot be manipulated at any level of the logical language.

The two opposing fields have both metaphysical and semantic facts to duel about. We won't insist on the former, for which we refer the reader to Ludlow (1999) and to Bonomi (2002). Concerning the latter, a case in point is constituted by temporal indexicals. Ludlow considers the situation of a person (himself, apparently) who thinks:

(65) My fifth anniversary is March 12.

Upon discovering that the very day of that thought *is* March 12, he shouts:

(66) My fifth anniversary is today!

These two tokens exemplify one of the classic problems of indexicals. If we take a referential view of times, and hypothesize that the meaning of an utterance is a tenseless (impersonal) proposition, then the two utterances above may end up having the same meaning – namely, the proposition that Ludlow's anniversary is March 12. But clearly, there's a difference between the kind of knowledge communicated by (65) and that pertaining to (66). Even if we admit that the two utterances have the same content/meaning – e.g., that a particular event (Ludlow's anniversary) occurs at a particular time – we need to account for the cognitive difference. The latter seems to consist of the fact that by uttering (66),

the speaker acknowledges that March 12 (the day of his anniversary) is the same day as that of his utterance. The particular mood he is in is caused by this very fact, not by the (much less urgent) piece of information that his anniversary occurs at such-and-such a time. A possible move suggested in the literature (Perry 1969, 1977; Kaplan 1990; etc.) consists in capturing the difference by means of the notion of the character/role of an (indexical) expression. Characters are entities which connect meanings to contexts of speech/thoughts in such a way that, given a context, the character of an indexical expression provides its meaning. In the case at hand, *March 12* and *today* are indexical expressions (the former is taken to refer to the next such day), and have different characters. The meanings (the time individuals) they provide are what enter the truth-conditions of the two utterances. Larson and Segal (1995) suggest executing this in the following way:

(67) a. Val(x, March 12, σ) iff σ(March 12) = x
b. Val(x, today, σ) iff σ(today) = u = x

These axioms yield the following truth-conditions:

(68) a. If u is an utterance of 'My fifth anniversary is March 12', s is the utterer of u, and t is the time of u, then u is true iff s's anniversary is at March 12.
b. If u is an utterance of 'My fifth anniversary is today', s is the utterer of u, and t is the time of u, then u is true iff s's anniversary is at t.

It should be noted that, in a sense, characters remain outside semantics; actually, they play a role in determining truth-conditions, but they do so only by delivering meanings, used to compute truth-conditions. This state of affairs has the consequence that even the differences between (65) and (66) remain beyond the reach of semantics. Indeed, the time of utterance happens to be March 12 for both sentences, hence the truth-conditions in (68) end up being the same. So, while the notion of character has some role in accounting for the different status of (65) as compared to (66), this remains outside the semantic realm.

For those who are dissatisfied with this outcome, believing that the difference between (65) and (66) should be reflected in the semantics/truth-conditions, the possibility is open of resorting to *token-reflexive* truth-conditions à la Reichenbach (1947), which incorporate the reference to the very utterance (thought) token in the truth-conditions. In this case, the truth-conditions for (65) and (66) are as follows:

(69) a. If u is an utterance of 'My fifth anniversary is March 12', s is the utterer of u, and t is the time of u, then this utterance is true iff s's anniversary is at t.
b. If u is an utterance of 'My fifth anniversary is today', s is the utterer of u, and t is the time of u, then this utterance is true iff s's anniversary is at t-the day of this very utterance.

Now, the right-hand sides of the truth-conditions differ, for the second explicitly mentions the utterance token when spelling out the referent of the indexical, whereas the other doesn't. So it seems that we have both captured the different cognitive significance of our two utterances, and managed to keep the distinction within semantics.

Successful as it may appear, however, the token-reflexive strategy has its own problems. In the first place, it is not clear how the required reference to the utterance can be introduced in the semantic machinery, a seemingly technical problem that we won't discuss here. Second, a case can be construed that causes the collapse (in Ludlow's view) of the token-reflexive strategy. The point to be made draws on observations made by Castañeda (1967) about token-reflexivity applied to the first person. In the case of temporality, it turns on the truth-conditions of utterances of (70a), which are as in (70b) according to the token-reflexive strategy:

(70) a. There is no (spoken) language.
b. If u is an utterance of 'There is no spoken language', s is the utterer of u, and t is the time of u, then this utterance is true iff there is no spoken language at t-the time of this very utterance.

The problem is that though utterances of (70a) are false, they are contingently so (it might have been the case that nobody uttered anything); (70b), however, is necessarily false, because of the presence of the reference to the utterance token in the truth-conditions. If we drop such a reference, however, we give up the prospect of bringing context/character within the semantics. Ludlow's conclusion is that the tension between a satisfactory account of temporal indexicality and the analysis of sentences that are about linguistic tokens, such as (70a), originates from the very resources of the B-series – namely, times and reference thereto. So attempts at getting rid of the B-series seem justified.

Are there any reasons, on the other hand, to prefer the B-series to the A-series? Of course there are, and we have already presented some of them when we discussed the shortcomings of temporal logics: complex tenses and anaphora are the best-known and most discussed problems, not only for temporal logics, but for any genuine A-series accounts. Given that the latter do not even admit temporal entities in the ontology, how can temporal anaphora be dealt with? And how can complex tenses be accounted for?

The only effective reply is to try and develop an explicit A-theory semantics. In this respect, we saw that the tensed approach takes change as real and as having a privileged status. How can such a primacy be captured? What does it mean that all we need are the notions of past, present, and future? Moreover, change must be accounted for in a non-circular way; it wouldn't help to resort to the metaphor of passing/flowing time, because such a passage or flow already takes place in time. The only solution seems to be that being past, present, or future be seen as properties that propositions (or proposition-like objects) have or fail to have, and that change is simply the fact that a certain proposition *was*

future, *is* present, and *will be* past. This, according to Ludlow, was Prior's (1967) position, often confused with the idea that there was *a time* at which a certain proposition was future, there is *a time* at which it is present, and there will be *a time* at which it will be past. The latter is what lies behind the attempts at capturing Prior's intuitions in tense logics, but those statements obviously fail to do justice to the untensed view of the A-series, for they admit temporal entities, and admit reference to them, even if only at the metalanguage level. Taking Prior's idea seriously amounts, therefore, to requiring that *Past* be "an indexical predicate that holds of a proposition-like object, effectively displaying the indexical sense of a past-tense morpheme" (Ludlow 1999: 97).

Consider the following axioms:

(71) a. Val(true, [$_{XP}$ T YP], σ) iff for some x Val(x, T, σ) and x = $_{\sigma}$[]YP[].
b. Val(x, Tpast, σ) iff x was true.
c. Val(x, Tpres, σ) iff x is true.
d. Val(x, Tfut, σ) iff x will be true.

The first axiom assigns the value *true* to the clausal structure [$_{XP}$ T YP] iff the ILF of YP (a proposition-like object) is the value associated with the tense node. As with tense logical approaches, this treatment relies on the idea that there is an appropriate representation in which the tense morpheme takes clausal scope. The contribution of the tense morpheme, in turn, is ruled by (71b–d), which implement the idea that tenses behave as indexical predicates of proposition-like objects. Once, e.g., (71a) and (71b) are put together, we can derive the following theorem for an utterance of *John left*:

(72) Val(true, [$_{XP}$ Tpast [$_{IP}$ John leave]], σ) iff $_{\sigma}$[]IP[] was true.

That is, that utterance is true iff the ILF of the IP phrase was true. To take another (well-known) example, consider utterances of the sentence *My root canal is over* used to express relief after a dreadful session at the dentist (similar examples are discussed by Prior 1967, Higginbotham 1995, and others). The present theory assigns it the truth-conditions in (73a), whereas the Larson-and-Segal-style B-series theory would yield (73b):

(73) a. Val(true, [$_{XP}$ Tpast [∃e(e is the event of my root canal)]], σ) iff $_{\sigma}$[][∃e(e is the event of my root canal)][] was true.
b. If u is an utterance at t, by s of [$_{XP}$ Tpast [∃e(e is the event of my root canal)]], then Val(true, u, σ) iff ∃e(e is the event of my root canal and e<t).

As argued by many, (73b) does not explain why one can express relief by uttering that sentence: what is there to be relieved about in the fact that an event precedes a certain time (or another event)? Arguably, (73a) fares better: the sense of relief stems from the fact that a given proposition (the ILF in (73a)) is past for the speaker.

Following the same path, it is possible to define axioms for other indexicals, such as *yesterday* or *tomorrow*, by treating them in the same disquotational manner as *past*, *present*, and *future* in (71):

(74) a. Val(true, [$_{XP}$ Adv YP], σ) iff there is an x such that Val(x, ADV, σ) and x = $_{\sigma}$[]YP[].
b. Val(x, yesterday/tomorrow, σ) iff x was true yesterday/will be true tomorrow.

4.2 Complex tenses

An important development of the theory concerns complex tenses. The account has similarities with the revised Reichenbachian analysis of Giorgi and Pianesi (1997) and others discussed in section 3.1, since it takes complex tenses to involve multi-clausal constructions. Giorgi and Pianesi exploit two tense categories (T1, which is responsible for the relationship between the event time and the reference time, and T2, which attends to the relationship between the reference time and speech time), and hypothesize that the clause hosting T2 is a complement of that where T1 lies, both being always explicit. Ludlow, on the other hand, provides LF representations for complex tenses based on matrix-adjunct structures, where the adjunct is a *when*-, *before*-, or *after*-clause that might remain implicit. Again, the axioms for the connectives rely on a disquotational treatment:

(75) a. Val(true, [$_{S}$ S1 when S2], σ) iff Val(true, S1, σ) when Val(true, S2, σ).
b. Val(true, [$_{S}$ S1 before S2], σ) iff Val(true, S1, σ) before Val(true, S2, σ).
c. Val(true, [$_{S}$ S1 after S2], σ) iff Val(true, S1, σ) after Val(true, S2, σ).

After this, it is hypothesized that all natural languages have (implicit) *when*-clauses, whose structure is the same as that of explicit ones, and whose tense is in concord with that of the main clause.

With this in place, the syntactic structure for a pluperfect such as (75a) is as in (75b), where the past tense prefixed to the *before*-clause results from the requirement that the tenses of the main and adjunct clauses match:

(76) a. had left
b. Tpast[S] before Tpast[. . .]

Attempting a Reichenbachian analogy, the matrix clause of (76b) expresses the relationship between the event time and the speech time; the adjunct relates the reference time to the speech time, and the connectives *when*, *before*, and *after* take care of linking the event and the reference times. This differs in important respects from the neo-Reichenbachian analyses: the latter, in fact, link the reference time both to the event time and to the speech time, sometimes encoding such a dependency, as in Giorgi and Pianesi (1997) in the morphosyntax of tenses.

The schematic LF in (76b) and the axioms given above yield the truth-conditions in (77b) for the sentence in (77a):

(77) a. John had left.
b. Val(true, 'John had left', σ) iff $_{\sigma}$[]∃e(leaving(e) ∧ Agent(e, John))[] was true before $_{\sigma}$[][. . .][] was true.

To repeat, tenses introduce indexical predicates that are treated disquotationally: what a past tense contributes is that the ILF corresponding to the de-tensed clause was true. There is no mention of times, as we would have in temporal logics (the proposition was true at a past time = the (de-tensed) proposition is true at a past time). Complex tenses require implicit *when-*, *before-*, or *after-*clauses, with temporal connectives also treated disquotationally.

Ludlow argues that thanks to this machinery, the theory avoids one of the commonest charges against temporal logics – namely, the unconstrained nature of the account of complex tenses (see section 2). Contrary to the case of temporal logics, the problem does not arise here, since complex tenses correspond not to the nesting operators, but to implicit clauses introduced by appropriate temporal connectives. Operator composition is not required, hence unwanted combinations are expected not to arise. As Ludlow (1999: 124) puts it: "The system merely recapitulates the structure made available by the system of explicit temporal conjunctions, and inherits the constraints on that system."

At this juncture, one might object that the possibility of predicting non-existing tenses might not be completely ruled out, since temporal clauses can be nested:

(78) John left when you started to address Mary after she provoked Henry.

To the extent that the syntax of implicit *when*-clauses parallels that of explicit ones, nesting temporal clauses cannot be dismissed; hence the danger of over-generating complex tenses isn't completely avoided.

As observed, the implicit temporal clauses can play the role of the Reichenbachian reference time. The latter, in turn, is a device for picking up contextually relevant times. Thus, for an utterance of *John had (already) left* to be felicitous, a contextually relevant time seems necessary, which plays the role of the reference time, as in the following discourse:

(79) Mary entered. John had (already) left.

This is a case of temporal anaphora, and in general the reference time has anaphoric properties.

As we know, A-series theories ban temporal reference: there are no singular propositions about times, but only general ones, in the sense that none depends upon a particular temporal entity. So Ludlow accounts for the anaphoric properties of Reichenbach's reference time by deploying an E-type theory of temporal anaphora. Accordingly, (possibly implicit) temporal anaphors stand proxy for

when-clauses, which provide the required descriptive content (for the notion of E-type anaphora, see Evans 1977). Thus, in the discourse above, the second sentence would have the LF:

(80) [[Tpast [John leave]] before TPast [. . .]]

The content provided by the *before*-clause, in the case at hand, is something like *Mary entered*. Hence, the resulting truth-conditions are:

(81) Val(true, [[Tpast [John leave]] before Tpast[. . .]], σ) iff Val(true, [Tpast [John leave]], σ) before Val(true, Tpast[. . .], σ).

Eventually, the second sentence of our small discourse is uttered truthfully iff *it was true that John left and this was before it was true that Mary entered*. Such a strategy, it is suggested, can be generalized to all cases of temporal anaphora. If workable, it would prove that A-series approaches can handle temporal anaphora, thus replying to an important objection made by its opponents.

4.3 Temporal adverbs

We saw that locating adverbs like *July 13, 1999* seem to provide a clear example of (rigid) reference to temporal entities. In the theory presently under discussion, they can be analyzed as being (elements of) implicit *when*-clauses:

(82) a. John left (on) July 13, 1999.
b. [Tpast [John leave] when Tpast [. . . July 13, 1999 . . .]]

The content of the (partially) implicit *when*-clause can be taken to be the result of some process of temporal measurement – e.g., 'when the calendar said July 13, 1999'. Notice the (implicit) tense prefixed to the adjunct clause in (82b). This follows from Ludlow's hypothesis that implicit *when*-clauses behave syntactically as explicit ones, so that their tenses are somehow coordinated with that of the main clause. In our case, the tense of the matrix is past, so that the adjunct clause has the same tense. In a different context it could be a future or present tense:

(83) a. John will leave (on) July 13, 2005.
b. [Tfut [John leave] when Tfut [. . . July 13, 2005 . . .]]

In this case, the truth-conditions are that 'John will leave when the calendar says *July 13, 2005*.'

This treatment can be extended to temporal expressions that exhibit contextual variability, such as *July 13*, or *Thursday*. In many cases they behave as indexicals, requiring additional information of linguistic provenance to define their interpretive contribution. Thus, according to whether the main tense is past or future, *Thursday* may mean either the last such day before the utterance, or the next one.

In other words, they do not seem to be intrinsically tensed, but import the relevant information from other phrases. Hence, they are different from, and not amenable to the same treatment as, *yesterday* and *tomorrow*. In the present framework, one could attempt the following strategy. Let us consider *next Thursday*, and hypothesize that *next* is an indexical predicate true of proposition-like objects:

(84) Val(x, next, σ) iff x next true.

The axiom for *next* is similar to that of a tense, treating it disquotationally. We can pursue the parallelism further, and suggest that, within an implicit *when*-clause, *next* can play the role of a tense; more precisely, of a future tense. Thence, it will be available when the matrix tense is a future, and it will be ruled out in the presence of a past tense. From what we already know, we can now derive:

(85) Val(true, [. . . next Thursday], σ) iff $_{\sigma}$[][. . . Thursday . . .][] next true.

That is, *next Thursday* is true iff *the clock says Thursday* will (next) be true. For a sentence such as *John will leave next Thursday* we have:

(86) Val(true, [John will leave next Thursday], σ) iff Val(true, [John will leave], σ) when Val(true, [next Thursday], σ).

With this, utterances of *John will leave next Thursday* are true iff *John leave* will be true when *next Thursday* will be true, i.e., when *the clock says Thursday* will (next) be true.

The case of bare temporal expressions, as in *John will leave (on) Thursday*, now follows. We need only recall that the tense (or the category playing the role of tense in the relevant phrase) must agree with that of the matrix. Because of this, the future-like *next* will be selected, giving:

(87) Val(true, [John will leave Thursday], σ) iff Val(true, [John will leave], σ) when Val (true, [*next* Thursday], σ).

We have written 'next' in italics to indicate that in this case it is not explicit, but stems from the general requirement ruling tense compatibility between matrix clauses and *when*-clauses.

As can be seen, the sketched analyses do not exploit times: there is no resort to entities such as the day *July 13* or the hour *five o'clock*. What you have are measure systems that provide tags related to particular events: striking five vs. saying July 13. And the very event of measuring, of course, is tensed; thus, it occurred, occurs, or will occur.

Admittedly, the discussion is very cursory, but it reflects the status of the theory as developed by Ludlow (1999). It should also be observed that it is not clear how explicit talk about time entities and about what in a B-series approach

appear as ordinal/metrical/topological properties can be accounted for. Thus, what should be done with *the third Thursday*, or with *in two hours*, *for two months*, etc? (This also relates to a conceptual problem we overlooked with the proposed treatment for *next*, for the idea of something being 'next true' seems to incorporate an ordinal notion of truth.)

Another important issue involves adverbs (and other devices) that have been argued by B-series theorists to be quantified over times/events:

(88) a. I always meet Mary.
b. $\forall t\ (\exists e'\ (\text{meet}(e') \wedge \text{Agent}(e', \text{I}) \wedge \text{Theme}(e', \text{Mary}) \wedge \text{at}(e', e))$.

(89) a. I often meet Mary.
b. $\text{Many}\ t(\exists e(\text{meet}(e) \wedge \text{Agent}(e', \text{I}) \wedge \text{Theme}(e', \text{Mary}) \wedge \text{at}(t, e))$.

The strategy suggested by Ludlow involves substitutional (rather than objectual) quantification over *when*-clauses. More precisely, times are reintroduced as second-order entities built out of *when*-clauses, in such a way that for a given sentence S and a given context of utterance c, a 'derived' time, is the set of clauses S' that are true when S is true. For instance, if S is 'John sang' and we know that at that time Mary danced, his brother slept, etc., then the contextually determined 'time' of S is t={'Mary danced', 'his brother slept', . . . }. With this, the truth-conditions for (88a) and (89a) are:

(90) a. For every time t, there is an S in t such that 'I meet Mary when "S" ' is true.
b. For many a time t, there is an S in t such that 'I meet Mary when "S" ' is true.

This seems to solve the problem of temporal quantification in an A-series framework: what you quantify over in sentences such as (89a) are not times/events, but descriptions of events. These are context-dependent, as they should be, and as they are acknowledged by any objectual quantification account (in that case, the issue is how to restrict quantifications to contextually relevant times/events/situations).

One possible problem concerns the extension of this strategy to sentences such as (91):

(91) When I got to London I always met Mary.

Are they to be accounted for along the lines of (92)?

(92) For every S=[I got to London], 'I met Mary when "S" ' is true.

If so, the role of quantification actually is in danger of being emptied. For there is only one sentence – namely, *I got to London* – in question, so that you evaluate

the right-hand side of (92) only once, obtaining the sentence *I met Mary when I got to London*. This, in turn, is true iff *it was true that I met Mary when it was true that I got to London*. Eventually, we have semel-factive truth-conditions. The speaker of (91), however, intends the *when*-clause to describe many events of going to London, but then it seems that we cannot use the same sentence for picking them up. In the end, if (92) is not the right way to address sentences such as (91), what should we do with it?

Beside this observation, some questions come naturally to mind. For instance, could one try to mimic the B-series on a contextual basis (e.g., by reintroducing a *later-than* relation on derived times, building on the connective *before*), thus recovering part of its expressiveness, and address, e.g., the problems we saw above with temporal locating phrases? And if derived time entities are needed because of quantification and/or because we can talk about their ordinal/metrical/topological properties, then doesn't this implicitly speak in favor of B-series approaches?

4.4 Sequence of tense

Let us briefly turn to sequence of tense in an A-series framework:

(93) a. John said that Mary was ill.
b. [John said that [Mary was ill when [. . .]]]

The implicit *when*-clause could be taken to E-type-refer to the time of the matrix event – that is, it could be something like *[when [John did the saying]]* – or, as Ludlow suggests, it can be an E-type anaphora to some other contextually relevant clause, e.g., 'when John went home'. The first option could then be used to account for the simultaneous reading of (90), whereas the latter might provide for the shifted reading. Such a suggestion incorporates the independent view of tenses (Dowty 1982b; Abusch 1997), according to which tenses in matrix clauses behave the same way as in matrices. However, it is inadequate, for the reasons discussed in section 3.2: not all past sentences will do, but only those that are not future with respect to the subject (John). So, to adopt a referential jargon, (93a) cannot be a true report of a speech of John's where he says 'Mary will be ill in two days.'

When dealing with B-series theories, it was argued that these and other cases point to the necessity of representing the subject's (= the attitude's agent) coordinate in the ILF of the subordinate clause. In essence, it was said that temporal indexicality, at least as far as tenses are concerned, must be relativized to subjects. The proposal was implemented by distinguishing assignment sequences for the speaker from those for the subject, and have the latter used for the ILF of the complement clause of propositional attitude predicates.

In the present framework, and with the present implementation of the A-series view, one might wonder whether this process of relativizing indexicals to subjects' contexts is still available. Tenses, in fact, are treated disquotationally, and their indexicality is not articulated anywhere, but directly used. Thus, in the

axiom below, it is the metalanguage *was* on the right-hand side that bears the burden of indexicality, being naturally interpreted as the user's (speaker's):

(94) Val(x, Past, σ) iff x was true.

On the other hand, in the cases we are interested in – say, the shifted reading of (93a) – we would like to say that both the *was* of the embedded clause and the tense of the implicit *when*-clause (or, if you prefer, the relevant perspective) are John's (the subject's). In the case of the simultaneous reading (and pending an explanation of SOT), the embedded tense expresses a present tense from John's perspective, etc. Given that, as observed, the indexicality of tenses is not articulated anywhere, it seems that the only possibility of the A-series approach capturing those intuitions consists in changing the way evaluation is accomplished. For instance, we could propose that the LFs of the embedded clauses of attitude reports are (or can be) evaluated by using a simulation strategy. In order to compute the correct ILF (or whatever it is that represents the content of the reported attitude), people project themselves onto, and adopt, the subject's egocentric perspective. Thus, when interpreting an utterance of (93a), the speaker/hearer continues to use axiom (94), however she does so, as if she were the subject, thus turning the tense into that of the (simulated) subject. This line of thought can be extended to DAR sentences (see section 3.3). If we agree that movement of the embedded tense to the higher C creates two copies of the temporal features, then we can retain the idea that the first, in-situ copy is evaluated in a simulative mode (as if it were the subject's), and that the other copy is evaluated in the ordinary mode (as being the speaker's). (Perhaps Ludlow could subscribe to the simulation strategy applied to tenses in subordinate context. He explicitly mentions it as a possibility for indexicals in general, 1999: 64.)

4.5 Taking stock of the A-series approach

Our survey of the A-series, tensed theory has been very cursory, both for reasons of space, and because the reference work (Ludlow 1999) is itself often cursory. Both in Ludlow's case and in ours, the goal was to show that the approach deserves to be pursued, that it can be motivated on both linguistic and non-linguistic grounds, and that, in the end, it can be compared to competing approaches by resorting to the usual notions and tools of descriptive and explanatory adequacy. Some critical observations, beyond those already provided during the discussion, can be made, though.

An important point concerns the burden Ludlow's program places on syntax. This is a heavy one and requires more investigation before the empirical and theoretical consequences of the theory can be properly assessed. For instance, the extensive use of implicit *when-/before-/after*-clauses requires that their status be better investigated and clarified. As it turns out from our survey, these clauses can be completely implicit, as in the case of complex tenses, or part of their content may be visible, as with locating temporal adverbial. As to partially

explicit *when*-clauses, one could think about adapting and extending the analysis Den Dikken et al. (1996) have proposed for intensional verbs such as *seek*, which they suggest also take (partially) implicit complement clauses. Borrowing ideas developed in that work, one might hypothesize that partially implicit *when*-clauses for temporal adverbials have a null verb with an underspecified semantic, so that the resulting structure would be (95), with the subject also being implicit:

(95) [Subj [$_{VP}$ V [three o'clock]]]

One could then go on by suggesting that Subj be spelled out as some measure system (the calendar, the clock, etc.), and that the implicit verb be given the following lexical axiom:

(96) Val(<x, y, e>, VERB, σ) iff e is an event of time measurement, x is the measuring tool/system, and y is the measure.

Again, this is just a possible way to proceed, and more work is needed to establish this on firmer grounds. Also, the status of temporal phrases as PPs or DPs should be considered. Perhaps expressions consisting of DPs could be integrated into the present view along the lines suggested above, as arguments of implicit verbs of implicit clauses. The move is not so straightforward for PPs, for the same (implicit) verb should select either them or DPs.

More serious difficulties are raised by temporal phrases in subject or direct object position:

(97) a. I spent Thursday/the last month/the period between May and July at the seaside.
b. May was a beautiful month.

Should those expressions be treated as part of implicit *when*-clauses, availing oneself of paraphrases such as (98a) for (97a) and (98b) for (97b)?

(98) a. I was at the seaside when [. . . Thursday . . .].
b. It was a beautiful month when [. . . May . . .].

Though perhaps workable for (97a), the strategy seems more difficult with (97b). For what would *beautiful* be predicated of? Should we resort to months, hence times, as second-order/derived entities? And given that the latter are sets of propositions, does it make any sense to say that *beautiful* is predicated of (sets of) them? The problem is even more acute in light of an example discussed by Bonomi (2002):

(99) Last Monday will be described by the newspapers as 'Black Monday'.

It seems impossible, here, to resort to the *when*-clause strategy, for what paraphrase based on it could do the work? And, even if this were possible, attention

should be paid to ensuring that whatever at LF corresponds to *last Monday* be not in the scope of the future tense – a problem which, as might be noted, is reminiscent of similar difficulties temporal logic approaches had in dealing with the scope interactions between the tense operator and those of noun phrases (see section 2).

In the end, even if the *when*-clause strategy can be made to work properly for locating temporal phrases, it is hard to see what the treatment of the same expressions could be like when they appear as subjects or objects. From the point of view of linguistic theory, referential approaches have an obvious advantage over non-referential ones here: whereas the former can treat temporal phrases uniformly, irrespective of whether they serve to locate the event or function as subjects/objects, the tensed approach might end up needing to maintain an asymmetry between the two.

Turning to fully implicit clauses, they are crucial for E-type temporal anaphora. The choice here is between truly implicit (non-visible, but syntactically active) clauses, or null pronouns that, in virtue of the E-type analysis, yield clausal-like contributions to the truth-conditions. Ludlow explicitly considers the first alternative, speaking of LF representations at which implicit clauses are available. An important point, in this respect, is how those LF representations are built from available material in the case of complex tenses:

(100) a. Pluperfect: had left Tpast[S] before Tpast[. . .].
b. Future perfect: will have left Tfut[S] before Tfut [. . .].
c. Future: in future Tfut[S] after Tfut[. . .].

According to the examples given, the main clauses contain the verb, and are prefixed by a tense that seems to be the one originally appearing on the auxiliary. So in *John had left*, the verb appears in the main clause, and the latter is prefixed by the past tense of the auxiliary: *[$_S$ Past [$_S$ John aux leave] . . .]*. This configuration can be obtained by letting the tense (covertly) take wide scope, and the auxiliary be interpretively inert. The participle marking on the verb, in turn, seems to play a role in determining the type of connective to be used: *before* in the case of the pluperfect tense and of the future perfect tense. Maybe this is due to some kind of agreement between some feature of the main verb (a tense feature, an aspectual one?) and the connective.

That this reconstruction of how LFs for complex tenses are derived is on the right track seems to be confirmed by the explicit attempt Ludlow makes (1999: 126) at analyzing connectives such as *before* and *after* as the combination of a past or future tense morpheme and the connective *when*. The tense morpheme thus introduced takes narrow scope, so that the LFs in (100) can be replaced by the following ones:

(101) a. Pluperfect: had left Tpast [Tpast [S] when [. . .]].
b. Future perfect: will have left Tfut [Tpast [S] when [. . .]].
c. Future: in future Tfut[Tfut [S] when [. . .]].

With this, the truth-conditions for *John left* become *it was true that (it was true that John leave) when . . .* , with the dots indicating the implicit *when*-clause. Note that (101) provides for a more straightforward derivation from the surface string than (100), and one which is more in line with current hypotheses about the syntax of tenses – e.g., Giorgi and Pianesi (1997): the tense on the auxiliary (T1) takes wide scope over the whole sentence, whereas that contributed by the past participle (T2) takes scope only over the main clause. Hence, it seems advisable to drop (100) and directly consider (101) as candidate for the LF representation of complex tenses.

The second strategy suggested for complex tenses has the advantage of providing an acceptable treatment of the present perfect tense. This is missing from Ludlow's inventory; if we try to fill this gap by applying the first procedure sketched above, we obtain for *John has left* the following LF, which is clearly wrong (contradictory, it seems):

(102) Tpres [$_S$ John leave] before Tpres [. . .].

If the second strategy is used (the one exploiting *when*-clauses with T2 taking narrow scope over the main clause), then we have:

(103) Tpres [Tpast [John leave] when [. . .]].

This representation does not yield contradiction, and has truth-conditions to the effect that *John has left* is true iff *it is true that (it was true that John leave) when . . .* , where the dots, as usual, stand for the implicit *when*-clause. Given that the tense having scope over the latter is the outermost present, we can conclude that *John has left* is true iff *it was true that John leave when I speak*.

This reconstruction of the present perfect is quite faithful to Reichenbach's (1947) intuition, which distinguished the present perfect from the simple past because with the former the reference time is/overlaps with the speech time, whereas in the latter the reference time is/overlaps with the event time. In the current A-series theory, the simple past features a *when*-clause in the scope of a past tense:

(104) Tpast[$_S$ . . .] when Tpast [$_S$ . . .]

whereas the present perfect has a present tense *when*-clause (cf. (103)). The presence of the latter is crucial for the A-series account of the present perfect, much as the idea that the reference time is/overlaps with the speech time was for Reichenbach: without it, (103) would reduce to the simple fact that *it was true that John leave*, thus becoming very similar to (104). It should also be recalled that the first attempts at capturing the semantics of the present perfect within a tense logical approach failed because it was analyzed as the combination Pres Past[$_S$ . . .], which reduces to Past[$_S$ . . .], this being the same representation postulated for the simple past. What those theories lacked was the acknowledgment (and means)

of the role of contextual factors in tense interpretation, something stressed by Reichenbach and his followers through the use of reference time. Ludlow's tensed theory avoids this problem thanks to the device of *when*-clauses and E-type anaphora.

5 Conclusion

To conclude, it seems that the non-referential, tensed approach (as worked out by Ludlow) fares well with tenses (in both main and subordinate clauses), and that their treatment as indexical predicates and the disquotational semantics given can be very promising both theoretically and empirically.

On the other hand, the theory, as it stands now, still has technical and conceptual problems with temporal phrases and temporal quantification. For the former, problems arise both on the syntactic side (the structure of partially implicit *when*-clauses) and on the semantic one (how should those phrases be analyzed when playing the role of subjects and/or objects?). With respect to temporal quantification, the idea of adopting a substitutional view is an intriguing one, sometimes considered by linguists too (for more on the topic, see Lewis 1985, and Ludlow 1985). However, it seems that more work is necessary before non-referential theories of temporal phrases and temporal quantification can fully compete with those made available by referential approaches.

We close this chapter by briefly returning to the linguistic/semantical reasons the A-theorist has for dropping temporal reference. In section 4.1 it was argued that B-theories don't have the resources to account both for temporal indexicals and for sentences referring to linguistic tokens. One might wonder, in this connection, why that line of argumentation is not extended to indexicality in general, thence rejecting the referential view for objectual talk too. Problems similar to those discussed in section 4.1 for time indexicals are, in fact, found with all of the so-called essential indexicals; witness the fact that Castañeda's (1967) original observations were about the first person pronoun. Nonetheless, Ludlow, our A-theorist, does not seem willing to reject objectual reference along with temporal. Possibly this is due to the fact that he also has philosophical reasons (which we haven't discussed) for distrusting the referential view as applied to temporal talk, so that the linguistic/semantical and the philosophical/metaphysical reasons reinforce each other. Thus, linguists who might not be convinced by the above line of argumentation about temporal indexicals, because, e.g., they are willing to maintain that part of the account of indexicals be outside semantics, should nevertheless face the philosophical arguments. However, the linguistic/semantical reasons might gain in importance if it could be argued that the proper treatment of indexicality is actually as suggested in section 4.1, but there is an asymmetry between temporal and objectual talk, which motivates maintaining a referential apparatus for the latter while discarding it for the former.

Perhaps such an argument can be based on the idea that indexicality seems a much more wide-spread and fundamental phenomenon in the temporal domain

than in the objectual one. Besides tenses and such terms as *yesterday*, *tomorrow*, etc., even *three o'clock* or *February 15* are indexical (or, more generally, context dependent). The only expressions that do not seem to fall within such a generalization are those providing full specification, e.g., *April 25, 2002*. These too interact with tenses, though, so that there seem to be enough reasons for maintaining that indexicality/context dependence is the rule for temporal talk. If so, the linguistic/semantical argument that Ludlow deploys could be extended toward the general conclusion that indexicality always requires a non-referential, disquotational analysis (which can be complemented with a simulationist approach to propositional attitudes: see section 4.4). Those devices (almost) exhaust the requirements of temporal talk, whereas the ubiquity of non-indexical (non-context-dependent) objectual talk motivates also a referential apparatus for the latter.

1 Introduction: topic prominence

Topicalization in a broad sense refers to the formation of any syntactic construction containing a topic, whether it is derived by movement or base-generated. By Asian languages we mean those topic-prominent languages spoken in Asia. Not all the Asian languages are topic-prominent. Indonesian and Tagalog, for instance, are not, but some Asian languages that have a large population of speakers, notably Chinese and Japanese, are typically topic-prominent. According to Gundel's (1988) generalization from an investigation of 30 languages spoken in Asia and other continents of the world, all of them have syntactic topic constructions. Topics in all these languages share a great number of syntactic, semantic, and pragmatic properties. The topic occurs to the left of a full comment sentence. It is definite or generic and is characterized by shared familiarity to both the speaker and the hearer. The comment is a clause that follows the topic and says something about it. The relation between the topic and the comment is commonly characterized as 'aboutness' in the literature. Aboutness may be strict or loose across languages. The following subsections present properties characteristic of topic-prominent languages as against other languages and, particularly, properties that have played a role in linguistic theorizing.

1.1 Variety of topic structures

The term 'topic prominence' dates back to Li and Thompson (1976), in which a new typology is proposed to classify languages as (i) subject-prominent, (ii) topic-prominent, (iii) subject-prominent and topic-prominent, and (iv) neither subject-prominent nor topic-prominent. Topic-prominent languages use a greater variety of topic structures than other languages. The following illustrations are Korean, cited from Sohn (1994: 192–195):

(1) Ku totwuk-un nay-ka cap-ass-ta.
the thief-TOP I-SUBJ catch-PAST-DEC[1]
'This thief, I caught.'

(2) I sacin-un, nay-ka caknyen-ey i sacin-ul ccik-ess-eyo.
this photo-TOP I-SUBJ last-year-at this photo-OBJ take-PAST-POL
'This photo, I look it last year.'

(3) Hankwuk-to inkwu-ka manh-ta.
Korean-also population-SUBJ much-DEC
'As for Korea also, the population is large.'

Korean is an SOV language. In (1), presumably the object has moved to the sentence-initial position, an operation called topicalization (in the narrow sense) in the literature. In (2), the initial NP is coreferential with another NP in the remaining part of the sentence. This is known as dislocation. Gundel's samples show that languages that are not topic-prominent also make use of topicalization and dislocation. What is coreferential with the topic may be an empty node, or a pronoun, or a full noun phrase. In topic-prominent languages, the coreferential constituent may be the partial or full repetition of the topic itself, as in the case of (2). Example (3) is typical of topic-prominent languages. It differs remarkably from the previous two sentences in that the initial NP is semantically related to the following part of the sentence but not coreferential with any empty node, pronoun, or full noun phrase in it. In other words, no constituent in the comment is more closely related to the topic than any other constituent. The comment as a whole is about the topic. Here are more examples from more languages, cited from Li and Thompson (1976: 462):

(4) Neichang huo xingkui xiaofang-dui lai de kuai. Chinese
that fire fortunately fire-brigade come quick
'That fire (topic), fortunately, the fire brigade came quickly.'

(5) Gakkoo-wa buku-ga isogasi-kat-ta. Japanese
school-TOP I-SUBJ busy-PAST-DEC
'School (topic), I was busy.'

(6) Siban-in hakkjo-ga manso. Korean
now-TOP school-SUBJ many
'The present time (topic), there are many schools.'

Such sentences are known in the literature as 'Chinese-style' topic structures, a term which originated in Chafe (1976), in contrast to 'English-style' topic structures.

Among the Chinese-style topic structures is a special construction, the so-called double subject construction or double nominative construction.[2] It is semantically characterized by a possessive relation, or a whole–part relation, or an inclusive relation between the first and the second NP. The following sentences are cited from Li and Thompson (1976: 468).

(7) Ho ō na-qhô yì ve yò. Lahu
elephant TOP nose long PRT DEC
'Elephants (topic), noses are long.'

(8) Neike shu yezi da. Chinese
that tree leaves big
'That tree (topic), leaves are big.'

(9) Sakana-wa tai-ga oisii. Japanese
fish-TOP red snapper-SUBJ tasty
'Fish (topic), red snapper is tasty.'

(10) Pihengki-nin 747-ka khi-ta. Korean
Airplane-TOP 747-SUBJ big-DEC
'Airplanes (topic), the 747 is big.'

The elephant is the possessor and the nose is the possessed in (7). The leaves are part of the whole tree in (8). Red snapper is a hyponym and fish is its superordinate term in (9). 747 is a subset of airplanes in (10).

1.2 Topic marking

Topic-prominent languages tend to mark topics just as subject-prominent languages tend to mark subjects. Particularly, OV languages like Japanese and Korean use special postpositions to mark a wide variety of expressions used as topics. The following examples are Korean, cited from Gundel (1988: 217):

(11) John-nin i salam-lil manna-ass-ta.
John-TOP this man-OBJ meet-PAST-DEC
'John (topic), met this man.'

(12) I salam-nin John-ka manna-ass-ta.
this man-TOP John-SUBJ meet-PAST-DEC
'This man, John met.'

(13) Suyeng-nin Waikiki-ka coh-ta.
swimming-TOP Waikiki-SUBJ good-DEC
'(As for) swimming, Waikiki is good.'

(14) Ecey-nin John-ka naksicil-lil ka-ass-ta.
yesterday-TOP John-SUBJ fishing-OBJ go-PAST-DEC
'Yesterday, John went fishing.'

(15) San-ey-nin namu-ka manh-ta.
mountain-at-TOP tree-SUBJ many-DEC
'At the mountain, there are many trees.'

(16) San-ey ka-1 ttay-ey-nin moca-lil ssi-la.
mountain-to go time-at-TOP hat-OBJ wear-IMP
'When you go to the mountain, wear a hat.'

What is marked as a topic can be a subject, an object, a nominalized VP, a temporal expression, a locative expression, a clause, etc. With a topic marker in place,

whether the sentence-initial expression is a topic or not is uncontroversial in Japanese and Korean.[3] In Chinese, topic marking is optional and in most of the Chinese dialects particles that are used to mark topics can also be used for other purposes, for instance, as sentence-final markers. This is one of the reasons why there are more controversies in the literature related to the structure and interpretation of Chinese topic constructions and also an important reason why more Chinese examples will be used in the remaining sections.

2 Topic structures containing a gap bound to the topic

This section addresses topic structures that contain a gap interpreted as co-referential with the topic. It considers the syntactic and semantic conditions on the relation between the topic and the gap.

2.1 Movement

A question naturally arises: do such topic structures involve movement? Opinions differ among Chinese linguists. Some are in favor of the transformational hypothesis (TH) and others are in favor of the base generation hypothesis (BGH).

The following Chinese and English sentences are structurally so parallel that it seems reasonable to assume that a Chinese topic structure containing a gap involves movement just as its English counterpart does, whether it is straightforward movement of an overt expression from the comment into the topic node, or more sophisticated movement of an abstract element along the lines of Chomsky's (1977b) analysis of *wh*-movement:

(17) a. Naben shu, ta na-le. Chinese
that book he take-ASP
'That book, he took.'
b. Ta na-le neiben shu.

(18) a. That book, he took. English
b. He took that book.

However, there is an underlying difference. While the English sentence in (19) is not grammatical, its Chinese counterpart in (20) is:

(19) *He took.

(20) Ta na-le.

Most of the Chinese verbs that are transitive in meaning can occur without an object.[4] The small number of transitive verbs that require an object cannot appear

without an object even in topic structures. Yuan (1996) emphasizes the impossibility of object drop in topicalization. Below are some Chinese illustrations:

(21) a. Xin Zhengce hui fanrong jinrong shichang.
new policy will boom money market
'The new policy will cause the money market to boom.'
b. *Jinrong shichang, xin zhengce hui fanrong.
money market new policy will boom
'The money market, the new policy will cause to boom.'

(22) a. Tade hua wennuan-le womende xin.
his words warmed our hearts
'His words warmed our hearts.'
b. *Womende xin, tade hua wennuan-le.
our hearts, his words warmed
'Our hearts, his words warmed.'

Even though it is logically possible that the topicalized expression undergoes movement and that the remaining part of the sentence must be grammatical by itself in some languages,[5] the arguments in support of the movement analysis for English sentences like (18a) on the basis of the requirement on subcategorization do not apply to Chinese sentences. The crucial test of the movement hypothesis is, of course, to see whether a topic can be related to a gap in islands such as complex noun phrases and sentential subjects.

2.2 Island effects

Following Chomsky (1977b), those in favor of the TH assume that the topic is base-generated in its surface position and that topicalization involves the movement of an abstract element from an argument position to a position immediately adjacent to the topic. The evidence presented in support of this hypothesis is that such abstract movement is subject to island constraints. Examples such as (23) have been provided in the literature to show that it observes Subjacency and attempts made to explain away apparent counter-examples such as (24):

(23) *Neige ren$_i$, [$_{IP}$[$_{NP}$[$_{IP}$ t$_i$ kanjian t$_j$] de xuesheng$_j$] lai-le]. Chinese
that man see MOD student come-ASP
'The student who saw that man came.'

(24) ??Neiben shu$_i$ [$_{IP}$[$_{NP}$[$_{IP}$ Lisi mei kan t$_i$]] zhen qiguai. Chinese
that book not read real strange
'That Lisi didn't read that book is really strange.'

(23) illustrates the effects of the Complex Noun Phrases Constraint. Movement out of the relative clause[6] is blocked because it crosses the boundaries of NP and

IP. (24) is acceptable,[7] even though the topic seems to have been moved out of the sentential subject. It has been suggested that (24) be assigned the structure in (25), where topicalization occurs within the inner clause and therefore does not violate the Subjacency Condition:

(25) $[_{IP}[_{NP}$[Neiben shu$_i$ $[_{IP}$ Lisi mei kan t$_i$]]] zhen qiguai].

Those in favor of the BGH argue against the transformational approach on the basis of the following counter-evidence:

(26) $[_{CP}$ Zheben shu$_i$ $[_{IP}$ $[_{NP}[_{IP}$ e$_j$ du guo e$_i$ de] ren$_j$] bu duo]]. Chinese
this book read ASP MOD people not many
'This book, there are not many people who read (it).'

(27) $[_{CP}$ Zhexie shi $[_{IP}$ wo juede $[_{IP}$ $[_{IP}$ ta shou e] bu heshi]]]. Chinese
these things I think he says not proper
'These things, I think it is not proper for him to say.'

Like (23), (26) contains a relative clause; nevertheless, the topic can be coreferential with the empty site represented by e across the boundaries of NP and IP. The difference in acceptability between (23) and (26) will be dealt with in section 2.5. Like (24), (27) contains a sentential subject. To rule out the possibility of assigning a structural description similar to (25) as has been proposed for (24), one can embed the sentence one clause further. It turns out that the topic in the leftmost position of the matrix clause can still be associated with a position inside the sentential subject embedded one or even more clauses down.

In (28) the topic is also coreferential with an empty site within the sentential subject:

(28) Zhege wenti [wo xiang [ni zheyang huida e] hen deti]. Chinese
this question I think you this-way reply very appropriate
'This question, I think it is very appropriate for you to answer in this way.'

If movement is always subject to the Subjacency Condition, then the evidence compels one to conclude that topicalization in Chinese does not involve movement.[8]

We now leave Chinese and turn to Japanese for the rest of this subsection. It was observed as early as Kuno (1973b) that the topic can be related to an empty site in islands:

(29) Sono syoonen$_i$-wa $[_{IP}$ $[_{NP}$ e$_i$ e$_j$ kawaigatte ita] inu$_j$]-ga sinde simatta.
that boy-TOP fond-of was dog-SUBJ dying ended up
'Speaking of that boy, the dog that he was fond of died.'

(30) Sono sinsi$_i$-wa [$_{NP}$ [$_{IP}$ e_1 e_j kite iru] yoohuku$_j$]-ga yogorete iru.
that gentleman-TOP wearing is suit-SUBJ dirty is
'Speaking of that gentleman, the suit that he is wearing is dirty.'

Later, Hasegawa (1981) points out that the following sentences are somewhat less acceptable, possibly due to their violation of Subjacency:

(31) ??Ano- hon-wa John-ga [$_{NP}$ [$_{IP}$ *e* kaita] hito]-ni aitagatte iru rasii.
that book-TOP John-SUBJ wrote person-to want-to-meet seem
'Speaking of that book, it seems that John wants to meet the person who wrote it.'

(32) ?Russell-wa John-ga [$_{NP}$ [$_{IP}$ *e* atta koto-ga aru] hito]-o mituketa rasii.
Russell-TOP John-SUBJ met fact-SUBJ have person-OBJ found seem
'Speaking of Russell, it seems that John found a person who had actually met him.'

Comparing (31) and (32) with their scrambling counterparts (33) and (34), Saito (1987) believes that the marginality of the former is due to a constraint weaker than Subjacency:

(33) ?*Ano hon-o John-ga [$_{NP}$ [$_{IP}$ *t* kaita] hito]-ni aitagatte iru rasii.
that book-OBJ John-SUBJ wrote person-to want-to-meet seem
'It seems that John wants to meet the person who wrote that book.'

(34) ?*Russell-ni John-ga [$_{NP}$ [$_{IP}$ *e* atta koto-ga aru] hito]-o mituketa rasii.
Russell-to John-SUBJ met fact-SUBJ have person-OBJ found seem
'It seems that John found a person who had actually met Russell.'

But Saito observes that topicalization of a prepositional phrase in (35d) is more difficult than topicalization of an object in (35b) or a locative noun phrase in (35c):

(35) a. John-ga [$_{NP}$ [$_{IP}$ Pekin-ni itta koto-ga aru] hito]-o mituketa rasii.
John-SUBJ Beijing-to went fact-SUBJ have person-OBJ found seem
'It seems that John found a person who has been to Beijing.'
b. ??Pekin-wa John-ga [$_{NP}$ [$_{IP}$ *e* itta koto-ga aru] hito]-o mituketa rasii Pekin-TOP.
c. ?*Pekin-ni John-ga [$_{NP}$ [$_{IP}$ *t* itta koto-ga aru] hito]-o mituketa rasii Pekin-to.
d. *Pekin-ni-wa John-ga [$_{NP}$ [$_{IP}$ *e* itta koto-ga aru] hito]-o mituketa rasii Pekin-to-TOP.

The former may be regarded as a case of island violation. But Saito notes that even the topic in situ is marginally acceptable in these sentences and so judgment is too subtle to be fully reliable. Later, Haig (1996) argues that the reason why

(35c) and (35d) are not acceptable is that there is no logical relationship between the topicalized noun phrase and the comment clause. It is more difficult to interpret a comment as being about 'to Beijing' than about 'Beijing' alone.

On the whole, there seem to be fewer proponents of the movement approach to topicalization among Japanese linguists than among their Chinese colleagues.

2.3 Generalized Control Rule

We now return to Chinese. To maintain that topicalization obeys Subjacency, Huang (1984) proposes a solution to problems that arise from the grammaticality of sentences such as (36), structurally similar to (26):

(36) Zhangsan, [[e xihuan e de] ren] hen duo. Chinese
Zhangsan like MOD people very many
'Zhangsan, people who he likes are many.'
'Zhangsan, people who like him are many.'

His solution makes use of Chomsky's (1982: 35) view on the functional determination of empty categories (EC). Whether an EC is derived by movement or base-generated, its interpretation is determined by its role in derivations and representations. An EC is a variable if it is in an A-position and is locally A'-bound. An EC that is not a variable is a pronominal if it is free or locally A-bound by an antecedent with an independent theta-role. The two ECs in (36) can be categorized in this light. Huang further proposes a rule of interpretation for empty pronominals, which he calls the Generalized Control Rule: co-index an empty pronominal with the closest nominal element.[9] With it he derives the two readings of (36) as follows.

In the first reading, the empty subject starts out as a pronominal. It is co-indexed with the closest nominal element, i.e., *Zhangsan*. Then it converts itself into a variable. The empty object is co-indexed with the head of the relative clause *ren*.

In the second reading, it is assumed that the empty object is moved to a topic position within the relative clause, a local movement that does not violate Subjacency. Then it can be co-indexed with the closest nominal element *Zhangsan* in accordance with the Generalized Control Rule, giving rise to the following structure:

(37) Zhangsan, [[e_i e_j xihuan t_i de] ren_j] hen duo.

The same analysis applies to (26) and can thus account for its grammaticality and interpretation despite its apparent violation of Subjacency.

2.4 Resumptive pronoun

The solution described in the preceding section works for cases where the relative clause is contained in the subject but not for those where it is contained in the object. (38) is an illustration of the latter:

(38) Neiben shu_i, [wo renshi hen duo [[e_j kan-bu-dong e_i de] ren_j]]. Chinese
that book I know very many cannot-understand MOD person
'That book, I know many people who can't read [it].'

In this sentence the object rather than the subject is relativized. The topic is associated with an empty category in a complex noun phrase that functions as the object. Suppose the empty object moves into the topic position of the relative clause: the Generalized Control Rule would predict that it should derive its content from the subject of the root clause *wo*, i.e., its closest nominal element. Since the topic is more remote than the subject, it should not be able to bind the empty object.

Another solution has been proposed by arguing that the empty object bound to the topic is actually a phonetically unrealized resumptive pronoun. In most cases Chinese pronouns take animate NPs but not inanimate NPs as antecedents. The contrast is clear in (39a, b):

(39) a. Neige jiahuo$_i$, [wo renshi hen duo [e_j bu xihuan ta_i de ren_j]].
that fellow I know very many not like him MOD person
'That fellow, I know many people who don't like him.'
b. *Neiben shu_i, [wo renshi hen duo [e_j kan-bu-dong ta_i de ren_j]].
that book I know very many cannot-understand it MOD person
'That book, I know many people who can't read it.'

So there is no alternative but to make the resumptive pronoun in (39b) empty, resulting in (38). In other words, (38) is a case of dislocation except that the resumptive pronoun has to be null for an independent reason. Once a resumptive pronoun is present, island conditions are simply not relevant. Similarly, violation of the Sentential Subject Constraint in (27), repeated below as (40), may also be more apparent than real for the same reason. *Zhexie shi*, too, is an inanimate NP and thus cannot but bind an empty resumptive pronoun.

(40) [$_{CP}$ Zhexie shi [$_{IP}$ wo juede [$_{IP}$ [$_{IP}$ ta shou e] bu heshi]]]. Chinese
these things I think he says not proper
'These things, I think it is not proper for him to say.'

The resumptive pronoun hypothesis has a difficulty: even an animate NP used as the topic can bind into an island. Though no such examples were documented in the earlier literature, they are not at all difficult to construct for Chinese:

(41) a. Zhege wanpi de $haizi_i$ [wo zhao-bu-dao [e_j yuanyi shouyang ta_i de ren_j]].
this naughty MOD child I can't-find willing adopt him MOD person
'This naughty child, I can't find a person who is willing to adopt him.'
b. Zhege wanpi de $haizi_i$ [wo zhao-bu-dao [e_j yuanyi shouyang e_i de ren_j]].

(42) a. Zhewei houxuanren$_i$ [women zai ge di jian-dao-le wushu
this candidate we PREP every place see-ASP numerous
[e$_j$ yonghu ta$_i$ de ren$_j$]].
support him MOD person
'This candidate, we saw numerous people who supported him everywhere.'

b. Zhewei houxuanren$_i$ [women zai ge di jian-dao-le wushu [e$_j$ yonghu e$_i$ de ren$_j$]].

These sentences are structurally identical to (38) except that the topics are animate NPs. Both the (a)-forms and the (b)-forms are grammatical. Since animate NPs can be the antecedents of overt pronouns in Chinese, there is no compelling reason for the resumptive pronouns to take a zero form. Therefore the empty objects in (41b) and (42b) must be either empty pronominals or variables. If they are identified as pronominals, they undermine the assumption made in Huang (1984) that objects can never be pro. If, on the other hand, they are variables bound to the topics, Subjacency is violated.[10]

2.5 Syntactic and semantic conditions

Researchers are still looking for more convincing evidence of island effects. Meanwhile topic structures in topic-prominent languages are found to be subject to other syntactic and semantic conditions. Among them is the well-known aboutness condition, which requires that the topicalized NP must be characterized by the rest of the sentence. See Takami and Kamio (1994), among others.

Xu and Langendoen (1985) postulate the following condition on topic structures in Chinese: the comment itself must be well-formed. This condition is not imposed on topicalization in English. On the contrary, to make the comment clause grammatical, the fronted topic must be recovered at its source position.[11] Since then this postulation has been reviewed by a number of researchers. It has been found to be a necessary but not a sufficient condition. Various additional conditions have been discovered.

Huang (1992) observes that the ungrammaticality of the (b)-sentences below is not predicted by the above generalization:

(43) a. Ta toutoude jiao ni shagua. Chinese
he stealthily call you fool
'He secretly calls you fool.'

b. *Shagua, ta toutou de jiao ni.

(44) a. Wo quan ta manpao. Chinese
I advise him jog
'I advised him to jog.'

b. *Manpao, wo quan ta.

The comment clauses in (43b) and (44b) are well-formed or can be made well-formed with minor revision. Huang points out that problem arises if the restriction on topicalization is formulated only in terms of syntactic categories. The ungrammaticality of (43b) and (44b) can be successfully treated by functionally based theories, but not by structurally based theories. Adopting the theory of Functional Uncertainty proposed by Kaplan and Zaenen (1989) in the framework of Lexical Functional Grammar, he postulates the constraint as follows: GFs (i.e., grammatical functions) of XCOMP (i.e., open complements of any categories) cannot be topicalized.

The functional theory is claimed to be able to account for the contrast in grammaticality shown in (45) as well:

(45) a. Ni yijing biye le, wo zhidao. Chinese
you already graduate ASP I know
'That you have already graduated, I know.'
b. *Ni yijing biye le, wo yiwei.
you already graduate ASP I think

The difference cannot be expressed in terms of syntactic categorization, since in both cases what is topicalized is S', i.e., CP. LFG labels the embedded clause in (45a) as OBJ2 (i.e., second object) and the one in (45b) as COMP (i.e., sentential argument representing a propositional role) respectively. The latter is excluded from a legal topic construction.

Yuan (1996) lists a wide range of constructions that resist topicalization, including those discussed in Huang (1992). Although he does not propose a theory to account for the facts, he also shows that the grammaticality of the comment clause is subject to various other conditions.

Jiang (1991a, 1991b) calls attention to another constraint on topicalization, which is shown in the embedded clause following certain verbs:

(46) a. Zhangsan xiangxin [Lisi qu kan le Wangwu]. Chinese
Zhangsan believe Lisi go see ASP Wangwu
'Zhangsan believes that Lisi has gone to see Wangwu.'
b. Zhangsan xiangxin [Wangwu, Lisi qu kan le].
Zhangsan believe that Wangwu, Lisi has gone to see

(47) a. Zhangsan xihuan [Lisi qu kan Wangwu]. Chinese
Zhangsan like Lisi go see Wangwu
'Zhangsan likes Lisi to go to see Wangwu.'
b. *Zhangsan xihuan [Wangwu, Lisi qu kan].

Topicalization can take place in embedded clauses following verbs like *xiangxin*, but not in those following verbs like *xihuan*. Jiang distinguishes the two types of complement clause by labeling them saturated clause (SAS) and unsaturated clause (NSS) respectively. SAS expands into XP S (i.e., topic and comment) while NSS expands into NP VP (i.e., subject and predicate).

Embedded topicalization in Japanese is studied in Maki et al. (1999). They show that it is found in the complement clauses of bridge verbs but not in the complement clauses of factive verbs:

(48) a. John-wa [kono hon-wa Mary-ga yonda to] Japanese
John-TOP this book-TOP Mary-SUBJ read COMP
sinziteiru.
believe
'John believes that this book, Mary read.'
b. John-wa [kono hon-*wa Mary-ga yonda no]-o kookaisiteiru.
John-TOP this book-TOP Mary-SUBJ read COMP-ACC regret
'John regrets that this book, Mary read.'

They posit that Japanese embedded topicalization involves IP adjunction and LF movement to the embedded COMP. The complement clause following a bridge verb is L-marked and that following a factive verb is not. Adjunction to a non-L-marked head is prohibited.

Not all constraints on the relation between the topic and what it binds are syntactic. For instance, what is responsible for the contrast in acceptability between (49a) and (49b) (given above as (26))?

(49) a. ??Zheben shu_i [$_S$ [$_{NP}$ [$_S$ e_j du guo e_i de] ren_j] lai le. Chinese
this book read ASP MOD man come ASP
*'This book, I think the man who read came.'
b. Zheben shu_i [$_S$ [$_{NP}$ [$_S$ e_j du guo e_i de] ren_j] bu duo].
this book read ASP MOD people not many
'There are not many people who read this book.'

Some researchers attribute the difference in acceptability to the contrast between specificity and non-specificity of the relativized NPs. The NP *du guo de ren* is understood as non-specific in (49b), but specific in (49a). The sentence in (49a) is less acceptable because of a semantic principle like the 'name constraint' of Guéron (1980), which prohibits a name (i.e., a complete referring expression) from containing a variable.[12]

In (50a, b) a lexical pronoun, rather than an empty category, is anaphorically related to the topic. But similarly, the result is acceptable if the NP containing the pronoun is non-specific, but less acceptable if it is specific:[13]

(50) a. Zhege qiangdao wo xiang neng zhuazhu ta de ren shi Chinese
this robber I think can catch he MOD man be
ge yingxiong.
a hero
'This robber, I think anyone who can catch him is a hero.'
b. ??Zhege qiangdao wo xiang zhuazhu ta de ren lai le.
this robber I think catch he MOD man come ASP
'This robber, I think the man who caught him came.'

3 Topic structures containing no element bound to the topic

This section addresses topic structures that do not contain a gap or an overt element interpreted as coreferential with the topic. As mentioned in section 1.1, they are known as 'Chinese-style' topic structures, involving neither topicalization (in the narrow sense) nor dislocation. We begin with Japanese and Korean and then move on to Chinese.

3.1 Base generation or movement?

3.1.1 Japanese

It is almost universally agreed by Japanese linguists that topics like those in (9) (repeated here as (51a)) and (51b), which do not bind an empty site, are generated in situ, following Kuno (1973b, 1973c):

(51) a. Sakana-wa tai-ga oisii.
fish-TOP red snapper-SUBJ tasty
'Speaking of fish, red snapper is tasty.'
b. Hana-wa sakura-ga ii.
flower-TOP cherry blossoms-SUBJ good
'Speaking of flowers, cherry blossoms are the best.'

However, Kuroda (1986, 1992) proposes an alternative analysis. He was the first to apply the tranformational-generative approach to the analysis of Japanese topicalization, in Kuroda (1965). Kuroda (1986, 1992) claims that the following (a)-sentences (cited from Kuno 1973c) are derived from the (b)-sentences and the latter from the (c)-sentences, even though some (b)- or (c)-sentences sound less natural:

(52) a. Sakana-wa tai-ga yoi.
fish-TOP red snapper-SUBJ good
'As for fish, the red snapper is good.'
b. ??Sakana-ga tai-ga yoi.
fish-SUBJ red snapper-SUBJ good
c. ??Sakana-no tai-ga yoi.
fish-POSS red snapper-SUBJ good

(53) a. Buturigaku-wa syuusyoku-ga taihen da.
physics-TOP employment-SUBJ hard DEC
'As for physics, employment is hard.'
b. Buturigaku-ga syuusyoku-ga taihen da.
physics-SUBJ employment-SUBJ hard DEC
c. ??Buturigaku de syuusyoku-ga taihen da.
physics with employment-SUBJ hard DEC

Kuroda observes that many *wa*-phrases alternate with *ga*-phrases, and argues that those that do not are not genuine topics but vocatives, etc., and therefore should be excluded from consideration. In contrast, *wa*-phrases that bind empty sites do not alternate with *ga*-phrases. So his hypothesis is that all topic phrases are generated in an argument or adjunct position within IP. They may move to an A'-position dominated by CP. Movement takes place prior to Linear Case Marking. Thus phrases within IP are assigned *ga* and those outside IP are assigned *wa* (Kuroda 1992: 286–287).

3.1.2 Korean

Choe (1995) argues that in Korean, even topics that apparently do not bind any element in the comment are derived by an operation called Topic Movement. There are several different types of Topic Movement. In some topic structures the topic has a whole–part relation with another NP in the comment. Earlier, Choe (1986) assumes that such a construction, as exemplified in (54a), is the result of Possessor Raising. Its surface structure is (54b):

(54) a. Khokkili-nun [kho-ka] kil-ta.
elephant-TOP nose-SUBJ long-DEC
'In speaking of elephants, noses are long.'
b. Khokkili-nun$_i$ [t$_i$ kho-ka] kil-ta.

In some other topic structures, the topic is also semantically related to another NP in the comment, but it is not a part–whole relation. The topic in (55a) is an example. Choe assumes that (55a) is derived from (55b) by a movement process which preposes the *nun*-phrase to the sentence-initial position:[14]

(55) a. Hyangki-nun cangmi-ka choeko-ta.
fragrance-TOP rose-SUBJ best-DEC
'In speaking of the fragrance (of flowers), roses are best.'
b. Cangmi-ka hyangki-nun choeko-ta.

3.1.3 Chinese

In the early days of transformational grammar, it was proposed in Thompson (1973) that (56a) is derived from (56b), not usable as a surface form:

(56) a. Shuiguo, wo xihuan pingguo.
fruit I like apples
'As for fruit, I like apples.'
b. *Wo xihuan pingguo shuiguo.

Since then linguists seem to have come to agree that the topic in (56a) is base-generated, and that so is the topic in the so-called double subject construction or double nominative construction in (57):

(57) Shuiguo, pingguo zui haochi.
fruit apple most tasty
'As for fruit, the apple is most tasty.'

Shyu (1995) proposes distinguishing two kinds of topics, assuming that a topic that does not bind a gap is base-generated in an IP-adjunction site, while a topic that does is moved to the Spec position of another maximal projection called TopP. She renames the former 'major subject', leaving the term 'topic' for the latter exclusively. A major subject can be raised to Spec TopP later.

3.2 Topic or not topic?

Linguists who do not believe that topic structures in Chinese, Japanese, and Korean are radically different from those in English and other European languages have two strategies to reduce or eliminate the diversity. One is to argue that any topic is derived by movement and thus always binds a gap. The other is to argue that the sentence-initial expression that does not bind a gap is, in fact, not a topic but something else; for instance, the subject of the sentence. Since a topic is unequivocally case-marked in Japanese and Korean as distinctive from a subject, the former strategy is more reasonable. Chinese does not require the use of overt markers to mark topics, so the latter strategy is plausible. There have always been Chinese grammarians who prefer to take the sentence-initial expression to be a possessive NP with a zero possessive marker, or as an adverbial with a zero form of preposition, or as a subject followed by a clausal predicate. A solution widely accepted by traditional grammarians (e.g., Chao 1968; Lü 1986) is calling the first NP 'main subject' or 'major subject' and the second one 'minor subject'. While the minor subject takes a VP as its predicate, the major subject takes a clause as its predicate, thus doing away with the troublesome term 'topic' completely.[15]

Shi (2000), based on Shi (1992), is a recent representative of the traditional reductionist view, this time in formalist terminology. His claim is summarized as follows:

(58) A topic is invariably related to a syntactic position in the comment and a comment is invariably an open sentence containing a gap or a resumptive pronoun coreferential with the topic. (Shi 2000: 388)

In this view every topic must be syntactically licensed. It cannot be merely semantically related to the comment as a whole, a relation known in the literature as aboutness. This is a strong claim. If it is true, then there is no significant structural difference between topic-prominent languages and other languages, though the former statistically use topic structures more often than the latter. To maintain (58), Shi adopts a piecemeal solution. He lists six types of 'dangling topics' and argues that in each case either there is a hidden gap or a resumptive pronoun in the comment from which the sentence-initial element originated, or

it is not a genuine topic. There are other types of Chinese-style topic structures as well, including the well-known double nominative construction represented by (8) and (57), and those that have no particular names, such as the topic structure in (56). To fulfill his objective, Shi must eliminate each and every one of them as well. This is an arduous task.

To refute (58) is an equally arduous task. Pan and Hu (2001, 2002) take a semantic approach, providing counter-evidence to Shi's (2000) treatment of all the six types of topic structures. In their analysis, a topic may be semantically licensed or syntactically licensed. What follows the topic may semantically be interpreted as an open predicate without a syntactic gap or resumptive pronoun. Sections 3.2.1 and 3.2.2 present their debate on two representatives of the six types listed in Shi (2000). For further discussion on the other types, see the appendix to this chapter (section 5).

3.2.1 Topic or subject?

Shi (2000) provides the two sentences in (59) and (60) to illustrate a special case of the double nominative construction:

(59) Tamen, wo kan ni, ni kan wo. Chinese
they I look you you look me
'They look at each other.'

(60) Tamen, da yu chi xiao yu. Chinese
they big fish eat small fish
'They act according to the rule of the jungle.'

The sentence-initial pronoun *tamen* represents a set, and the NPs that follow, *wo*, *ni* or *da yu*, *xiao yu*, are members of the set. These two sentences differ from other Chinese-style topic structures in that, as Shi points out, the clauses that follow the pronouns are idioms, in which the lexical items are not freely changeable and their order is fixed. He argues that the pronouns are, in fact, subjects[16] that take idioms as their predicates. This analysis is supported by the fact that the adverb *zhuanmen* (specially), which always follows the subject but never precedes it, appears between the pronoun and the idiom:

(61) Tamen, zhuanmen da yu chi xiao yu. Chinese
they specially big fish eat small fish
'They are doing nothing but acting according to the rule of the jungle.'

Pan and Hu challenge Shi in three respects: the definition of idiom, the assignment of a thematic role, and the adverbial placement test.

Shi's argument is based on two implicit assumptions: (i) an idiom can be the predicate of a sentence, even though it is in the form of a clause, complete with a subject of its own; (ii) a clause that is not an idiom cannot be a predicate. So the distinction between an idiom and an ordinary clause is important. Pan and Hu call readers' attention to sentences like (62):

(62) Tamen, zuotian xiawu Xiao Zhang mei lai, Xiao Li Chinese
they yesterday afternoon Xiao Zhang not come Xiao Li
ye mei lai.
also not come
'Yesterday afternoon, of the two people, Xiao Zhang didn't come and Xiao Li didn't come, either.'

This sentence is structurally similar to Shi's examples in (59) and (60). It begins with a plural pronoun followed by one or more clauses. The pronoun represents a set and the subject of the clause represents its members. What follows the pronoun in (62) is obviously not an idiom, because it contains randomly selected proper names and an adverbial referring to specific time. If any complete clause, whether or not an idiom, can be analyzed as the predicate of the sentence, then it just repeats the solution proposed by traditional Chinese grammarians involving major subjects and minor subjects. If only an idiomatized clause can be the predicate, one would like to know why one should give idioms special consideration and how to analyze non-idiom clauses like the one in (62).

Even if one is ready to take any clause as a predicate, there is a problem in assigning a thematic role to the sentence-initial pronoun. If it is a topic, according to Shi (2000: 405), it "always depends on an element inside the comment for its thematic role." If it is a subject, it should have an independent thematic role. Pan and Hu wonder how the pronouns in (59–62) can get a thematic role. The predicate in the form of a clause is syntactically saturated and therefore does not have an extra thematic role for the sentence-initial pronoun.

The adverbial placement test is also problematic and unreliable. Pan and Hu provide an example in which the adverb *zhuanmen* appears after an uncontroversial topic.[17]

Pan and Hu (2001, 2002) formally formulate their semantic licensing condition for such topic-comment structures as follows:

(63) $\lambda P \lambda Z \subseteq$ things $\lambda x \lambda y$ [$x \in Z$ & $y \in Z$ & $P(x, y)$]

After applying (63) to the first clause in (59), they get C = λZ [ni'$\in Z$ & wo'$\in Z$ & kan' (ni', wo')]. Since C is an open predicate, it can take the topic *tamen* as its argument, and thus the topic in question is licensed by the open semantic predicate C. (There is a process of conjunction between the two clauses in (58). Actually, the topic is combined with the conjoined clauses, which have the semantic representation λZ [ni'$\in Z$ & wo'$\in Z$ & kan'(ni', wo') & kan'(wo', ni')].

3.2.2 With or without a gap?

Another type of Shi's 'dangling topic' is represented by (64), a classic example that first appeared in Chao (1968) and was later cited repeatedly in the literature (e.g., in slightly different form, as (4) above):[18]

(64) Nachang huo, xingkui xiaofangdui lai-de kuai. Chinese
that fire fortunately fire-brigade came fast
'That fire, fortunately the fire brigade came quickly.'

Shi admits that *nachang huo* may be taken as a topic but argues that it is so because it is related to an empty position in a sentence which is understood by the speaker and the hearer.[19] What he means is that there should be a phonologically unrealized subsequent sentence which contains a gap anaphoric to the topic. Shi (2000: 393) puts forward the following sentence as subsequent to (64), containing an empty subject marked by e:

(65) Buran e jiu hui shao-si bu shao ren. Chinese
otherwise really will burn-die not-few people
'Otherwise (it) would have killed many people.'

Earlier, Shi (1992: 109) characterized sentences such as (64) as 'incomplete'. The addition of a subsequent sentence makes it a complete discourse and provides an empty subject position. Yuan (1996) independently proposes exactly the same solution.

Although addition of a subsequent sentence may make the discourse complete or more complete, whatever 'complete' means, there is no guarantee that it always contains a gap. For instance, the subsequent sentence can be (66) instead of (65):

(66) Buran women dou hui sidiao. Chinese
otherwise we all will die
'Otherwise we would all have died.'

Addition of (66) to (64) achieves equal completeness, yet there is no empty position in (66) to license the topic. Aware of this problem, Shi argues further that in such a case one can interpret the topic as a sentential adverbial and then add another adverbial such as *naci* 'that time' to (66) to be anaphoric to the topic. Adding it to (66) produces (67a). It is generally possible to insert a temporal adverbial freely. Even if the temporal adverbial does not occur overtly, an empty one will serve the purpose as well. So one can take (66) as containing an empty resumptive proform anaphoric to the topic, as in (67b):

(67) a. Nachang huo$_i$, xingkui xiaofangdui lai-de kuai. Buran naci$_i$ Chinese
women dou hui shao-si.
b. Nachang huo$_i$, xingkui xiaofangdui lai-de kuai. Buran e$_i$
women dou hui shao-si.

Pan and Hu (2001, 2002) object that by so doing Shi allows the topic in (64) to be licensed by a null element in a null clause. This is such an extremely powerful

means that it makes his hypothesis in (58) unfalsifiable. It has hardly any explanatory power.

3.2.3 Related but not coreferential?

Shi's six types of topic structures, each supposedly containing a 'dangling topic', do not form an exhaustive list of Chinese-style topic structures. There is at least one more type of topic structure that merits more attention. It is also among the most frequently cited illustrations of Chinese-style topic structures. One example of this type, cited from Chen (1996), appears in Shi (2000: 401) in a paragraph in which he considers the possibility of relativizing topics. But he does not make it clear whether the sentence-initial NP in (68) is also a subject:

(68) Shuiguo wo zui xihuan chi xiangjiao. Chinese
fruit I most like eat banana
'(Among) all fruits, I like to eat bananas the most.'

This sentence represents a commonly used topic structure, where the topic is the superordinate term while there is another NP in the comment which is semantically its hyponym.[20] But unlike in the double subject construction, the two semantically related NPs are not adjacent to each other. (68) differs from the double nominative construction and also from any of the topic structures involving 'dangling topics'. Obviously, *shuiguo* cannot be taken as a modifier or specifier of *wo*. It is related to *xiangjiao*, of course. But the relation is not coreferential. It does not inherit a thematic role from it. Thus it is not compatible with Shi's definition of topic in (58).

To summarize, on the one hand, the so-called Chinese-style topic structures do share some syntactic and semantic properties. On the other hand, they appear in such a variety of constructions that it is hard to reduce each and every one of them to an English-style topic structure or to a structure without a topic.

4 Post-subject topic

The canonical word order of Chinese is SVO, as exemplified in (69a). Alongside the topic structure in (69b), in which the object is situated at the front, we also find (69c), where it occurs between the subject and the verb:

(69) a. Ta du le zheben shu. Chinese
he read ASP this book
'He read this book.'
b. Zheben shu ta du le.
c. Ta zheben shu du le.

The preposed NP *zheben shu* in (69c) is known variably as preposed object, shifted object, or post-subject topic, and also as preverbal topic, subtopic, secondary

topic, inverted topic, etc., in the literature. Some researchers argue that it is not a topic, but a focus. The two controversial issues with regard to this construction are: (i) how is (69c) syntactically derived, and (ii) what is the nature of the preposed object – a topic or a focus?

4.1 Derivation

4.1.1 Double topicalization

Presumably, the sentence in (70c) may be derived by topicalizing both the subject and the object in (70a) in the following manner. The object in (70a) moves to the clause-initial position first, producing (70b), and then the subject moves across the preposed object, producing (70c):

(70) a. Ta du le zheben shu. Chinese
b. Zheben shu_i, ta du le e_i.
c. Ta_i zheben shu_i e_j du le e_i.

This mechanism is called Double Topic Hypothesis by Ernst and Wang (1995) and Shyu (1995).[21]

4.1.2 VP adjunction

Ernst and Wang (1995) present evidence against the Double Topicalization Hypothesis in favor of the VP-Adjunction Hypothesis. The latter allows the object to move and adjoin to any segment of the VP. It can account for the following data:

(71) a. *Yijing Guorong ye ziji feng-hao yifu le. Chinese
already Guorong also self sew clothes ASP
'Guorong already can sew clothes himself.'
b. Guorong yijing yifu ye ziji feng-hao le.
Guorong already clothes also self sew ASP

The adverb *yijing* must occur in the VP. Hence the contrast between (71a) and (71b) in grammaticality. If both the object and the subject undergo movement to the front, they should both precede the adverb. The VP-Adjunction Hypothesis, on the other hand, makes the correct prediction, as it allows the object to adjoin freely to a position under the adverb, giving (71b).

4.1.3 Substitution movement

Qu (1994), Shyu (1995), and some other researchers maintain that the preposed object undergoes overt A-movement. A-movement is subject to the locality condition. This hypothesis can account for the fact that object preposing, unlike topicalization, never crosses sentence boundaries. The object of the embedded clause can move to the front of the matrix clause, but it cannot be located between the matrix subject and the verb:

(72) a. Zheben shu, laoshi zhidao [xuesheng du guo e]. Chinese
this book teacher know student read ASP
'This book, the teacher knows the students have read.'
b. *Laoshi zheben shu zhidao [xuesheng du guo e].
teacher this book know student read ASP

Those who advocate A-movement agree that it is motivated by feature checking but disagree as to which feature or features to check and where. Following Pollock (1989) and Chomsky and Lasnik (1993), Qu (1994) assumes that the object raises to Spec of AgrOP for case and feature (presumably phi-features) checking. It is a substitution movement. Treating the preposed object as a focused NP on a par with those bearing an overt focus marker, Shyu (1995) assumes that it raises to Spec of FP (Focus Projection) to check the focus feature. Similarly, Gasde (1998) hypothesizes the existence of a Focus Phrase within IP, which he calls Focus2 Phrase to distinguish it from the Focus1 Phrase higher up. An object with the feature [+contrastive] can move into the Spec of Focus2P and stay there. Alternatively it can use this position as a medial landing site on the way to the Spec of Focus1P. Zhang (2000) also holds that movement is triggered by focus, though the focus marker is phonetically unrealized. The focus marker, overt or covert, triggers a strong feature and results in object shift to the checking domain. Accusative Case feature is checked along with it.

4.1.4 Base generation

There is another construction containing an NP between the subject and the verb, illustrated by (73b), alongside the typical topic structure in (73a). The latter is extensively discussed in Tsao (1990), but not considered by proponents of the movement hypothesis:

(73) a. Shuiguo ta zui xihuan pingguo. Chinese
fruit he most like apple
'Speaking of fruit, he likes apple most.'
b. Ta shuiguo zui xihuan pingguo.
he fruit most like apple

The two sentences are equally well-formed and one is the exact paraphrase of the other. The only difference is that the NP semantically related to the one in object position is situated clause-initially in (73a), but between the subject and the verb in (73b). They are both 'Chinese-styled', as it were. Once the existence of (73b) is recognized, previous controversies over movement and base generation in topic structures are revived. Since there can be no possible original site for *shuiguo* in (73b), one is compelled to admit that at least some post-subject NPs are base-generated. It has no Accusative Case feature to check because Accusative Case is assigned to another NP, *pingguo*, in the postverbal object position. It has no focus feature to check, either, since *shuiguo* in (73b), just like *shuiguo* in (73a), is not contrastive. So even if one insists that it originates in a postverbal position somewhere, there is nothing that triggers its movement.

4.2 Focus or topic?

In this section we focus our attention on the construction containing a gap bound to an NP between the subject and the verb. Compare:

(74) a. Ta shi putaojiu bu he. Chinese
he FOC wine not drink
b. Putaojiu ta bu he.
c. Ta putaojiu bu he.

When *putaojiu* in all three of these sentences is contrastive, researchers all agree that it is an overtly marked focus in (74a) and a topic in (74b). What is controversial is whether the one in (74c) is a focus or a topic.

4.2.1 Notion of focus

Ernst and Wang (1995), Shyu (1995), Gasde (1998), and Zhang (2000) call the NP between the subject and the verb 'focus' in view of the fact that it is contrastive and is structurally distinctive from the sentence-initial topic. Typologically, some languages designate a syntactic position for focus. A well-known representative is Hungarian. It has a designated preverbal focus position in addition to a topic position. Such languages are called discourse-configurational language in the terminology of Kiss (1995a).[22] The configuration proposed by Shyu (1995), Gasde (1998), and Zhang (2000) for Chinese sentences like (74c) is quite similar to that of Hungarian focus structures exemplified in Kiss (1998). Shyu and Zhang assume that the preverbal NP is a focus with a zero focus marker, and argue that it has the same semantic properties an overtly marked focus possesses.

But the terms 'topic' and 'focus' are notoriously confusing. Researchers who prefer to call the NP between the subject and the verb 'topic' are aware that what Shyu, Gasde, and Zhang call 'focus' is conceptually different from 'identificational focus'[23] as defined in Kiss (1995a), or 'kontrast' in Vallduví and Vilkuna (1998), or 'operational focus' in Roberts (1998).[24] Identificational focus is characterized by exhaustive identification of a set of entities given in the context or situation. Identifying some entity or entities means excluding others. In English and Hungarian, identificational focus has the feature complex of [+exhaustive], [+contrastive]. Kiss uses two tests, designed by Szabolcsi (1981b) and Donka Farkas (p.c. to Kiss) respectively, to determine which expressions in English and Hungarian are exhaustively identificational. The same tests can be used to distinguish Chinese expressions that express exhaustive identification and those that do not. The results can show whether the Chinese NP between the subject and the verb is an identificational focus.

4.2.2 Diagnostic tests for identificational focus

Szabolcsi's test involves a pair of sentences. The first one contains a focus consisting of two coordinate NPs. The second sentence differs from the first in that one of the NPs has been dropped. If the first sentence does not logically entail the second one, then the focus is exhaustively identificational. As shown by Kiss,

the results of the test confirm exhaustive identification of focus in English cleft constructions and their Hungarian counterparts, and disconfirm exhaustive identification in English and Hungarian topic constructions. Xu (2001) adopts the test to distinguish Chinese sentences containing overtly focus-marked NPs, sentence-initial topic NPs, and postverbal NPs:

(75) a. Ta shi putaojiu he pijiu bu he. Chinese
he FOC wine and beer not drink
'It is wine and beer that he doesn't drink.'
b. Ta shi putaojiu bu he.
'It is wine that he doesn't drink.'

(76) a. Putaojiu he pijiu, ta bu he. Chinese
wine and beer he not drink
'Wine and beer, he does not drink.'
b. Putaojiu, ta bu he.
'Wine, he does not drink.'

(77) a. Ta putaojiu he pijiu bu he. Chinese
he wine and beer not drink
b. Ta putaojiu bu he.

The sentence in (75a) does not logically entail the one in (75b). This shows that a focus-marked expression expresses exhaustive identification. It has the feature complex of [+contrastive], [+exhaustive]. But the sentences in (76b) and (77b) are logical consequences of those in (76a) and (77a) respectively. So, unlike the focus-marked NP in (75), the sentence-initial topic NP in (76) and the NP between the subject and the verb in (77) do not express exhaustive identification. They both have the feature complex of [+contrastive], [−exhaustive].[25]

Donka Farkas's test involves a dialogue, in which the second speaker intends to negate the statement made by the first speaker. If what the first speaker says expresses exhaustive identification, negation sounds natural:

(78) a. A: Ta shi Putaojiu bu he. Chinese
he FOC wine not drink
'It is wine that he doesn't drink.'
b. B: Bu, ta pijiu ye bu he.
no he beer also not drink
'No, he doesn't drink beer, either.'

(79) a. A: Putaojiu, ta bu he. Chinese
wine he not drink
'Wine, he does not drink.'
b. B: #Bu, pijiu, ta ye bu he.[26]
no beer he also not drink

(80) a. A: Ta putaojiu, bu he. Chinese
he wine not drink
b. B: #Bu, ta pijiu ye bu he.
no he beer also not drink

The negation of (78a) by (78b) is natural. With the focus marker *shi*, speaker A uses (78a) to identiify wine as the only thing that the person doesn't drink. If he doesn't drink beer, either, then it is justified for speaker B to use *bu* to negate the exhaustivity expressed by the focus maker. On the other hand, (79b) and (80b) are not natural negations of (79a) and (80a). Neither (79a) nor (80a) implies that wine is the only thing the person doesn't drink. The propositions expressed in (79b) and (80b) are mere extensions of or additions to the previous statements made by speaker A. The negative particle *bu* is out of place.

The two tests produce the same results. Both of them show that an NP between the subject and the verb is conceptually similar to a sentence-initial topic, but different from a focus-marked expression. The NP *putaojiu* is evidently an identificational focus in (74a) but not in (74b), and (74c). In recognition of this difference, some researchers call the one in (74a) 'focus' and the one in (74b) or (74c) 'topic'. One is a major topic and the other is a subtopic or secondary topic. Other researchers prefer to call the one in (74c) 'focus', as a mnemonic to distinguish it syntactically from the sentence-initial 'topic', without regard to their common feature characterization.

5 Appendix

Shi (2000) reopens an important issue and makes a very strong claim about the structure and interpretation of topic constructions in Chinese. If justified, it may be applicable to languages like Japanese and Korean as well, and may deny some characteristic properties of topic-prominent languages. This article has already given rise to controversy among Chinese linguists. The most important response is from Pan and Hu (2001, 2002), but at the time of writing this was not available in published form. This appendix presents the two opposing views in more details for readers interested in the issue, on top of the illustrative discussion in section 3.2.

As has been mentioned, Shi adopts a piecemeal solution. He lists six types of 'dangling topics' and argues that in each case either there is a hidden gap or a resumptive pronoun in the comment from which the sentence-initial element originated, or it is not a genuine topic.

5.1 Function of wh*-words*

Shi calls attention to structures in which the clause following the sentence-initial element begins with a *wh*-word. He points out that *shei* in (81) is an indefinite

pronoun, interpreted as a quantifier corresponding to *anyone* in English, not an interrogative pronoun corresponding to *which person*.[27] The quantifier *shei* can be deleted without affecting the interpretation of the sentence, giving (81b):

(81) a. Tamen shei dou bu lai. Chinese
they who all not come
'They (topic), none of them is coming.'
b. Tamen dou bu lai
they all not come
'None of them is coming.'

Since the pronoun in (81b) is obviously the subject, so is the one in (81a). Shi provides further evidence in support of this analysis. Modal verbs must follow the subject and the modal verb *keyi* 'may' does follow *tamen* in (82):

(82) Tamen keyi shei dou bu lai. Chinese
they may who all not come
'None of them may come.'

Pan and Hu (2001, 2002) contrast (81a) with (83a), an interrogative sentence in which the *wh*-word must be interpreted as *which person*, not as *anyone*. Deleting *shei* in (83a) would convert the *wh*-question into a yes/no question, as in (83b):

(83) a. Tamen, shei hui lai? Chinese
they who will come
'Which of them will come?'
b. Tamen hui lai?
they will come
'Will they come?'

If the sentence-initial pronoun in (83a) is also the subject, does the *wh*-clause *shei hui lai* function as the predicate just as the idioms in (59) and (60) do?[28] Then why should interrogative clauses and idiomatized clauses be grouped together as exceptional, as against other clauses?

Pan and Hu also question the validity of using the distribution of *keyi* to locate the subject. They provide a grammatical sentence in which *zhe wan fan* is an uncontroversial subject and *keyi* precedes the subject:[29]

(84) Zhe wan fan keyi liangge ren chi. Chinese
this bowl rice may two people eat
'This bowl of rice may serve two people.'

Since the position of *keyi* is variable, it cannot be used as a valid test to locate the subject.

5.2 Preposition drop

Another type of topic structure discussed in Shi (2000) is exemplified by (85):

(85) Zhejian shi, ni bu neng guang mafan yige ren. Chinese
this matter you not can only bother one person
'As for this matter, you cannot just bother one person.'

Shi argues that (85) is derived from (86) by an operation of preposition drop, as some Chinese prepositions can be deleted without changing the meaning of a sentence:

(86) Wei zhejian shi, ni bu neng guang mafan yige ren. Chinese
for this matter you not can only bother one person
'For this matter, you cannot just bother one person.'

A prepositional phrase used as an adverbial can occur in other positions of the sentence as well; for instance, within the VP. So the sentence-initial NP in (85), even if taken as a topic, may be analyzed as syntactically related to an unoccupied position in the comment marked by e in (87):

(87) Zhejian shi_i, ni bu neng e_i guang mafan yi-ge ren.

Pan and Hu challenge Shi's hypothesis of preposition drop by providing the following example containing the same preposition, *wei*:

(88) a. Wei zhejian shi, zuotian Zhangsan dajia-le. Chinese
for this matter yesterday Zhangsan fight-ASP
'Zhangsan fought a fight for this matter yesterday.'
b. *Zhejian shi zuotian Zhangsan dajia-le.
this matter yesterday Zhangsan fight ASP

According to their intuitions, the preposition in (88a) cannot be deleted. On the other hand, many sentence-initial NPs cannot take *wei* or any other preposition. The fact that some of them can is idiosyncratic rather than systematic.

5.3 NP predicate

Shi (2000: 395) defines another type of "dangling topic" as consisting of "two sets of NPs but no verb to head the predicate":

(89) Na zhong douzi yi jin sanshi kuai qian. Chinese
that kind bean one catty thirty dollar money
'That kind of beans (topic), one catty is thirty dollars.'

He argues that *na zhong douzi* in this construction should be analyzed as a subject rather than a topic on two accounts. First, the NP preceding the non-verbal predicate can be indefinite, as exemplified by (90a). Second, it can be preceded by the emphatic marker *shi*, as exemplified in (90b). In contrast, the topic in a genuine topic structure, like those in (91a) and (91b), cannot be indefinite and resists focus-marking:

(90) a. Yizhi qinwa sitiao tui. Chinese
one frog four leg
'A frog (has) four legs.'
b. Shi na zhong douzi yi jin sanshi kuai qian.
be that kind bean one catty thirty dollar money
'It is that kind of beans that is worth thirty dollars a catty.'

(91) a. *Yi zhong douzi, wo mai-le. Chinese
a kind bean I bought-ASP
b. *Shi na zhong douzi wo mai-le.
be that kind bean I buy-ASP

It is true that a topic is generally definite. But Pan and Hu wonder why Shi does not simply use sentences structured like (89) to test the definiteness of the topic. If the demonstrative *na* in (89) is replaced by a numeral *yi*, the sentence becomes ungrammatical. The difference between (89) and (92) in acceptability straightforwardly confirms the topichood of the sentence-initial NP in (89):

(92) *Yi zhong douzi yi jin sanshi kuai qian. Chinese
one kind bean one catty thirty dollar money
'A kind of beans (topic), one catty is thirty dollars.'

Furthermore, they show that a topic does not necessarily exclude the emphatic marker *shi* even in a sentence containing a gap bound to it. (93) is a typical topic structure that passes Shi's definition in (58):

(93) Shi na zhong douzi wo mei mai. Chinese
be that kind bean I but buy
'It is that kind of beans that I didn't buy.'

A topic cannot convey new information and therefore cannot be an informational focus. But *shi* marks contrastive focus rather than informational focus. In fact, it may mark contrastive topic as well.[30] The distribution of *shi* cannot be used to distinguish a topic from a subject. Pan and Hu show that evidence is yet to be found to support Shi's claim that the sentence-initial NP in the fifth type of topic structure is not a topic.

5.4 AP predicate

Still another type of topic structure with a 'dangling topic' discussed in Shi (2000) is represented by (94), cited from Chen (1996), where two NPs are followed by a clause containing an adjective phrase but no verb:

(94) Wujia Niuyue zui gui. Chinese
price New York most expensive
'Speaking of the price of things, New York is most expensive.'

Shi argues that the first NP should be analyzed as a subject rather than a topic and that the second NP is a locative adverbial rather than a subject on both semantic and syntactic grounds. Semantically, what is expensive is the price not the city. Syntactically, *wujia* passes a diagnostic test on subjecthood: a subject precedes adverbials like *yiding* (certainly) and *jingchang* (often):

(95) a. Wujia yiding Niuyue zui gui. Chinese
price certainly New York most expensive
'The price of things is certainly the highest in New York.'
b. *Yiding wujia niuyue zui gui.

Pan and Hu present (96), in which *wujia* and *Niuyue* have switched positions:

(96) Niuyue yiding wujia zui gui. Chinese
New York certainly price most expensive
'The price of things is certainly the highest in New York.'

This example is intended to place Shi in a dilemma. His adverbial placement test selects *Niuyue*, the NP preceding *yiding*, as the subject. But semantic predication precludes it. Since what is most expensive can only be the price but not the city, the subject should be *wujia*. Hence an obvious contradiction exists between his syntax and his semantics. In Pan and Hu's analysis of (94), *wujia* is the topic, and the subject of the comment clause is a headless NP.[31]

Pan and Hu (2001, 2002) derive the topic structure in (94) from the following formula:

(97) $\lambda P \lambda Q \lambda Z \subseteq$ things λx [$x \in Z$ & P(x) & Q(x)], where P(x) = x is Niuyue de Wujia, Q(x) = x is zuigui, Z = wujia.

5.5 Double nominative construction

Shi's six types of topic structures with a 'dangling topic' do not include the double nominative construction, commonly regarded in the literature as one of the representatives of Chinese-style topic structures. Shi discusses double nominative sentences like (98) in a later section:

(98) Li Taitai nuer piaoliang. Chinese
Li Mrs. daughter beautiful
'Mrs. Li's daughter is beautiful.'

The analysis of the Chinese double nominative construction has been controversial since Teng (1974a). An easily available solution is to take the first NP as the modifier of the second one. Schlobinski and Schütze-Coburn (1992), for instance, still analyze the two NPs as a complex NP structure functioning as a subject, thus concluding that Chinese, like German and English, does not possess a double-subject or double-topic construction.[32] What prevents Chinese grammarians from accepting this kind of solution is their awareness of the fact that adverbs, modal words, etc., may be inserted between the two NPs.

Tsao (1990) observes that the so-called double nominative construction is not homogeneous. In some cases, for instance in (99) below, the second NP has become part of a frozen compound, or at least a semi-compound, and therefore not fully productive:

(99) Wang Taitai tou teng. Chinese
Wang Mrs. head ache
'Mrs. Wang is having a headache.'

On the basis of Tsao's dichotomy, Shi (2000: 405) assigns the following structural descriptions to (98) and (99) respectively:

(100) a. $[_{NP}\ [_{SPEC}$ Li Taitai$]\ [_{N}$ nuer$]]\ [_{PRED}$ piaoliang$]$.
b. $[_{NP}$ Wang Taitai$]\ [_{PRED}$ tou teng$]$.

In (100a) *Li Taitai* is a possessive NP taking specifier position, and *nuer* takes head position. Together they function as the subject of the sentence. In (100b) *Wang Taitai* is the subject, and its predicate is the entire idiom *tou teng*, which is a clause by itself.[33] Neither (100a) nor (100b) is a topic structure in his view. To prove the structural description he assigns to *Li Taitai nuer* is correct, he shows that adverbs like *feichang* cannot intrude into the NP:

(101) *Li Taitai feichang nuer piaoliang. Chinese
Li Mrs. extremely daughter beautiful
'Mrs. Li's daughter is extremely beautiful.'

In Tsao's (1990: 141) analysis, *Li Taitai* is the topic and *nuer* is the subject in (100a). He takes *Wang Taitai* as both the topic and the subject in (100b). Tsao (1990: 125) reveals the complexity and unreliability of adverbial tests, as "adverbs are far from a homogeneous class." The reason why (101) is ungrammatical is not that *Li Taitai* and *nuer* cannot be separated, but that *feichang* and *piaoliang* cannot be separated. The adverb *feichang* modifies the adjective *piaoliang* and must be adjacent to it. Other expressions can appear between *Li Taitai* and *nuer*:

(102) Li Taitai jushuo nuer hen piaoliang. Chinese
Li Mrs. reportedly daughter very beautiful
'Reportedly Mrs. Li's daughter is beautiful.'
(Lit. *'Mrs. Li reportedly daughter is beautiful.')

The occurrence of *jushuo* is expected if *Li Taitai* is analyzed as the topic rather than the specifier, and *nuer* as the subject rather than the head noun. Compare (102) with (103), a less controversial topic structure. In (103), *jushuo* can also occur between the topic and the subject:

(103) Zhetiao xianglian, jushuo Wang Taitai bu xihuan. Chinese
this necklace reportedly Wang Mrs. not like
'Reportedly, this necklace, Mrs. Wang doesn't like.'

More convincing evidence is needed to maintain the claim of the reductionist view stated in (58).

NOTES

1 Glosses used in this chapter are: ASP = aspectual marker, DEC = declarative sentence marker, FOC = focus marker, IMP = imperative sentence marker, MOD = modifier marker, PAST = past tense marker, OBJ = object (objective case) marker, POL = polite speech marker, PREP = preposition, PRT = particle, SUBJ = subject (nominative case) marker, TOP = topic marker.

2 It does not literally contain two nouns in nominative case in Chinese; cf. double nominatives in Japanese, where two nouns are overtly marked as nominative, dealt with in chapter 20.

3 However, there is a great deal of confusion in the literature about usage of the topic marker (*wa* in Japanese and *nun* in Korean) and the subject marker (*ga* in Japanese and *ka* in Korean). See Choe (1986) for a summary.

4 One may take *na* as either transitive or intransitive, but it is intransitive in (20). Alternatively, one may assume that such a verb is transitive but may take a null object. Whichever analysis one adopts, it makes no difference to the facts presented in this section. According to the statistics reported in Hu and Fan (1995), only 3 percent of Chinese verbs are required to take an object.

5 An example is split topicalization in German, discussed in Van Riemsdijk (1989a).

6 A relative clause precedes the head and contains no *wh*-words in Chinese. A modifier marker is used between the relative clause and its head noun phrase.

7 Many, perhaps most, native speakers accept the sentence with little or no difficulty. They do not assign two question marks to it.

8 Huang (1982a, 1998), Li (1990), and Shi (2000) are in favor of the movement analysis, whereas Xu and Langendoen (1985), Xu (1986), Cheng (1997), and Huang (1992) are against it. Of the above examples, (23–25) are cited from Huang (1982a: 457, 1998: 326), (26–27) from Xu and Langendoen (1985), and (28) from Huang (1992), with S and S′ replaced by IP and CP.

9 The rule is proposed to account for the asymmetry between the subject and the object in topic binding in the following sentences:

(i) Zhangsan [e chang ge de] shenyin hen haoting.
Zhangsan sing song MOD voice very pleasant
'Zhangsan, the voice (with which) he sings songs is very pleasant.'

(ii) *Zhanghai wo xihuan [e chang ge de] shenyin.
Zhangsan I like sing song MOD voice
'Zhangsan, I like the voice (with which) he sings songs.'

(i) is grammatical because the empty category indicated as e in the relative clause in brackets can be co-indexed with the closest NP, i.e., the topic. (ii) is ungrammatical because the topic is not the NP closest to the empty category, which is situated in a relative clause whose head *shenyin* is the object. Hasegawa (1984) and Yoshimura (1986) find the subject–object asymmetry in accessibility to topicalization in Japanese as well.

10 Of the examples in this subsection, (38) is cited from Huang and Li (1996) and (41) from Xu and Liu (1998: 47). For the analysis of (38) and (27) (= (40)) involving resumptive pronouns, see Shi (1992, 2000).

11 See previous discussion on the difference in transitivity between Chinese and English in section 2.1.

12 (23) is as unacceptable as (49a) for the same reason, i.e., due to a specific NP containing a variable.

13 The examples in (50a, b) are cited from Xu and Langendoen (1985). Huang (1992) shares their view, provides similar examples, and supports the semantic account for the contrast therein.

14 Choe notes the semantic difference between the alternative forms. Whereas *hyangkinun* can have either a thematic reading or a contrastive reading in (55a), it has only a contrastive focus reading in (55b).

15 Chao (1968) uses the term 'subject' but defines it as topic.

16 Here we are confronted with another difficult issue in Chinese grammar. Without markers corresponding to *wa* and *ga* in Japanese, the distinction between topic and subject is never obvious. In some researchers' view what is called subject by Shi is topic anyway. See LaPolla (1993).

17 When it is used as an adverb, *zhuanmen* has more than one sense. It is used in the sense of 'specially' in (i):

(i) Shang ci wo shunbian lai kan ni; zhe ci wo zhuanmen lai kan ni.
last time I conveniently come see you this time I specially come see you
'Last time I came to see you in passing; this time I came specially to see you.'

But the same word can also be used as an adverb of frequency, somewhat similar in meaning to *always*, *usually, frequently,* etc. When it is inserted in (59) and (60), as in (ii) here, it makes sense only when it is interpreted as an adverb of frequency:

(ii) Tamen, zhuanmen wo kan ni, ni kan wo.
they always I look you you look me
'They always look at each other.' Not: 'They specially look at each other.'

Like many other adverbs of frequency, it is a focus-sensitive operator capable of floating for the purpose of marking the scope of focus. Focus is phonologically marked by intonation contour in English but often syntactically realized in Chinese by means of operator float. Compare the following pair:

(iii) a. Xiao Zhang zhuanmen qing Xiao Li zai waimian chifan, cong bu zai jiali chi.
Xiao Zhang always invite Xiao Li at outside dine ever not at home dine
'Xiao Zhang always invites Xiao Li to dine out and never dine at home.'

b. Zhuanmen Xiao Zhang qing Xiao Li; Xiao Li cong bu qing Xiao Zhang.
always Xiao Zhang invite Xiao Li Xiao Li ever not invite Xiao Zhang
'It's always Xiao Zhang that invites Xiao Li; Xiao Li never invites Xiao Zhang.'

The adverb *zhuanmen* can precede the subject if the latter is intended to be focused or to be within the scope of focus, as in (iiib) above. So the word order in (61) merely shows that the sentence-initial pronoun is not within the focus; it is not proof that it is the subject.

18 This sentence is discussed in Li and Thompson (1976, 1981), Huang (1982a), Xu and Langendoen (1985), LaPolla (1990), Jiang (1991a), Ning (1993), Shyu (1995), Chen (1996), etc.

19 He further argues that the word *xingkui* 'fortunately' is crucial. Without it the sentence would be ungrammatical. But the result of a survey conducted in Beijing shows that only one of the 73 native speakers of Chinese found it hard to accept the sentence without *xingkui*.

20 Another example of this type is (56a) in section 3.1.3.

21 They refer to Xu and Langendoen (1985), Lee (1986), Tang (1990), and Lin (1992). However, not all those who that allow multi-topic structures explicitly or even implicitly advocate double topicalization. Some of them take one or both topics as base-generated.

22 Chinese is probably a Type A discourse-configurational language, as it represents categorical proposition and thetic proposition in different forms, thus meeting Kiss's definition of topic-prominent languages. It uses SVO order for categorical propositions but not for thetic propositions. Compare the following:

(i) Zhetiao gou zai ken gutou.
this dog PROG chew bone
'This dog is chewing a bone.'

(ii) Wu li you yitiao gou.
room in have a dog
'There is a dog in the room.'

If, like Hungarian, Chinese has a position for focus, it is a Type B discourse-configurational language as well.

23 The NP position between the subject and the verb in Chinese is clearly not a position for information focus, as it is typically for definite or generic NPs rather than indefinite NPs, for expressions carrying old information rather than new information.

24 All of the three papers distinguish two notions of focus, but give them different names: 'information focus' and 'identificational focus' in Kiss (1998), 'rheme' and 'kontrast' in Vallduví and Vilkuna (1998), and 'informational focus' and 'operational focus' in Roberts (1998).

25 It is mentioned in Kiss (1998) that in some languages identificational focus may have the features complex of [+contrastive], [–exhaustive]. If Chinese is such a language, there is still no way to distinguish the sentence-initial NP from the NP between the subject and the verb conceptually.

26 The hash sign indicates unnatural use of the negative particle *bu*.

27 The Chinese counterpart of English *wh*-words can be either an interrogative pronoun or an indefinite pronoun. So (i) is ambiguous between an interrogative reading and a declarative reading:

(i) Ta kanjian-le shei.
he saw whom/someone
'Who did he see?' Or 'He saw someone.'

28 It is mentioned above that Shi seems reluctant to make a more general claim that any clause can be a predicate.

29 In fact, *keyi* is also a focus-sensitive operator, capable of floating around. Compare (ia, b) and note the difference in focus:

(i) a. Ta keyi qu, ye keyi bu qu.
he may go also may not go
'He may go and may not go.'
b. Keyi ta qu, ye keyi ni qu.
may he go also may ni go
'He may go and you may go.'

The two sentences are equally grammatical, but (ib) has no corresponding structure in English, since English modal verbs like *may* cannot float. It is misleading to gloss *keyi* as *may*. Syntactic categorization of modal words is controversial among Chinese grammarians. Some of them classify *keyi* and *bixu* as modal verbs, corresponding to *may* and *must*, whereas others classify them as adverbs, corresponding to *possibly* and *necessarily*.

30 There is a great deal of terminological confusion regarding contrastive topic and contrastive focus. See Molnár (1998). Lee (2003) tries to differentiate contrastive topic and contrastive focus in Korean, Chinese, and other languages.

31 This type of topic structure is common in Chinese. (i–iii) are all grammatical:

(i) Cao Yu de juben zui hao.
Cao Yu 's plays most good
'Cao Yu's plays are the best.'

(ii) Juben, Cao Yu de zui hao.

(iii) Juben, Cao Yu zui hao.

In (ii) and (iii) the head noun is topicalized, leaving the possessive NP behind in the subject position. The sentence in (94) has the same structure as the one in (iii).

32 Other researchers do not accept this proposal, but believe that a topic that is more like an adverbial should be regarded as a modifier that forms a modifier–modified sequence with the comment.

33 This is similar to his analysis of (59) and (60) in section 3.2.1.

1 Introduction

It has long been known that quantificational expressions in natural language do not all have the same scope properties. While the scope of some expressions is closely related to their observable, 'surface' position in syntactic structure, other expressions display a remarkable degree of freedom with respect to the relative scope that may obtain between them and other expressions in the structure. Compare (1) and (2):

(1) a. Some girl watched every movie.
    b. Some girl will be happy if every movie is shown.

(2) a. Every girl watched some movie.
b. Every girl will be happy if some movie is shown.

(1a) is ambiguous: it can be read as involving a girl who has seen all the movies, but is also judged true when each movie was seen by a different girl; the latter reading may be described by saying that *every movie* takes wide scope relative to *some girl*. (1b), on the other hand, does not allow wide scope for *every movie* relative to *some girl*; its truth requires that there be (at least) one indefatigable girl who will be happy if all the movies are shown. Thus, while the scope of *every movie* is not exactly fixed at its observable position – witness the ambiguity of (1a) – neither is it completely free. When *every movie* is embedded in an *if*-clause, as in (1b), it cannot take scope over another expression that is not so embedded. See chapters 16, 53, and 64. The restriction observed in (1b) does not, however, apply to all NPs, as we find in (2), where the positions of the two NP types are reversed. The indefinite NP *some movie* can escape the scope of *every girl* not only in (2a), but also in (2b), regardless of the *if*-clause. Thus, (2b) can be understood as stating that there is a particular movie, such that every girl will be happy if it is shown.

This chapter focuses on the scope properties of NPs such as *some movie* in (2b), which, following tradition, we will refer to as being *specific* on the intended reading.[1] Section 2 provides a little historical background, and introduces two opposing views that underlie much of the literature on the subject. Section 3 describes the properties that make the scope of indefinites exceptional in several respects. Section 4 discusses the issue of 'intermediate island-escaping scope', which has featured prominently in the literature since Fodor and Sag (1982). Section 5 goes into some detail in describing a fairly recent approach, which holds that a semantic choice function mechanism is to be held responsible for the exceptional wide-scope readings found with specific NPs; section 6 discusses one prominent problem that seems to attend this approach. Section 7 discusses some of the, mostly tentative, work that has been devoted to delineating the class of indefinite NPs that show exceptional wide scope. A more detailed outline and summary is given as section 8.

Our aims are highly descriptive throughout. We will refrain from attempting to summarize the wide variety of (mainly semantic) theories that have been proposed in explanation of the specificity phenomenon. We will merely attempt to establish the reality of the phenomenon, describe some of its attendant properties and preconditions, and delineate the prerequisites for a successful theory of specificity as they emerge from recent research.

2 Specificity: a binary ambiguity?

This section introduces the specificity phenomenon. It provides some historical background, and along the way it presents some of the basic observations, and describes two prominent approaches to the analysis of specificity. The first

approach says that indefinite NPs show an inherent binary ambiguity: they may be interpreted as quantificational expressions (non-specific) or as something else (specific). The second approach holds that indefinites are always quantificational expressions, and that the specific vs. non-specific ambiguity is a scope ambiguity.

By way of introduction to the binary ambiguity approach to specificity, consider the following examples adapted from Karttunen (1968) (see also Baker 1966 for the observation regarding (4b)):

(3) Mary has *a car*. *It* is blue.

(4) a. *Mary doesn't have *a car*. *It* is blue.
b. *John wants to catch *a fish*. You can see *it* from here.
c. *All the boys in this town are in love with *a girl in this town*. *She* is very pretty.

In (3), the pronoun *it* can be felicitously used to refer to a car owned by Mary. This option is due to the appearance of the indefinite *a car* in the first sentence of the discourse, which, Karttunen claimed, introduces a discourse referent that the pronoun refers to. The pronouns in (4), on the other hand, cannot be so used. For instance, *it* in (4a) cannot be taken to refer to the car that Mary doesn't have. The generalization that apparently governs these facts is that in (4), the indefinite NPs are embedded in the scope of some other expression (*not*, *want*, *all the boys in this town*); this prevents the introduction of a discourse referent.

In many cases, however, some slight adjustment in the example will allow discourse anaphora even in the structures of (4):

(5) a. Mary doesn't own *a car she drives*. She rents *it* instead.
b. John wants to catch *a fish he spotted today*. You can see *it* from here.
c. All the boys in this town are in love with *a redheaded gogo-dancer who works at the Moonlight Inn*. *She* is very pretty.

Apparently, the indefinites in (5) do manage to introduce a discourse referent, despite the presence of a higher scoped element. Karttunen's (1968) description of these facts stated that indefinites are ambiguous between a specific and non-specific reading. He took this binary ambiguity to reside in the interpretation of the indefinite itself. The non-specific ones in (4), which do not introduce a discourse referent from a scopally embedded position, are interpreted as existentially quantified expressions; the specific ones in (5), which introduce a discourse referent even from a scopally embedded position, function semantically as name-like referential expressions.[2] This description provides no answer to the question why the non-specific readings are strongly favored in (4), whereas slight lexical and structural variations bring out the specific readings in (5) (a question that still goes unresolved; in fact, speakers generally allow a specific reading, and discourse anaphora, in (4) as well, albeit less readily than in (5); see section 7). The proposed quantificational/referential ambiguity does, however, point toward

an explanation for the different discourse anaphora options along the following lines.

If the indefinites in (3) and (4) are associated with existential quantifiers, then we expect them to be sensitive to the presence of other scopal expressions in the structure. From a more modern DRT perspective, the sentences in (3) and (4) might then be roughly represented (Heim 1982-style) as in (6) and (7):

(6) $[_T \exists x\ [_S \text{car}(x) \wedge \text{Mary has } x].\ [_S x \text{ is blue}]]$.

(7) a. ?? $[_T \exists\ [_S \text{NEG } \exists x\ [\text{car}(x) \wedge \text{Mary has } x]].\ [_S x \text{ is blue}]]$.
b. ?? $[_T \exists\ [_S \text{John wants } [\exists x\ [\text{fish}(x) \wedge \text{PRO catch } x]]].\ [_S \text{You can see } x \text{ from here}]]$.
c. ?? $[_T \exists\ [_S \forall x\ [\text{boy}(x) \rightarrow \exists y\ [\text{girl}(y) \wedge x \text{ loves } y]]].\ [_S y \text{ is very pretty}]]$.

Here, consecutive sentences are thought of as being attached to a single T(ext) node. Discourse anaphora can come about when an existential quantifier takes scope at T level, binding a variable in one sentence, and subsequently binding a pronoun, translated as the same variable, in the next sentence. Thus, the indefinite in (3), even if it is non-specific and interpreted through existential quantification as in (6), may antecede the pronoun because the existential quantification in question takes place at Text level, and this quantifier takes scope over the second sentence and binds the pronoun. The non-specific indefinites in (4), on the other hand, are associated with a lower existential quantifier in scope, which does not scope over, and hence does not bind, the pronoun; even if there is a Text-level (default) existential quantifier, it binds nothing in the first sentence and cannot relate the pronoun in the second sentence to the indefinite.

If, furthermore, the specific indefinites in (5) are indeed 'name-like' expressions, as Karttunen claimed, then we expect them to be insensitive to scope effects and to license discourse anaphora from any position, just like proper names. For instance, (5a) is expected to bear a close semantic resemblance to (8):

(8) Mary doesn't own *Fido*. She is looking after *him* for the weekend.

Karttunen's (1968) view of specific indefinites exemplifies an approach to specificity that plays an important role in the literature to this day – namely, that the phenomenon derives from a binary ambiguity residing in the indefinite NP itself: an indefinite may be interpreted through a quantificational or a referential mechanism.[3]

Around the same time, work by Heringer (1969) and Fodor (1970) on the interpretation of specific and non-specific indefinites in opaque contexts provided evidence against this view, and in favor of the view that indefinites are invariably quantificational expressions, involved in scope ambiguities. Fodor discussed several different effects that show up the ambiguity that obtains when an indefinite is embedded in an intensional context. First, such contexts block existential entailments:

(9) a. + John has a car ⇒ there is a car.
b. – John wants to marry a witch ⇒ there is a witch.
c. + John wants to marry a witch he met last week ⇒ there is a witch John met last week.

When an indefinite is not embedded, the proposition it occurs in is judged to allow the entailment that the noun-set of the indefinite is not empty, as indicated in (9a). When the indefinite is embedded in an opaque context, a *de re*/*de dicto* ambiguity arises. The *de re* reading, prominent in (9c), says that there is a particular witch that John wants to marry; this reading entails that there is such a witch. The *de dicto* reading, favored in (9b), can be paraphrased as saying that John wants to marry any witch at all, a wish he may well entertain even if there exist no witches; hence, the entailment does not hold. Similar entailment observations can be made with respect to the other embedding contexts illustrated in (4) and (5) above.[4]

Another ambiguity obtaining in opaque contexts relates to whether or not the description in the indefinite may be replaced by any extensionally equivalent description without changing the truth-conditions of the sentence. Such substitution is valid when the indefinite is not embedded, as the intuited validity of the inference in (10) illustrates:

(10) Mary employs an Italian man.
All Italian men drive a moped.
+_____
Mary employs a man who drives a moped.

When the indefinite is embedded in an opaque context, however, an ambiguity arises. On the *de dicto* reading, which is more prominent in (11), the inference is not valid; on the *de re* reading, which is more prominent in (12), it is:

(11) Mary wants to marry an Italian man.
All Italian men drive a moped.
–_____
Mary wants to marry a man who drives a moped.

(12) Mary wants to marry an Italian man she met in Venice the other day.
All Italian men drive a moped.
+_____
Mary wants to marry a man who drives a moped.

These ambiguities are traditionally described by assuming that indefinites are interpreted as existential quantifiers, which may take narrow or wide scope relative to the intensional verb (see, e.g., Bach 1968: 107, but also Quine 1956). The narrow-scope reading corresponds to the *de dicto* reading; the wide-scope reading to the *de re* reading. (13) illustrates this:[5]

(13) John wants to marry a witch.
  a. John wants [∃x [witch(x) ∧ PRO marry x]].
  b. ∃x [witch(x) ∧ John wants [PRO marry x]].

In (13b), the existential quantifier takes wide scope relative to *want* (so that the sentence is about a particular individual (witch), and existential entailment is valid), and so does the description *witch* (so that that particular individual is asserted to be a witch in the world in which the sentence as a whole is evaluated, or 'according to the speaker' – hence, substitution *salva veritate* is allowed). In (13a), both quantifier and description take narrow scope; hence the sentence is not about a particular individual, and both the existence of such an individual and the description *witch* need only hold in those worlds that conform to John's wishes; the description is not the speaker's responsibility, it is John who wants to marry any individual 'under the description of' her being a witch. (13b) logically allows the existential entailment and the substitution; (13a) does not.

(13) exemplifies a view on specific indefinites that opposes Karttunen's (1968) proposal. There is no binary ambiguity in the indefinite; rather, the indefinite is always interpreted with an existential quantifier. The observed ambiguities reflect the various scope positions available for the quantifier. Indeed, Karttunen (1971a) adopted this view and argued that it explains the discourse anaphora facts in (3–5) as well: the specific indefinites in (5) are existential quantifiers that escape the scope of the other operators, and therefore allow discourse anaphora just like the indefinite in (3) (cf. (6)). Much of the literature on specificity since then has revolved around the pros and cons of these two opposing views.

Fodor presented several observations that argue against a binary referential/quantificational ambiguity. One such observation is that the analysis in (13) is not fine-grained enough. There is no strict correlation between the existential entailment and substitution effects; with an effort, we can observe a four-way ambiguity according to these two parameters. (14) approximates the two additional readings for (13), where the scope of the existential quantifier and the scope of the description do not coincide:

(14) John wants to marry a witch.
  a. ?? witch(x) ∧ John wants [∃x ∧ PRO marry x].
  b. ?? ∃x John wants [witch(x) ∧ PRO marry x].

Some context can help to bring out the intended readings. Suppose, first, John wants to marry any old lady wearing a pointed hat who flies a broomstick, but believes these are called 'airline-hostesses'. Then we can truthfully utter (14); but the description *witch* is the speaker's responsibility (John's desires do not relate to that description) whereas there is not one particular such individual that John wants to marry – something like (14a) seems to be called for. Suppose, next, that John hallucinates the existence of several witches, and wants to marry a particular one among them. (14) is again true, but this time scope relations are reversed: John's desire is particularized to an individual (*de re*: wide-scope existential), but

the description *witch* is not the speaker's responsibility; we end up with something like (14b).

These two additional readings for indefinites have received relatively little attention in the literature; partly, no doubt, because the readings are more elusive than those in (13), partly because their analysis is so problematic. We will henceforth ignore them – the reader is referred to Farkas (1997) for an analysis that teases apart the scope of the restriction and the quantifier in a way that seems promising; see also Abbott (1993) for an insightful discussion. The observed four-way ambiguity does, however, indicate that a simple binary ambiguity of indefinite NPs does not provide sufficient descriptive latitude.[6]

Another observation by Fodor, and one which allows of analysis by more conventional means, also argues against a simple ± specific ambiguity. When more than one intensional verb c-commands an indefinite, more than two readings, corresponding to more potential scopal positions for the quantifier, are observed (the same observation, relating to definite NPs as well, is made in Karttunen 1971a; Jackendoff 1972: 281; Kripke 1979; the oldest version of this argument that I am aware of is due to Bach 1968: 107). Consider (15) (from Kripke):

(15) Hoover charged that the Berrigans plotted to kidnap a high American official
  a. . . . but he said they couldn't decide which one (to kidnap).
  b. . . . but he didn't know which one (they plotted to kidnap).
  c. . . . guess which one (he charged they plotted to kidnap).
  a′. Hoover charged (the Berrigans plotted (∃x [Hi.Am.Off.(x) ∧ PRO kidnap x])).
  b′. Hoover charged (∃x [Hi.Am.Off.(x) ∧ the Berrigans plotted (PRO kidnap x)]).
  c′. ∃x [Hi.Am.Off.(x) ∧ Hoover charged (the Berrigans plotted (PRO kidnap x))].

(15) allows three readings, brought out by the three sluices in (15a–c), and corresponding to three scope positions for the existential quantifier associated with *a high American official* as indicated in the primed formulae. An analysis of specificity which holds that indefinites show a binary ambiguity between a referential reading, and a reading as an existential quantifier that is interpreted in its position in overt syntax, fails, in particular because it cannot account for the 'intermediate scope' brought out by (15b). Here, *a high American official* is not referential (Hoover's charge is not about a particular individual, and there need not even exist any American officials for this reading to be felicitous and true). But if the indefinite is quantificational, the position of the quantifier here does not coincide with the surface position of the indefinite. Hence, it must be assumed that an indefinite may be interpreted by means of an existential quantifier that may be dislocated with respect to the indefinite's surface position. But if that much is assumed, the wide-scope reading (15c) and the other specific readings discussed above follow automatically, and no motivation for assuming a referential

reading in addition to the quantificational reading of indefinites seemed to remain. What did remain, of course, was the question of how to account for the fact that an indefinite can be so freely associated with different scope positions.

2.1 A brief note on ambiguity

Before we can turn to this question, there is a potentially confounding issue that needs to be addressed. We have so far assumed that the examples under discussion are truly ambiguous, not merely vague. This is an analytical assumption that is sometimes difficult to justify. Consider (16):

(16) Every girl saw some movie.
  a. $\forall x$ [girl(x) $\rightarrow$ $\exists y$ [movie(y) $\wedge$ saw(x,y)]]
  b. $\exists y$ [movie(y) $\wedge$ $\forall x$ [girl(x) $\rightarrow$ saw(x,y)]]

When we claim *some movie* in (16) can be specific or non-specific relative to *every girl*, we attribute to the sentence two different readings that can, for instance, be represented as in (16a) and (16b). However, as the two alleged readings are not logically independent, this might well be unnecessary. (16b) entails (16a), so that the situations in which (16b) comes out as true are just a subset of the situations in which (16a) is also true. We judge (16) true when some particular movie is seen by every girl, but to explain this we need not assume that (16) can *mean* that there is some movie that was seen by every girl, as (16b) states; if (16) just means (16a), we expect the same judgment.[7] We might conclude that (16) is ambiguous if we found we could confidently judge it *false* when every girl saw some movie, but a different one – that would indicate we had 'chosen' reading (16b). But readings that render a sentence false are usually, for pragmatic reasons, difficult to detect when a reading that renders it true, as (16a) would in this situation, is also available. For these reasons, it is wise to concentrate on examples where the two purported readings are logically independent, and one is not just a special case of the other:

(17) Every girl but one saw some movie.

We judge (17) true when every girl saw *Brazil*, but every girl but one saw *2001* – a narrow-scope construal of *some movie* does not allow that, but a wide-scope construal does. Below, we will be careful to point out the logical independence of the readings that we attribute to our examples.

3 The scope of indefinites and QR

Assume that the ambiguity of structures containing indefinite NPs reflects not some inherent binary ambiguity, but the different scope positions that may be taken by some (existential) quantifier involved in the interpretation of the indefinite,

as suggested by the multiple ambiguity of (15). Then what explains this variation in scope? An obvious answer, and one that will function as a straw-man theory from here on, is that the indefinite itself denotes an existential quantifier, and that the indefinite is subject to a general scope-shifting rule. Such rules have been proposed to be operative in semantics (e.g., Cooper's 1983 storage, which 'separates' a QNP's denotation from the denotation of the structure it is contained in, and then recombines the two; see Abusch 1994 for a similar approach geared specifically to indefinites) and in syntax as well – notably, Quantifier Raising (see chapter 53). The literature provides considerable evidence that this approach to specificity will not work. The present section reviews the evidence; we will concentrate mainly on the feasibility of explaining specificity as an effect of syntactic movement.

3.1 Island-escaping scope

Consider once more a simple example:

(18) Almost every girl saw a movie.
  a. $[_{IP}$ Almost every girl$_i$ $[_{IP}$ a movie$_j$ $[_{IP}$ t_i $[_{VP}$ saw $t_j]]]]$.
  b. $[_{IP}$ A movie$_j$ $[_{IP}$ almost every girl$_i$ $[_{IP}$ t_i $[_{VP}$ saw $t_j]]]]$.

Supposing that QR associates (18) with the two LFs (18a) and (18b) (and perhaps more), familiar techniques yield the wide-scope and narrow-scope (specific and non-specific) readings for *a movie*, in the same way they derive the ambiguity of (1a) when QR applies to *every movie*.

There exist, however, strong indications, put forward most forcefully by Fodor and Sag (1982), that treating indefinites on a par with other, especially universally quantified NPs in this manner is undesirable. Their scope properties are very different. First and foremost, while QR as it applies to such NPs as *every movie* is subject to a wide array of familiar constraints on movement, and may even be essentially clause-bounded, the scope of indefinites seems, at least superficially, to be insensitive to such constraints. Consider (19) (cf. Fodor and Sag 1982):

(19) a. If a relative of mine dies, I will inherit a fortune.
  b. IF a relative of mine dies THEN I will inherit a fortune.
  c. A relative of mine x [IF x dies THEN I will inherit a fortune].
  d. −(19b) ⇒ I have relatives.
  e. +(19c) ⇒ I have relatives.
  f. IF a relative of mine dies THEN I will inherit a fortune. (19b)
  John is a relative of mine.
  +_____
  IF John dies THEN I will inherit a fortune.
  g. A relative of mine x [IF x dies THEN I will inherit a fortune]. (19c)
  John is a relative of mine.
  −_____
  IF John dies THEN I will inherit a fortune.

Sentence (19a) is ambiguous between a narrow-scope and wide-scope reading for *a relative of mine*; the two readings are paraphrased schematically in (19b) and (19c). According to the first, I will inherit a fortune if any one of my relatives dies; according to the latter, I will become rich if one particular relative of mine dies. Neither supposed reading, furthermore, entails the other, so that no problems of the type described in section 2.1 arise. First, (19c) entails that I have at least one relative (see (19e)), whereas (19b) does not. So (19b) does not entail (19c), as it would then share all entailments of (19c). Second, in combination with the premise that John is a relative of mine, (19b) allows the conclusion that I will inherit if John dies (see (19f)). (19c) does not allow this reasoning; John may just not be the particular relative whose death will put me in clover. So (19c) does not entail (19b), or it would also allow the conclusion about John.

Since we judge the sentence true even if my indigent uncle John will not leave me a fortune, we need in particular to posit the wide-scope reading (19c); the narrow-scope reading (19b) is false in that situation. Under the QR hypothesis, obtaining the wide-scope reading involves extracting the indefinite from the *if*-clause:

(20) ??[A relative of mine$_i$ [[if t_i dies] [I will inherit a fortune]]].

However, this type of movement is generally disallowed as an Adjunct Condition violation; e.g., *wh*-expressions cannot be extracted from an *if*-clause (see chapter 64). And indeed, a universally quantified NP undergoing QR cannot escape this, or any other extraction island (see chapter 53):

(21) If every woman gave birth to John, then he has a nice mother.
  a. + IF every woman gave birth to John THEN he has a nice mother.
  b. – every woman x [IF x gave birth to John THEN he has a nice mother].

(21), adapted from Winter (1998), can only be understood in the pragmatically odd way paraphrased in (21a): if John has as many mothers as there are women, then he has a nice mother. This is the reading that corresponds to narrow scope of *every woman* inside the *if*-clause. Pragmatics thus pushes us toward a, much less odd, wide-scope reading (21b): whoever John's mother, she would be a nice mother. The fact that this reading is nevertheless unavailable shows very clearly that *every woman* cannot be QRed out of the extraction island. This observation constitutes a major obstacle to semantic treatments of quantifier scope such as Cooper storage; it is equally problematic for a QR treatment of the scope of the indefinite in (19).

Other Ross islands (Ross 1986; and see chapter 64) provide similar examples:

(22) a. Mary dates every man who has met a producer I know.
  b. $\forall x$ [[man(x) $\wedge$ $\exists y$ [producer_I_know(y) $\wedge$ x met y]] $\rightarrow$ Mary dates x].
  c. $\exists y$ [producer_I_know(y) $\wedge$ $\forall x$ [[man(x) $\wedge$ x met y] $\rightarrow$ Mary dates x]].
  d. – (22b) $\Rightarrow$ I know a producer.
  e. + (22c) $\Rightarrow$ I know a producer.

f. (22b)
John is a producer I know.
+_____
Mary dates every man who has met John.
g. (22c)
John is a producer I know.
–_____
Mary dates every man who has met John.

(22) is ambiguous between a narrow- and wide-scope reading for *a producer I know*, shown in (22b) and (22c). As before, neither reading entails the other.[8] (22d) and (22e) show that the narrow-scope reading does not entail the wide-scope reading, and, more significantly, (22f) and (22g) show that the wide-scope reading is not a special case of the narrow-scope reading. We can judge (22) true even if John is a producer I know, but Mary does not date every man who knows John. Hence, the wide-scope reading is well-motivated; but deriving it through QR would involve a Complex Noun Phrase Constraint (CNPC) violation. Compare (23):

(23) Mary dates a man who has met every producer I know.

(23) is not ambiguous, and only allows narrow scope for *every producer I know*, as we expect from the syntactic movement properties of QR.

These examples provide similar evidence from other extraction islands:

(24) a. Mary denied that *a theory of mine* was correct.
b. Mary denied that *every theory of mine* was correct.

(25) a. Almost every expert admired John's picture of *a statue in Washington*.
b. Someone admired John's picture of *every statue in Washington*.

(26) a. Almost every expert admired *an article of mine* and nominated me for a Pulitzer.
b. Some expert admired *every article of mine* and nominated me for a Pulitzer.

In each of the (a)-cases, the indefinite can take wide scope even though it occupies a position from which overt movement, as well as QR in the (b)-cases, is disallowed. Movement in (24) would cross a non-bridge verb (see chapters 10 and 64); in (25) it would violate the Specificity Condition (see Davies and Dubinsky 2003 for recent discussion and references); in (26) it would violate the Coordinate Structure Constraint (see, e.g., Fox 1999 and references cited there).

In conclusion, it seems unlikely that the same rule can be held responsible for the scope options of both indefinites and other types of quantificational NPs. Furthermore, any syntactic movement rule seems an inappropriate device for describing the scope of indefinites, as one would need to exempt such a rule from

all normal constraints on movement. On the other hand, semantic devices for lifting an indefinite NP denotation out of its context would need to be prevented from applying to other quantificational NPs as well.

Nonetheless, let us continue to assume that indefinite NPs unambiguously denote (existential) quantifiers, and let us now assume also, for the sake of argument, that for the purpose of scope assignment they can be dislocated from their observable position by some unrestricted mechanism which is somehow insensitive to the usual scope and movement islands – say, 'island-free QR'. This describes the observations in the present section. The following section presents arguments to the effect that these, already highly questionable, assumptions are still not sufficient to describe all scope properties of specific indefinites.

3.2 Against 'island-free QR'

This section takes as its point of departure a straw-man 'island-free QR' theory of specificity: indefinite NPs unambiguously denote quantifiers, which may be assigned wide scope regardless of the usual island constraints on movement and scope taking. Several types of observations argue against this approach: it both overgenerates and undergenerates readings. Fodor and Sag (1982) pointed out that on the island-free QR approach, one expects indefinites to be able to scope out of islands without necessarily having the widest scope in the structure; they claimed this is not the case (section 3.2.1). Fodor and Sag argued further that if indefinites are always quantifiers, they disregard not only island conditions, but also conditions on free variables in VP-deletion contexts (section 3.2.2). Ruys (1992) pointed out that if indefinites freely take wide scope, one naturally expects plural indefinites to freely take wide, distributive scope as well; he claimed this is not the case (section 3.2.3).

3.2.1 Intermediate readings

Having established the point made above in section 3.1, Fodor and Sag (1982) presented an empirical argument against an 'island-free QR' hypothesis. Consider (27):

(27) Every professor overheard [$_{NP}$ the rumor [$_{CP}$ that a student of mine had been called before the dean]].
   a. \+ Every professor x [x overheard the rumor [that a student of mine y [y had been called before the dean]]].
   b. – Every professor x [a student of mine y [x overheard the rumor that [y had been called before the dean]]].
   c. \+ A student of mine y [every professor x [x overheard the rumor that [y had been called before the dean]]].

The indefinite *a student of mine* is embedded in an extraction island (the complex NP *the rumor that . . .*); this NP itself is c-commanded by yet a higher quantifier, the matrix subject *every professor*. If the scope of indefinites were indeed

unbounded, one would expect *a student of mine* to be able to remain within the complex NP that contains it in overt syntax (as in 27a), or to leave the complex NP and land below the matrix subject (27b), or to take widest scope (27c). Fodor and Sag claimed that just the (b)-reading is unavailable. The unavailability of such 'intermediate island-escaping readings' for specific indefinites seems virtually impossible to describe with any 'free-scope' mechanism: if the indefinite is able to move all the way up to a position outside the scope of the matrix subject, then surely it should be able to move less far, and land outside the complex NP but below the matrix subject. Therefore, Fodor and Sag returned to the hypothesis, rejected by Fodor (1970) and others, that specificity is due to a binary ambiguity in the indefinite NP itself. An indefinite can be a quantifier, in which case it may undergo local QR but not leave an island: (27a). Or it can be a referential expression, in which case it is insensitive to all scope effects and yields a reading nearly equivalent to (27c).[9] (27b) is not derived: in order to derive the intermediate island-escaping reading, the indefinite would have to be neither referential (or the student could not vary with every professor), nor a regular quantificational NP subject to conditions on movement.[10]

Fodor and Sag's elegant demonstration has been the subject of considerable debate in the literature. Many counter-examples to the supposed impossibility of island-escaping intermediate readings have been put forward; we will turn to these in section 4.

3.2.2 *VP ellipsis*

Fodor and Sag (1982) presented one more imaginative argument in favor of a binary, quantificational/referential ambiguity in indefinites, based on a generalization from Sag (1980) and Williams (1977) concerning VP-deletion examples such as the following ((28a) from Fodor and Sag, (28b) from May 1985, (28c) from Fiengo and May 1994):

(28) a. Someone [$_{VP1}$ loves *everyone*]. Chris knows that someone does [$_{VP2}$ e].
b. Some student [$_{VP1}$ admires *every professor*], but John doesn't [$_{VP2}$ e].
c. Some student [$_{VP1}$ hit *everyone*], and Max did [$_{VP2}$ e], too.

The observation is that the italicized direct object may not scope over the subject in this context, in which VP1 functions as antecedent for the elided VP2. The Sag/Williams generalization was (roughly) that a VP containing a free variable may not function as antecedent for an elided VP.[11] This explains the observation: for the italicized NP to scope over the subject, it must move out of VP1, thereafter binding a variable in VP1; VP1 then contains a variable that is free in VP1; hence VP1 can no longer function as antecedent for VP2.

Now consider (29) ((29b) is from Fox 1995b):

(29) a. Sandy thinks that every student in our class [$_{VP1}$ plays chess better than *a guy I beat this morning*]. Chris thinks that every student does [$_{VP2}$ e] too.
b. Exactly half the boys [$_{VP1}$ admire *a certain professor*], and Mary does [$_{VP2}$ e] too.

(30) A certain professor x [exactly half the boys [$_{VP1}$ admire x]], and a certain professor x [Mary does [$_{VP2}$ admire x]] too.

In (29), the italicized indefinite in VP1 may be interpreted outside the scope of the quantificational subject. For instance, (29b) may involve one particular professor whom exactly half the boys admire. This cannot be due to a quantificational reading of the indefinite, as that would involve a variable free in the antecedent VP1 – this is illustrated for (29b) in (30).[12] Hence, indefinites must possess some other means of creating the impression of a wide-scope construal. This is the referential reading of indefinites.

Fodor and Sag's assumptions do allow for a potential escape from this conclusion, but its correctness depends on subtle and undecided intuitions. The Sag/Williams generalization comes with an exception clause: a VP containing a free variable may antecede an elided VP, provided that the same quantifier instance binds both variables. This is exemplified in (31) (Williams 1977: (85)):

(31) a. John saw everyone before Mary did [$_{VP}$ e].
b. Everyone x [John [$_{VP1}$ saw x] before Mary [$_{VP2}$ saw x]].

One of the readings of (31a) is given in (31b): here each of the antecedent and elided VPs contains a free variable, but both variables are bound (outside VP) by the same instance of *everyone*. Given this option, the indefinite in (29) might be interpreted through wide-scope quantification, provided that the quantifier takes scope over both conjuncts, and binds two variables Across-the-Board, as illustrated in (32) for (29b):

(32) A certain professor x [[exactly half the boys [$_{VP1}$ admire x]], and [Mary does [$_{VP2}$ admire x] too]].

However, unlike the proscribed structure (30), the ATB structure (32) is associated with a maximal-scope reading by which the *same* professor is admired by exactly half the boys and by Mary. Fox (1995b: fn. 44) reports that speakers' intuitions are unclear on whether this is indeed the only available reading. It is not clear to me from their discussion which of the two wide-scope readings Fodor and Sag perceived to be available; but their treatment of indefinites is such that the two instances of the indefinite may have different referents, suggesting that they would not be satisfied with a restriction to (32).[13] It is possible also that Fodor and Sag did not envisage the option that a quantifier might take cross-sentential scope, as an ATB analysis of their example, (29a) above, would require. Under DRT and related dynamic approaches to semantics, however, the option of cross-sentential quantification cannot be ruled out. So, a quantificational approach to the wide scope of indefinites is still conceivable; but the cross-sentential case (29a) does rule out a description in terms of syntactic movement.[14]

Quite apart from the possible ATB analysis of (29), the Sag/Williams generalization that Fodor and Sag rely on has itself not remained unchallenged. Hirschbühler (1982) presented examples such as (33) that contradict it ((33b) and (33c) from Fox 1995b; (33d) from Fiengo and May 1994):

(33) a. A Canadian flag was [$_{VP1}$ hanging in front of *each window*], and an American one was [$_{VP2}$ e] too.
b. One guard is [$_{VP1}$ standing in front of *every building*], and one policeman is [$_{VP2}$ e] too.
c. Some boy [$_{VP1}$ admires *every teacher*] and some girl does [$_{VP2}$ e] too.
d. Some student [$_{VP1}$ hit *everyone*], and some professor did [$_{VP2}$ e], too.

Further counter-examples are due to Lappin (1992, 1993) ((34a) cited from Fox 1995b; (34b) cited from Fiengo and May 1994):

(34) a. At least one MP [$_{VP1}$ attended *every committee meeting*], and Bill did [$_{VP2}$ e], too.
b. A guide [$_{VP1}$ accompanies *every tour of the Eiffel Tower*], and Jeanne does [$_{VP2}$ e], too.

In each of these examples, the italicized NP may take wide scope. Furthermore, the examples in (35) are incompatible with an Across-the-Board analysis as considered in (32) ((35a) from Hirschbühler; (35b) from Fiengo and May; (35c) from Fox):

(35) a. A Canadian flag was [$_{VP1}$ hanging in front of *most windows*], and an American one was [$_{VP2}$ e] too.
b. A Canadian flag was [$_{VP1}$ hanging in front of *many windows*], and an American flag was [$_{VP2}$ e], too.
c. A guard is [$_{VP1}$ standing in front of *many buildings*], and a policeman is [$_{VP2}$ e] too.

For instance, no building needs to have both a guard and a policeman standing in front of it for the wide-scope reading of (35c) to be true. So the Williams/Sag generalization requires modification. Fox (1995b) suggests that the correct generalization is this: the inverted scope order is allowed in the antecedent structure just in case inverting the order in the elided structure will also have some semantic effect; if not, economy forbids QR in the elided structure, and then the parallelism requirement on deletion forbids QR in the antecedent structure as well. QR is disallowed in, say, (28b) because whether *every professor* takes wide or narrow scope relative to *John* makes no semantic difference. In (33) and (35) the right-hand conjunct has a quantified subject; crossing it will have a semantic effect, hence we obtain a wide-scope reading for the objects in the both conjuncts. If this is the correct generalization,[15] then the specific reading of *a certain professor* in (29b) still argues against a QR explanation of specificity. But if we manage to derive a quantificational wide-scope interpretation for the indefinite by some mechanism, other than QR, that is insensitive to this type of economy, then economy is not violated here and we may still avoid a referential/quantificational ambiguity. See the references cited above for further discussion.

3.2.3 Distribution and scope

So far, we have considered only singular number indefinites. When we take plural indefinites into account, an additional problem arises for an 'island-free QR' approach to specific indefinites, as pointed out in Ruys (1992). Consider first (36):

(36) a. Three relatives of mine wore a tie.
b. $\lambda P\ [|\mathbf{relative_of_mine'} \cap P| \geq 3]\ (\lambda x_i\ \exists y[\mathbf{tie'}(y) \wedge \mathbf{wear'}(y)(x_i)])$

The natural interpretation of (36a) is a 'distributive' (as oppposed to 'collective') one: my three relatives did not together wear one and the same tie, but each his own. How this distributive reading for *three relatives of mine* is achieved depends, among other things, on the semantic treatment of plurals. We obtain the distributive effect for free with the simplest Generalized Quantifier (GQ) interpretation of the subject, as in (36b).[16] Alternatively, if the subject basically denotes a plural individual (see, e.g., Link 1983), a distributivity operator needs to be applied in order to obtain this reading.[17] In any case, whatever the analysis, we observe that *three relatives of mine* must be granted a distributive interpretation.

Keeping this simple observation in mind, consider (37):[18]

(37) a. If three relatives of mine die, I will inherit a house.
b. [three relatives of mine_i [[if t_i die] I will inherit a house]].
c. $\lambda P\ [|\mathbf{relative_of_mine'} \cap P| \geq 3]\ (\lambda x_i$ [IF x_i dies THEN I will inherit a house]).
d. $\exists X\ [X \subseteq \mathbf{relative_of_mine'} \wedge |X| = 3 \wedge$ [IF X die THEN I will inherit a house]].

Suppose, as before, that NPs such as *three relatives of mine* may undergo island-free QR. Then we derive the LF (37b), and we expect the interpretation represented in (37c). That is, we expect *three relatives of mine* to allow a distributive reading with scope over the *if*-clause, which says that there are three relatives of mine such that, if *any one* of them dies, I inherit a house. But this reading is not available. That is not to say that plural NPs such as *three relatives* cannot be specific. There is a reading on which *three relatives of mine* escapes the *if*-clause, but only the one roughly stated in (37d): there are three relatives of mine, such that if they *all* die, I inherit a house. In other words, while existential quantification over (sets of) relatives of mine can take scope outside the extraction island (so that we find the entailment properties illustrated for (19c) above), the distributivity that the NP normally allows cannot scope over the island.[19]

Consider some examples from Winter (1998) that illustrate this further:

(38) a. #Every artist who was born in *three cities* became famous.
b. #If *three women* gave birth to John then he has a nice mother.

To begin with, (38a) has an odd narrow-scope reading for *three cities*, which attributes fame to every artist with a triple birthplace. The sentence also has the (equally odd) specific reading that there is a set of three cities, such that every artist born in all three of them became famous. The wide-scope distributive reading (there are three cities x, such that every artist born in x became famous) would not share this oddity; hence we would expect it to be highly prominent if it were available. As we find (38a) to be odd, the wide-scope distributive reading must be impossible; similar observations apply to (38b). (39) provides further evidence ((39a) from Ruys 1992):

(39) a. John overheard the rumor that some friends of mine had been called before the dean.
b. I met a man who wore three neckties with red polka dots.
c. Exactly one house that some friends of mine built made it through the quake (so their business has lost its credibility).

(39a) allows an island-escaping specific reading for the plural indefinite, but it is necessarily about one single rumor. (39b) is not ambiguous (the wide-scope non-distributive reading and the narrow-scope reading happen to be equivalent here) and entails the existence of a man wearing three neckties – if the indefinite could both take wide scope (as we know it can) *and* distribute, the sentence should allow for different men wearing each of those ties.[20]

It follows from these observations that positing a simple-minded 'island-free QR' predicts readings that are in fact not available. If a plural indefinite can be lifted out of an island, as illustrated in LF (37b), then how do we prevent the interpretation (37c), assuming that the NP denotes a simple GQ? And if we take the more sophisticated view that indefinites start out with a collective interpretation, then how do we prevent the usual mechanisms for deriving distributivity from applying once the NP is outside the island?

One option that springs to mind is that, perhaps, 'island-free QR' may apply only to collectively interpreted NPs to begin with – but this maneuver is easily blocked:[21]

(40) If three workers on our staff have a baby soon, we will have to face some hard organizational problems.
a. $\exists X\,[X \subseteq \textbf{workers'} \wedge |X| = 3 \wedge$ [IF $\forall x \in X$ (x has a baby) THEN we face problems]].
b. $\exists X\,[X \subseteq \textbf{workers'} \wedge |X| = 3 \wedge \forall x \in X$ [IF (x has a baby) THEN we face problems]].

(40) allows a specific reading for *three workers on our staff* (without distribution over the *if*-clause), but on this reading each worker may still have her own baby. Schematically: although (40b) is not allowed (wide-scope existential, wide-scope distribution), (40a) is (wide-scope existential, narrow-scope distribution). There is distributivity associated with specific NPs, but it is island-restricted.

So far, we have looked at plural specific NPs in islands, and observed that they may not scope and distribute over those islands. We conclude that an 'island-free QR' analysis of specificity faces severe problems. But a similar point can be made on the basis of much simpler examples (Ruys 1992). If it were really the case that indefinite NPs undergo QR so easily, and with such greater freedom than other quantifiers do as the initial specificity data seem to suggest, then we certainly expect them to take wide scope with supreme ease when *no* islands intervene. And indeed, an indefinite in object position, as in (18), effortlessly escapes the scope of a quantifier in subject position. But when the specific object-NP is plural, we find that it allows a distributive reading with wide scope *over* the subject only with great difficulty, if at all. Consider (41):

(41) Two boys read three books.
   a. [three books$_i$ [two boys read t$_i$]].
   b. λP [$|$**books'** ∩ P$|$ ≥ 3] (λx$_i$ [two boys read x$_i$]).

Given the supposed exceptional wide-scope propensity of indefinites, we would expect LF (41a) with the interpretation (41b) to be most readily available. This is not the case. The boys may not vary with the books: for (41) to be judged true it is not sufficient that each of three books was read by a different set of two boys, or it is only marginally so. Evidence has been available since at least the mid-1970s, and consensus growing since the early 1990s, that weak plural NPs take inverse wide scope in this sense much less easily than strong quantificational NPs such as *every friend of mine* (cf. Ioup 1975b; Verkuyl 1988;[22] Liu 1990; Ruys 1992, 1997; Beghelli 1993, 1995; Kamp and Reyle 1993; and references cited there). Consider also a structure of inverse linking, in which strong quantifiers preferably take inverse scope (May 1977):

(42) a. Een paar mensen in iedere stad hadden de luchtballon gezien.
   a few people in every city had the hot-air balloon seen
   b. Een paar mensen in drie steden hadden de luchtballon gezien.
   a few people in three cities had the hot-air balloon seen
   c. Two pictures of every senator were on sale at the gift shop.
   d. Two pictures of three senators were on sale at the gift shop.

In Dutch, (42b), unlike (42a), is interpreted as making a statement about a few people each of whom were in three cities. Similarly, (42d) is about two 'three-senator pictures', not (or only marginally) about three times two 'single-senator pictures', in contrast with (42c), which easily allows wide scope for *every senator*. Consider finally (43):

(43) a. Everyone believed that three friends of mine had been called before the dean.
   b. A professor believed that three friends of mine had been called before the dean.

c. Three friends of mine$_i$ [a professor believed that t_i had been called before the dean].

If the wide-scope, specific reading of *three friends of mine* relative to *believed* and *everyone* in (43a) were due to non-clause-bounded QR, we would equally expect (43b) to have the LF (43c). But the evidence is against this, as *three friends of mine* cannot take wide distributive scope over *a professor*.

We seem to be faced with a contradiction. When we look at one set of data, such as presented in section 3.1, which show island-escaping specificity, we want to allow indefinites unlimited, 'island-free' QR. But to explain the absence of wide-scope distributive readings for indefinites outside islands, and even locally, we want to prevent indefinites from undergoing QR altogether. There are several ways of resolving the contradiction.

One option is to give up the assumption that specificity is due to wide-scope quantification, and to follow Fodor and Sag (1982) in returning to a referential/quantificational ambiguity in indefinites. Apparent wide scope is then due to the referentiality option, and we can, without contradiction, attempt to explain the limited distributive scope of indefinites in terms of limited QR. This option is discussed in section 4.

Another option is to describe the interpretation of indefinite NPs in terms of one mechanism for existential quantification over plural or singular individuals, and a separate mechanism for distributivity. We must then ensure that existential quantification can take unlimited scope, while the domain of application of the distributivity operator is kept very local. If we pursue this option, an approach that manages to assign an indefinite its wide existential scope without displacing the indefinite itself is preferred, as the in-situ distributive properties of the indefinite are then likely to follow automatically. We will discuss such an approach in section 5. In contrast, an approach that does, through syntactic movement or some other means, displace the indefinite in order to derive its existential scope must define and motivate some way of separating the distributive mechanism from the indefinite and ensure that *it* does not acquire unbounded scope. To appreciate some of the difficulties such an approach would have to overcome, note that it must, all the same, allow distributive readings for plural weak NPs that are displaced in overt syntax through A-movement or A-bar-movement, as in (44) and (45a), and even wide-scope distributive readings in certain examples that appear to be due to QR, as in (45b) (from Reinhart 1997):

(44) a. Fifty US senators appear to at least one supreme court judge to have violated the constitution.
b. Three languages are spoken by over a billion people.

(45) a. Which men did some woman love?
b. A guard is standing in front of two buildings.

For instance, (44b), where *three languages* c-commands *over a billion people* only after A-movement, allows wide distributive scope for *three languages*: it is true if

each of three languages is spoken by a different set of over a billion people. (45a) can be answered by providing a set of men each of whom was loved by a different woman.

We want to mention briefly another popular account of structures containing specific indefinites (as in (18), (41), etc.) which avoids island-free QR and diagnoses them as instances of branching quantification (see, e.g., Liu 1990; Ruys 1992), as illustrated for (41) in (46):

(46) Two boys read three books.

a. three books y — x read y
two boys x —

The usual interpretation for branching quantification structures such as (46a) is that the value for a quantifier on one branch does not vary with the value for quantifiers on other branches.[23] So, *three books* in (46a) is not in the scope of *two boys* (wide 'existential' scope for *three books*), but neither is *two boys* in the scope of *three books* (no 'distributive' wide scope for *three books*) – this seems to be exactly what we need.[24] The crucial problem, of course, is how to (compositionally) derive (a denotation equivalent to) (46a) given the syntactic structure of the sentence. Another problem is that a quantifier on one branch cannot bind a variable in the restrictive clause of a quantifier on another branch, which is what we would need if we wanted to use a branching quantification structure to represent the specific reading of a quantifier A relative to B when A is contained in B. So the representational mechanism does not work in cases such as (42b) and (42d) ('inverse linking'), or for island-escaping examples such as (19) and (20).

A syntactic description of specificity might, however, build on the 'branching quantification' insight by attempting to encode 'branching' relations among quantifiers in syntactic representations. Now, the desired type of 'upward branching' cannot be directly encoded in tree structures (in any sensible syntactic representation of (46), either *two boys* c-commands *three books* or vice versa). So to implement this idea, syntactic representations must be enriched with a diacritic mechanism with which the relative scopal dependence or independence of any two quantifiers (or other scoped expressions) can be encoded.[25] This is not an attractive prospect, unless considerable independent evidence for such a diacritic mechanism can be adduced. Furthermore, the problem of compositional interpretation of such 'scope-marked' syntactic representations is not at all straightforward.

In conclusion, an analysis that assigns wide scope to indefinites by raising them to a scope position across an unlimited distance (be it a syntactic 'island-free QR' or an unrestricted semantic storage mechanism) is not the optimal description (let alone explanation) of specificity effects. Such an analysis is likely to predict unattested wide-scope distributive readings for indefinites, unless special precautions are taken to prevent this. An analysis that does not predict such distributive readings is to be preferred.[26]

3.3 ACD and specificity

We might look for syntactic clues to determine whether the island-escaping scope of indefinites is due to syntactic movement, but we don't expect to find much evidence either way. QR does not, for instance, appear to feed Binding Theory in general (see chapter 54). One small piece of evidence, however, comes from Antecedent Contained Deletion. If ACD resolution is generally due to QR (see, e.g., May 1985; Fox 1995a; Kennedy 1997a), then a syntactic 'island-free QR' hypothesis would lead us to expect wide-scope indefinites to license unlimited ACD.[27] We cannot look directly at island-escaping specificity, though:

(47) a. Mary [$_{VP1}$ dates every man who knows a producer OP Sue does [$_{VP2}$ e]].
b. [$_{IP}$ [$_{NP}$ a producer OP Sue does [$_{VP2}$ e]]$_i$ [$_{IP}$ Mary [$_{VP1}$ dates every man who knows t_i]]].
c. *[$_{IP}$ [$_{NP}$ a producer OP$_j$ Sue does [$_{VP2'}$ date every man who knows t_j]]$_i$ [$_{IP}$ Mary [$_{VP1}$ dates every man who knows t_i]]].
d. *There is a producer x such that Sue dates every man who knows x, and such that Mary dates every man who knows x.

(47a) does not allow VP1 to antecede the empty VP2: the reading given in (47c), paraphrased in (47d), is not available. But this does not in itself entail that LF (47b) is not derived. If it were, matrix ACD resolution should still be out because the relation between the relative pronoun OP and the trace inside the copied VP, VP2', violates the CNPC in (47c). Consider, however, (48), from Kennedy (1997a):

(48) John [$_{VP1}$ believed that Bill [$_{VP2}$ had seen a certain film that I did [$_{VP3}$ e]]].

(48), according to Kennedy, has a *de re* reading with *a certain film that I did* specific relative to *believed*, but even on this matrix-scope reading, only VP2 may antecede the empty VP. Wide-scope specific readings apparently do not feed ACD resolution. This accords with our observation in section 3.2.3 that if indefinites undergo QR, QR must be (very) local.

3.4 Conclusions

In this section, we have investigated the option of analyzing the specific/non-specific ambiguity as a scope ambiguity. Several conclusions may be drawn from this section. First, if the scope of indefinites is to be determined in syntax, it cannot be through a rule of movement; that hypothetical rule would exhibit such extraordinary properties as to render its characterization as a syntactic movement rule vacuous. As a corollary, nothing can be learned about QR by observing the scope of singular indefinite NPs, as in *everyone loves someone*. Second, if specificity is a scope phenomenon, and not due to a referential reading on indefinites, then the mechanism responsible for the scope of indefinites cannot

be just the same one that also assigns scope to other quantificational NPs. QR is not a viable option; neither is a semantic storage mechanism that applies to all quantifier types. Third, if specificity is due to scope, not referentiality, then the mechanism that determines the scope of indefinites, be it syntactic or semantic, must distinguish two scope properties: free existential scope and scopally restricted distribution. This is likely to be easier when the indefinite itself is not displaced. Again, QR is not indicated, and neither is semantic storage. In section 5, we discuss one theory on the scope of indefinites that satisfies these requirements.

Several other issues have arisen that require further discussion. As we observe that not only singular indefinites but also plurals allow specific readings, we want to delineate the exact class of NPs that come with this property. Until we turn to that task in section 7, we will simply speak of 'indefinite NPs' as the relevant class. More urgently, we want to ascertain whether Fodor and Sag's 'intermediate reading' argument indeed provides conclusive evidence for a binary ambiguity in the indefinite, and against the scope ambiguity approach. This is the subject of the next section.

4 Intermediate readings

In section 3.2.1 above we outlined Fodor and Sag's (1982) claim that a specific indefinite cannot take island-escaping intermediate existential scope: *a student of mine* cannot scope above *the rumor* but below *every professor* in (27). If true, this implies that an indefinite does itself not denote an (existential) quantifier that is somehow interpreted at an arbitrary distance from its surface position. We subscribe to this conclusion. But there is a stronger implication. Specificity cannot involve quantification at all, unless one can define some quantificational mechanism that can take island-escaping maximal scope, but not island-escaping non-maximal scope. As they see no non-stipulative way of accomplishing this, Fodor and Sag return to the binary ambiguity position: indefinites are interpreted either through local quantification, or as referential expressions. Must we adopt this conclusion as well? This section outlines the case against it.

The weak point in Fodor and Sag's claim is that it involves subtle intuitions on complex examples containing at least three scope elements: the indefinite; the scope island from which it escapes; and the higher scoped expression below which the indefinite may or may not remain. Even before Fodor and Sag's paper had appeared in *Linguistics and Philosophy* in 1982, counter-examples to their generalization had been presented. The following is from Farkas (1981):

(49) Each student has to come up with [$_{NP}$ three arguments which show that *some condition proposed by Chomsky* is wrong].

It is fairly easy to obtain an intermediate scope reading for the italicized NP, saying that each student has some (different) condition assigned to her, and must

come up with three arguments regarding that particular condition. Unfortunately, as pointed out by Reinhart (1997), the wide-scope reading of the italicized NP relative to the complex NP entails the narrow-scope reading, so that we may just be considering a special case of the narrow-scope reading here, not a separate reading (cf. section 2.1).[28] But this is easily fixed:

(50) Each student has to come up with [$_{NP}$ exactly three arguments which show that *some condition proposed by Chomsky* is wrong].
   a. Each student x [some Chomsky-condition y [x has to come up with exactly three arguments which show that y is wrong]].

There is a fairly strong intuition that (50) has the reading schematized in (50a). If so, this is a reading that cannot be attributed to QR, for reasons outlined in the previous section, or to a referential reading of the indefinite, as the choice of problem varies with each student. It now appears that intermediate island-escaping readings *are* possible, so that Fodor and Sag's argument collapses.

Many other authors have taken up Fodor and Sag's challenge and constructed examples which display intermediate readings; see, e.g., Partee and Rooth (1983), King (1988), Ludlow and Neale (1991), Ruys (1992), Abusch (1994), and Reinhart (1997) for elaborate discussion of Fodor and Sag. We shall not go into all the details or discuss all the examples. We will present a few representative cases and consider ways of making the relevant intuitions more secure. Below are some more simple cases, from Abusch (1994) and Reinhart (1997):

(51) a. Every gambler will be surprised if one horse wins.
   b. Most linguists have looked at every analysis that solves some problem.

In both cases, the narrow-scope reading runs counter to our knowledge of the world; in (51b), the maximal-scope reading does so as well. This favors the intermediate-scope reading, which is felt to be available.

Ruys (1992) investigates several ways of rendering intermediate readings more easily detectable by suppressing the other two readings. The wide-scope reading can be eliminated by placing a pronoun bound by the higher quantifier inside the indefinite ((52b) is from Abusch):

(52) a. Every professor$_i$ will rejoice if *a student of his*$_i$ cheats on the exam.
   b. Every professor$_i$ rewarded every student who read *a book he*$_i$ *had recommended*.

In these examples, only two potential scope positions for the indefinite are left (given that we choose a bound reading for the pronoun) – the intermediate reading thereby becomes more prominent. Combining this with a mechanism that strengthens the specific reading (although such mechanisms are hard to find and ill-understood, as we will see later (section 7)), we obtain examples where the intermediate reading is strongly favored:

(53) a. Every professor$_i$ will rejoice if *a certain student of his*$_i$ cheats on the exam.
b. Every professor$_i$ rewarded every student who read *a particular book he*$_i$ *had recommended*.

Another method for isolating intermediate readings employed in Ruys (1992) requires some introduction. Recall from section 2 Karttunen's (1968) observation that an indefinite structurally embedded below a scope-taking expression may nonetheless introduce a discourse referent if it is interpreted specifically. Island-escaping specificity licenses discourse anaphora as well:

(54) a. If *a relative of mine* dies, I will inherit a fortune. *He* got lucky on the derivatives market.
b. Mary dates every man who has met *a producer I know*. She wants to talk about *him* all the time.

We may use this property to influence the scope of an indefinite, provided that we control for two exceptions to Karttunen's generalization. First, a *plural* pronoun may be used to pick up the collection of all verifying values for an indefinite in the scope of a quantifier: in (55a), *they* may be taken to refer to all the girls the boys brought to the party.[29] Second, when the pronoun is in the scope of a quantifier as well, it may have a functional reading relating it to the indefinite narrow-scope antecedent (cf. note 2); see (55b). (For work on such issues see Kamp and Reyle 1993, Chierchia 1995a, and references cited there; see also chapter 9.)

(55) a. Every boy brought *a girl* to the party. But *they*/**she* got bored quickly.
b. Every boy brought *a girl* to the party. And every boy took *her* home as well.

Given this background, we can use donkey anaphora structures to elicit wide-scope readings. The principle is illustrated in (56):

(56) a. He often reads a book about linguistics.
b. [Anyone who often reads *a book about linguistics*] understands *it* well.
c. [Anyone who often reads *a book about linguistics*] understands *them* well.
d. [Anyone who often reads *a book about linguistics*] usually understands *it* well.

The ambiguity of (56a) shows that in structures such as this, the indefinite *a book about linguistics* may take wide or narrow scope relative to the adverbial *often*. Next, when we embed the structure in such a way that the indefinite becomes the antecedent for a donkey anaphor, we observe the same effects that occur with discourse anaphora, only one 'scope level' down. A singular indefinite may antecede a singular donkey anaphor provided that the indefinite is not scopally

embedded, except of course relative to the universal quantifier which also takes scope over the pronoun. In other words, the indefinite must occur in the immediate scope of the 'unselective binder' *anyone*.[30] Thus, there is only a wide-scope reading relative to the adverbial for the indefinite in (56b). If we want to achieve narrow scope for the indefinite, we must either use a plural pronoun, as in (56c), cf. (55a), or use a similar adverbial to take scope over the pronoun, as in (56d), cf. (55b).

By placing the donkey antecedent in a scope island, we can now force an island-escaping intermediate-scope reading:

(57) a. Every critic who reviews each and every book that *some author* writes quickly grows sick of *him*.
b. Every country whose security is threatened if *a building* is attacked by terrorists protects *it* well.
c. Whenever Beatrix overhears the rumor that *some politician* is corrupt, *the poor slob* loses his job.

We observe that the pronouns in (57) can function as donkey anaphors, with their antecedents taking intermediate island-escaping scope. In (57a), for instance, *some author* cannot be referential, since it is in the scope of *every,* but it must scope outside the embedded complex NP or it could not antecede a singular donkey pronoun. (57c) is interesting in that it allows an intermediate reading even though its structure mirrors that of Fodor and Sag's example (27). See Ruys (1992: 213ff.) for examples with other island and donkey anaphora types; see also Abusch (1994: 93).

There may be yet another, more theory-internal argument for the existence of intermediate island-escaping specificity. Recall from section 3.2.3 that the mechanism responsible for specificity does not yield distributive wide-scope readings. Consequently, distributive wide scope must be the effect of some other scope mechanism, e.g., (island-bound) QR. We found that in most structures, including simple SVO configurations such as (46), plural indefinites take distributive inverse wide scope with great difficulty, if at all. That would entail that (almost) any structure is a QR-island for indefinites; in particular, one might suppose that such NPs are never subject to QR. If so, any scope position that does not match the indefinite's syntactic surface position is 'island-escaping' and must be due to the specificity mechanism. And any such scope taking would falsify Fodor and Sag's claim if it were non-maximal. Consider (58) (cf. Ruys 1992):

(58) a. Elke professor vindt dat iedere student *een bepaalde theorie* moet aanhangen.
'Every professor believes that every student should support a certain theory.'
b. It seems that every senator will accept *a proposal endorsed by Ronald Reagan*.
c. When every professor really likes *a student*, she is usually a genius.

Dutch (58a) supports a reading paraphrasable as 'for every professor there is a theory he believes every student should support'. This reading cannot be due to QR, since a plural indefinite in the position of *een bepaalde theorie* could not even distribute over an indefinite in the position of *iedere student*, let alone take matrix scope. But if it is a case of specificity, specificity cannot be due to referentiality. Similarly, the indefinite in (58b) can be specific relative to *every senator* but in the scope of *seems* at the same time; (58c) is an example of this type in a donkey anaphora context, as above. If this line of reasoning is valid, we could conceivably even recycle one of the original arguments against a binary, referential/quantificational ambiguity of indefinites, namely the intermediate reading in examples such as (15).

When we accept the findings reported in this section, Fodor and Sag's main argument for a binary referential/quantificational ambiguity in indefinites no longer holds. Instead, we have again a version of the argument *against* such a binary ambiguity, such as resulted from the work of Fodor (1970) and others, as discussed in section 2. Since intermediate-scope readings sometimes arise, as in (15), we need to assume a quantificational mechanism whose scope need not reflect the surface position of the indefinite. Since intermediate island-escaping scope readings sometimes obtain, as we now find, we need to assume that this quantificational mechanism is insensitive to scope islands. Hence, there is no need to assume a referential interpretation of indefinites as well, since the 'maximal-scope' readings that would result from that also follow from the required quantificational mechanism. The next section describes one quantificational mechanism that serves our purposes.

5 One solution: choice functions

We find ourselves with the following desiderata for a theory of specificity. It must specify a quantificational mechanism that is involved in the interpretation of indefinites, which can take any scope without being sensitive to scope islands, and which allows no distributive specific readings. Several quantificational mechanisms for indefinites have been proposed that meet these requirements to some degree (see, e.g., Ruys 1992; Abusch 1994; Farkas 1997; Kratzer 1998). It would not serve the purposes of our discussion to consider them all and compare their relative merits; empirical differences falling within the purview of this chapter are slight and not always essential. We will outline one treatment of the scope of indefinites, which was proposed by Tanya Reinhart in (1997) and earlier work, and refined and developed further in Winter (1997, 1998).

We concluded in section 3.4 that a description of the scope of indefinites is more likely to meet the empirical requirements if it does not involve movement, especially syntactic movement, of the indefinite itself. This entails that we must assume that the quantifier whose scope determines the existential import of the indefinite is not part of the interpretation of the indefinite itself; e.g., *some* does not denote the existential quantifier. The obvious alternative is to make use of the

mechanism of default existential closure familiar from DRT (Kamp 1981a; Heim 1982; Kamp and Reyle 1993). But it is well known (see, e.g., Heim 1982) that existential quantification over individuals will not work for our purposes, as (19), repeated as (59), shows:

(59) If a relative of mine dies, I will inherit a fortune.
  a. $\exists$ x IF relative_of_mine(x) $\wedge$ die(x) THEN I will inherit a fortune.

DRT holds that the indefinite *a relative of mine* is interpreted as an open sentence relative_of_mine(x); default existential closure binds the variable. If we now allow a default quantifier at matrix level to bind that variable in (59a), we have matrix scope but not the correct meaning, as the descriptive content of the indefinite is still interpreted inside the *if*-clause. (59a) does not state there is a relative of mine with such-and-such property, but that there is an individual such that *if* he is a relative of mine, I inherit. This comes out true if there exists any individual who is not a relative of mine. The reason is that we can then pick as a value for *x* any individual not a relative of mine; this will render the antecedent clause false; hence the implication should be judged true. We want to solve this problem without extracting the indefinite from the *if*-clause. Reinhart's solution to this puzzle, which occurs also when we want to interpret *wh*-expressions in situ (see chapter 77), was to use default existential quantification over choice function variables instead.

We will use the provisional definition of choice function, CF, in (60):

(60) $CF =_{df} \lambda f_{<<e,t>,e>} \forall P_{<e,t>} [P \neq \varnothing \rightarrow P(f(P))]$

A choice function is a function which, when applied to a non-empty set, yields as its value a member of this set (we will discuss the empty set case in section 6). Reinhart assumed that the free variable that DRT postulates in the interpretation of an indefinite is not of type e (individual) but of the type of CF. This free function variable takes the set denoted by the descriptive content of the indefinite as its argument; the resulting individual is the denotational value of the indefinite DP. The function variable is bound through default existential closure. For example, (61a) is interpreted as (61b):

(61) a. A woman entered the room.
  b. $\exists$f [CF(f) $\wedge$ f(woman) entered the room].

(61b) paraphrases as: 'there is some manner of choosing, such that the woman chosen in that manner entered the room'; in other words: 'some woman entered the room'. Given these assumptions, (59) now comes out correctly, as shown in (62):

(62) a. IF $\exists$f [CF(f) $\wedge$ f(relative_of_mine) dies] THEN I will inherit a fortune.
  b. $\exists$f [CF(f) $\wedge$ IF f(relative_of_mine) dies THEN I will inherit a fortune].

A relative of mine is interpreted, in situ, as f(relative_of_mine); default existential closure states that there is a CF *f* with the indicated property. If closure applies immediately, as in (62a), we get just the narrow-scope reading for the indefinite. We obtain specificity of the indefinite relative to the *if*-clause when default existential closure takes place outside this clause, as in (62b). (62b) paraphrases as 'there is a way of choosing an individual from a set, such that if the person we choose from my relatives in that way dies, then I inherit a fortune'. This does not fail in the way (59a) did, as it cannot be rendered trivially true by picking some individual that is not a relative of mine. Supposing that I have relatives, *f*, being a CF, is guaranteed to pick a relative of mine when applied to relative_of_mine. (62b) then comes down to the statement that there is a relative of mine that we can pick, such that if he dies, I will inherit.

To see that this analysis has the required properties, we want to look again at the entailment properties of (59) that we discussed in section 3.1 (see reading (19c)). We will ignore the existential entailment property until section 6, and concentrate on the weakening effect of wide scope in this context: the reasoning in (63) should not be valid:

(63) ∃f [CF(f) ∧ IF f(relative_of_mine) dies THEN I will inherit a fortune]. (= (62b))
John is a relative of mine.
– _____
IF John dies THEN I will inherit a fortune.

This reasoning is indeed not valid; if there is *some* way of choosing a relative of mine that renders the implication true, that does not entail that choosing *any* relative, such as John, will render the implication true.

Other observed properties of specific indefinites also follow. As existential closure is not directed by syntax and may take place wherever a quantifier can bind the CF variable, intermediate readings are generated – we have decided in section 4 that this is desirable. This is illustrated in (64) (from Winter 1998: ch.3, (89)):

(64) Every country's security will be threatened if some building is attacked by terrorists.
  a. Every country x IF ∃f [CF(f) ∧ f(building) is attacked by terrorists] THEN x's security will be threatened.
  b. Every country x ∃f [CF(f) ∧ IF f(building) is attacked by terrorists THEN x's security will be threatened].
  c. ∃f [CF(f) ∧ [every country x IF f(building) is attacked by terrorists THEN x's security will be threatened]].

(64b) gives the intermediate reading: it allows a different choice (of building) to be made for every country.

As for specificity in VP-deletion contexts, the CF hypothesis conforms to our conclusion in section 3.2.2 that this construction militates against a QR treatment

of wide-scope indefinites, but not against a quantificational treatment per se. As no syntactic movement is involved in existential closure, an account of the restrictions on wide-scope quantification in VP-deletion antecedents in terms of economy constraints on syntactic movement will not affect the scope of indefinites, as pointed out by Fox (1995b). We derive wide scope for *a certain professor* in (29b), repeated as (65), as indicated in (65a):

(65) Exactly half the boys [$_{VP1}$ admire *a certain professor*], and Mary does [$_{VP2}$ e] too.
   a. ∃f [CF(f) ∧ Exactly half the boys admire f(professor)] AND ∃f [CF(f) ∧ Mary admires f(professor)].
   b. ∃f [CF(f) ∧ [Exactly half the boys admire f(professor) AND Mary admires f(professor)]].

A potentially troubling situation would arise if it turned out that only the maximal-scope Across-the-Board reading (65b) is available. We would then need to rule out (65a), by returning, e.g., to the Sag/Williams ban on free variables in elided VPs, which allows only (65b).[31] But this would leave us without an account of the examples in (33–35) and other problems: see section 3.2.2 and references cited.

An important advantage of the CF hypothesis is that it explains the observations reported in section 3.2.3 above, as pointed out by Reinhart (1997) and Winter (1997, 1998). Indefinites may have unlimited existential scope, but the *distributive* scope of a plural indefinite is quite limited. Consider again example (37a), repeated as (66):

(66) If three relatives of mine die, I will inherit a house.
   a. ∃f [CF(f) ∧ IF f(three relatives of mine) die THEN I will inherit a house].

The observation was that *three relatives of mine* may scope, *qua* existential import, outside the *if*-clause, but may not be understood with distributive wide scope over the *if*-clause. This follows automatically from the CF mechanism, which yields the specific reading of (66) given in (66a). The reason is that the descriptive content of the indefinite, and in particular the cardinality information (*three*) associated with it, remains inside the *if*-clause. Taking wide scope over the *if*-clause is only the existential quantifier over CFs; no plurality is available there with respect to which distribution might take place.

For the CF mechanism to work with plural indefinites, we need to assume that these do not (always) denote generalized quantifiers. Instead, *three relatives of mine* must denote a set of plural individuals. Taking plural individuals to be sets, *three relatives of mine* then denotes the set of all sets that contain three relatives of mine; the CF *f* chooses one such set.[32] (66a) then paraphrases as 'there is a way of choosing, such that if the three relatives of mine chosen in that way die, I inherit a house'. This gives us the required wide-scope reading.

Still, as with any similar approach to the semantics of plurals, we must account for the fact that plural indefinites can be interpreted distributively in a local domain, as in *three relatives of mine wore a tie* ((36) above). Reinhart (1997) leaves open the option that indefinites are ambiguous and that in such examples *three relatives of mine* denotes a (distributive) generalized quantifier (with local scope), local distributivity in (66a) being due to a lexical property of the predicate *die*. But this is not sufficient, in view of our example (40), repeated as (67):

(67) If three workers on our staff have a baby soon, we will have to face some hard organizational problems.

On the intended reading, *three workers on our staff* in (67) is specific, hence not a generalized quantifier, but must take distributive wide scope relative to *a baby*. Therefore, we need to postulate a device that allows a distributive reading for the plural individual chosen by the CF. Given such a distributivity operator, we need not assume that indefinites ever denote in any other way than through the CF mechanism (see Winter 1997, 1998). More importantly, while the indefinite itself may move, covertly or overtly, within a local domain, and shift the scope of the distributivity operator in that way (see (44), (45)), there is no obvious way we can apply one in (66a) so as to derive island-escaping distributivity.

Nevertheless, the advantage gained by adopting the CF approach lies in its explanatory value, not just in its descriptive adequacy. We can see why this is so by comparing the present hypothesis with that put forward by Abusch (1994). Abusch proposes a semantic storage mechanism which may 'lift' an indefinite (a description applied to a free variable, as in DRT, and the associated cardinality information) out of islands. At any level, an existential closure rule may 'reattach' the indefinite and bind its free variable. The variable that gets bound with wide scope may range over plural individuals, and a distributivity operator is assumed that may apply to such a variable and pick out its members. Abusch especially stipulates that the distributivity operator may be syntactically deep-generated anywhere, so as to derive island-escaping distributivity (which she felt was possible; cf. note 20) without movement. It does not appear too problematic to adopt the reverse stipulation and allow the distributivity operator to be generated only close to the indefinite's syntactic position. This would lead to a system that is empirically hard to distinguish from the CF system. However, this merely demonstrates that Abusch's approach to indefinites does not *predict* that wide-scope distributivity is impossible; the basic approach allows one to shift the predictions in any desired direction. The CF approach, on the other hand, predicts that there will be no wide-scope distribution, as the numeral and descriptive content information never leave the island and are not available for any wide-scope distributivity operator one might wish to employ. The system would require significant stipulative modification in order for it to make the wrong prediction in this respect.

The CF Hypothesis performs well with regard to the properties of specific indefinites mentioned so far. There is, furthermore, accumulating independent

evidence that NL semantics makes use of the CF mechanism. For instance, Reinhart (1992) has argued that *wh*-in-situ is likewise interpreted through existential quantification over CFs, and Reinhart (1997) argues they can be profitably employed in the description of sluicing (see chapter 60); Ruys (1997) suggests that quantification over CFs might be used to resolve some of the semantic problems associated with the Move-Spec/Move-F analysis of Quantifier Raising proposed in Chomsky (1995c) (see chapter 53) (see also Von Heusinger 1999).

Not all properties of specific indefinites are easily treated in terms of CFs, however. Consider the complex issue of specificity in intensional contexts, exemplified by (68) (see section 2):

(68) John wants to marry a waitress.
  a. $\exists$f [CF(f) $\wedge$ **want'**(**John'**, ^(**marry'**(**John'**, f(**waitress'**))))]

In order to obtain the *de re* reading of (68), by which there is a particular individual, who *is* a waitress ('according to the speaker'), and who John wants to marry, we want to assign wide scope not only to the existential quantifier, but also to the description *waitress*. But so far, the best we can obtain is (68a), where *waitress* is interpreted inside the intensional context. Reinhart (1992), in the context of a CF treatment of *wh*-in-situ, proposed that the CF apply to the intension of the description of the indefinite. We may assume, for instance, the definition of intensional choice function in (69a), and represent the desired reading of (68) as (69b):

(69) a. ICF $=_{df} \lambda f_{<<s,<e,t>>,e>} \forall P_{<s,<e,t>>} [^{\vee}P \neq \varnothing \rightarrow {}^{\vee}P(f(P))]$
  b. $\exists$f [ICF(f) $\wedge$ **want'**(**John'**, ^(**marry'**(**John'**, f(^**waitress'**))))]

By (69b), *f* applies to the property **^waitress'** and, by the definition of ICF, assigns it to an individual who is a member of the extension of **waitress'** in the world of evaluation of the matrix sentence; John is said to want to marry that individual. The definition (69a) seems to work fine for this relatively simple case, but is difficult to maintain when we consider the possibility that the set of waitresses is empty (see next section). Also, we already observed in section 2 (see the discussion concerning (14)) that the issue of intensionality is considerably more complicated than this mechanism can handle. There are, furthermore, indications that 'wide-scope' readings of the descriptive content of, e.g., universally quantified noun phrases are also possible in certain contexts; see, e.g., Abusch (1994) and Farkas (1997) ((70) from Abusch):

(70) Things would be different if every senator had grown up to be a rancher instead.

This is not the place, and I am not qualified, to discuss these issues further.

Another question that requires further research is how CFs relate to anaphora. We noted in section 2 that specific indefinites introduce discourse referents; we saw in section 4 that specific indefinites may function as antecedents in donkey

anaphora contexts, as discussed in Ruys (1992) and Abusch (1994). Consider again (71) (cf. (57a)):

(71) Every critic who reviews each book that *some author* writes quickly grows sick of *him*.

Given that *some author* must be specific here relative to *each book that . . .* , we need to allow the value chosen by a CF to antecede the pronoun. A naive solution might be to assume that the relevant CF variable is unselectively bound by *every*, and that *him* is interpreted as f(some author). But it is unclear how this should be achieved; also, the solution is subject to the proportion problem.[33] Abusch's (1994) theory provides a more straightforward solution for these examples; since the mechanism she proposes can lift a restricted individual variable up to the highest universal quantifier, that quantifier can unselectively bind the variable and the pronoun can also be interpreted as that bound variable. But the proportion problem occurs here as well.

The next section takes a detailed look at one further complication that attends the CF hypothesis: the case of the empty restriction set.

6 Do specific NPs support existential entailments?

In section 3.1 we first considered such examples as (19) (repeated as (72)):

(72) If a relative of mine dies, I will inherit a fortune.
  a. IF ∃x [relative_of_mine(x) ∧ x dies] THEN I will inherit a fortune.
  b. ∃x [relative_of_mine(x) ∧ IF x dies THEN I will inherit a fortune].
  c. IF ∃f [CF(f) ∧ f(relative_of_mine) dies] THEN I will inherit a fortune.
  d. ∃f [CF(f) ∧ IF f(relative_of_mine) dies THEN I will inherit a fortune].

We observed that (72) has two readings, corresponding to two scope positions for the indefinite; we presented them schematically as in (72a) and (72b). In the previous section we discussed the CF Hypothesis, which attributes to (72) the two readings in (72c) and (72d). Unfortunately, the CF Hypothesis only partly accounts for the observations that initially led us to assume the readings (72a, b).

The truth conditions given by (72b) are weaker, in one sense, than those of (72a), which allowed us to construct a model where (72b) is true and (72a) false: uncle John dies, and I do not inherit. Since we judged (72) true in such a model, we concluded that a wide-scope reading such as (72b) must be assumed to exist. The wide-scope reading we now derive with the CF mechanism, (72d), is not directly equivalent to (72b), but it is sufficiently similar to (72b) in that it has the required property of being true in the given model.

We also noted that, in another sense, (72b) has stronger truth-conditions than (72a): (72b) entails that I have relatives, (72a) does not. We had already come across a similar observation in section 2 (see (9)): wide-scope, specific indefinites

have traditionally been taken to enable existential entailments (but see note 5). This does not, however, follow from the CF treatment (72d). In this section, we will consider whether this deviation from tradition is justified.

To see why the entailment fails, consider first this simple example:

(73) A unicorn appeared.
  a. (73) ⇒ There exists a unicorn.
  b. $\exists x$ [**unicorn′**(x) ∧ **appeared′**(x)]
  c. $\exists f$ [CF(f) ∧ **appeared′**(f(**unicorn′**))]
  d. $\exists f$ [CF(f) ∧ f(**unicorn′**)(**appeared′**)]

The indefinite *a unicorn* in (73) has wide scope (trivially). The sentence is judged to support the entailment stated in (73a). This is accounted for if the indefinite is interpreted as in (73b) – call this the Existential Hypothesis.

The entailment intuition is not accounted for if the indefinite is interpreted as in (73c). As Reinhart (1997) and Winter (1997) point out, the basic definition of CF in (60) states that for every non-empty set X, a CF f applied to X yields a member of X. It imposes no restriction on the value of f(X) when X is empty. Hence, when there are no unicorns, (73c) comes out as true if anything appeared at all. But (73) is solidly judged false when there are no unicorns, as the Existential Hypothesis predicts. In order to remedy this, Reinhart and Winter revise the definition so that, when a CF is applied to the empty set, the value will be something that gives falsehood for every predicate. Winter's (1997) revised definition is as follows:

(74) $\mathrm{CF} =_{df} \lambda f_{<<e,t>,<<e,t>,t>>} \cdot f(\varnothing_{<e,t>}) = \varnothing_{<<e,t>,t>} \wedge \forall P_{<e,t>}[P \neq \varnothing \rightarrow \exists x[P(x) \wedge f(P) = \lambda R_{<e,t>} R(x)]]$

We adopt this definition from now on. By this definition, a CF applied to a non-empty set yields the Generalized Quantifier corresponding to some member of the set, but applied to the empty set it yields the empty GQ, which is false of every predicate. This means that the CF reading of *a unicorn* in (73) now results in (73d), and comes out as false when there are no unicorns, as desired. Call this the CF Hypothesis.

For simplex examples such as (73) the CF Hypothesis, thus refined, yields the same existential entailments as the Existential Hypothesis. This does not hold, however, of such complex examples as (72), predicted to have the specific reading (72d). When the argument set of a CF is empty, its value is the empty GQ, which takes a predicate and yields False. But in (72d), the further embedding of this falsehood is such that the sentence as a whole comes out True. Hence, the CF Hypothesis, unlike the Existential Hypothesis, predicts that the specific reading of this sentence is true when I have no relatives.

We are faced with an empirical question. When they adopt the CF Hypothesis, Reinhart (1997) and Winter (1997) predict that an indefinite on its specific reading does not support an existential entailment in contexts such as (72), or in other

downward-entailing contexts such as below a single negation, or in the restriction of a universal quantifier. Abusch (1994) and the 'island-free QR' straw-man theory of section 3.2 do predict such entailments, by implementing the more traditional Existential Hypothesis illustrated in (72b).[34] Which is the correct prediction? It turns out that this question is difficult to answer.

The contexts mentioned so far do not decide the issue. Rather than considering (72) directly, we can show this more easily by looking at the simpler case of an indefinite embedded under a single negation:

(75)	It is not the case that a unicorn appeared.		**unicorn'** = ∅
	a.	NOT ∃x [**unicorn'**(x) ∧ **appear'**(x)]	TRUE
	b.	∃x [**unicorn'**(x) ∧ NOT **appear'**(x)]	FALSE
	c.	NOT ∃f[CF(f) ∧ f(**unicorn'**)(**appear'**)]	TRUE
	d.	∃f[CF(f) ∧ NOT f(**unicorn'**)(**appear'**)]	TRUE

Ignoring for the moment the option of applying QR to *a unicorn*, the Existential and CF Hypotheses predict the readings in (75a, b) and (75c, d) respectively. Only the wide-scope readings are different. The CF Hypothesis derives the wide-scope reading (75d), which is true in a model without unicorns (if **unicorn'** is empty, the subclause is false, hence (75d) as a whole true). The Existential Hypothesis gives the wide-scope reading (75b), which is false in such a model. But it is hard to evaluate this prediction, as the Existential Hypothesis still predicts that we may judge the sentence true in a model without unicorns – namely, on the basis of the narrow-scope reading (75a). In fact, if we take the truth-conditions of an ambiguous sentence to be simply defined as the truth-conditions of the disjunction of its readings, then both hypotheses are indistinguishable, since (75a) ∨ (75b) is equivalent to (75c) ∨ (75d).

There is one way in which we might conceivably distinguish the two hypotheses with regard to (75). Suppose the intuited truth-conditions for an ambiguous sentence need not be just the truth-conditions of the disjunction of its readings. Suppose instead that speakers have the ability to 'choose' one reading as the interpretation of a sentence, ignoring any other readings. Then by the CF Hypothesis, we still cannot judge (75) false in a model without unicorns, on any of its readings. But by the Existential Hypothesis we should be able to judge the sentence false in a model without unicorns, on the basis of its wide-scope reading (75b). If we were now to find that speakers do not succeed in judging (75) false in the relevant model, this would count as evidence against the Existential Hypothesis. Unfortunately, the evidence would be far from conclusive. Even if we attribute to speakers an ability to 'choose' readings, which is questionable in itself, the Existential Hypothesis still does not predict that the 'false' reading will be easy to discern. On the contrary, as already pointed out in section 2.1, even on the Existential Hypothesis we expect such a 'false' judgment to be difficult to secure, since it is in competition with a reading that renders the sentence true in the given model (narrow-scope (75a)), and a reading that renders the sentence true is likely to be much more prominent.

We may nonetheless look for ways of rendering the relevant intuitions more secure. Both Winter (1998) and Reinhart (1997) provide examples which, they claim, support the CF hypothesis. Reinhart presents the following paradigm:

(76) a. The organizers did not invite two American kings to the party.
b. There are two American kings that the organizers did not invite to the party.
c. The organizers did not invite two American linguists to the party.

(76a) is a simple variation on (75): given the non-existence of American kings, the CF Hypothesis predicts that (76a) is true on either reading; the Existential Hypothesis predicts that we might judge it false by 'choosing' its wide-scope reading. But, Reinhart notes, (76a) is most easily judged as true. We agree on the judgment, but we do not believe it is significant as an argument against the Existential Hypothesis. Reinhart points out that (76a) contrasts with (76b), where the 'false' reading (predicted by both hypotheses) is much more easily obtained. But (76a) and (76b) are not a clean minimal pair. The reason we expect a 'false' reading to be hard to obtain in (76a), even on the Existential Hypothesis, is that it is in competition with a true reading. We expect the 'false' reading to be completely apparent in (76b), since (76b) is not ambiguous and the false reading is the only one. The contrast between (76a) and (76c) does little more to disprove the Existential Hypothesis. Reinhart points out that it is easier to judge (76c) true in a model where two specific American linguists were not invited, but others were, than it is to judge (76a) false in a model without American kings, although both these judgments would follow from the same mechanism (taking the indefinite as specific) on the Existential Hypothesis. However, even if we can 'choose' readings, we do not expect readings that are false in a given model to be as easily accessed as ones that are true. As a matter of Gricean cooperativeness, we will lean toward the true reading.[35]

The logical equivalencies observed in relation to (75) also obtain in the other contexts we have mentioned (an indefinite in the antecedent clause of an implication, i.e., (72), or in the restriction of a universal quantifier). For instance, (72a) $\vee$ (72b) is equivalent to (72c) $\vee$ (72d), so that the distinction between our two hypotheses is obscured here, as well. Furthermore, as discussed at length in Reinhart (1997) and especially Winter (1998), such contexts present additional difficulties. In models where our two hypotheses differ (the restriction on the indefinite denotes the empty set), the CF Hypothesis predicts such sentences, on either reading, to be *trivially* true by rendering the antecedent clause of an implication false; such judgments are notoriously hard, which confounds the issue. We might, however, be able to avoid this particular problem. Instead of regular *if*-clauses, we might consider counterfactuals. Instead of *every,* we might consider other left monotone decreasing determiners:

(77) There were no real Americans who liked *a devoutly communist friend of mine*.

This example has the same logical properties as (75), but is a real example in that we no longer need to ignore QR in order to make the point, as the indefinite is safely embedded in an island. The Existential Hypothesis predicts that we may judge (77) false (but also true) if I have no communist friends; on the CF Hypothesis, (77) can only be judged true. However, even on this example I have not been able to obtain secure judgments.

I see two possible ways out of the present quandary, both of which require further research. We may look for configurations where the logical equivalencies observed in the examples above do not hold. Such structures exist, but quickly become too complex to process. Another option is to use some means of forcing a specific reading on the indefinite and thus remove the ambiguity that obscures the distinction between the two hypotheses. Again, this is not easy, as reliable specificity-inducing measures are scarce (see also next section).[36] We will conclude this section by looking at specificity in intensional contexts, which provides potential evidence of both types. Consider first (78), discussed by Winter (1997):

(78) John believes that some cat snored.
   a. $\exists x$ [**cat'**(x) $\wedge$ **believe'**(^[**snore'**(x)])(**john'**)]
   b. $\exists f$ [ICF(f) $\wedge$ **believe'**(^[f(^**cat'**)(**snore'**)])(**john'**)]
   c. ICF $=_{df} \lambda f_{<<s,<e,t>>,<<e,t>,t>>} . \forall P_{<s,<e,t>>}$ [($^{\vee}P=\varnothing \rightarrow f(P)=\varnothing_{<<e,t>,t>}$) $\wedge$ ($^{\vee}P\neq\varnothing \rightarrow \exists x[^{\vee}P(x) \wedge f(P) = \lambda R_{<e,t>}R(x)]$)]
   d. John believes that there are cats which are not cats.

When considering these examples, we first need to adapt the ICF definition (69a) to the empty set case, along the lines of (74) above. The revised ICF is defined in (78c).[37] We obtain the wide-scope reading (78b): *f* applies to the property ^**cat'** and assigns it the GQ corresponding to some member of the extension of **cat'** in the world of evaluation of the matrix sentence; if that extension is the empty set, *f* yields the empty GQ. By the Existential Hypothesis, we obtain (78a). Again, (78a) entails there are cats; (78b) does not. Rather, when evaluated in a model without cats, (78b) attributes to John the belief that **snore'** is a member of the empty GQ, a necessarily false proposition. In other words, in such a feline-free model, (78) should be on a par with (78d). This does not seem correct, but, as Winter states, the result is difficult to evaluate. However, we may be able to improve on the example.

In intensional contexts, there exist familiar ways of forcing wide or narrow scope. Consider Spanish (79), from Klein (1974):

(79) Busco a un guía que $\text{habla}_{\text{IND}}$/$\text{hable}_{\text{SUB}}$ quechua.
   'I'm looking for a guide who speak(s) Quechua.'

When an NP has a relative clause in the subjunctive mood, the NP must take narrow scope relative to the intensional operator that licenses the subjunctive; with *hable*, (79) means I'm looking for any such guide, not a particular one. Unfortunately, in many Romance languages, the reverse is not true: indicative

mood does not force the wide-scope reading we are looking for (see especially Farkas 1982). In Catalan, however, it sometimes does (see Quer 1998 and references cited there):

(80) Vull que un llibre que m'agrada$_{IND}$ / m'agradi$_{SUB}$ el convenci.
I-want that a book that me-pleases / me-please him convinces
'I want a book that pleases me to convince him.'

With indicative, (80) is not ambiguous and has only a *de re* reading for the embedded subject. When there are in fact no books that please me, the sentence with indicative is solidly judged false, as the Existential Hypothesis predicts. We may improve the example further as in (81):

(81) És impossible que una noia francesa que jo conec$_{IND}$ / conegui$_{SUB}$ faci
Is impossible that a girl French that I know / know do
una cosa així.
a thing like-that
'It is impossible that a French girl I know should do a thing like that.'

Again, with the indicative, the sentence is judged false when I know no French girls. The CF Hypothesis, at least as implemented in (78c), clearly fails here. With the set of French girls I know empty 'in the real world', a wide-scope CF analysis has the embedded sentence denoting a necessarily false proposition, as explained above. The statement that such a proposition is 'impossible' should be true, and quite natural, for instance in the context of a Semantics 101 class. Nevertheless, this reading is not obtained.[38]

It should be clear that more research is required, on extensional CF and certainly on intensional CF, in order to determine whether the weakening of existential entailments of specific indefinites that the CF Hypothesis predicts can be upheld. At present, it does not appear that the CF approach can easily be falsified in this respect.[39]

7 How to create a specific NP

In this final section we return to more basic empirical concerns, and ask what are the factors that contribute to specificity. We will look at some properties of indefinites that favor or disfavor a specific reading, and we briefly examine Kratzer's (1998) account of the conditions under which intermediate-scope readings arise.

The literature abounds with descriptions of types of indefinites, and contexts containing indefinites, that allegedly induce 'specificity'. In many cases, as noted, the property so identified is not the wide-scope property under examination here, but some other supposed semantic property of the indefinite, e.g., some sort of 'D-linking' (see chapter 77).[40] In many cases, authors simply state that a given

indefinite in a given context is 'specific' without detailing the semantic intuitions that lead them to this characterization, making it impossible to determine the relevance of the statement for any particular line of research, given the existing terminological confusion.[41] But such distractions apart, the crop of necessary and sufficient conditions for specificity still remains meager.

Fodor and Sag (1982) provide a useful list of factors that help or hinder what they consider (see sections 3.1, 3.2, 4) a referential reading on indefinites – i.e., the reading that we have diagnosed as involving wide-scope quantification over CF. For instance, increasing the 'descriptive content' of the indefinite (adding modifiers, adding relative clauses, especially appositive ones) contributes to this reading. The pragmatic rationale seems to be that a speaker who can provide such details apparently has a particular person in mind when using the indefinite; and, furthermore, that adding information to the indefinite that does not seem directly relevant to the truth of the intended assertion invites the inference that the information is added in order to single out a particular individual that verifies the assertion. It seems to me that these observations remain relevant, even though we do not adopt Fodor and Sag's contention that this individual the speaker has in mind is also, semantically, the referent of the indefinite; it still seems correct that wide-scope indefinites are often *used* in order to make a statement about a particular individual, who for some reason we cannot or would not identify more directly, e.g., by using a proper name. Nonetheless, what we describe here is only a tendency: indefinites endowed with considerable descriptive content, and even appositive relative clauses, may still be interpreted with narrow scope. Some reliable wide-scope-inducing modifiers I am aware of are positive polarity items – e.g., the Catalan indicative relative clauses cited in the previous section, or the German IV2 relative clause discussed by Gärtner (2000); unfortunately, none of these can be employed in a wide enough range of contexts for them to be a helpful tool in examining many of the empirical questions addressed in previous sections. Syntactic contexts that favor 'specific' readings as intended here have also been widely discussed (see, e.g., Kerstens 1975, Reuland 1988, and Rullmann 1989 on Dutch VP-external subjects; Kerstens 1975, de Hoop 1992, and Diesing 1992b on Germanic scrambling; see also chapter 43; and many references cited there) – but again, wide-scope readings are rarely the only readings available for indefinites in such contexts.[42]

Measures for inducing narrow scope, although less useful for the kind of research reported here, are often somewhat more reliable. Indefinites containing bound variable pronouns take narrow scope relative to their binders (but see later in this section), as do indefinites containing polarity items, or subjunctive mood relative clauses, relative to their licensers. Bare plurals are rarely interpreted with wide scope, and neither are indefinites in predicative position (but see Winter 1998), adverbial indefinite NPs, and certain indefinite pronominals (e.g., Dutch *wat* 'something'). Other syntactic contexts disfavoring 'specificity' typically include *there*-insertion sentences, but again this is only a tendency (see, e.g., Fodor and Sag 1982; De Hoop 1992). In addition, the explanation of many of these tendencies remains obscure.

However, since the early 1990s, evidence has accumulated that one factor systematically determines whether an indefinite may be specific in our sense: the choice of determiner. Liu (1990), Beghelli (1993, 1995), and Beghelli and Stowell (1997) conducted research on the scope properties of different NP types, distinguished by determiner (see chapter 71), which, although it was aimed at local (within-clause) scope phenomena, was relevant to our subject matter for the following reasons. We have found in section 3.2.3 that, in order to explain island-escaping, non-distributive wide scope (specificity), we need some interpretive mechanism that allows an indefinite to 'escape' the scope of any higher operator, but without scoping (distributing) over that operator. The CF mechanism explained in the previous sections is such a mechanism. Now, even though we needed examples of island-escaping scope to motivate such a specificity mechanism, now that we know it exists, we must assume that it can operate in a local domain as well. Consider therefore an indefinite in object position, and its scope relative to the (local) subject. If the indefinite seems to escape the scope of the subject, this may reflect any of a number of mechanisms in operation: e.g., non-distributivity of the subject, local QR of the indefinite object, or specificity. Indeed, when we find that the 'non-narrow' scope of the indefinite object in such a configuration can be described by the specificity mechanism (e.g., CF), then we should not look for another explanation, e.g., in terms of movement, as the specificity mechanism is needed independently to explain the phenomena in the previous sections (see note 24). More significant is the reverse situation: suppose we find that the indefinite object cannot escape the scope of the subject in a way that can be described by the specificity mechanism. Then we must conclude that the specificity (CF) mechanism cannot apply to this particular indefinite. Liu and Beghelli found several such cases:

(82) a. Fewer than five girls saw *more than five movies*.
b. Every girl saw *fewer than six movies*.
c. $\exists$f [CF(f) $\wedge$ fewer than five girls x [x saw f(more than five movies)]].
d. $\exists$f [CF(f) $\wedge$ every girl x [x saw f(fewer than six movies)]].

In these examples, it is impossible for the object to escape the scope of the subject: there is no 'independent' scope reading, in Liu's terms. For instance, (82a) does not have the reading that there was a particular set of more than five movies, such that fewer than five girls saw each of those movies; likewise, (82b) does not have a reading according to which there is a particular set of fewer than six movies, such that every girl saw those movies. Yet these are exactly the readings that would obtain if the specificity mechanism were to apply to the indefinite object; i.e., the readings that we do not find are exactly the readings given by wide-scope existential quantification over CF, as indicated in (82c) and (82d): a choice from the object is made independently of values of the subject, but the object does not show distributive scope over the subject.

Much more can be said about these examples. One point is that, apparently, a 'collective' interpretation for the subject is impossible here, as well, since that

would presumably lead to an interpretation very much like the interpretation we expect from specificity of the object (see especially Szabolsci 1997b and Winter 1998 for discussion of what property of the subject is responsible for this). Furthermore, a wide-scope *distributive* reading for the indefinite object (which could not result from the specificity mechanism, see section 3.2.3, but might conceivably result from QR of the object), is also missing. Beghelli and Beghelli and Stowell explain this by separating the (collective) indefinite from a syntactically fixed distributivity operator, and then allowing just the indefinite to move (Quantifier Raise) to a higher position. However, since such movement will never lead to island-escaping specific readings, so that some specificity mechanism that generates wide scope without movement is needed independently (as Beghelli confirms), it is unclear to me what purpose is served by assuming that these indefinites may move at LF at all (see section 3.2.3). The only readings we do find in (82) are wide-scope distributive readings for the subject, and possibly a 'cumulative' reading for (82a).

For our purposes, the relevant observation is that specificity is not an option for the italicized indefinites in (82). The class of weak NP determiners that show this behavior, according to Liu and Beghelli, are all modified numerals, and all determiners that are not monotone increasing. In other words, specificity is reserved for simple monotone increasing weak determiners: *a*, *several*, *some*, *three*, etc.[43] These observations, based initially on local scope phenomena, are confirmed by the absence of island-escaping wide scope with other than simple increasing DETs:

(83) a. If *fewer than three relatives of mine* die, I will inherit a house.
b. If *more than three relatives of mine* die, I will inherit a house.

Neither (83a) nor (83b) has a specific reading for the italicized indefinite. The same observation was made independently in Corblin (1997) for French:

(84) a. Chaque professeur a récompensé [$_{NP}$ chacque étudiant [$_{CP}$ qui a lu *un roman*]]. (Three readings)
'Every professor has rewarded every student who has read a novel.'
b. Chaque professeur a récompensé [$_{NP}$ chacque étudiant [$_{CP}$ qui a lu *au moins/au plus/exactement un roman*]]. (One reading)
'Every professor has rewarded every student who has read at least/at most/exactly one novel.'

(84a) has three possible scope positions for *un roman* (including an island-escaping intermediate-scope reading; cf. section 4); the modified numerals in (84b) allow only a narrow-scope reading.

All monotone decreasing (and non-monotone) weak NP determiners are included here in the set of determiners that resist specific readings. That the specificity (CF) mechanism must not be allowed to apply to NPs with such determiners is also apparent from much simpler examples:

(85) a. Fewer than six boys arrived.
b. Exactly six boys arrived.
c. $\exists f$ [CF(f) $\wedge$ f(fewer than six boys)(arrived)].
d. $\exists f$ [CF(f) $\wedge$ f(exactly six boys)(arrived)].

The CF analyses for (85a, b) given in (85c, d) describe adjectival readings for *fewer than six* and *exactly six*. For instance, (85c) states there is some way of choosing fewer than six boys, such that those boys arrived; allowing that many other boys may also have arrived. Such monotone increasing readings for these determiners are not attested unless under very special circumstances. Hence, we know that these NPs do not allow CF readings; the same holds of other specificity mechanisms I am aware of.

Explaining the Liu/Beghelli bifurcation is another matter. Beghelli and Stowell (1997) and Szabolcsi (1997b) distinguish the two types of weak NPs in terms of morphosyntactic features as well as semantically. But this is hard to achieve other than by stipulation. Reinhart (1997) proposes a distinction on the basis of DP-internal syntax, inspired by Danon (1996). Unmodified numerals may occupy the D head position, leaving the spec, DP position free for a covert CF variable, whereas modified numerals cannot, for obvious reasons, occupy D^0; these are in Spec, DP. This approach requires further elaboration. For instance, a separate stipulation is needed to prevent a CF reading for unmodified monotone decreasing determiners (*no*, *few*). Furthermore, syntactic considerations indicate that modified numerals may occur more deeply embedded in DP; they may, e.g., be preceded by demonstratives, definite and universal determiners, and possessive phrases. More research on this topic is required, but the progress that has been made in identifying at least one necessary condition for specificity is promising.

Let us finally consider the conditions under which intermediate, island-escaping scope readings for indefinites may arise. Recall from section 3.2.1 that Fodor and Sag (1982) claimed that such a reading did not occur in (27), repeated as (86a): either *a student of mine* scopes inside the complex NP island, or it takes the widest possible scope. We subsequently argued in section 4, on the basis of many counter-examples from the literature, that intermediate readings out of islands do occur: (86b) is an example (from Abusch 1994):

(86) a. Every professor overheard [$_{NP}$ the rumor [$_{CP}$ that a student of mine had been called before the dean]].
b. Every professor$_i$ rewarded [$_{NP}$ every student [$_{CP}$ who read some book he$_i$ had recommended]].

As a consensus began to emerge in the literature that intermediate readings exist, little further attention was paid to Fodor and Sag's original intuition: that no such reading exists in (86a). Indeed, given the complexity of the structure and the competition of other available readings, it does not seem unreasonable to suppose that (86a) is assigned an intermediate reading as well, which just

happens to be difficult to detect. We saw that in other examples special measures were often required to bring the intermediate reading to the fore.

Kratzer (1998) is an impressive and careful attempt to combine the best of both worlds. She takes Fodor and Sag's intuitions seriously, and develops a semantics for indefinites that is intended to explain the distinction between (86a) and (86b). This involves a return to an inherent binary ambiguity in indefinites, a sophisticated version of the referential/quantificational ambiguity postulated by Fodor and Sag and their predecessors and discussed at length in sections 2 and 3. Indefinites have one reading as a Generalized Quantifier, which yields the local-(narrow-)scope readings in (86). Alternatively, a CF variable may apply to an indefinite's description and pick a member of the set it denotes. But there is no free existential closure of CF variables, which would result in intermediate readings. Instead, the CF variable remains free and acquires its value from the context of utterance (just like a 'referential' indefinite in Fodor and Sag's analysis). This results in a 'maximal-scope' reading in (86a): the value of the indefinite is the particular individual picked from my students by the contextually given CF. The problem now lies in explaining how an intermediate reading arises in (86b).

Kratzer argues that the crucial difference between the two examples lies in the fact that the indefinite in (86b) contains a bound variable pronoun. We pointed out in section 4 that this prevents a maximal-scope reading and thereby removes some of the competition for the intermediate reading. Ruys (1992) and Abusch (1994) made use of this device in order to make the intermediate reading more prominent. But it was not assumed that the intermediate reading is *caused* by the bound variable.[44] Kratzer starts out by investigating this option: that the bound pronoun is directly responsible for the occurrence of the intermediate reading. Consider a simpler example:

(87) a. Every boy_i read *a book* $\textit{he}_i$ *liked*.
b. Every boy x [x read f(book x liked)].
c. $\exists$f [CF(f) $\wedge$ every boy x [x read f(book x liked)]].
d. Every boy x [x read f_x(book x liked)].

If we attempt to assign the indefinite wide scope here, either by wide-scope existential closure of CF, as in (87c) or by leaving the CF variable free, as in (87b), the reading we obtain is, paradoxically, almost a narrow-scope reading. Since *f* chooses from a set that may be different for every boy, the choice of book may be different for every boy, as in a narrow-scope reading. This would hold in (86b) as well: a free CF variable applied to *some book he had recommended* may give a different value for every professor, resulting in a reading where the indefinite seems to remain in the scope of *every professor*.

But the reading obtained is not quite the narrow-scope reading. Supposing that two boys happen to like exactly the same books, (87b) and (87c) would say that those boys would read the same books, as *f* chooses from the same set (call this the case of accidentally identical sets). This is not what a narrow-scope reading gives us, and it is also, more significantly, not what (87a) means: (87a) cannot be

false just because John and Bill like exactly the same books, but read a different choice from their common favorites. For the same reason, we do not quite obtain the intermediate-scope reading for (86b) in this way.

Kratzer's solution is to assume next that the CF variable itself is parameterized: (87a) may be interpreted as (87d), where *f* is a (contextually given) function from individuals to CFs. Since the (subscript) *x* on *f* may be bound by *every boy*, we may have a different CF for every boy, hence a different choice of book even if the set of books liked happens to be the same. Independent evidence for such a 'functional' reading on indefinites comes from the semantics of *a certain* analyzed by Hintikka (1986): Kratzer discusses (88):

(88) a. Each husband had forgotten a certain date – his wife's birthday.
b. Every husband x [x had forgotten f_x(date)].

In (88a), we may apparently interpret *a certain date* neither as a narrow-scope indefinite (for each husband any date at all), nor just as a wide-scope indefinite (one date, say September 14, for all husbands), but as a 'wife's birthday' function which, for each husband, gives a function which picks one date from the set of dates, as in (88b).

This seems to solve the problem of accidentally identical sets: both in (87) and in (86b) the CF is parameterized in this manner, which leads to a 'narrow-scope reading' relative to the binder of the parameterizing variable in the CF. The problem is that we have now lost our explanation for the distinction between (86a) and (86b). There is no relation between the presence of a bound pronoun in the indefinite, and the occurrence of a parameterized CF. Nothing prevents *every professor* in (86a) from binding a parameter on the CF as well. Kratzer's solution to this is more tentative. She suggests that 'functional readings' for indefinites (with parameterized CF) are generally hard to obtain – an appropriate function must be salient in the context (such as a function from husbands to their wives' birthdays in (88)). The reading seems easier to obtain in (86b) than in (86a) because the *un*parameterized CF reading already *almost* gives the same interpretation, the marginal case of accidentally identical sets apart.

Herein lies the weak point in Kratzer's analysis. For the explanation just given to go through, we must allow the unparameterized CF to be a freely available option in (86b) and (87). Indeed, given that parameterized, functional readings are assumed to be hard, we expect the unparameterized reading itself to be prominent in (86b) and (87). But this is not the case. We have seen this for (87), and it holds for (86b) as well: (86b) does not have a reading whereby for every professor there is some book he recommended, such that he rewarded all students who read it, with the proviso that two professors who happen to recommend the same books must also reward reading of the same book.

On the other hand, (87) presents a problem for any CF analysis of indefinites: the reading (87c) must not be allowed. The problem is discussed at length in Reniers (1997)[45] and in Winter (1998). Winter provides a solution very similar to Kratzer's, which is, furthermore, sensitive to the presence of a bound pronoun in

the indefinite; I speculate that Winter's proposal might be employed to complete Kratzer's program.

Other problems for Kratzer's approach are more directly empirical. As pointed out by Reinhart (1997), examples can be given of intermediate-scope readings for indefinites without bound pronouns, which do not seem to depend on a functional reading of the indefinite. Some examples can be found in section 4 above; (89) is a variation on an example from Abusch (1994):

(89) At most four committee members resisted my proposal that *a candidate* be turned down.

I feel (89) may be read with an intermediate-scope reading for *a candidate*, without its being understood that there is some relevant function from committee members to (choices from) candidates that they do not want to see turned down. One might further test Kratzer's predictions by constructing examples involving an indefinite escaping a scope island, while remaining inside the scope of some other operator, but one which does not bind a variable (e.g., negation). In spite of the problems mentioned, Kratzer's is an insightful suggestion, and it does not seem unreasonable to suppose that functional readings of indefinites may indeed account for many cases of apparent intermediate-scope readings.

8 Conclusion: outline and summary

Examples such as (19):

(19) If a relative of mine dies, I will inherit a fortune.

admit of a wide-scope (or 'specific') reading for the indefinite NP *a relative of mine*; it can be paraphrased as:

(i) There is a relative of mine, such that: if (s)he dies, I will inherit a fortune.

Wide scope is not available for other types of NPs (e.g., *every relative of mine*) in this structure, nor is extraction from the *if*-clause (of, e.g., *wh*-expressions) possible in overt syntax. Thus, (19) shows 'island-escaping scope' (section 3.1).

In order to describe island-escaping scope, one might postulate that indefinites can be extracted from the *if*-clause (through some semantic mechanism (storage) or through some exceptional form of syntactic movement): call this 'island-free QR'. But several observations argue against this (section 3.2).

If indefinites could be moved out of an island, one would naturally expect them to be able to move out of an island while still remaining in the scope of some other, yet higher scope-taking operator (section 3.2.1). So (27):

(27) Every professor overheard [$_{NP}$ the rumor [$_{CP}$ that a student of mine had been called before the dean]].

b. Every professor x [a student of mine y [x overheard the rumor that [y had been called before the dean]]].

would be expected to admit of the reading given in (27b): 'intermediate island-escaping scope'. Fodor and Sag (1982) claimed that it does not.

Wide-scope indefinites not only violate known movement and scope islands, they also appear to violate conditions on variable binding in VP-deletion contexts, so 'island-free QR' still undergenerates readings (section 3.2.2).

If indefinites underwent unrestricted QR, then wide-scope *distributive* readings for plural indefinites would naturally be expected (section 3.2.3); (37a) would be expected to allow the reading paraphrased in (ii):

(37) a. If three relatives of mine die, I will inherit a house.

(ii) There are three relatives of mine, such that if any one of them dies, I will inherit a house.

But (Ruys 1992) this is not the case. In fact, a distributive wide-scope reading is (all but) impossible even for *three books* in (41),

(41) Two boys read three books.

which suggests that these NPs do not freely undergo QR at all.

In conclusion, the 'island-free QR' straw-man is falsified; the scope of indefinites is not determined through syntactic movement; in fact, the scope of indefinites is not determined through displacement, either syntactic or semantic, of the indefinite itself.

An alternative explanation of the apparent island-escaping wide-scope readings of indefinites was proposed by Fodor and Sag (1982): there is an inherent ambiguity in the indefinite itself. Either it denotes a quantifier, which may scope locally but may not escape islands. Or it functions as a referential, name-like expression; such expressions are insensitive to scope effects, creating the impression of a wide-scope quantifier: this accounts for the (now: apparent) island-escaping wide scope in (19), and is in accordance with the other scope properties observed above (excepting perhaps (41)).

However (section 4), it has since become apparent that intermediate island-escaping scope readings do exist. (51b) admits of the reading in (iii):

(51) b. Most linguists have looked at every analysis that solves some problem.

(iii) For most linguists there is some problem x such that they have looked at every analysis that solves x.

This argues against the Fodor and Sag approach: the indefinite on its referential reading cannot be interpreted in the scope of any higher operator; the indefinite on its quantificational reading should not escape islands.

An alternative analysis due to Reinhart (1997) (section 5) says that indefinites do not have a referential reading and cannot be extracted from islands. Instead they may be interpreted in situ as open formulae containing a free variable that may be bound by an existential quantifier anywhere in the structure; when the indefinite is in an island, and its variable is bound from outside the island, 'island-escaping scope' results. In order to obtain the correct semantics, the variable must be of the choice function (CF) type: a choice function is a function which, when applied to a set, picks out a member of this set. For (19), this gives the island-escaping wide-scope reading (62b), which is paraphrased in (iv):

(19) If a relative of mine dies, I will inherit a fortune.

(62) b. $\exists$f [CF(f) $\wedge$ IF f(relative_of_mine) dies THEN I will inherit a fortune].

(iv) There is a way of choosing an individual from a set, such that if the person we choose from my relatives in that way dies, then I inherit a fortune.

The CF approach correctly predicts that intermediate island-escaping scope is possible, and that island-escaping distributive wide scope is not.

It has traditionally been assumed that wide-scope indefinites support existential entailments. For instance, the wide-scope reading for *a relative of mine* in (19) has been taken to entail that I have at least one relative. The CF approach, however, predicts that this is not always the case; for instance, (62b) for (19) does not entail that I have relatives. Section 6 takes a close look at the relevant intuitions and concludes that the CF approach cannot easily be falsified; it may well be that wide-scope indefinites do not always support existential entailments.

Section 7 looks into the conditions on (island-escaping) wide-scope readings for indefinites. There are many ill-understood factors that help or hinder these readings; there appears to be at least one cross-linguistically constant and reliable necessary condition: the indefinite must have a simplex, monotone increasing determiner. Thus, there is no wide-scope reading in (83):

(83) a. If *fewer than three relatives of mine* die, I will inherit a house.
b. If *more than three relatives of mine* die, I will inherit a house.

This section also returns to intermediate island-escaping scope, and looks at Kratzer's (1998) investigation of the factors that make these readings possible.

NOTES

I would like to thank Sarah Kennelly, Josep Quer, Yoad Winter, and two referees for helpful comments and suggestions.

1 A note on this terminology: the label 'specific' has been attached to indefinite (as well as definite) NPs for widely different reasons, and on the basis of widely different observations – whether those observations will all permit of one unified analysis is highly questionable. We use it here as a non-theoretical term in the sense of, e.g., Karttunen (1971a), Ruys (1992): an indefinite or weak NP is specific relative to a given operator (that c-commands it in overt syntax) if it is not interpreted in the scope of that operator, under some reasonable analysis.

2 Karttunen did not fail to observe that even non-specific indefinites may introduce discourse referents, albeit short-term ones that quickly 'decay'. Thus, the scopally embedded indefinites in (i) allow for discourse anaphoric pronouns, provided the pronouns are embedded in a similar way (see further (54–56) below):

(i) a. You must write *a letter* to your parents. *It* has to be sent by airmail.
b. Harvey courts *a girl* at every convention. *She* always comes to the banquet with him.

3 To avoid the terminological confusion that hindsight may bring, the reader should note that 'quantificational' is used here in the uncomplicated sense of 'involving a quantifier' (namely, the existential quantifier ∃ (or, notationally, the ŋ-operator)). We are not concerned yet with such niceties as the 'quantificational' (as opposed to 'cardinal') use of weak determiners (Milsark 1974), or with 'essentially quantificational' NPs in the sense of non-intersective and necessarily distributive NPs (see Szabolcsi 1997b and references cited there). Likewise, the 'referential' reading in Karttunen's work was thought of as simply being brought about by translating the indefinite as an individual constant, just like a proper name.

4 There may be grounds for doubting the validity of the existential entailment intuition for (9c) and similar examples. We discuss this issue in section 6.

5 To be slightly more historically accurate: for reasons having to do with such cases as (14) below, Fodor proposed a novel operator instead of the existential quantifier employed here – one which does not allow existential entailment but merely captures the 'individuating' effect of the *de re* reading. The existential entailment does, however, appear to be real in many cases.

6 Example (70) below may indicate, furthermore, that the problem is not restricted to indefinites.

7 For an analysis of this issue and an overview of its role in the literature, see Ruys (1992: 7–15).

8 Despite mistaken claims to the contrary in the literature; see Cooper (1979) and Farkas (1981).

9 Nearly, but not quite, as pointed out also by Abbott (1993). The referential reading is obtained in Fodor and Sag (1982) by enriching the model with a context that includes a value for "the individual the speaker has in mind"; a specific indefinite refers to this individual. This implies that the specific reading of, say, (19a) could be falsified in case uncle Winston's death would make me rich, but I had my penniless aunt Sue in mind when I uttered (19a). This subtle prediction is difficult to verify, if only because the non-specific, narrow-scope reading is also false in that situation.

10 Recall that intermediate readings are possible for examples like (15), a fact that was originally put forward as an argument against a simple binary ambiguity analysis of specificity. But (15) does not falsify Fodor and Sag's position, which allows island-obeying Quantifier Raising in addition to the inherent binary ambiguity. Since *a high*

American official in (15) is not embedded in an extraction island, the intermediate reading (15b) can be derived by Quantifier Raising the indefinite on its quantificational reading to the intermediate position. We will attempt to revive the argument from (15) in section 4.

11 . . . unless the copy of that variable in the elided VP is bound by the same quantifier (see below).

12 (30) assumes a 'deletion under LF identity' approach to VP ellipsis, as in Sag (1980) and Fox (1995b); under Williams's (1977) copying of LF theory, VP2 in (30) would contain an unbound variable.

13 Fiengo and May (1994: 232, fn. 34) likewise report on *every student hit someone, and every professor did, too* that it "permits a reading in which the existential has broad scope, but under which different people were hit."

14 Hirschbühler (1982), however, speculates that a sequence of sentences might constitute a single conjoined structure, allowing syntactic scope taking across sentence boundaries.

15 The right-hand conjuncts in (34) do not have a quantificational subject; Fox argues that QR is licensed here because it results in inverse scope relative to a covert quantifier over events and a generic quantifier, respectively. The reported intuitions on (28a) and (28c), however, remain unaccounted for.

16 For an introduction to Generalized Quantifier theory, see, e.g., Gamut (1991), Keenan (1996). (36b) paraphrases as: 'Among the sets whose intersection with the set of my relatives contains three elements, is the set of individuals wearing a tie.' This is equivalent to:

(i) $\exists X\,[X \subseteq \textbf{relative_of_mine'} \wedge |X| = 3 \wedge \forall x \in X\ \exists y[\textbf{tie'}(y) \wedge \textbf{wear'}(y)(x)]]$.

17 For an introduction to plurality, see Landman (1996) and references cited there.

18 (37a) is used here for simplicity's sake but may be susceptible to the objection that (taking *If* as material implication) (37c) entails (37d), creating a problem of the type hinted at in section 2.1 (see also Winter 1998: 95ff.). The problem does not arise with the examples given below. ((37) is not from Ruys 1992 but from Ruys 1995; however, it was deleted from the published version of that manuscript due to space limitations.) For those unfamiliar with Generalized Quantifiers: (37c) is equivalent to:

(i) $\exists X\,[X \subseteq \textbf{relative_of_mine'} \wedge |X| = 3 \wedge \forall x \in X$ [IF x dies THEN I will inherit a house]].

19 This description of the problem in terms of 'existential scope' and 'scope of distributivity' follows the detailed discussion of specificity and its interaction with distributivity/collectivity effects in Winter (1998).

20 I know of one example in the literature that has been claimed to show island-escaping distributive scope for a plural indefinite: Abusch's (1994: (44)):

(i) Every critic who reviewed two books by Henry Miller panned them.

Abusch states that (i) can be read as conveying that there is a set of two books by Miller, such that for each book x from this set, whoever reviewed x, panned x. If this intuition is genuine, it undermines the argument being made here, but it is hard to see how one could derive a wide-scope distributive reading for (i) without predicting that (37–39) also have such a reading, which they clearly do not. If we must choose

which intuition is genuine, I would hesitate to follow Abusch, for two reasons. First, the reading Abusch attributes to (i) is not logically independent from the reading that all agree on, the wide-scope non-distributive reading that there is a set of two books by Miller such that whoever reviewed both, panned both. The alleged distributive reading entails the non-distributive reading, and can therefore be explained away as a 'special case' (see section 2.1 above, and Abusch 1994: 88ff.). Second, Abusch appears to feel that a wide-scope distributive reading is also possible when we replace *two books* in (i) with the strong quantifier *most books* – if so, this cannot be an effect of specificity and her dialect must allow real island-insensitive QR. See also Winter (1997: fn. 21) for discussion of Abusch's claim.

21 This example represents joint work with Yoad Winter: see Winter (1997, 1998). That specific indefinites distribute locally was assumed also in Ruys (1992: 217) (but not demonstrated).

22 Verkuyl (1999: ch. 6) does allow inverse wide scope for *three books* in (41), albeit grudgingly.

23 For recent discussion of branching quantification see Beghelli et al. (1997), as well as references cited there.

24 Hence, the interpretation of *three books* given in (46a) is often described as the 'branching' or 'independent' reading. The similarity with the island-escaping non-distributive readings in (37–40) above, however, is often ignored, although it is hard to see how an account of specificity that explains the island-escaping examples could fail to explain the 'independent' reading (46a) as well. See also section 7.

25 This describes the approach advocated in Ruys (1992).

26 See section 5 for further discussion, and comparison of possible solutions.

27 And if ACD resolution is due to Case-movement in general, that still would not necessarily exclude the possibility that in certain instances ACD can be resolved through QR. This might explain why we find a contrast between QNPs and referential NPs in contexts without Case-movement such as (i):

(i) a. *Mary stood near Susan, who Emily did [$_{VP}$ e] as well.
b. Mary stood near everyone Emily did [$_{VP}$ e].

28 Actually, this is not quite true, since the structure really contains *four* scoped elements if we count the modal *has to*. Wide scope relative to this expression does not entail the narrow-scope reading. But taking advantage of this would again involve very subtle judgments.

29 Kamp and Reyle's (1993) 'abstraction'.

30 Other types of intervening scope takers are disallowed as well. Thus, (ia) only has a *de re* reading for *a dog*. As in (56d), we need to repeat the modal to obtain a *de dicto* reading, as (ib) illustrates; see also Roberts (1987):

(i) a. Every farmer who was looking for a dog found it.
b. Every farmer who was looking for a dog wanted it to be really big.

31 Fox suggests that the problem, if it exists, might be overcome by resorting to Kratzer's (1998) CF account without existential closure, to be discussed in section 7 below; but to the extent that Kratzer allows apparent intermediate-scope readings as an effect of functional readings on indefinites, she would also allow the intermediate reading (65a).

32 CF must then be of a higher type than stated in definition (60); we shall not discuss such technical details; the reader is referred to the publications by Reinhart and Winter cited above.
33 See Von Heusinger (1999) for a dynamic choice function approach to indefinites.
34 Yet another hypothesis might be that specific indefinites carry existence presuppositions; this naturally fits, e.g., the referential approach to specific indefinites advocated by Fodor and Sag (1982). We will not consider this option here; see Reinhart (1997: 388ff.) for some discussion. Reinhart also considers a way of using partial choice functions in a three-valued logic that emulates the Existential Hypothesis; see also Kratzer (1998).
35 An additional complication attends Reinhart's discussion of (76a). Strictly, she makes the same prediction as the Existential Hypothesis: that (76a) has a false reading next to its true readings. In view of (45b), she assumes that indefinites may undergo QR. If *two American kings* in (76a) QRs across the negation, the CF analysis renders the sentence false. Thus, in order to explain her observation that it is difficult to judge (76a) false, she must attribute it either to a pragmatic preference for true readings, thereby vindicating the Existential Hypothesis, or to a dispreference for QR in this context, to be explained. A similar problem attends Winter (1998: ch. 3, (128a)).
36 Many 'specificity markers' discussed in the literature (e.g., overt Accusative Case in Turkish; see Enç 1991) are either unrelated or only tangentially related to the 'specificity' phenomenon under discussion here.
37 This is not precisely the definition given in Winter (1997), which mistakenly lifts the embedded predicate (**snore′**) out of the intensional context as well; the corrected version (78c) is due to Yoad Winter (p.c.).
38 Furthermore, the context (81) is a scope island for *tot* 'every', so this wide-scope reading should be the only reading on the CF Hypothesis. I am grateful to Josep Quer for help in constructing these examples.
39 See the references cited above, and Ruys (1999), for further discussion.
40 See Abbott's (1995) excellent review of Enç (1991) for an illustration.
41 For instance, there is a considerable body of literature (much of it in the typological tradition, but also in the generative framework) on 'specificity markers' in various languages: Persian *râ* is a famous example (see, e.g., Browne 1970; Karimi 1990, 1999). Unfortunately, most of this work bears little relevance to our present concerns, for the reasons stated in the text. A recent exception is Matthewson's (1999) description of St'át'imcets: some indefinite determiners in this language force (island-escaping, non-distributive) wide scope; another indefinite determiner prevents it.
42 See also Ruys (2001).
43 For convenience, we will continue to call NPs with these determiners 'indefinites'. See the references cited above, and also Reinhart (1997), for discussion of other properties that set these determiners apart. Unfortunately, the generalization is not without exception; e.g., *exactly n* sometimes seems to allow a specific reading, as in *if exactly one relative of mine dies, I will inherit a house*.
44 Matthewson (1999), however, claims that in St'át'imcets, certain indefinite determiners force a wide-scope reading, and allow an intermediate- (or narrow-)scope reading only when the NP contains a bound pronoun. Matthewson takes this as evidence that existential closure of CF in this language is always in the widest scope position, contra Reinhart (1997) and Winter (1997, 1998).
45 Reniers concludes from this and similar problems that the CF line must be abandoned.

  5.1 Head-final derivations (inversion)
  5.2 Head-initial derivations (inversion)

1 Introduction

The term 'verb cluster' refers to constructions involving more than one verbal element, such as the examples in (1). The notation in this chapter will follow common practice used in works on verb clusters, which is to label the different verbal elements with numbers representing the hierarchical (i.e., deep-structure or selectional) order of the elements. In particular, ascending numbering will be used such that the structurally highest verb (i.e., the verb that scopes over all other verbs) is assigned 1, the next highest 2, etc. As the examples in (1a–c) show, in a language like English, the linear order of verbs in a verb cluster strictly follows the hierarchical order in that a verbal complement follows the selecting verb. To express, for instance, a sense that John is required to have the desire to leave, a sentence like (1a) would be used, whereas the sense that John has a desire to be required to leave would be expressed by a sentence like (1b). In a language like German, on the other hand, the linear order of verbs in a verb cluster corresponds to the opposite hierarchical order: as can be seen in (1d), the verbs appear in a descending 3-2-1 order – i.e., hierarchically lower verbs precede hierarchically higher verbs:

(1) **English vs. German:**
   a. John has to (1) want to (2) leave. (3)
   b. John wants to (1) have to (2) leave. (3)
   c. that John must (1) have (2) been (3) elected (4)
   d. daß Hans gewählt (4) worden (3) sein (2) muß (1)
      that Hans elected become be must

The contrast between (1c) and (1d) might not appear particularly surprising, given that the order between heads and complements is often inverted in the two languages. However, looking in more detail at the distribution of verb clusters in German and other West Germanic languages and dialects, it has been observed that the situation is in fact far more complex in that not only ascending and descending word orders are possible, but also (in at least certain languages and constructions) various other combinations. To give an illustration of (some aspect of) the verb-cluster phenomenon, consider Swiss-German. As is shown in (2) (cf. Schönenberger 1995: 382), constructions involving two modal verbs can (at least for certain Swiss speakers) be expressed with a fully ascending order of the verbs (cf. the 'English' order in (2a)), with a fully descending order as in (2b), or with mixed orders such as the 1-3-2 order in (2c) and the 3-1-2 order in (2d). Importantly, all versions of (2) have the same meaning – i.e., *want* takes scope over *can* and not vice versa.

(2) **Swiss-German – double modal construction:**
   a. das er ... wil chöne vorsinge
      that he ... wants (1) can (2) sing (3)

b. das er ... vorsinge chöne wil
that he ... sing (3) can (2) wants (1)
c. das er ... wil vorsinge chöne
that he ... wants (1) sing (3) can (2)
d. das er ... vorsinge wil chöne
that he ... sing (3) wants (1) can (2)
All: 'that he wants to be able to sing'

Beside differences among languages or dialects in the order of the verbal elements of a cluster, the distribution of verb clusters is also subject to various language-internal properties. As is illustrated by the contrast between the examples in (2) and in (3) (all from Swiss-German), different types of constructions do not necessarily allow the same orders. While double modal constructions can be represented by the four orders in (2), a modal(1)–auxiliary(2)–participle(3) construction is best in 1-3-2 order, accepted by some speakers in 3-2-1 order and 3-1-2 order, and excluded in 1-2-3 order:

(3) **Swiss-German – modal–auxiliary–participle construction:**
a. wil er si mues gsee ha
since he her must (1) seen (3) have (2)
b. %wil er si gsee ha mues
since he her seen (3) have (2) must (1)
c. %wil er si gsee mues ha
since he her seen (3) must (1) have (2)
d. *wil er si mues ha gsee
since he her must (1) have (2) seen (3)
All: 'that he must have seen her'

In the context of verb clusters a number of interesting empirical and theoretical questions have been raised, which this chapter attempts to summarize. Beginning with the empirical characterization – i.e., the determination of the (im)possible orders of verbal elements in different constructions and different languages and dialects – a phenomenon one is immediately struck by is the notable speaker, language, and dialect variation found in this area. It has long been known that among the West Germanic languages, closely related languages (in particular, languages with comparable syntactic properties) diverge significantly in the distribution of verb clusters. For instance, while Dutch and German are quite similar regarding the general layout of their syntactic structures, they show the exact opposite word orders in many verb-cluster constructions. Apart from these well-known differences among languages, recent dialect studies have revealed that the distribution of verb clusters also shows significant microparametric variation and that in addition to the 'standard' word orders reported in grammars, many other orders are possible in certain dialects as well. Some aspects of this complex distribution and the variation attested in verb clusters will be presented in section 2.

To see what the basic theoretical questions are that have been addressed in the works on clusters, we begin with a very simple example: an auxiliary–participle construction (i.e., a verb cluster involving two verbal elements). As is shown in (4), Dutch allows both of the two possible orders between these elements.

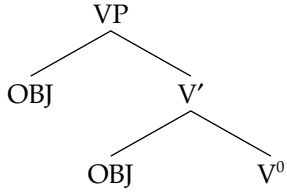
(4) **Dutch – auxiliary–participle construction:**

a.	dat	Jan	het boek	gelezen		heeft	
	that	Jan	the book	read	(2)	has	(1)
b.	dat	Jan	het boek	heeft		gelezen	
	that	Jan	the book	has	(1)	read	(2)

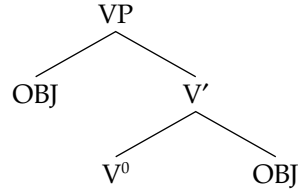
The first question raised by the distribution in (4) is whether the two orders are both basic orders (i.e., whether the two verbs are freely generated in any order) or whether there is a derivational relation between the two orders. The predominant view in the works on verb clusters is that only one of the orders in (4) is the basic order and that the other order is derived. The details of (i) what the basic order is and (ii) how the reordering is derived, however, are far from being agreed upon and have led to very interesting discussions among researchers interested in the topic.

One such issue is the question of whether languages like German and Dutch involve a head-initial or a head-final base structure. The traditional view is that the verb is base-generated to the right of its complement in Dutch and related languages (cf. (5a)), since objects generally precede the verbs in these languages. A more recent view, on the other hand, which has been inspired by Kayne's (1994) Linear Correspondence Axiom (LCA), is that all languages involve a basic head-initial structure (cf. (5b)) and that the final position of the verb is derived by leftward movement of the complement:

(5) a. **Head-final structure:**



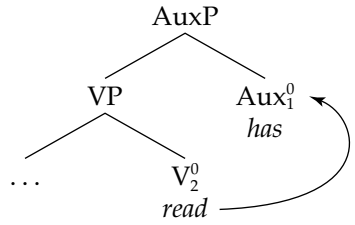
b. **Head-initial structure:**



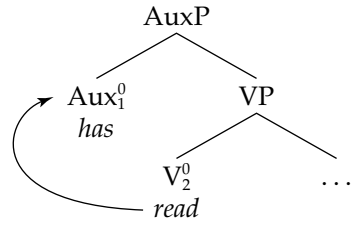
Assuming the different orders in verb clusters are not base-generated but derivationally related, one obviously has to pick one of the structures as the basic structure. An interesting question then is whether the distribution of verb clusters provides any indication for the superiority of one of the approaches in (5). As we will see in the course of this chapter, the mechanical derivation of the possible word orders is fairly trivial under both a head-final and a head-initial structure, given generous assumptions about movement possibilities. To give a basic illustration, consider again the two orders in (4). Assuming a basic head-final structure (cf. (6a)), nothing is required to derive the 2-1 order, whereas the

1-2 order would require reordering such as rightward movement of the lower verb or verb phrase. Assuming a basic head-initial structure (cf. (6b)), nothing is required to derive the 1-2 order, whereas the 2-1 order would require reordering such as leftward movement of the lower verb or verb phrase:

(6) a. **Head-final structure:**



b. **Head-initial structure:**



Thus, this overview will show that the question of whether one of the two approaches in (6) is superior cannot be determined on purely empirical grounds. The more interesting question then is whether one of the two approaches is superior in terms of its explanatory power. Comparing representative examples of both approaches, the conclusion this chapter will reach (see section 3.4) is that the choice between the two approaches can only be made in conjunction with the choice of a particular syntactic framework or aspect of a syntactic theory, and hence the decision between the head-final and the head-initial structure is largely a subjective one.

Besides the directionality issue, questions that have been discussed concerning the actual derivation of the different orders in verb clusters (i.e., the technical implementation of the arrows in (6)) include the question of whether the reorderings involve head-movement or phrasal movement, the question of what the target positions are, the question of what the triggers for the reorderings are, and the question of where the reorderings apply (i.e., surface structure, PF, LF). Furthermore, an interesting issue that is raised by verb clusters is the question of what elements are involved in clustering phenomena. As we have seen in the Swiss examples in (2) vs. (3), verb clusters are not homogeneous constructs (in one and the same language), but rather, different orders depend crucially on the category of the elements involved. In general, clustering phenomena are found with auxiliaries and modal verbs. In some languages, other so-called 'restructuring verbs' (which include, for instance, *try*, *begin*, *dare*) also participate in various reordering phenomena. Since in many approaches, auxiliaries and modal verbs are distinguished from full main verbs, the distribution of verb clusters also raises interesting questions regarding the general architecture of clauses, the classification of verbal elements (auxiliaries vs. main verbs, functional vs. lexical categories, thematic vs. non-thematic verbs), and the issue of restructuring.

The aim of this chapter is to present the progress that has been made in answering these questions. The works on verb clusters have brought to light a wealth of fascinating facts, and among the numerous interesting proposals on the topic, many insightful explanations have been offered as answers to the issues

mentioned. There is, however, one question which has not received a fully satisfactory answer yet. As we will see in the course of this overview, many interesting accounts have been suggested addressing the question of *how* verb clusters are derived. However, what still appears to be an open question is that of *why* the elements of a verb cluster are inverted in certain languages and constructions. An answer to the question of what the (deep) motivation of verb-cluster formation is and why this phenomenon exists only in certain languages is still outstanding, and any new insight into this question would be highly beneficial not only to the study of verb clusters and restructuring, but also to our general understanding of clause structure and the architecture of grammar.

This overview is organized as follows. Section 2 presents a summary of the empirical situation of verb clusters as attested so far in some West Germanic languages and dialects, and provides a descriptive account along the lines of the analysis developed in Haegeman and Van Riemsdijk (1986). Section 3 addresses the questions of whether verb-cluster reordering involves head or phrasal movement, what the motivation of verb-cluster reordering is, and whether a head-final or a head-initial approach can be considered to be superior. Finally, section 4 presents an overview of the restructuring phenomenon and summarizes the major findings related to this topic.

2 Empirical overview

2.1 Verb-cluster languages

To define the set of languages that display verb-cluster phenomena, various criteria have been invoked depending on the theoretical background assumptions. The most common criterion is word order: a language is a verb-cluster language if it does not display a rigid word-order pattern in multiple verb constructions – i.e., if the unmarked order of verbal elements is different from the underlying order in at least one construction.[1] Languages that fall into this category (independently of whether one takes the underlying order to be a head-final or a head-initial order) are Afrikaans, Dutch, German, Swiss-German, West Flemish (including all the dialects of these languages), and Hungarian. Setting aside Hungarian, which differs from the other languages in many respects, the remaining languages have all traditionally been characterized as head-final. However, the correlation between the head-final nature of these languages and verb-cluster formation might also be challenged. First, apart from Hungarian, one could see Yiddish as a counter-example to the generalization that all head-initial Germanic languages display a rigid 1-2-3 order. Since Yiddish, which many researchers treat as a head-initial language, allows optional reordering of passive participles in multiple verb constructions (cf. Den Besten and Moed-van Walraven 1986), Yiddish could be classified as a head-initial verb-cluster language. Second, it can be debated whether all head-final Germanic languages indeed display verb-cluster phenomena. Frisian, for instance, features a rigid 3-2-1 order in modal and auxiliary

constructions (i.e., configurations that typically show clustering effects in other languages; see sections 2.2 and 2.3). Assuming an underlying OV structure, Frisian thus would not involve any verb-cluster reordering. If, however, the empirical domain is extended to include *te/to/zu*-infinitives, certain reorderings are obligatory (cf. De Haan 1992, 1993, 1996), and hence Frisian would qualify as a verb-cluster language, allowing us to maintain the generalization that all head-final Germanic languages are verb-cluster languages.

In light of more recent approaches – in particular, approaches that are based on the Universal Base Hypothesis (cf. Kayne 1994) – the 'head-initial' vs. 'head-final' distinction is not a grammatical notion, since all languages are considered to be organized along a head-initial schema. Hence, the generalization noted above cannot be stated by referring to the directionality setting of the base structure. Thus, in these approaches, verb-cluster languages do not share an underlying typological property, but are rather defined by the overt/covert settings of various movement operations or the factors that trigger verb-cluster formation itself.

A further commonality of the (Germanic) verb-cluster languages that has been noted in the works on verb clusters is the so-called Infinitivus Pro Participio ('Infinitive For Participle', or IPP) effect. As illustrated in (7), Dutch modal verbs that occur in a perfective construction (i.e., under the auxiliary *have*) do not show up as participles but rather as infinitives (the same is the case for causative and perception verbs, as well as other restructuring verbs in Dutch):

(7) **Dutch – Infinitivus Pro Participio (IPP):**

a. dat Jan het boek heeft kunnen lezen
that Jan the book has (1) can-IPP (2) read (3)
'that Jan has been able to read the book'

b. *dat Jan het boek heeft gekund lezen
that Jan the book has (1) can-PART (2) read (3)
'that Jan has been able to read the book'

The IPP effect is found in Dutch, German, and West Flemish – i.e., languages that are also classified as verb-cluster languages.[2] Thus, an interesting question arising from this first generalization is whether there is a strong or weak correlation between the IPP effect and verb-cluster formation (i.e., whether it is the case that all languages displaying the IPP effect also involve verb-cluster reordering and/or whether it is the case that all languages involving clustering also display the IPP effect). Other languages that have to be considered in this respect are Afrikaans, Frisian, and Swiss-German. Note first that Afrikaans and Swiss-German, which are other clustering languages (again independently of the base structure), appear to be irrelevant for the present issue, since these languages do not distinguish between infinitives and participles, and hence, it is not testable whether these languages display the IPP effect (cf. Robbers 1997 for Afrikaans and Schönenberger 1995 for Swiss). Turning to Frisian, it has been noted that Frisian permits only rigid descending (i.e., 3-2-1) orders in multiple-verb constructions (except – as pointed out above – in constructions with *to*-infinitives); thus, under a head-final

base structure, no reordering takes place in these constructions in this dialect. If the IPP effect is only found when reordering takes place we would expect that Frisian should not display the IPP effect. According to what is reported in the literature, this seems to be correct. It has been pointed out by a number of researchers (cf., for instance, De Haan 1992; Hoekstra and Taanman 1996; IJbema 1997) that Frisian lacks the IPP effect (in the descending order).[3] Thus, we can state a one-way generalization between languages that involve verb-cluster reordering and languages that display the IPP effect: IPP is only found in languages that divert from the strict descending 3-2-1 order. Although this correlation appears to be quite striking and is unlikely to be accidental, it is not clear what property of grammar it targets and what its importance is. The reason is that this correlation is an indirect generalization about languages and not about a causal relationship between the properties involved (verb-cluster formation and the IPP effect). To strengthen the IPP/verb-cluster correlation, it has therefore been suggested that there is in fact a direct causal relationship between the IPP effect and verb-clustering (see, for instance, Den Dikken 1989; Van der Meer 1990). This step, however, has to be taken with some caution (see IJbema 1997 for a critical overview of this issue).

Although a detailed illustration will be postponed until section 2.3 (see in particular table 75.2), it should be mentioned at this point that (i) the IPP effect is licensed in the presence and absence of verb-cluster formation; and (ii) verb-cluster formation takes place in the presence and absence of the IPP effect. Regarding the first point, it is the case that independently of what one considers to be the base structure for the languages under consideration, there are constructions displaying the IPP effect but lacking verb-cluster reordering (assuming a head-final base structure, certain Austrian and German dialects would be problematic for the claim that the IPP effect is triggered by or tied to verb-cluster reordering; assuming a head-initial base structure, Dutch, Swiss-German, and West Flemish IPP constructions would be problematic for this claim). Thus, verb-cluster reordering cannot be seen as the (sole) cause of the IPP effect. Regarding the second point, we will see that verb-cluster formation takes place in all types of constructions (e.g., double modal constructions, auxiliary–participle constructions) and is not restricted to IPP constructions. Furthermore, IJbema (1997) also shows that there are dialects such as Achterhoeks where, although reordering takes place in potential IPP constructions, the IPP effect nevertheless does not occur or is optional in these constructions. Thus, the IPP effect cannot be considered to be the cause for clustering.

In sum, while there are interesting generalizations between verb-cluster reordering and the directionality setting of a language as well as the IPP effect, the generalizations are only one-way and direct causal relationships between these properties cannot be established. In what follows, an overview of the distribution of verb clusters in West Germanic will be provided (Hungarian is set aside here; the reader is referred to Koopman and Szabolcsi 2000). Since the majority of works on verb clusters concentrate either on a single construction or on a single language or dialect, it is sometimes hard to see how particular word orders and

specific theoretical claims and analyses relate to a more global characterization of this phenomenon. The aim of the following overview is hence to present a summary of the verb-cluster patterns as documented for the major West Germanic languages and dialects. While this empirical overview has the aim of presenting the verb-cluster patterns for all major constructions in any given language, it also has to be kept in mind that it is by no means an exhaustive characterization – in particular, many interesting micro-parametric differences cannot be distinguished here. The overview will then form the basis for the subsequent review of the theoretical accounts of the verb-cluster phenomenon.

2.2 *Two-verb clusters*

The constructions involving verb clusters with two verbs are auxiliary–participle constructions (e.g., *John has left*) and auxiliary/modal–infinitive constructions (e.g., *John will/must leave*). Table 75.1 summarizes the possible word orders for two-verb clusters in a number of West Germanic languages/dialects; data illustrating these orders are provided in the appendix to this chapter.

The following three generalizations emerge from the languages/dialects investigated so far. First, the distribution of auxiliary–participle constructions does not (necessarily) coincide with the distribution of modal–infinitive constructions. In

Table 75.1 Verb clusters with two verbal elements

Language	Aux-Part	Mod-Inf
Afrikaans	2-1	1-2[a]
Dutch (1 = finite)	1-2	1-2
	2-1	2-1
Dutch (1 = non-finite)	1-2	1-2
	2-1	
Frisian	2-1	2-1
German	2-1	2-1
Swiss-1	2-1	2-1
		1-2
Swiss-2	2-1	2-1
	1-2	1-2
West Flemish	2-1[b]	1-2

Notes:

[a] *Come* + INF allows the 2-1 order (Robbers 1997).

[b] 1-2 is possible if 2 is followed by an extraposed PP or CP (Haegeman 1995a: 53; 1998c: 294).

Sources: References are given only for cases that might be considered to be controversial or are not well established.

Swiss-1: Schönenberger (1995); Haeberli (p.c.); Van Riemsdijk (p.c.).

Swiss-2: Schönenberger (p.c.; Bernese), Hsiao (1999, p.c.).

Frisian: Quoted from Zwart (1996) and IJbema (1997); confirmed by the results of a questionnaire conducted by Peter Ackema.

Afrikaans, Dutch (when 1 is non-finite), Swiss-1, and West Flemish, the orders vary with respect to the constructions involved – i.e., there is no general (1-2 or 2-1) word order schema for two-verb clusters in these languages. Note in particular that in Afrikaans and West Flemish, where only one order is possible in each construction, the order required in the auxiliary–participle construction is excluded in the modal–infinitive construction (and vice versa). Second, the 2-1 order is possible in all dialects for auxiliary–participle constructions. In other words, no dialect requires the 1-2 order in this construction (this is again different in the modal–infinitive construction). Third, if the 1-2 order is possible in an auxiliary–participle construction it is also possible in the modal–infinitive constructions (but not vice versa).

Given the distribution in table 75.1, dialects can be grouped into five types: (i) dialects with rigid 2-1 order (German, Frisian); (ii) dialects with rigid 2-1 order in auxiliary–participle constructions, but flexible order in modal–infinitive constructions (Swiss-1); (iii) dialects with flexible order in both constructions (Swiss-2, Dutch when 1 is finite); (iv) dialects with flexible order in auxiliary–participle constructions and finite modal–infinitive constructions, but rigid 1-2 order in non-finite modal–infinitive constructions (Dutch when 1 is non-finite); and (v) dialects with rigid 2-1 order in auxiliary–participle constructions and rigid 1-2 order in modal–infinitive constructions (West Flemish, Afrikaans). What appears to be unattested (at least to this end) are, first, dialects that display clustering effects but only allow a 1-2 order for auxiliary–participle constructions, and, second, languages that allow a flexible order for auxiliary–participle constructions but a rigid 2-1 order for modal–infinitive constructions.

2.3 Three-verb clusters

The five major types of constructions involving verb clusters with three verbal elements are: double modal constructions, two types of auxiliary–modal constructions, modal–auxiliary constructions, and double-auxiliary constructions.[4] Examples are given in an abstract form in (8) (English words are used to illustrate the constructions, but of course, some of the examples would be impossible in English, since modals can only be part of a multiple-verb construction when they are the highest verbal element in English). Constructions involving infinitival complements with an infinitival marker (*to*, *zu*, *te*, etc.) are not considered in this section (see section 3.1.3 and section 4):

(8) a. **Mod-Mod-V:** John must (1) can (2) sing. (3)
FIN (1) INF (2) INF (3)
'John must be able to sing.'

b. **Aux-Mod-V:** John will (1) must (2) sing. (3)
FIN (1) INF (2) INF (3)
'John will have to sing.'
John has (1) must (2) sing. (3)
FIN (1) IPP (2) INF (3)
'John has had to sing.'

c. **Mod-Aux-V:** John must (1) have (2) sung. (3)
John must (1) be (2) elected. (3)
FIN (1) INF (2) PART (3)
d. **Aux-AUX-V:** John has (1) been (2) elected. (3)
FIN (1) PART (2) PART (3)

The distribution of these constructions in various West Germanic languages and dialects is given in table 75.2 (for examples the reader is referred to the appendix to this chapter). Note that the rows 'German and Austrian dialects' and 'Swiss dialects' refer to the superset of various dialects (i.e., there are speakers who accept all the orders listed, however, there are also speakers who only accept subsets of these orders). The reader is referred to Hsiao (1999, 2000) and Wurmbrand (2000, 2004) for some more refined characterizations of the distribution in different dialects. If a cell contains more than one option, the word orders are given in order of preference where the highest order one is the most preferred option. Furthermore, it should be noted that column 4 (i.e., 'AUX-MOD-V; FIN-IPP-INF') refers to the orders in the second construction in (8b) irrespective of whether a language overtly displays the IPP effect. In Afrikaans, for instance, infinitives and particles are non-distinct and hence it cannot be concluded that the modal verb occurs in the IPP form. However, as the different word orders show, it is still necessary to distinguish this construction from others.

Before going into details about the distribution of verb clusters, some general points should be noted. First, of the six possible combinations involving three verbal elements, five orders are indeed possible. The 2-1-3 order, on the other hand, has not been attested in any of the constructions or languages and dialects in table 75.2 (it is found in extraposition contexts; however, many authors have argued that these constructions display different properties and have to be distinguished from the constructions in table 75.2; see, for instance, Rutten 1991, Robbers 1997, and Wurmbrand 2001). Furthermore, the 2-3-1 order is found only in the IPP construction.

Second, as is evident from table 75.2, verb-cluster reordering is not restricted to a particular type of construction (such as the IPP construction), but is found in all types of constructions. Since the fully ascending and descending orders do not necessarily involve reordering (i.e., the 1-2-3 and 3-2-1 orders could be treated as basic orders depending on whether one takes a language to follow the head-initial or head-final schema), we restrict our attention for the moment to the 1-3-2, 3-1-2, and 2-3-1 orders, which clearly involve some sort of reordering under both the head-final and the head-initial approach. As the table shows, at least one language displays one or more of these orders in each construction: German/Austrian dialects and Swiss-German in the double-modal construction; all varieties of German in the auxiliary–modal construction; Afrikaans, all varieties of German, Swiss, and West Flemish in the IPP construction; Afrikaans, Dutch, German/Austrian dialects, Swiss, and West Flemish in the modal–auxiliary–participle construction; and Dutch and West Flemish in the double-participle construction. Thus, as mentioned before, since verb-cluster reordering is neither restricted to IPP environments nor necessary in IPP constructions, it cannot be assumed that

Table 75.2 Verb clusters with three verbal elements

Language	Mod-Mod-V Fin-Inf-Inf	Aux-Mod-V Fin-Inf-Inf	Aux-Mod-V Fin-IPP-Inf	Mod-Aux-V Fin-Inf-Part	Aux-Aux-V Fin-Part-Part
Afrikaans	1-2-3	1-2-3	2-3-1	1-3-2 3-1-2[a]	N/A
Dutch	1-2-3	1-2-3	1-2-3	1-2-3 3-1-2 1-3-2 [3-2-1]	?3-1-2 ?1-3-2 [?Others]
Frisian	3-2-1	3-2-1	3-2-1 [1-2-3][b]	3-2-1	3-2-1
German (Standard)	3-2-1	3-2-1 1-3-2	1-3-2	3-2-1	3-2-1
German and Austrian dialects	3-2-1 1-3-2	3-2-1 1-3-2 3-1-2	1-3-2 3-1-2 3-2-1 [1-2-3]	3-2-1 1-3-2	3-2-1
Swiss dialects	1-2-3 3-2-1 1-3-2 3-1-2	N/A	1-2-3 1-3-2 3-1-2	1-3-2 3-2-1 3-1-2	3-2-1
West Flemish	1-2-3		1-2-3[c] 2-3-1[c]	1-3-2 3-1-2	3-2-1 1-3-2

Notes:
Orders in brackets are attested but very restricted in the language for which they are listed and could not be verified; these orders will not be considered as possible orders for these languages, but they are listed in the table to indicate that a further refinement and dialect separation is necessary.
[a] 3-1-2 is only possible when 2 is a passive auxiliary.
[b] IPP is not obligatory; some speakers do not use IPP; 1-2-3 is mentioned in Hoekstra and Taanman (1996) and IJbema (1997) for certain constructions (perception verbs and aspectual auxiliaries) in West Frisian.
[c] 1-2-3 is obligatory when the auxiliary is in the past or has a negative marker attached; 2-3-1 is obligatory when the auxiliary is non-finite.
Sources: **Dutch:** The 1-3-2 and 3-2-1 orders for the Mod-Aux-V construction are mentioned in Zwart (1996), IJbema (1997), and Robbers (1997); the authors note variation among Dutch speakers; the 3-2-1 order is possible in certain Dutch dialects (but very marked). Double-participle constructions involving *geworden* are generally considered marginal; for double-participle constructions involving *get*+ PART (i.e., 'has gotten PART'), the 1-3-2 order is mentioned in Robbers (1997: 124).
Frisian: Quoted from De Haan (1993), Zwart (1996), and IJbema (1997); confirmed by Peter Ackema (p.c.).
German: The orders are the result of a literature survey and a questionnaire-based study conducted by the author in 1999–2000 (approx. 100 informants; see Wurmbrand 2000 for detailed results); the 1-3-2 order is documented for the double-modal construction in Den Besten and Edmondson (1983), Broekhuis (1992: 189), and Koopman (1999a), and confirmed by a subgroup of the informants of the questionnaire-based study; the 1-3-2 order is noted for the Mod-Aux-V construction in Zwart (1996) but confirmed by only very few of the informants (mainly speakers from Vorarlberg); the 3-1-2 order is reported

in Patocka (1997) as the unmarked order in Austrian German, which was robustly confirmed for both AUX-MOD-V constructions by the informants of the questionnaire-based study (the 3-1-2 order has not been tested for the other modal constructions); the 1-2-3 order for the IPP construction was accepted by only a very small group of informants and was rejected in most non-Allemanic dialects; a systematic documentation of the variation in the IPP construction is also available in Hsiao (1999).
Swiss: Schönenberger (p.c.), Haeberli (p.c.), Van Riemsdijk (p.c.), and five other consultants. The auxiliary *will* is not used in Swiss dialects and therefore this construction could not be tested. A systematic dialect characterization (and in particular, a survey of how the distinction between Swiss-1 and Swiss-2 in two-verb clusters compares to the options in three-verb clusters) is not available at this point.

a causal relation holds between these two properties. This point is particularly important for (Standard) German. As has been observed by many researchers, the IPP construction is special in German, since it involves obligatory reordering, which contrasts with the otherwise typical 3-2-1 order in that language. However, what has often been ignored (but see Kathol 1996, 1998a, 1998b for exceptions) is that the special reordering is *not* restricted to IPP constructions but is also found in auxiliary–modal constructions in which the 'auxiliary' is the future element *werden* 'will'. Importantly, these constructions are not IPP constructions, but involve an infinitive which is selected by the future element. Thus, the generalization regarding Standard German is that the 3-2-1 order is obligatory in all constructions except auxiliary–modal constructions. Thus, the 1-3-2 order cannot be attributed to the IPP property but has to be seen as a special property of auxiliary–modal constructions.

Third, it is also obvious from the distribution in table 75.2 that verb-cluster formation cannot be seen as a simple rule or operation that arranges verbs in multiple-verb constructions according to some language-specific hierarchical schema (such as 'the lowest verb precedes/follows the n-highest verb'). Rather, the distribution of verbal elements is crucially dependent on the type of construction. This is most strikingly the case in West Flemish. West Flemish allows all five orders attested in verb clusters; however, the distribution of these orders is severely restricted by the type of construction: the 1-2-3 order is possible only in the double-modal construction and certain IPP constructions; the 1-3-2 order is possible only in participle constructions; the 3-1-2 order is possible only in the modal–auxiliary–participle construction; the 3-2-1 order is possible only in the double-auxiliary construction; and finally, the 2-3-1 order is restricted to IPP constructions. Thus, an account of the distribution of word orders in multiple-verb constructions has to take into account the language-specific and construction-specific nature of this phenomenon.

While the distribution in table 75.2 might look overwhelming at first sight, there are generalizations that emerge both within one language and across languages. In particular, the word-order patterns show interesting generalizations when the category of the elements involved is taken into consideration. This is most clearly the case in Dutch. Dutch verb clusters display a rigid 1-2-3 schema, with the exception that participles are free to occur anywhere in the cluster. That is, if 3 is a participle, it can occupy any position in the cluster, resulting in three

possible word orders: {3}-1-{3}-2-{3}. We can also note that participles can always precede the auxiliary (with the possible exception of the passive auxiliary *werden* 'become' in Dutch); i.e., if 3 is a participle, the order 3 . . . 2 is possible (but not necessary) in all dialects; or in other words, there is no dialect that requires the auxiliary to precede the participle (in fact, Dutch is the only language that allows the participle to follow the auxiliary; cf. the 1-2-3 order in the modal–auxiliary–participle construction).

In the next section, the generalizations regarding the distribution of verb clusters in the languages/dialects mentioned will be fleshed out. The (descriptive) generalizations will be stated from both a head-final and a head-initial perspective in the framework of the analysis of Haegeman and Van Riemsdijk (1986).

2.4 Generalizations of the inversion patterns

One of the first works that takes into account the variation in the distribution of verb clusters across West Germanic is the reanalysis approach suggested by Haegeman and Van Riemsdijk (1986). The account consists of two parts. First, the authors propose that in certain constructions (namely, in restructuring constructions that show verb-cluster phenomena) the underlying structure can be 'reanalyzed'. Reanalysis is essentially a rebracketing procedure for syntactic structure which reduces the distance between the elements in a cluster and unifies elements that are further away in the basic structure. The second part of the analysis is the postulation of PF-inversion rules that specify which elements can, cannot, or have to invert in a reanalyzed structure. Thus, in contrast to most syntactic approaches to the verb-cluster phenomenon (see section 3), Haegeman and Van Riemsdijk suggest that reordering operations are not operations of syntax proper; rather, reordering operations are post-syntactic morpho-phonological operations (this view has recently been revived again by Wurmbrand 1999c, 2000, 2004). The inversion parameters suggested by Haegeman and Van Riemsdijk (1986) are summarized in (9). As can be seen, the rules consist of specifications regarding the complexity of the inverting elements (cf. (9a)), the category of the inverting elements (such as modal, auxiliary, etc.), a specification regarding (non-)optionality, and specifications regarding the node dominating the inverting elements (cf. (9d), which states that the node Vα that dominates the inverting elements has to or does not have to be the highest node in a verb cluster):

(9) **Inversion – main parameters** (Haegeman and Van Riemsdijk (1986: 426)):
   a. The non-head must be (non-)branching or need not be branching.
   b. The head of V must be V-AUX or V-MOD or is unrestricted.
   c. Inversion is optional or obligatory.
   d. Vα is maximal or unrestricted.

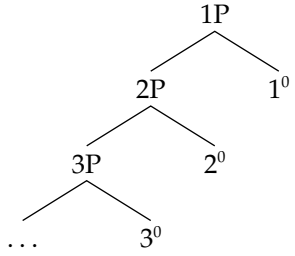
Since the Haegeman and Van Riemsdijk system offers a straightforward way to formulate the conditions regulating verb-cluster formation in the different languages, it will be used here (in a slightly modified way) to illustrate the generalizations and the specifications necessary to capture the distribution of the

verb clusters in tables 75.1 and 75.2. Whether the first step in a verb-cluster configuration – i.e., the step that creates mono-clausal structures – indeed involves reanalysis as Haegeman and Van Riemsdijk suggest, or any other mechanism that has been suggested to account for clause union or restructuring constructions (see section 4), will not be essential for the discussion here. Furthermore, although the Haegeman and Van Riemsdijk analysis is coached in a head-final approach, the inversion rules will be provided for both a head-final and a head-initial system. Note that the derivations suggested below will be preliminary and require certain revisions as we go on. However, this preliminary overview seems instructive as a first approximation to the question of how all the structures in the tables above can be derived.

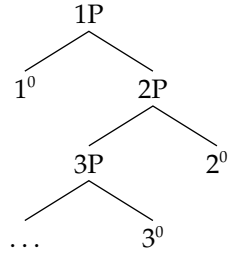
The major idea of inversion is that under certain circumstances, two sister nodes are flipped with each other (see also Williams 1998, 1999, 2004 for a more recent implementation of this idea). Inversion in this sense is reminiscent of precedence constraints as developed in the HPSG framework by, for instance, Kathol (1996, 1998a, 1998b) and Meurers (1999), among many others. As illustrated in (10) and (11), inversion of sister nodes straightforwardly derives the orders 3-2-1, 1-2-3, 1-3-2, and 2-3-1 in three-verb clusters. To be more specific, under the head-final approach, the 3-2-1 order in (10a) is the basic structure which does not involve any inversion; the 1-3-2 order is derived by inverting the highest verb with its sister (cf. (10b)); the 2-3-1 order is derived by inverting the middle verb with its sister (cf. (10c)); and the 1-2-3 order is derived by inverting both the highest and the middle verb with their sisters (cf. (10d)). Similarly, under the head-initial approach, the 1-2-3 order in (11a) is the basic structure which lacks any inversion; the 2-3-1 order is derived by high inversion (cf. (11b)); the 1-3-2 order is derived by low inversion (cf. (11c)); and the 3-2-1 order is derived by both high and low inversion (cf. (11d)). Regarding the 3-1-2 order, however, simple inversion of sister nodes is not sufficient and both approaches have to make recourse to an additional operation. One option would be to assume that the lowest verb phrase undergoes some form of leftward movement prior to or independent of verb-cluster inversion. As illustrated in (10e), if this form of leftward movement is followed by high inversion, the 3-1-2 order is derived in a head-final structure. Similarly, in (11e), leftward movement of the lowest verb phrase yields the 3-1-2 order (in this approach, additional inversion would result again in the 3-2-1 order).[5]

(10) **Head-final inversions:**

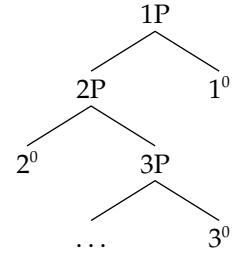
a. **No inversion:**



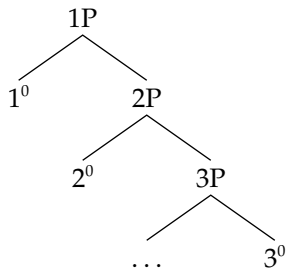
b. **High (=1-2) inversion:**



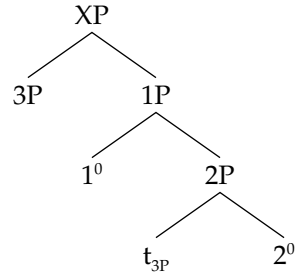
c. **Low (=2-3) inversion:**



d. **Two inversions:**

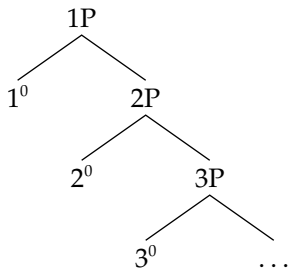


e. **Leftward movement of 3: and high inversion:**

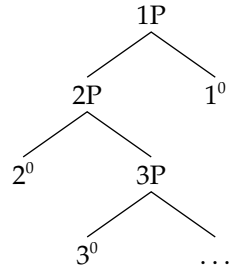


(11) **Head-initial inversions:**

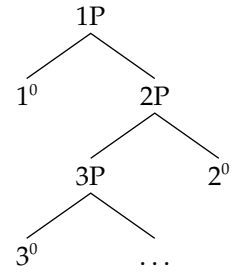
a. **No inversion:**



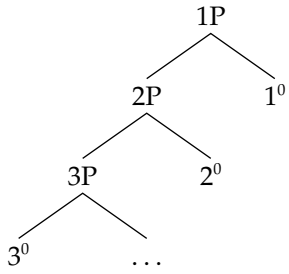
b. **High (=1-2) inversion:**



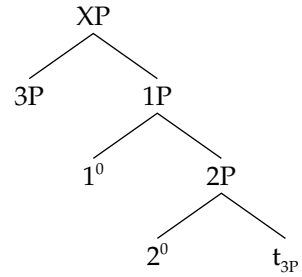
c. **Low (=2-3) inversion:**



d. **Two inversions:**



e. **Leftward movement of 3:**



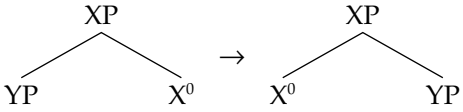
Importantly, if inversion under sisterhood and leftward movement of the lowest verb phrase are the only tools available to derive verb-cluster constructions (modulo object movement, etc.), the lack of the 2-1-3 order can be accounted for. To derive this order in the head-final approach, rightward movement of the lowest verb phrase would be necessary; to derive it in the head-initial approach, movement of 2 to the exclusion of 3 would be necessary.

Armed with these tools, let us now turn to the generalizations and specifications required to account for the distribution of verb clusters in the languages mentioned in tables 75.1 and 75.2. Starting with the head-final approach, the inversion rule is given in (12) and the conditions under which inversion applies are listed in table 75.3 ("3-LEFT" refers to leftward movement of 3 as in (10e))[6].

Table 75.3 Inversion rules (head-final base)

Language	Inversion rules	Optionality	Other
Afrikaans	X is a modal	Obligatory	• *Will*: modal • Passive participles: optional 3-LEFT
Dutch	A: Y is an infinitive B: Y is a participle	A: Obligatory B: Optional	• Inversion is optional in finite 2-verb clusters • Participles: optional 3-LEFT
Frisian	No inversion	–	–
German (Standard)	X is an auxiliary and Y is a modal	Obligatory	• *Will*: modal or auxiliary
German/Austrian dialects	Y is a non-main verb infinitive	Optional	• AUX-MOD-V: optional 3-LEFT
Swiss dialects	A: X is an auxiliary and Y is a modal B: Y is an infinitive	A: Obligatory B: Optional	• Optional 3-LEFT • 3-2 inversion only if 2-1 inversion
West Flemish	A: X is an operator (MOD, TENSE, NEG) and Y is an infinitive B: X and Y are auxiliaries	A: Obligatory B: Optional	• Present: [±TENSE] • MOD-AUX-V: optional 3-LEFT

(12) **Head-final inversion rule:**

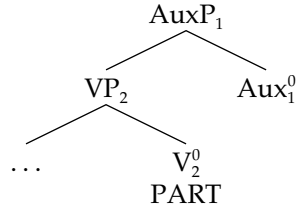


iff the conditions in table 75.3 hold.

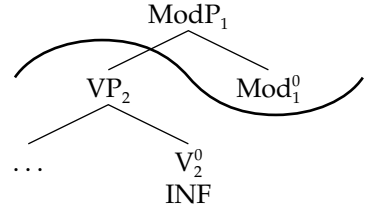
An illustration of these inversion rules is provided in (13), which summarizes the application of the inversion rules in Afrikaans (all data are from Robbers 1997). The Afrikaans inversion rule is stated such that it applies obligatorily to modals and their complements.[7] Thus, in (13b, c, d, e, e'), inversion applies as indicated. Furthermore, it is assumed that the future 'auxiliary' is a modal in Afrikaans, which has been argued for independently by, for instance, Erb (2001). Thus, future constructions behave essentially like double-modal constructions. Finally, passive participles allow the special leftward movement (cf. (13e')), in which case inversion between the modal and its complement does not include the lowest VP – resulting in the 3-1-2 order. Assuming that no other inversions are allowed, the rule specifications given in table 75.3 derive exactly the structures attested in Afrikaans and only those structures. An illustration of the inversion rules in the other languages can be found in the appendix to this chapter.

(13) **Afrikaans – head-final inversions:**

a. **AUX-PART (no inversion – 2-1):**



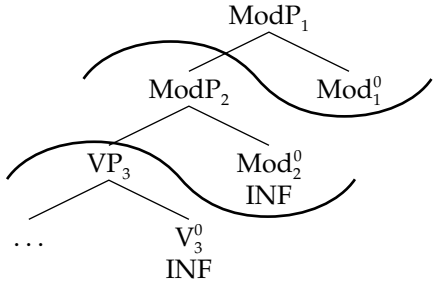
b. **MOD-INF (inversion – 1-2):**



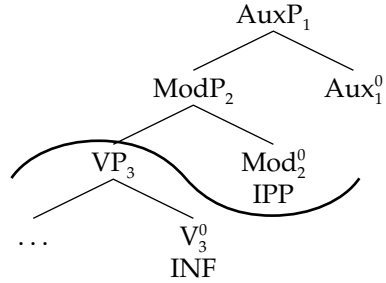
a. dat Jan Marie gesien het / *het gesien
that Jan Marie seen-2 has-1 / *has-1 seen-2

b. dat Jan môre kan werk / *werk kan
that Jan tomorrow can-1 work-2 / *work-2 can-1

c. **MOD-MOD-V**
(2 inversions – 1-2-3):



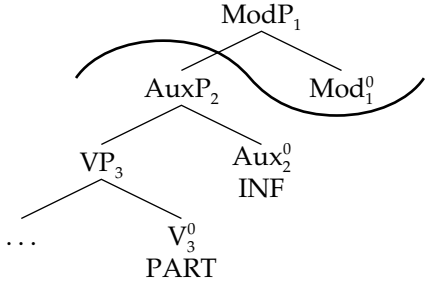
d. **AUX-MOD-V**
(1 inversion – 2-3-1):



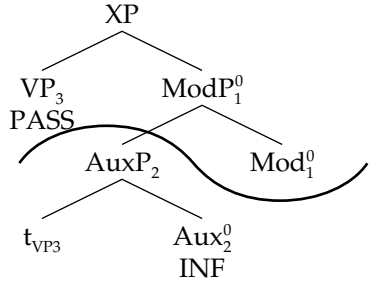
c. dat Jan môre sal kan werk (*All others)
that Jan tomorrow will-1 can-2 work-3

d. dat Jan kon werk het (*All others)
that Jan could-2 work-3 has-1

e. **Mod-Aux-V**
(1 inversion – 1-3-2):



e′. **Mod-Aux-V (1 inversion + 3-LEFT – 3-1-2):**

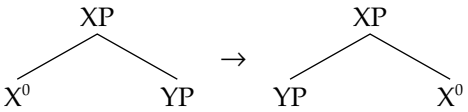


e. dat Jan Marie kan gesien het (*All others)
that Jan Marie can-1 seen-3 have-2
dat Jan toe kon gevang word
that Jan then could-1 caught-3 be-2

e′. dat Jan toe gevang kon word
that Jan then caught-3 could-1 be-2

Turning to the head-initial approach, the inversion rule is given in (14) and the specifications necessary to derive the verb cluster patterns are listed in table 75.4.

(14) **Head-initial inversion rule:**



iff the conditions in table 75.4 hold.

To illustrate these rules, consider again Afrikaans; the head-initial derivations are given in (15) (the derivations for the other languages can be verified in the appendix to this chapter). In Afrikaans, auxiliaries invert obligatorily with their sisters (thus (15a, d, e) involve inversions as indicated). Assuming that *will* is a modal again groups future constructions with double-modal constructions rather than with IPP constructions and no inversion takes place in (15b, c). Finally,

Table 75.4 Inversion rules (head-initial base)

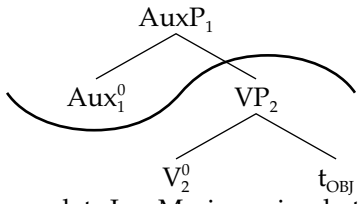
Language	Inversion rules	Optionality	Other
Afrikaans	X is an auxiliary	Obligatory	• *Will*: modal • Passive participles: optional 3-LEFT
Dutch	A: Y is a participle B: X is finite and Y is a main verb	A: Optional B: Optional	• Participles: optional 3-LEFT
Frisian	X and Y are verbs	Obligatory	
German (Standard)	X and Y are verbs, except when Y is an auxiliary and Y is a modal[a]	Obligatory	• *Will*: modal or auxiliary
German/ Austrian dialects	A: Y is a participle B: Y is a main verb C: Y is an infinitive	A: Obligatory B: Obligatory C: Optional	• Infinitives: optional 3-LEFT across a higher auxiliary
Swiss dialects	A: Y is a participle B: X is a modal	A: Obligatory B: Optional	• Optional 3-LEFT • 1-2 inversion only if 2-3 inversion
West Flemish	A: X is a [–TENSE] auxiliary B: Y is a main verb participle	Obligatory	• Present: [±TENSE] • NEG, PAST: [+TENSE] • Participles: optional 3-LEFT across a modal

Note: To avoid the 'except' clause in the rule for German, one could state instead the following three obligatory rules: A: Y is a participle; B: Y is a main verb; C: X is a modal. These rules would guarantee inversion in all but auxiliary–modal constructions, but would also involve a significant amount of redundancy.

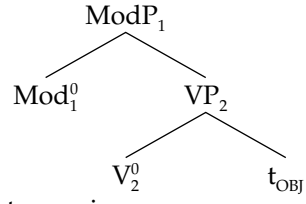
passive participles again allow an optional leftward movement which results in the 3-1-2 order illustrated in (15e′). In principle, inversion would also take place in (15e′); however, since the complement of the auxiliary is a trace, inversion is vacuous. The rules suggested for Afrikaans thus again derive exactly the word orders found in verb clusters with two and three verbs in this language.

(15) **Afrikaans – head-initial inversions:**

a. **AUX-PART (inversion – 2-1):**



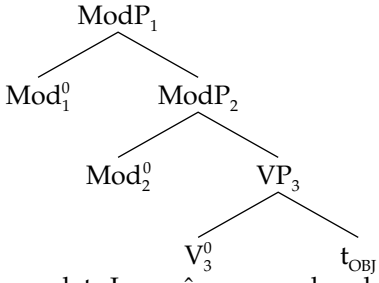
b. **MOD-INF (no inversion – 1-2):**



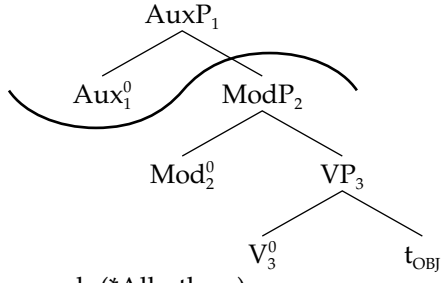
a. dat Jan Marie gesien het / *het gesien
that Jan Marie seen-2 has-1 / *has-1 seen-2

b. dat Jan môre kan werk / *werk kan
that Jan tomorrow can-1 work-2 / *work-2 can-1

c. **MOD-MOD-V (no inversion – 1-2-3):**



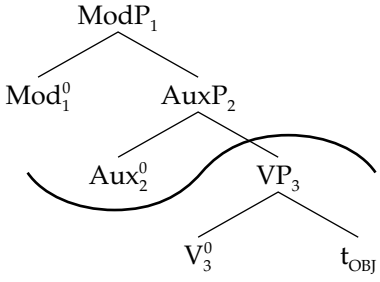
d. **AUX-Mod-V (1 inversion – 2-3-1):**



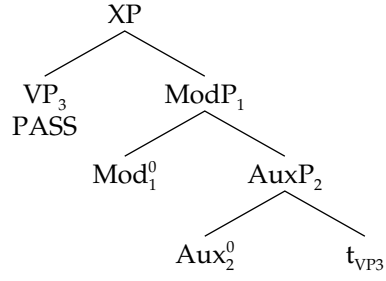
c. dat Jan môre sal kan werk (*All others)
that Jan tomorrow will-1 can-2 work-3

d. dat Jan kon werk het (*All others)
that Jan could-2 work-3 has-1

e. **MOD-AUX-V (1 inversion – 1-3-2):**



e′. **MOD-AUX-V (3-LEFT – 3-1-2):**



e. dat Jan Marie kan gesien het (*All others)
that Jan Marie can-1 seen-3 have-2
dat Jan toe kon gevang word
that Jan then could-1 caught-3 be-2
e'. dat Jan toe gevang kon word
that Jan then caught-3 could-1 be-2

To conclude, a Haegeman and Van Riemsdijk-type approach to the verb cluster phenomenon has the advantage that language-specific and category-specific conditions as well as the notion of optionality can be built into the reordering rules, and hence, the varied distribution of verb clusters in tables 75.1 and 75.2 can straightforwardly be derived. However, one might object (as many researchers have) that this type of approach also has a number of disadvantages. In particular, the systems outlined above are unattractive for their arbitrariness, lack of motivation of the inversion rules, and lack of predictive power. What would be preferable is an explanatory account – i.e., an account that relates the reordering rules to other aspects of grammar or derives them from independent principles or constraints (while nevertheless keeping its empirical adequacy). The next section will address this issue, and in particular the question of whether such an explanatory account exists and what it must look like, in light of the distribution of verb clusters in the languages and constructions summarized in tables 75.1 and 75.2.

3 Deriving verb clusters

As noted above, the majority of analyses of the verb cluster phenomenon are based on the idea that verb-cluster reordering is a form of syntactic movement. This section addresses four major issues arising for such accounts:

(i) Are verb-cluster reordering operations best described as head-movement or as phrasal movement?
(ii) What kind of material can occur interspersed in a verb cluster (i.e., what is the distribution of so-called 'verb-projection-raising' constructions)?
(iii) What is the motivation for verb-cluster reordering?
(iv) Do verb clusters shed light on the directionality debate (i.e., does verb-cluster formation provide evidence for or against either a head-final or a head-initial approach)?

These issues will be discussed in turn in the next subsections.

3.1 Head-movement vs. phrasal movement

Before discussing some specific approaches to verb-cluster reordering, a more technical question that has been central to the discussions of verb-cluster formation from very early on will be addressed. To illustrate the issue, consider again

a simple two-verb cluster such as the Dutch auxiliary–participle construction in (16) (repeated from (4)).

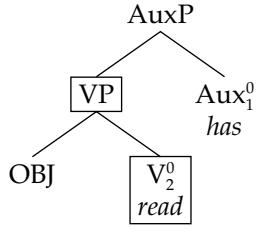
(16) **Dutch – auxiliary–participle construction:**

a. dat Jan het boek gelezen heeft
that Jan the book read (2) has (1)

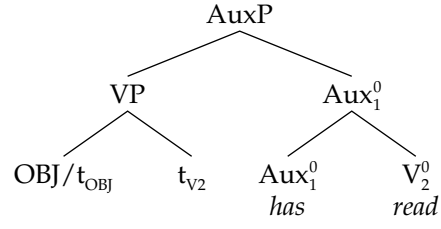
b. dat Jan het boek heeft gelezen
that Jan the book has (1) read (2)

As mentioned above, (16a) would count as the derived version under a head-initial base structure, whereas (16b) would be the derived version under a head-final base structure. Besides the issue of directionality, there are two options (for both the head-final and the head-initial structures) concerning the actual derivation of the non-basic examples in (16): head-movement vs. phrasal movement. The two options are illustrated in (17) and (18) for both approaches. The diagrams in (17a) and (18a) display the basic orders and indicate what categories can undergo movement to derive the non-basic orders. As shown, movement can apply either to the head V^0-2 or to the whole VP-2 (or a functional projection containing 2 but excluding 1 if one were to assume a more refined structure for these examples). The diagrams in (17b) and (18b) show the derivations with head-movement; the diagrams in (17c) and (18c) show the derivations with phrasal movement. Note that the object occurs to the left of the auxiliary in both examples in (16). To accommodate this fact, movement of the verb or the VP has to be preceded by leftward movement of the object (i.e., scrambling or object shift) in the head-initial structures (cf. (18b, c)) as well as the head-final structure involving VP-movement (cf. (17c)). Since reordering operations such as (17c) and (18b, c) apply to incomplete constituents, movement operations of this type have been dubbed 'remnant movement'.

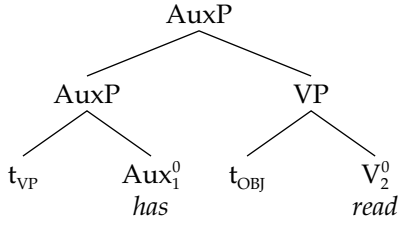
(17) a. **Head-final structure:**



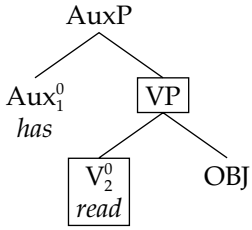
b. **X^0-movement (head-final):**



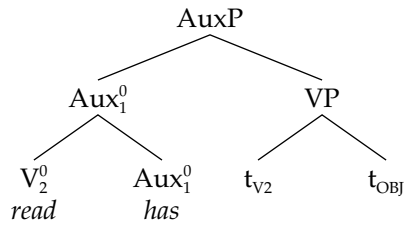
c. **XP-movement (head-final):**



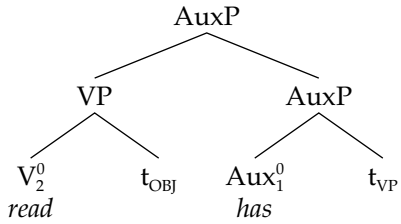
(18) a. **Head-initial structure:**



b. **X^0-movement (head-initial):**



c. **XP-movement (head-initial):**



In light of these options, the following questions arise: how can head-movement vs. phrasal movement structures be distinguished? Can verb clusters be derived solely by head-movement? Can verb clusters be derived solely by phrasal movement? The following subsections attempt to shed light on these questions.

3.1.1 Against an incorporation account

In this section, we will see that verb clusters cannot be seen as complex heads derived (exclusively) by head incorporation, but that (at least) certain constructions require a derivation involving phrasal movement or a non-incorporation analysis of head-movement (see below). Importantly, this conclusion will be based entirely on the mechanics of the derivations and will hold for both head-initial and head-final base structures.

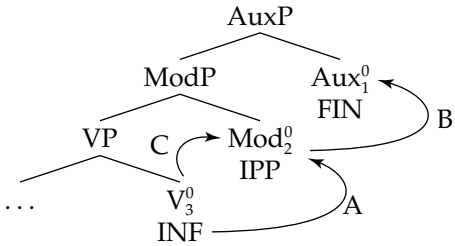
To illustrate the basic movement operations necessary to derive verb clusters by head incorporation, we will look at the distribution of IPP constructions (repeated here in table 75.5). As pointed out in section 2.3, of the six possible orders, five are attested in the IPP construction.

Table 75.5 West Germanic IPP construction

Language	3-2-1	3-1-2	1-2-3	1-3-2	2-3-1	2-1-3
Afrikaans	*	*	*	*	OK	*
Dutch	*	*	OK	*	*	*
Frisian	OK	*	*	*	*	*
German (Standard)	*	*	*	OK	*	*
German and Austrian dialects	OK	OK	*	OK	*	*
Swiss dialects	*	OK	OK	OK	*	*
West Flemish	*	*	OK	*	OK	*

Let us start with the head-final structure. To derive the five orders attested in West Germanic by head incorporation (again, the purpose of this section is merely to mechanically derive the different word orders; conditions attached to different orders will be ignored for this basic illustration), three movement operations are necessary (A, B, and C in the diagram in (19a)): movement of the lowest verb to the right of the higher verb (A), movement of the lowest verb to the left of the higher verb (C), and movement of the middle verb to the right of the highest verb (B). The reader can verify that the various combinations in (19b) yield exactly the five word orders attested (see, for instance, Evers 1975b and Den Besten and Edmondson 1983 for accounts similar to the one sketched):

(19) a. **Head-final structure:**



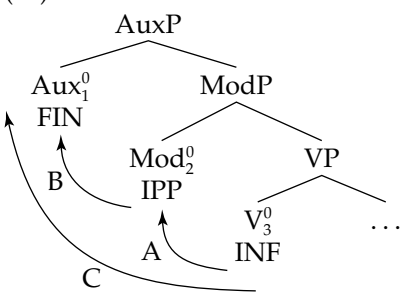
b. **Possible derivations:**

No overt movement:	3-2-1
Only A:	2-3-1
Only B:	3-1-2
Only C:	3-2-1 (vacuous)
A and B:	1-2-3
C and B:	1-3-2

The sixth order – the unattested 2-1-3 order – can be excluded by the assumption of (some version of) the Head Movement Constraint (HMC): in order to derive 2-1-3, the lowest verb 3 would have to move and adjoin to 1, skipping over 2 and hence causing an HMC violation.

Turning to the head-initial approach, again three movement operations are necessary: movement of the lowest verb to the left of the higher verb (A), movement of the lowest verb to the left of the highest verb (C; potentially with a stopover in 2), and movement of the middle verb to the left of the highest verb (B). These movement operations are illustrated in (20a) and the possible combinations are listed in (20b). Note that to derive the 2-3-1 order either movement C applies before movement B (i.e., movement C creates the complex head 3-1 to which 2 attaches afterwards), or movement B applies first (creating the complex 2-1) followed by movement C; however, 3 does not left-adjoin to the complex 2-1 but 'tucks in' between the two verbs (cf. Hsiao 1999, following Richards 1997, for an account along these lines):

(20) a. **Head-initial structure:**



b. **Possible derivations:**

No overt movement:	1-2-3
Only A:	1-3-2
Only C:	3-1-2
A and B:	3-2-1
C and B:	2-3-1
B and C:	3-2-1
	2-3-1 ('tucking in')

Assuming a system that allows the derivations in (20), it is again straightforward to derive the five word orders found in West Germanic IPP constructions. To exclude the unattested 2-1-3 order under this approach, the following options come to mind. Since movement B has to be possible in principle (i.e., to derive the orders in which 2 precedes 1), one has to ask why a derivation that involves *only* movement B is prohibited. A way to approach this question would be to assume that movement from the middle of a verb cluster is excluded, or in other words, that only the lowest verb in a configuration can move (i.e., movement B would only be licensed after movement A or movement C has occurred). Note that in this case, the 2-3-1 order could only be derived by tucking in. Another option (Marcel den Dikken, p.c.) would be to see the impossibility of the 2-1-3 order as the result of a licensing failure of the lowest verb. Under the assumption that the lowest verb (V-3) has to move (either overtly or covertly) to the next higher verb (Mod-2), overt dislocation of Mod-2 could be seen as an obstruction to the licensing of V-3. That is, one could develop an account according to which (i) adjunction to traces is prohibited (i.e., V-3 cannot adjoin to the trace of Mod-2), and (ii) some locality condition excludes covert tucking in or covert adjunction of V-3 to Mod-2 when the latter is in a dislocated position (i.e., adjoined to Aux-1).

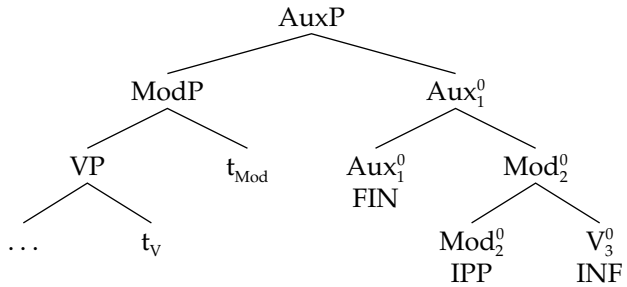
The systems outlined in (19) and (20) naturally raise a number of questions, depending on the type of syntactic theory one assumes and the principles and conditions that hold in one's favorite framework. For example, if a syntactic theory has no room for head-movement (cf. Sportiche 1996a; Koopman 1999a; Koopman and Szabolcsi 2000), a proponent of such a system would obviously not consider any of the above derivations. If a system involves an assumption such as Kayne's (1994) Linear Correspondence Axiom (LCA), derivations involving a head-final structure and rightward movement (such as (19)) would not be an option in that framework. If (head-)adjunction has to be uniformly in one direction, movement C in (19) would be excluded. If a system does not tolerate a violation of the HMC or involves a notion such as 'Attract closest', movement C as depicted in (20) might be problematic.

Questions of this sort are doubtless important to keep in mind when developing an actual analysis of verb-cluster formation. However, since these types of questions are only valid in their particular frameworks, they do not seem to challenge analyses along the lines of (19) or (20) beyond the framework they are couched in, and hence they do not bear on the question of whether a (pure) head-movement approach is in principle an option to account for the distribution of verb clusters. There is, however, an empirical phenomenon that goes beyond theory-internal considerations. The empirical evidence that, as we will see, will argue strongly against a (pure) head-incorporation approach to verb-cluster formation has become known as the verb projection raising phenomenon (see Haegeman and Van Riemsdijk 1986, among many others). The argument against verb clusters as complexes of incorporated heads (whether head-initial or head-final) is straightforward. Under both approaches, it is predicted that in certain orders the verbs form a complex head, and hence these clusters should be impenetrable for XP-material. We will see that this prediction is not borne out and that hence head-incorporation derivations as outlined above are problematic (but

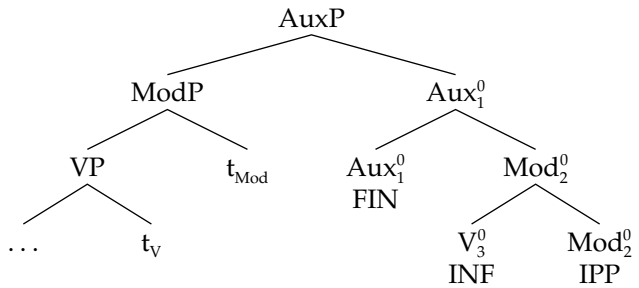
see below for a different way to nevertheless make use of head-movement in verb clusters).

To begin with the head-final structure in (19), (21) shows in detail the structures for the 1-2-3 order ((21a)), the 1-3-2 order ((21b)), and the 2-3-1 order ((21c)). According to this approach, it should be impossible for XP-material to occur between 1 and 2, and 1 and 3 in (21a), between 1 and 3, and 3 and 2 in (21b), and between 2 and 3 in (21c):

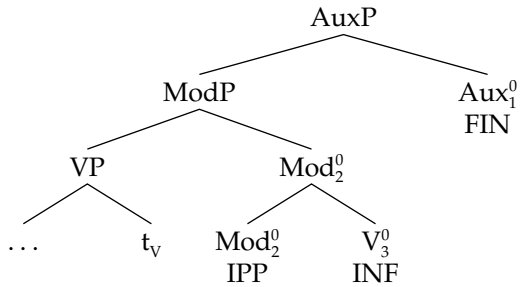
(21) a. **1-2-3 order in head-final approach:**



b. **1-3-2 order in head-final approach:**



c. **2-3-1 order in head-final approach:**



The following data from Swiss-German, West Flemish, and German show that these predictions are not fulfilled in all but one case (see also section 3.2 for a more detailed discussion of verb projection raising). The examples in (22) make the point for the 1-2-3 order; the examples in (23) represent the 1-3-2 order; and the example in (24) illustrates the problem in the 2-3-1 order. In more detail, in

(22a) from Swiss-German (SG), a definite object occurs between 1 and 2, and in the Swiss example in (22b) and the West Flemish (WF) example in (22c), various XPs occur between 2 and 3.[8] Since the verb clusters in (22) are split up by material which is clearly phrasal, it seems unclear how these examples can be accommodated under a structure like (21a):

(22) **Verb projection raising (1-2-3):**

a. Ob si hett **d Prüeffig** chöne besto. SG
whether she had (1) the exam can (2) pass (3)
'[Who knows] whether she would have been able to pass the exam.'

b. Ob si hett chöne **d Prüeffig** besto.
whether she had (1) can (2) the exam pass (3)
'[Who knows] whether she would have been able to pass the exam.'

c. da Valère oa willen **morgen no Gent** goan WF
that Valère had (1) want-ipp (2) tomorrow to Gent go (3)
'that Valère had wanted to go to Gent tomorrow'

(Haegeman 1995a: 72)

The same problem arises in the 1-3-2 order and the 2-3-1 order. In the German (GE) example in (23a) and the SG example in (23c), phrasal material appears between 1 and 3 in the 1-3-2 order (see also Den Besten and Broekhuis 1992 for further examples), and in the WF example in (24), both objects occur between 2 and 3 in the 2-3-1 order. The only case which indeed requires adjacency between elements of a cluster is illustrated in (23b) and (23d) (i.e., examples with elements between 3 and 2 in the 1-3-2 order). The generalization, which will be discussed in more detail in section 3.4.2, is that XP-material is allowed within a verb cluster (in certain languages and dialects) only if the intervening XPs precede the lowest verb. Thus, in the 1-3-2 order as well as in the 3-1-2 order, phrasal material cannot occur between 3 and 2 or between 1 and 2, respectively (examples for the latter claim will be provided in section 3.4.2).

(23) **Verb projection raising (1-3-2):** GE

a. daß er das Buch hätte **genau** durchsehen sollen
that he the book had (1) carefully through-look (3) shall (2)
'that he should have looked through the book carefully'

(Zwart 1996)

b. *daß er das Buch hätte durchsehen **genau** sollen
that he the book had (1) through-look (3) carefully shall (2)
'that he should have looked through the book carefully'

c. Ob si hett **d Prüeffig** besto chöne. SG
whether she had (1) the exam pass (3) can (2)
'[Who knows] whether she would have been able to pass the exam.'

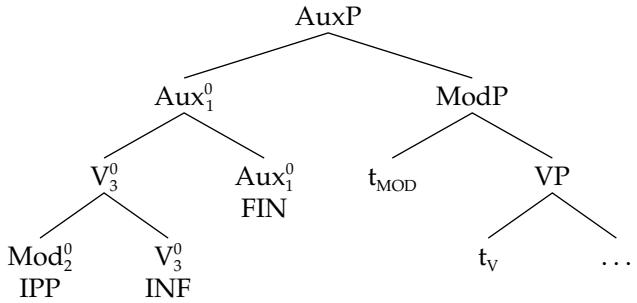
d. *Ob si hett besto **d Prüeffig** chöne.
whether she had (1) pass (3) the exam can (2)
'[Who knows] whether she would have been able to pass the exam.'

(24) **Verb projection raising (2-3-1):**
da Valère willen [**Marie** dienen boek geven] eet WF
that Valère want-ipp (2) [Marie that book give] (3) has (1)
'that Valère has wanted to give Marie that book'
(Haegeman 1998c: 260)

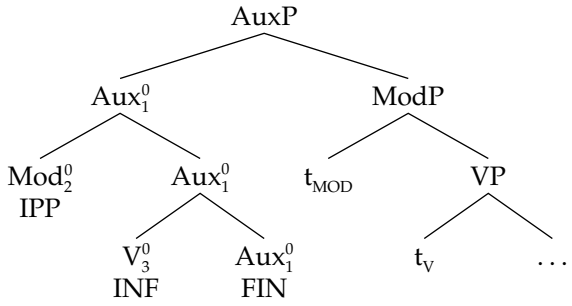
To conclude, it seems that the only way to maintain an incorporation analysis for the (grammatical) constructions in (22–24) would be to assume that the intervening material is X^0-incorporated in the verb clusters. This claim might be conceivable for certain small adverbs such as the one in (23a); however, it appears highly implausible for the definite objects and prepositional phrases. It can thus be concluded that in light of verb projection raising constructions, a pure incorporation account is insufficient to derive the full range of verb cluster constructions in the head-final approach.

The same situation holds for the head-initial approach in (20); however, there is only one case which allows us to make the argument – the 2-3-1 order. To derive this order under a head-initial base structure by making use solely of head incorporation, two derivations have been suggested above (the two options are fleshed out in more detail in (25)). For the point to be made here, we do not have to decide between these two options, since under both the same prediction is made: 2 and 3 are part of a complex head, and hence, it should not be possible for phrasal material to occur between these two verbs. As we have seen above, this prediction is not borne out: examples such as the WF (24) show that 2 and 3 do not form a complex head, and hence a head-movement derivation as in (25) has to be excluded:

(25) a. **2-3-1 order in head-initial approach (movement C before movement B):**



b. **2-3-1 order in head-initial approach (tucking in):**



In sum, the phenomenon of verb projection raising which is found in a subset of West Germanic languages and dialects poses a serious challenge for accounts that aim to derive verb clusters solely by head incorporation. This conclusion, however, does not force us to give up head-movement as a means to derive verb clusters altogether.[9] First, as many authors have suggested, verb-cluster formation can involve both types of movement – that is, certain configurations are derived by head-movement, others by phrasal movement (see Bennis and Hoekstra 1989, Haegeman 1990, 1992, 1994, 1998b, Rutten 1991, Broekhuis et al. 1995, Zwart 1996, and Den Dikken and Hoekstra 1997 for accounts that also involve head-movement derivations). Second, for both the head-final and the head-initial approach, there is in principle an option that maintains a pure head-movement account. The assumption necessary would be that the verbs of a cluster do not form a complex head with each other (i.e., the verbs do not incorporate into each other), but that head-movement targets different (non-overt) heads. That is, if for example in (21c), the lowest verb does not attach to the next higher verb but to a functional head between 2 and 1; or similarly, if in (25a), the modal (MOD–2) does not attach to the higher verb but to a functional head above the AuxP; verb-cluster movement could again be analyzed as head-movement. One might object that these derivations involve violations of the HMC. However, as has been argued by Den Dikken and Hoekstra (1997), the problem arises only under the strict version of the HMC. If the locality conditions for head-movement – like A or A'-movement – are *relativized* (i.e., head-movement is not blocked by intervening heads in general, but only by heads of the same type), skipping of certain heads becomes possible. Thus, while a general verb-to-verb incorporation account seems inadequate to capture the verb cluster phenomenon, a head-movement account is nevertheless conceivable assuming the relativized version of the HMC.

3.1.2 Phrasal movement derivations

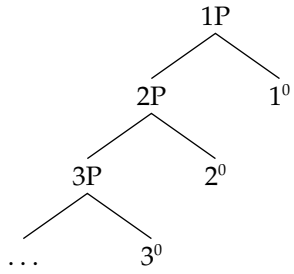
The second question regarding the head vs. phrasal movement debate is whether verb clusters can be derived solely by phrasal movement or whether certain constructions necessitate head-movement. Before laying out arguments that have been presented for head-movement in verb clusters (section 3.1.3), a quick overview of the different phrasal movement operations necessary to derive verb clusters in the head-initial and head-final approach will be provided. The purpose is to simply illustrate the basic derivations and to show that none of the orders poses an a priori challenge for phrasal movement accounts.

To begin with the head-final approach, the 3-2-1 order (cf. (26a)) is the underlying order and hence no movement is necessary (or all movements are covert). The 2-3-1 order (which is found in WF and Afrikaans) can be derived by movement of the lowest XP to the right of the middle XP (cf. (26b)). Movement of the middle XP to the right of the highest XP yields the 1-3-2 order as in (26c) (see Den Besten and Broekhuis 1992 for one of the first suggestions of this derivation). Movement of both lower XPs as in (26d) results in the 1-2-3 order. Finally, there are two options for deriving the 3-1-2 order which are illustrated in (26e, e'). The first option involves movement of the lowest XP to some specifier or adjoined

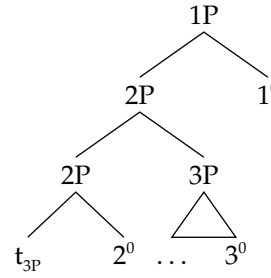
position on the left, followed by rightward movement of the middle XP. The second option involves rightward movement of the lowest XP, followed by rightward movement of the lower XP-2 created by adjunction:

(26) **Head-final derivations:**

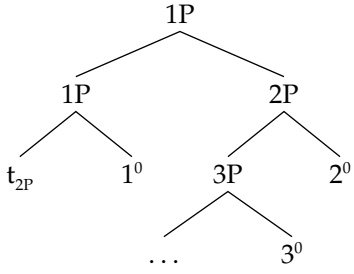
a. **3-2-1 – basic head-final structure:**



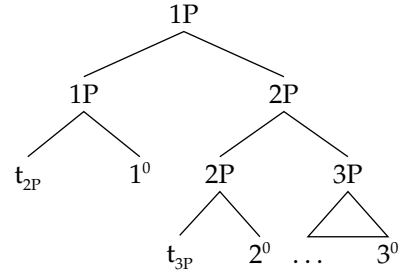
b. **2-3-1 movement of lowest XP:**



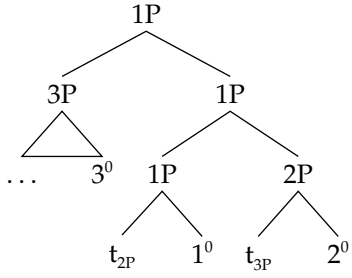
c. **1-3-2 – movement of middle XP:**



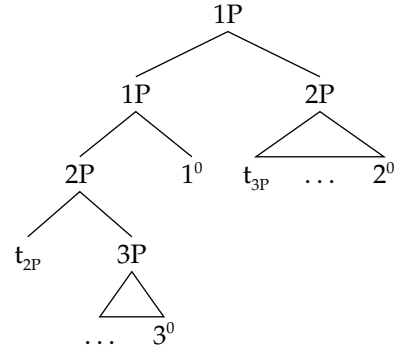
d. **1-2-3 – movement of both lower XPs:**



e. **3-1-2 – movement of middle XP:**



e′. **3-1-2 – movement of both lower XPs:**



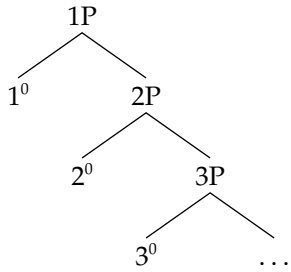
To exclude the unattested 2-1-3 order of the verb clusters in table 75.2 (i.e., constructions involving modal and auxiliary verbs; the situation is slightly more complex for *to*-infinitives), one can follow Haegeman (1992), who suggests that verb clusters of this type are subject to some form of Relativized Minimality. That

is, if it is assumed that verb-cluster movement has to target the next higher XP and that intervening XPs (except adjunction segments) cannot be skipped, movement of the lowest VP and adjunction to the highest XP by skipping the middle XP would be prohibited, and hence the 2-1-3 order could not be derived.

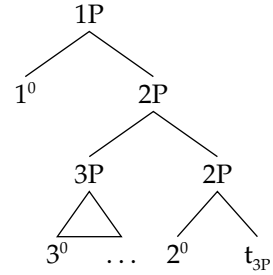
Under the head-initial approach, the 1-2-3 order is the basic order, which does not require any movement operations (cf. (27a)). To derive the 1-3-2 order, the lowest XP undergoes movement to left of the middle XP (cf. (27b)). Movement of the middle XP to the left of the highest XP yields the 2-3-1 order in (27c). Movement of both lower XPs results in the 3-2-1 order (cf. (27d)). Finally, the 3-1-2 order is derived by movement of the lowest XP to the left of the highest XP (whether it moves in one step or stops in the specifier of the middle XP is not crucial at this point; cf. (27e)):

(27) **Head-initial derivations:**

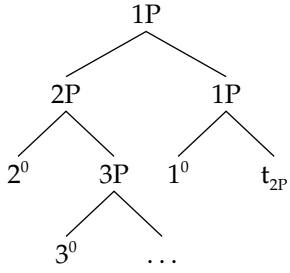
a. **1-2-3 – basic head-initial structure:**



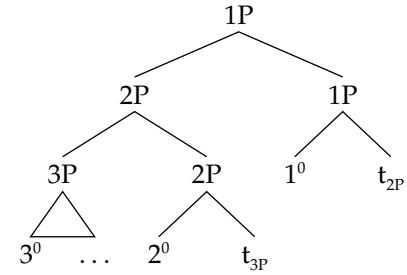
b. **1-3-2 – movement of lowest XP:**



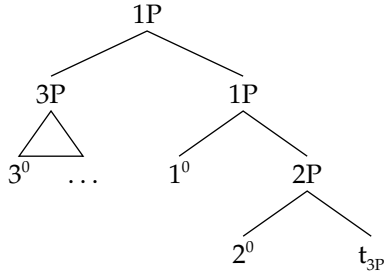
c. **2-3-1 – movement of middle XP:**



d. **3-2-1 – movement of both lower XPs:**



e. **3-1-2 – movement of lowest XP (above highest XP):**



In order to block the 2-1-3 order, one could assume for instance that movement of the lowest XP targets the specifier position of the middle XP (and not, for instance, the specifier position of a functional projection between 1P and 2P). Since the lowest XP would then be part of the middle XP, movement of the latter would always carry along the lowest XP, and hence 2-1-3 could not be generated. Alternatively, one could assume that traces must be c-commanded by their antecedents (at surface structure). Thus, in a derivation where 3P moves to a position (whether adjoined or a specifier) above 2P (but below 1P) and 2P undergoes further movement to the left of 1P, the 2-1-3 order would be derived; however, the trace of 3P (which is contained in 2P) would not be c-commanded by the actual 3P anymore.

In contrast to (pure) head-movement approaches, the challenge for phrasal movement approaches is generally not that they are too restrictive but rather that they massively overgenerate. Thus, deriving verb projection raising configurations is trivial in the structures in (26) and (27). What is less clear, however, is how verb projection raising configurations can be excluded in languages that do not allow phrasal material between the elements of a cluster (see 3.2). As will be illustrated in more detail below, the way to achieve these restrictions in phrasal movement structures is by assuming additional (leftward) movement operations that (fully or partially) pre-empty the phrases that undergo verb-cluster movement (i.e., remnant movement instead of full phrasal movement has to become obligatory in certain languages and constructions).

To conclude, both head-final and head-initial approaches have the capacity to derive verb clusters via phrasal movement operations (in terms of the mechanical derivation; nothing has been said so far about how the movement operations can be motivated and restricted).

3.1.3 Head- and/or phrasal movement accounts (head-final approach)

The question that will be addressed in this section is whether a pure phrasal movement approach is sufficient to derive verb clusters across West Germanic or whether there is reason to assume that certain constructions must involve head-movement. A number of interesting arguments have been put forward for the claim that certain (parts of) verb clusters are derived by head-movement. The arguments fall into two groups: arguments from locality and arguments from the size of the moved material. Let us begin with the first type of argument.

Under the standard assumption that head- and phrasal movement are subject to different locality domains (in the sense that only heads intervene in head-movement dependencies and only XPs intervene in phrasal movement dependencies), the lack vs. existence of certain locality effects can be taken as evidence for/against a particular type of movement. An elaborate instantiation of this argument can be found in Den Dikken and Hoekstra (1997). Den Dikken and Hoekstra investigate an interesting property found in Frisian verb clusters, namely the Participium Pro Infinitivo (PPI) effect. The Frisian PPI effect can be seen as the opposite of the IPP effect (which Frisian lacks, incidentally): as illustrated in (28), infinitives in certain environments can also be realized as participles:

(28) **Frisian – Participium Pro Infinitivo (PPI) effect:**

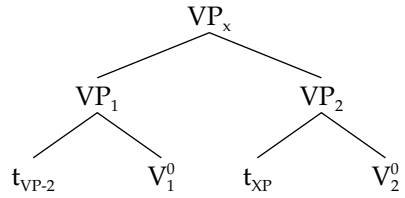
a. Hy soe it dwaan/dien wollen ha.
he would it do-INF/do-PART want-PART have-INF
'He would have liked to do it.'

b. Hy soe it dien ha wolle /wollen.
he would it do-PART have-INF want-INF /want-PART
'He would like to have done it.'

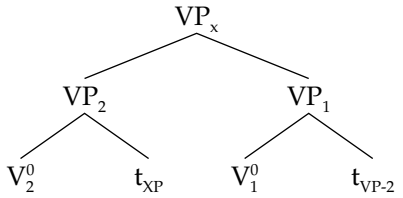
The analysis suggested in Den Dikken and Hoekstra (1997), which crucially makes use of both head-movement and phrasal movement, not only derives the word orders in Frisian verb clusters but also accounts for the existence of the PPI effect and the distribution thereof. Although it is not possible to replicate the details of the analysis here, the conclusion is essentially that movement of participles (which is necessary to license both true and PPI participles) can skip intervening heads of the same type (i.e., heads with the same features), whereas movement of auxiliaries is blocked by intervening heads with the same features. Assuming a restrictive theory of movement, the authors conclude that participle movement is phrasal movement (hence not sensitive to intervening heads), whereas in the same language, movement of auxiliaries is head-movement (hence subject to the (relativized) HMC).

Before presenting the second type of argument for head-movement in verb clusters (the argument from the size of the moved material), it should be noted that there are certain phenomena – in particular, certain adjacency requirements – which will not be considered as arguments for head-movement here. As discussed in the previous section, a commonly accepted restriction for head-movement configurations is that a complex head cannot include phrasal material. Thus, if phrasal material can occur between two verbs, it can safely be concluded that these two verbs do not form a complex head (see the previous section for arguments along this line). However, the opposite does not hold. If a verb cluster disallows phrasal material between the verbs, it does not follow that the verb cluster has to be formed by head-movement. In other words, while it is true that a head-movement configuration entails adjacency between the elements involved, adjacency does not entail a head-movement configuration (for instance, Case adjacency in English does not entail that the verb and the object form a complex head). To illustrate the fallibility of arguments that are built on an adjacency requirement between the verbs of a cluster, let us assume a context in which the two verbs of a two-verb cluster cannot be separated by phrasal material. Under a head-movement derivation, this adjacency requirement follows directly from the derivation itself. However, under a phrasal movement derivation, it is also possible to derive this adjacency requirement. As shown in (29), adjacency can be created by remnant movement of the lower VP under both the head-final and the head-initial approach. The only assumptions necessary to enforce adjacency in these contexts are that movement of the VPs and XPs in (29) is obligatory, and that nothing can adjoin between the (originally) higher VP (labeled VP-1 in (29)) and the landing site of the lower VP (labeled VP-x):

(29) a. **XP-movement (head-final):**



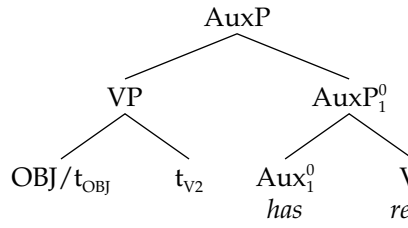
b. **XP-movement (head-initial):**



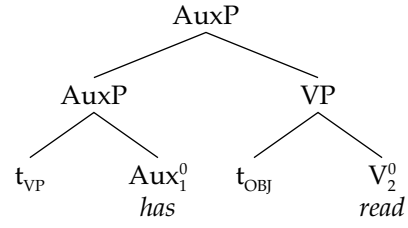
While these assumptions would of course have to be motivated, the possibility of deriving adjacency in phrasal movement constructions nevertheless shows that adjacency between elements in a verb cluster does not allow us to jump to the conclusion that the cluster has to involve head-movement. Adjacency requirements found in verb clusters will hence be ignored in this section.

An important contribution to the issue of head vs. phrasal movement has been provided in Den Besten and Rutten (1989) (see also Rutten 1991; Den Besten and Broekhuis 1992; Broekhuis et al. 1995; and many others). As mentioned at the beginning of this section, a crucial difference between the head-movement structure in (17b) and the phrasal movement structure in (17c) (repeated below in (30a, b) is that in the latter a remnant constituent is moved – i.e., all but the verb has to have left the VP prior to verb-cluster movement. This difference leads to the following predictions. If the leftward movement step is prohibited (i.e., if a construction involves VP-internal elements that are not allowed to scramble/object shift), and a construction of the form OBJ-1-2 is well-formed, the derivation can only involve head-movement. If, on the other hand, leftward movement of (certain) VP-internal XPs is prohibited and a construction of the form OBJ-1-2 is ungrammatical in these contexts (but well-formed when the VP contains movable XPs), the derivation can only involve phrasal movement. In what follows, we will see that in Dutch under certain assumptions, both predictions find an instantiation:

(30) a. **X^0-movement (head-final):**



b. **XP-movement (head-final):**



Contexts that have been taken to involve elements that cannot undergo movement (but see below) are particle constructions such as *to call up* and (semi-)idiomatic expressions such as *to take into consideration*. As is illustrated in (31a, b), (non-idiomatic) objects are free to move to the left of adverbs such as *toen toch* (with some subtle differences in meaning). For material that is part of an idiomatic expression ((31c)) and particles ((31d)), on the other hand, this movement operation is prohibited (the position of the object has no influence on the ungrammaticality):

(31) **Dutch – particle and (semi-)idiomatic constructions:**

a. dat Jan {dat aanbod} toen toch {dat aanbod} in overweging nam
that Jan {that offer} then ADV {that offer} in consideration took
'that Jan then did take that offer into consideration'

b. dat Marie {haar vader} toen toch {haar vader} op belde
that Marie {her father} then ADV {her father} up called
'that Marie then did call her father'

c. *dat Jan dat aanbod in overweging toen toch nam
that Jan that offer in consideration then ADV took
'that Jan then did take that offer into consideration'

d. *dat Marie haar vader op toen toch belde
that Marie her father up then ADV called
'that Marie then did call her father'

Assuming that adverbs such as *toen toch* mark the left edge of the VP, one can conclude (but see again below) that parts of idiomatic expressions and particles cannot leave the VP. These types of constructions thus offer contexts in which the two predictions mentioned above can be tested.

Let us first look at a situation where the constructions in (31) are embedded in a verb cluster (in particular an auxiliary–participle construction). In the 1-2 order (which is the relevant order for the head-final approach), idiomatic material can only appear to the (immediate) left of the auxiliary as in (32a), and can occur neither to the left of the VP-adverb (cf. (32c)) nor between the auxiliary and the participle (cf. (32e)). Particles, on the other hand, are also prohibited from occurring to the left of a VP-adverb (cf. (32d)), but they can appear either to the (immediate) left of the auxiliary as in (32b) or between the auxiliary and the participle as in (32f):

(32) **Dutch – particle and (semi-)idiomatic constructions in verb clusters:**

a. dat Jan {dat aanbod} toen toch {dat aanbod} in overweging heeft
that Jan {that offer} then ADV {that offer} in consideration has
genomen
taken
'that Jan then HAS taken that offer into consideration'

b. dat Marie {haar vader} toen toch {haar vader} op heeft gebeld
that Marie {her father} then ADV {her father} up has called
'that Marie then HAS called her father'

c. *dat Jan dat aanbod in overweging toen toch heeft genomen
that Jan that offer in consideration then ADV has taken
'that Jan then has taken that offer into consideration'

d. *dat Marie haar vader op toen toch heeft gebeld
that Marie her father up then ADV has called
'that Marie then has called her father'

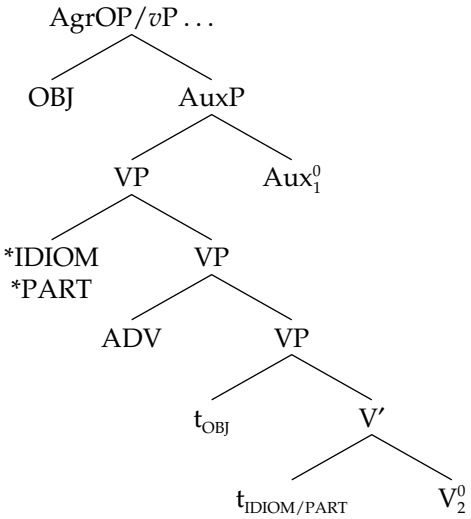
e. *dat Jan dat aanbod toen toch heeft in overweging genomen
that Jan that offer then ADV has in consideration taken
'that Jan then has taken that offer into consideration'

f. dat Marie {haar vader} toen toch {haar vader} heeft op gebeld
that Marie {her father} then ADV {her father} has up called
'that Marie then has called her father'

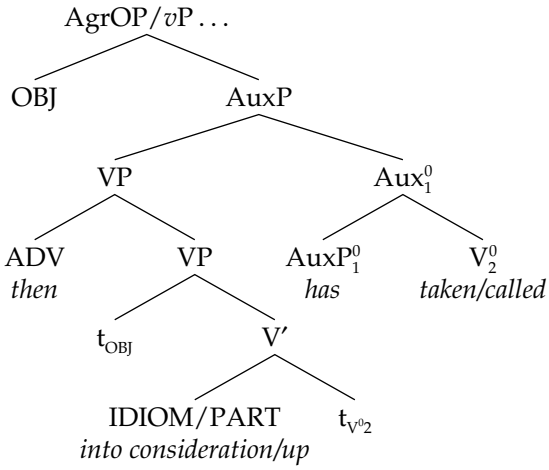
Under the assumption that parts of idiomatic expressions and particles cannot leave the VP, the distribution in (32) provides an argument for head-movement and against phrasal movement in this type of construction.

Let us start with (32c, d). The prohibition against movement of parts of idioms and particles (cf. (33a)) immediately accounts for the ungrammaticality of these examples (independent of the question of whether the lower verb has undergone head- or phrasal movement). Furthermore, assuming idioms and particles cannot leave the VP, remnant VP movement cannot be an option for (32a, b). If, on the other hand, the examples in (32a, b) involve head-movement as in (33b), idioms and particles can be stranded in the VP when the lower verb (head) moves and adjoins to the higher auxiliary. Finally, assuming that (at least in this language and construction) verb-cluster formation can only involve head-movement and phrasal movement is prohibited, (32e) is expected to be ungrammatical since in this case, the (remnant) VP has undergone movement. Similarly, (32f) can be accounted for if it is assumed that the particle and the verb form a complex head at the level where verb-cluster formation applies. That is, either particle constructions are base-generated X^0-elements (cf., for instance, Neeleman and Weerman 1993; Neeleman 1994a; and references therein) or involve incorporation of the particle into the verb (cf. for instance Den Dikken 1995c; Koopman 1995; among many others).[10] Under the assumptions mentioned, particle and (semi-)idiomatic constructions can thus be seen as an instantiation of the first prediction–verb-cluster formation in auxiliary–participle constructions (and the same holds for modal–infinitive constructions) can only involve head-movement in Dutch:

(33) a. **Illicit particle/idiom movement:**



b. **No particle/idiom movement and X^0-movement:**



Before turning to an alternative analysis, cases instantiating the second prediction will be discussed. Dutch verb-cluster formation is found not only with auxiliary and modal constructions but also with certain infinitival constructions involving the infinitival marker *te* 'to'. As is shown in (34), the object appears to the left of the higher verb (i.e., the matrix verb), whereas the particles and idiomatic phrases occur between the two verbs. The grammaticality of (34a, b) thus contrasts sharply with the ungrammaticality of the auxiliary–participle construction in (32e). Under a head-final base structure, (34a, b) then lead to the conclusion that remnant XP-movement is possible in infinitival constructions involving matrix verbs such as *try* or *decide*:[11]

(34) **Dutch – particle and (semi-)idiomatic constructions in infinitival constructions:**

a. dat Elsje de prijs probeerde [in ontvangst te nemen]-XP
that Elsje the award tried [in acceptance to take]-XP
'that Elsje tried to accept the award'

b. dat Elsje de prijs besloot [in ontvangst te nemen]-XP
that Elsje the award decided [in acceptance to take]-XP
'that Elsje decided to accept the award'

c. dat Elsje haar vader probeerde op te bellen
that Elsje her father tried up to call
'that Elsje tried to call her father'

d. dat Elsje haar vader besloot op te bellen
that Elsje her father decided up to call
'that Elsje decided to call her father'

To determine whether phrasal movement is possible or necessary, we must look again at contexts in which phrasal movement would be excluded. As above, the immovability of particles and parts of idiomatic expressions allows us to construct such a context. If these elements can occur to the left of the higher verb

in the 1-2 order, the construction can only involve head-movement (again assuming that particles and idiom chunks cannot leave their base position); if these elements cannot occur to the left of the higher verb in the 1-2 order, head-movement is prohibited. Changing the examples in (34) along these lines reveals an interesting contrast, which is illustrated in (35):

(35) **Dutch – particle and (semi-)idiomatic constructions in infinitival constructions:**

a. dat Elsje de prijs in ontvangst probeerde [te nemen]-X^0
that Elsje the award in acceptance tried [to take]-X^0
'that Elsje tried to accept the award'

b. *dat Elsje de prijs in ontvangst besloot [te nemen]-X^0
that Elsje the award in acceptance decided [to take]-X^0
'that Elsje decided to accept the award'

c. dat Elsje haar vader op probeerde [te bellen]-X^0
that Elsje her father up tried [to call]-X^0
'that Elsje tried to call her father'

d. *dat Elsje haar vader op besloot [te bellen]-X^0
that Elsje her father up decided [to call]-X^0
'that Elsje decided to call her father'

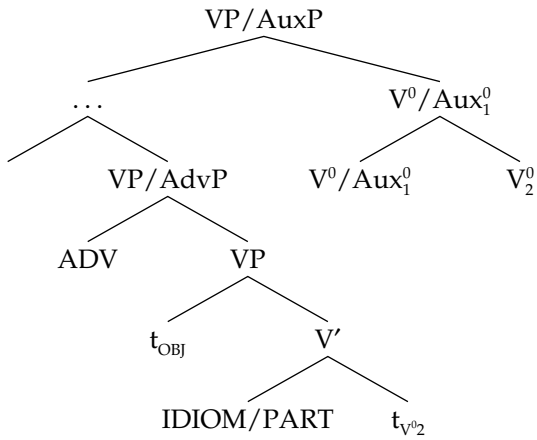
While *try*-constructions allow particles and idiomatic phrases to occur to the left of the higher verb, *decide*-constructions prohibit stranding of these elements. Assuming again that movement of particles and idiomatic phrases is excluded, one can conclude from the examples in (35) that head-movement is possible in *try*-constructions but not an option in *decide*-constructions. Thus, infinitives of the latter type instantiate the second prediction – verb-cluster formation in infinitival constructions of the *decide*-type can only involve phrasal movement in Dutch.

To recapitulate, the account sketched leads to the conclusion that there are three types of verb clusters: verb clusters that only allow head-movement (auxiliary–participle constructions), verb clusters that only allow phrasal movement (*decide*-type infinitives), and verb clusters that allow both head and phrasal movement (*try*-type infinitives). Although this account seems advantageous in that it allows us to develop criteria to distinguish between head and phrasal movement in verb clusters, one might object that the arguments presented in (31–35) are built on assumptions that are not necessarily generally shared (such as the immovability of particles and idiom chunks), and that a unified account (i.e., an analysis that employs only one type of movement in verb-cluster constructions) might be preferable. In the rest of this section, an outline of such an alternative analysis will be presented.

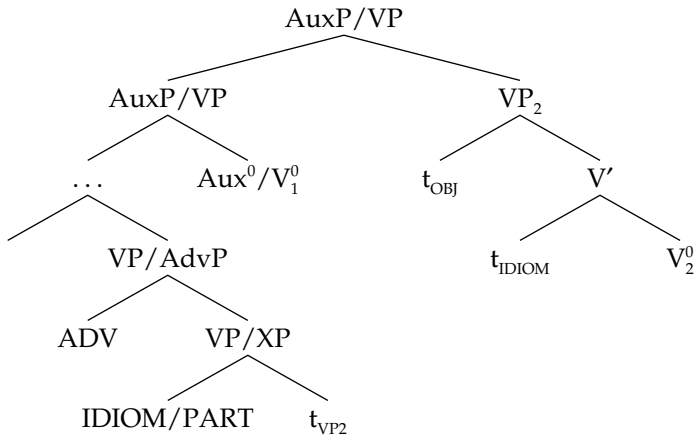
The crucial examples that led to the conclusion that certain constructions can only involve head-movement are (32a, b, e), (35a, c), and, under certain assumptions about the structure of particle verbs, (32f). The head-movement derivation suggested for these examples is repeated in (36a).[12] However, (36a) is not the only

derivation for these examples; as shown in (36b), a phrasal movement account is conceivable as well. To be more specific, under a phrasal movement account, the idiomatic phrase or particle first moves out of the VP and (string-vacuously) adjoins to the VP (or it moves to a specifier of a functional projection between the adverb and the VP). The lowest VP can then undergo remnant XP-movement to the right, 'stranding' the particle or idiom chunk to the left of the higher verb:

(36) a. **X^0-movement:**



b. **XP-movement:**

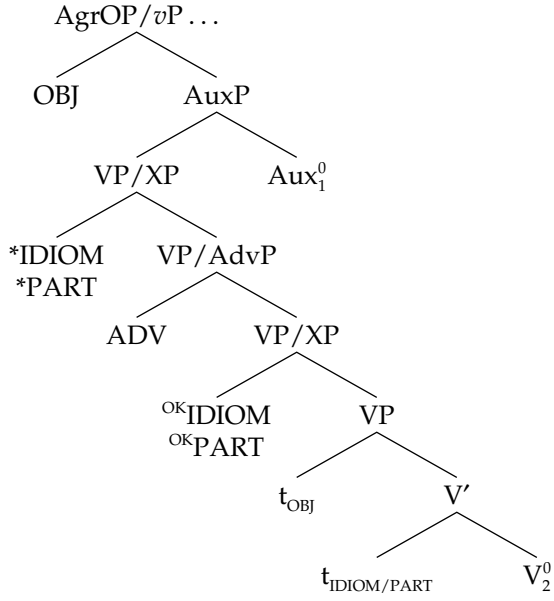


A derivation such as (36b) has been excluded above by the assumption that particles and parts of idioms cannot move out of the VP. The reason for this assumption was the ungrammaticality of the examples in (32c, d) and (35b, d) – i.e., examples that show that particles and parts of idioms cannot occur to the left of VP-adverbs. In the previous account, this fact was seen as a direct consequence of the assumption that idiomatic phrases and particles are immobile – i.e., they

cannot undergo any kind of movement. To accommodate these facts under a phrasal movement account such as the one outlined in (36b), on the other hand, it cannot be the case that movement of idiomatic phrases and particles is inherently blocked (otherwise the derivation in (36b) would be impossible). Rather it has to be assumed that particles and idiomatic phrases are able to move, although only as long as they do not cross any other material (see Den Besten and Broekhuis 1992 and Broekhuis et al. 1995 for claims along these lines).[13] Thus, short string-vacuous movement as in (36b) is licensed; however, movement across the adverb as in (32c, d) is ruled out (cf. (37)).

At this point, one has to ask why particle and idiom movement should be subject to such a restriction. However, note that the same question arises for the claim that particles and idiom chunks are immobile. A detailed motivation cannot be given here, but it seems that either assumption could be motivated by some syntactic or semantic adjacency requirement between the different parts of an idiomatic expression and between the particle and the verb:

(37) **Idiom/particle movement:**



While an analysis along these lines accounts for the examples in (32a–d), it raises some questions concerning (32e) and examples involving *te*-infinitives. Starting with the former, the importance of (32e) (repeated as (38a)) and the examples in (38b–e) is that in auxiliary–participle constructions, no phrasal material can intervene between the auxiliary and the participle. This restriction follows straightforwardly in a head-movement approach. For the phrasal movement account in (36b) and (37), however, it would mean that objects and idioms (but not particles; cf. (32f)) not only can move out of the VP, but in fact must leave

the VP obligatorily. Furthermore, it has to be ensured that only the lowest VP undergoes movement to the right in this construction:

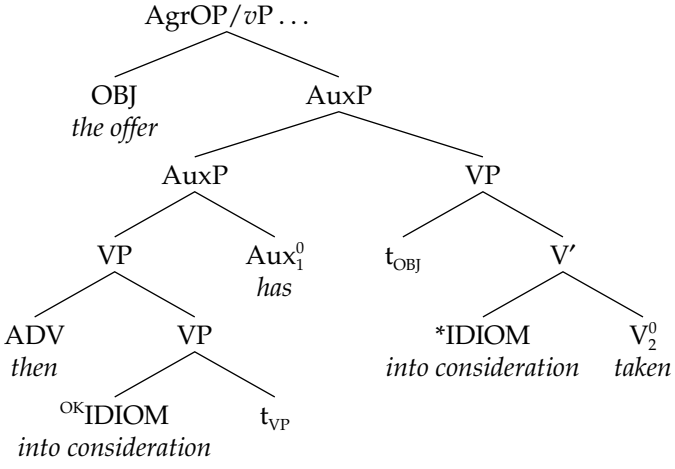
(38) **Dutch – objects and (semi-)idiomatic constructions in two-verb clusters:**

a.	*dat Jan dat aanbod	toen toch	heeft	in overweging	genomen
	that Jan that offer	then ADV	has	in consideration	taken
b.	*dat Jan toen toch	een aanbod	heeft	in overweging	genomen
	that Jan then ADV	an offer	has	in consideration	taken
c.	*dat Jan toen toch	in overweging	heeft	een aanbod	genomen
	that Jan then ADV	in consideration	has	an offer	taken
d.	*dat Jan toen toch	heeft	een aanbod	in overweging	genomen
	that Jan then ADV	has	an offer	in consideration	taken
e.	*dat Jan dat aanbod	in overweging	heeft	toen toch	genomen
	that Jan that offer	in consideration	has	then ADV	taken

All intended: 'that Jan then HAS taken that/an offer into consideration'

Thus in sum, the assumptions necessary to account for the distribution of particles and idiomatic phrases in verb clusters under a phrasal movement approach are as follows: (i) all VP-internal elements except particles are required to leave the VP; (ii) particles can move out of the VP; (iii) idiomatic phrases and particles can only move string-vacuously; and (iv) in auxiliary–participle constructions only the lowest VP can move to the right (cf. (39)):

(39) **XP-movement:**



Note that this analysis has a direct consequence for the structure of examples such as the one in (40a), where both the object and the idiomatic phrase appear below the VP adverb. In the phrasal movement analysis just sketched, both the object and the idiomatic phrase must have left the VP and attached *below* the VP adverb (as is evident from (40b), these movement operations can again not change the underlying order between the two phrases):

(40) **Dutch – objects and (semi-)idiomatic constructions in two-verb clusters:**
a. dat Jan toen toch een aanbod in overweging heeft genomen
that Jan then ADV an offer in consideration has taken
'that Jan has taken an offer into consideration at that moment'
b. *dat Jan toen toch in overweging een aanbod heeft genomen
that Jan then ADV in consideration an offer has taken
'that Jan has taken an offer into consideration at that moment'

The second set of examples that requires some adjustment in a pure phrasal movement approach involves the examples in (35), schematically repeated in (41):

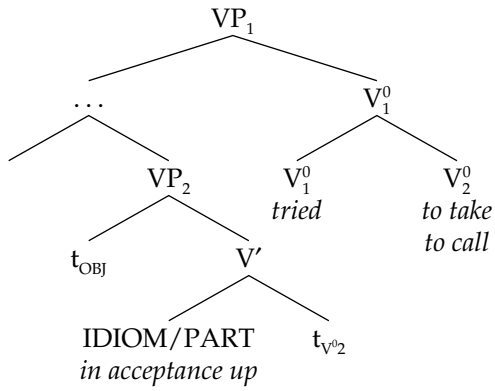
(41) **Dutch – particle and (semi-)idiomatic constructions in infinitival constructions:**

a.	*that*	SUBJ	OBJ	*decided*	IDIOM/PART	*to* VERB
b.	*that*	SUBJ	OBJ	*tried*	IDIOM/PART	*to* VERB
c.	**that*	SUBJ	OBJ	IDIOM/PART	*decided*	*to* VERB
d.	*that*	SUBJ	OBJ	IDIOM/PART	*tried*	*to* VERB

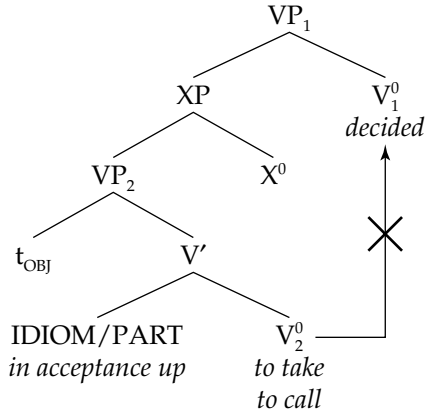
As has been laid out above, an account that makes use of head and phrasal movement offers a straightforward explanation for the distribution in (41): *try*-infinitives allow both head-movement and phrasal movement, whereas *decide*-infinitives permit only phrasal movement.

An interesting question is why only certain infinitival constructions permit head-movement. Without going into detail at this point (see section 4), a common feature of most approaches to this problem is the claim that *try* and *decide* infinitives represent two different types of infinitival constructions. While *try*-infinitives are in some sense deficient (i.e., they either lack certain functional projections or involve projections that are or become ineffective by various mechanisms), *decide*-infinitives are made of more 'solid' material (i.e., projections that make them less transparent and hence block certain operations). To be more concrete, one can assume (as many authors have) that *try*-type infinitives are transparent in that they do not involve categories or features that would block head-movement (it is not crucial for the point to be made here whether *try*-infinitives simply lack offending projections or whether the projections are present but somehow rendered invisible by the time verb-cluster formation takes place). An illustration is given in (42a) vs. (42b). Assuming that *decide*-infinitives involve more (operative) structure than *try*-infinitives, the prohibition of head-movement in the former can be reduced to some version of the HMC. That is, if *decide*-infinitives but not *try*-infinitives include a projection which is simply labeled XP for now, the intervening head X^0 would block head-movement across it in (42b) but not in (42a). On the other hand, no problem arises for phrasal movement in *decide*-infinitives – depending on the position of the object, either the XP or the lower VP can undergo movement to the right in (42b):[14]

(42) a. **X^0-movement – *try*-infinitive:**



b. **X^0-movement – *decide*-infinitive:**



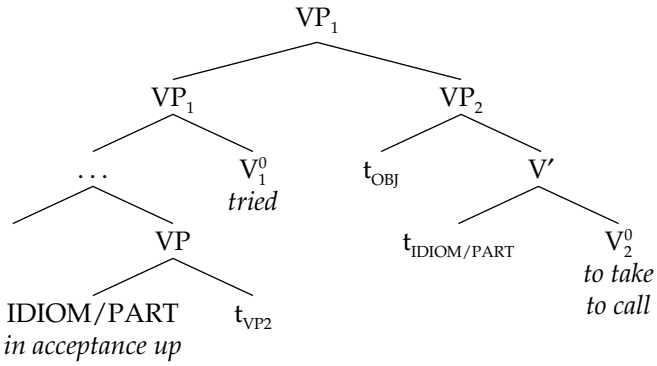
The question then of course is what kind of element X is and why it is present or active in one construction but not in the other. As will be shown in section 4.4, a likely candidate for X is tense, since the two types of infinitival constructions differ in their tense properties. In particular, we will see that *decide*-infinitives contribute independent tense information, whereas *try*-infinitives lack any independent tense interpretation (see also Guéron and Hoekstra 1988, Bok-Bennema and Kampers-Manhe 1994, Wurmbrand 1997, 1998a, 1998c, 2001, and Gonçalves 1998, among others, for the claim that certain infinitives lack tense or are tense-deficient).

Returning to the account that employs only phrasal movement to derive verb clusters (as outlined in (36b), (37), and (39)), the derivation of (41d) (i.e., a *try*-infinitive with a stranded particle or idiomatic phrase) is straightforward. As before, the idiomatic phrase leaves the VP, and the lowest VP undergoes movement to the right (cf. (43a)). To account for the difference between auxiliary–participle constructions and *try*-infinitives (i.e., the contrast between (32e) and (41b)) in the mixed account, it has been suggested that the former allow only head-movement, whereas the latter allow head or phrasal movement. A similar

distinction can be made in the pure phrasal movement approach. While auxiliary–participle constructions permit only movement of the lowest VP, *try*-infinitives allow movement of higher VPs/XPs as well. Thus, in (41b), the idiomatic phrase again leaves the VP; however, what moves to the right is not the lowest VP but the VP/XP dominating the idiom.[15]

Turning lastly to *decide*-infinitives, the assumption necessary is that in contrast to *try*-infinitives only the higher VPs/XPs can undergo rightward movement. Thus, depending again on the derived position of the object, either the XP or the VP-2 in (43b) moves to the right, but movement of the lowest VP is prohibited. While under the mixed account, the more restricted behavior of *decide*-infinitives could be derived from the structure of these infinitives (i.e., the presence of X^0, which blocks head-movement), it is not clear that the presence vs. absence of functional projections in the infinitive should have an effect on the possibility vs. impossibility of movement of the lowest VP in the pure phrasal movement approach. All else being equal, considerations of parsimony would seem to favor the mixed account sketched above; however, the ultimate decision between the two approaches evidently depends on the framework used:

(43) a. **XP-movement – *try*-infinitive:**



b. **XP-movement – *decide*-infinitive:**

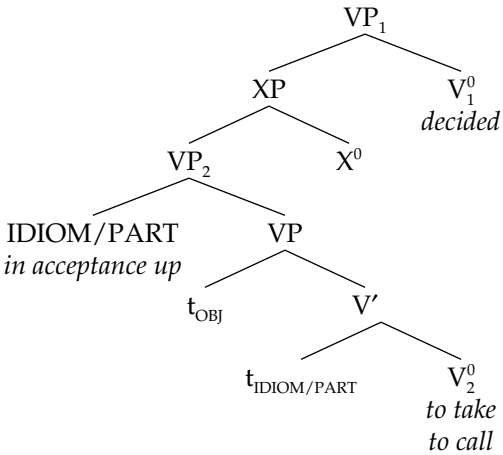


Table 75.6 Two head-final approaches to (some) verb clusters in Dutch

Constructions	Mixed approach	Pure XP-movement approach
Auxiliary–participle construction	Optional X^0-movement	Optional movement of lowest VP
Try-infinitives	X^0 or XP-movement	Movement of VP or higher XP
Decide-infinitives	XP-movement	Movement of higher XP
	X^0-movement impossible (HMC)	Movement of VP impossible
Particles	No movement	Optional movement Constraint: only string-vacuous movement
Idiomatic phrases	No movement	Obligatory movement Constraint: only string-vacuous movement

To conclude, if it is assumed that idiomatic phrases and particles are immobile, the distribution of these elements in Dutch verb clusters leads to the conclusion that both head- and phrasal movement are necessary to derive verb clusters under a head-final base structure. If it is assumed that idiomatic phrases and particles are not immobile per se but subject to a vacuous movement constraint, a pure phrasal movement approach can in principle be maintained. Table 75.6 summarizes the constructions discussed and the assumptions necessary to account for the distribution of these constructions in the mixed account and in a pure phrasal movement approach.

3.2 Verb projection raising

This section focuses on the distribution of non-verbal elements (such as objects, particles, and prepositional phrases) in verb-cluster constructions. A phenomenon that has interesting repercussions for a number of issues arising in the verb-cluster debate is that of verb projection raising, illustrated in (44) from WF, Afrikaans (AF), and SG. What is crucial in these constructions is that phrasal material appears between the verbs of a cluster:[16]

(44) **Verb projection raising – 1 – [. . . 2]:**

a. da Valère wilt vele boeken lezen WF
that Valère wants many books read
'that Valère wants to read many books' (Haegeman 1998c: 261)

b. da Jan . . . {da boek} wilt {da boek} vuor Marie kopen
that Jan . . . {that book} wants {that book} for Marie buy
'that Jan wants to buy that book for Marie' (Haegeman 1992: 148)

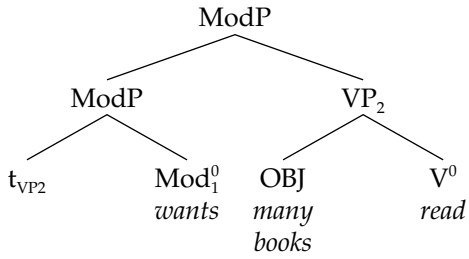
c. as hulle daar moet goeie onderwys gee AF
if they there must good education give
'if they must provide a good education there' (Robbers 1997: 76)

d. das si am Grendel wöt sini velore chlaue zruggeh SG
that she to-the Grendel wants his lost paw back-give
'that she wants to return the lost paw to Grendel'

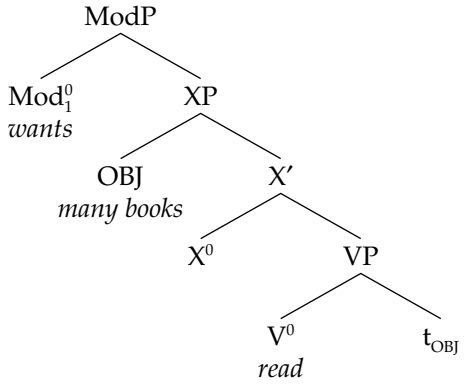
To derive these configurations under the head-final approach, the entire lower VP moves to the right of the modal verb (i.e., the object remains inside the VP as in (45a)). Equivalently, it could be assumed (see, for instance, Van den Wyngaerd 1989b) that the object moves to a functional projection outside the VP (e.g., SpecAgrOP) and that this functional projection rather than the VP undergoes movement to the right. To derive the examples in (44) under a head-initial approach, no verb or verb phrase movement takes place; the only movement operation necessary is object movement to a functional projection between the modal and the main verb (as in (45b)):

(45) **Verb projection raising – 1 – [. . . 2] (= (44a)):**

a. **Head-final base:**



b. **Head-initial base:**



Note that verb projection raising is not an obligatory phenomenon (except for certain elements; see below). In particular, in all of the above examples, the objects can also precede the higher verb. For the head-final approach, this means that the object can move out of the VP prior to VP movement in (45a) (or, under the AgrOP-movement analysis, one has to allow for either AgrOP movement or VP movement). For the head-initial approach, these facts indicate that the object

can move (further) to a functional projection above the higher verb. Thus, either approach has to involve some notion of optionality – in head-final approaches, optionality comes in as a choice between overt and covert movement of the object or a choice between two (or more) categories that can undergo verb projection raising (i.e., VP or AgrOP); in head-initial approaches, optionality comes in as an option for the ordering of functional projections (i.e., whether XP is below or above ModP in (45b)).

Looking across the West Germanic languages/dialects, there are some interesting restrictions and cross-linguistic generalizations regarding what elements can, cannot, or must intervene between the verbs of a verb cluster. First, verb projection raising is not possible in all West Germanic languages/dialects. Examples such as the verb projection raising ones in (44), for instance, are ungrammatical in Dutch (i.e., while Dutch allows the 1-2 order in these clusters, the object has to precede the higher verb). Second, we find that among the languages allowing verb projection raising structures, the types of elements that can occur inside a cluster are not the same across these languages. Although the distribution shows some degree of variation, there is also an interesting generalization that emerges. As can be seen in the summary in table 75.7 (illustrations will be provided below), the 'bigger' or the more 'independent' an element is, the less likely it is to be licensed as part of a verb cluster. Furthermore, if a language allows verb projection raising with elements from a certain category in table 75.7, it also allows verb projection raising with the elements that are in columns further to the left – i.e., if 'bigger' elements can occur in a cluster, all 'smaller' elements are also allowed to occur between the verbs of a cluster.

Let us begin with the distribution of particles which are considered the 'smallest' category. The claim that these elements are small finds support in the assumption (which most researchers make in one form or another) that particles form a complex head (whether base-generated or derived) at some level with the verb they are associated with. Importantly for the present discussion, these elements can be part of verb clusters in all languages (cf. (46a–e)), and in fact, they must

Table 75.7 Verb projection raising (with modals, auxiliaries)

Language	Separable particles	Low adverbs, idioms, bare Ns	Indefinite objects, PPs	Definite objects
Afrikaans	Obligatory[a]	Possible	%Possible	Impossible
Dutch	Possible	Marginal[b]	Impossible	Impossible
German	Obligatory[a]	Possible	%Possible	Impossible
Swiss	Obligatory[a]	Possible	Possible	Possible
West Flemish	Possible	Possible	Possible	Possible

Notes: **Adjustments**

[a] Obligatory with 'idiomatic' particles (cf. Robbers 1997, citing le Roux 1988); 'transparent' particles are marginal in stranded position in Swiss and German (Wurmbrand 1999b).

[b] Only possible if element is morphologically not complex (cf. Neeleman 1994a).

be part of the cluster and cannot be stranded in some of the languages (cf. the examples from AF, GE, and SG in (46a, c, d), respectively – DU = Dutch):[17]

(46) **Particles in verb clusters:**

a. Die bende sal ons {*aan} bly {aan} rand. AF
The gang will us {*on} remain {on} assault
'The gang will go on assaulting us.' (Robbers 1997: 61, fn. 14)

b. dat Jan zijn moeder {op} wil {op} bellen DU
that Jan his mother {up} wants {up} call
'that Jan wants to call his mother' (Neeleman 1994: 24)

c. dass er das Buch {*durch} hätte {durch} sehen sollen GE
that he the book {*through} had {through} look shall
'that he should have looked through the book'

d. dass er da Buech {*doere} het soele {doere} laese SG
that he the book {*through} has shall {through} read
'that he should have read (through) the book'
(Schönenberger p.c.; Haeberli p.c.)

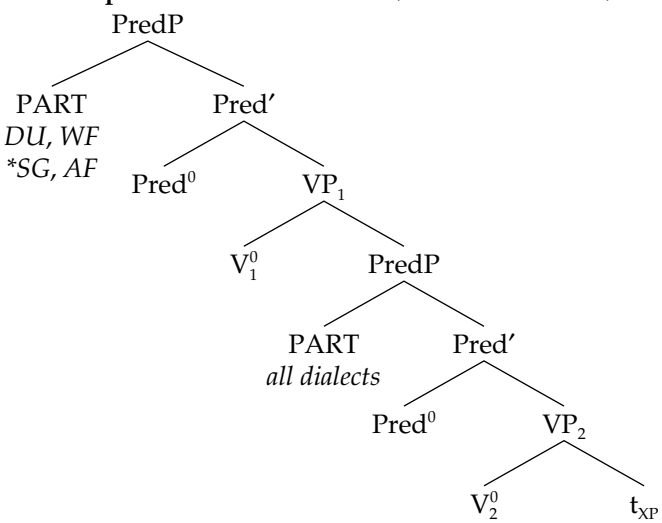
e. dan ze hem vu dienen cursus {in} moeten {in} schrijven WF
that they him for that course {in} must {in} write
'that they must register him for that course' (Rutten 1991: 60)

There are two basic ways to capture this distributional difference regarding particle placement. First, it has been assumed that the difference lies in the properties of the particles in the two language groups (i.e., DU and WF, on the one hand, and AF, GE, and SG, on the other hand). Second, it has been assumed that the difference lies in the properties of verb-cluster formation. Starting with the head-final approach, particle incorporation could be seen as obligatory in the non-stranding languages and optional (or optionally covert) in the stranding languages. Thus, independent of whether verb clusters are formed by head- or phrasal movement, in a language with obligatory overt incorporation of particles, particles will always be carried along with the verb or verb phrase, and hence the particle will show up next to the verb it is associated with. According to the second option, the difference between DU and WF, on the one hand, and AF, GE, and SG, on the other hand, would lie in a difference in the process of verb-cluster formation. If – as discussed in section 3.1.3 – it is assumed that particles are immobile, the difference could be seen as a contrast between the possibility (DU, etc.) vs. impossibility (GE, etc.) of head-movement to derive verb-cluster reordering (i.e., in the latter only phrasal movement is allowed, and hence stranding of the particles would be prohibited). Finally, under a pure phrasal movement approach to verb-cluster formation, it could be assumed that DU and WF allow leftward movement of particles prior to VP movement (and hence stranding of particles when the VP undergoes rightward movement), whereas particles cannot undergo phrasal movement in AF, GE, and SG. Turning to the head-initial approach, the most common assumption is that in AF, GE, and SG, the projection targeted by particles is directly above the phrase hosting the

verb with which the particle is associated, whereas the landing site for particles can be higher up the tree in DU and WF.

Thus, to account for the properties of particle placement in West Germanic, both the head-final and the head-initial approach require certain language-specific assumptions. The ultimate goal is to derive these assumptions from other properties of grammar; however, at this stage, it seems that this goal has not been reached. While there are accounts (such as Zwart 1996; see section 3.4.1) that provide algorithms for why particles can target higher positions in certain languages, it is still an open question why this position is not available in other languages. To be more specific, the question is how differences such as the one illustrated in (47) can be motivated. Assuming for simplicity a head-initial structure (although the same question arises for the head-final approach), AF, DU, SG, and WF allow the basic 1–2 order in modal–infinitive constructions, and hence involve a structure without verb-cluster movement. However, since the languages show a difference regarding the position where particles can go (DU and WF allow the particles to precede the higher verb, whereas AF and SG require the particle to be next to the lower verb), it has to be assumed that the landing site of particles (PredP) is different in the two language groups (i.e., PredP is above or below the higher verb). While this assumption derives the correct word order, it should also be noted that an analysis along these lines is based on a stipulation. That is, the stipulated ordering of functional projections gives us the right result, but the question as such remains: why can PredP be higher than VP-1 or why can particles move to a higher PredP in some languages but not in others?

(47) **Particle placement in 1-2 order (head-initial base):**



Thus, what seems to be still called for is an account that does not simply restate the distribution of particles (and in fact of all elements in table 75.7, as we

will see below) as assumptions about the ordering of syntactic projections, but that derives the variation from independent principles. More can be said about the intricacies of particle placement in West Germanic verb clusters, and some issues will be addressed in section 3.4; however, for the present discussion, the crucial observation is that particles are always allowed to interrupt a verb cluster (which, in the head-initial setting, could be seen as evidence for the presence of a PredP between the verbs of a cluster), but that particle placement is also driven by language-specific properties.

The next class of elements in table 75.7 consists of bare nouns, low adverbs, resultatives, and parts of idioms. Since the distribution of these elements is by and large the same in any given language, they will be considered together here (however, refinements are likely to be necessary). As is illustrated in (48), all languages allow these elements as parts of a verb cluster (modulo the restriction noted by Neeleman 1994a, namely that only morphologically non-complex elements are possible in DU; cf. the contrast between (48b′) and (48b″)). Furthermore, in contrast to particles, no language *requires* that these elements be part of the cluster:

(48) **Other 'small' elements in verb clusters:**

a. dat hulle hier kom water drink het AF
that they here come water drink have
'that they have come here to drink water' (Robbers 1997: 75)

a′. Jy sal seker moet vinnig reageer.
You will certainly must quickly reply
'You will certainly have to reply quickly.' (Robbers 1997: 83)

a″. Jy sal dit moet in ag neem.
You will it must into consideration take
'You will have to take this into consideration.' (Robbers 1997: 73)

b. dat Jan de deur {groen} wil {groen} verven DU
that Jan the door {green} wants {green} paint
'that Jan wants to paint the door green' (Neeleman 1994a: 24)

b′. dat Jan de meloen {open} zal {open} snijden
that Jan the melon {open} will {open} cut
'that Jan will cut open the melon' (Neeleman 1994a: 237)

b″. dat Jan de meloen {helemaal open} zal {*helemaal open} snijden
that Jan the melon {all-the-way open} will {*all-the-way open} cut
'that Jan will cut the melon all the way open' (Neeleman 1994a: 237)

b‴. dat Jan de bloemen {water} heeft willen {?*water} geven
that Jan the flowers {water} has want-ipp {?*water} give
'that Jan wanted to water the flowers' (Veraart p.c.)

c. daß er vor der Abreise noch {Blumen} hätte {Blumen} GE
that he before the departure still {flowers} had {flowers}
gießen sollen
water shall
'that he should have watered the flowers before his departure'

c′. dass er das Buch {genau} hätte {genau} durchsehen sollen
that he the book {carefully} had {carefully} through-look shall
'that he should have looked through the book carefully'

c″. daß er dieses Faktum {in Betracht} hätte {in Betracht}
that he this fact {in consideration} had {in consideration}
ziehen müssen
take must
'that he should have taken this fact into consideration'

d. dass er vor de Abreis no {Blueme} het soele SG
that he before the departure still {flowers} had shall
{Blueme} guesse
{flowers} water
'that he should have watered the flowers before his departure'
(Schönenberger p.c.; Haeberli p.c.)

d′. dass er da Buech {gnau} het soele {gnau} doere laese
that he the book {carefully} had shall {carefully} through read
'that he should have read through the book carefully'
(Schönenberger p.c.; Haeberli p.c.)

d″. dass er das {i Betracht} het soele {i Betracht} zieh
that he that {in consideration} had shall {in consideration} take
'that he should have taken this into consideration'
(Schönenberger p.c.; Haeberli p.c.)

e. da Jan dat boek absoluut wilt thuis lezen WF
that Jan that book absolutely wants at-home read
'that Jan absolutely wants to read that book at home'
(Haegeman 1992: 190)

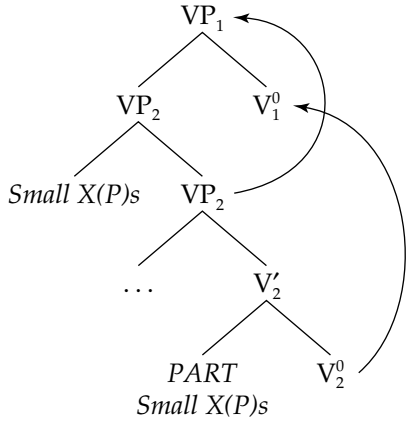
e′. da Valère oa willen morgen no Gent goan
that Valère had want-ipp tomorrow to Gent go
'that Valère had wanted to go to Gent tomorrow'
(Haegeman 1995a: 72)

The fact that the elements in (48) behave like particles in that they are allowed to split up a verb cluster (across West Germanic) could be seen as support for the claim that resultatives, bare nouns, idiom chunks, and perhaps certain adverbs share a common property with particles (e.g., they form a complex head with the verb as suggested by Neeleman 1994a, or they target the same functional projection – PredP in (45)). On the other hand, the fact that these elements do not have to be part of the verb cluster in any of the languages discussed shows that these elements also contrast with particles in some crucial respect (e.g., depending on one's analysis of particle constructions, the elements in (48) do not have to form a complex head with the verb, even in languages where particles are required to do so; or in the head-initial setting, the landing site of the elements in (48) can be further away from the verb than the one where particles must move to). The derivation of the word orders attested in verb clusters involving 'small' elements such as bare nouns, adverbs, etc., is fairly straightforward. The diagrams in (49)

illustrate possible head-final and head-initial derivations and summarize the assumptions necessary to capture the distribution of particles and other small elements in verb clusters. As in the case of particles, an open question regarding the distribution of these elements is whether the assumptions in (49) can be related to other properties of the particular languages, or whether they simply constitute irreducible language-specific facts that do not follow from other conditions or constraints but that must be learned for each language:

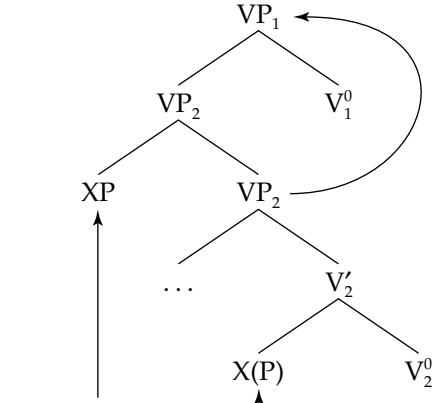
(49) **Verb projection raising with particles and other 'small' elements:**

a. **Head-final base – mixed account:**



X^0-movement: DU, WF
XP-movement: All others

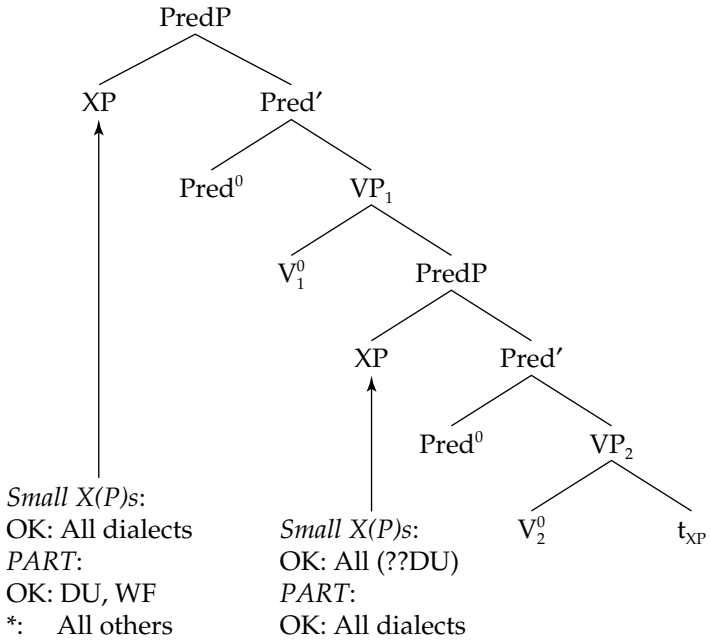
a'. **Head-final base – XP-movement account:**



Small X(P)s:
OK: All dialects
PART:
OK: DU, WF
*: All others

Small X(P)s:
OK: All (??DU)
PART:
OK: All dialects

b. **Head-initial base:**



The final two categories that have to be distinguished in verb projection raising constructions (see again table 75.7) are indefinite (or weak) noun phrases and prepositional phrase, on the one hand, and definite or (strong) noun phrases on the other hand. While the phrases of the former type are allowed to occur within a verb cluster in SG, WF, and (at least for some speakers) in AF and GE, the latter are allowed only to separate the verbs of a cluster in SG and WF. The examples in (50) illustrate this last difference found among the West Germanic dialects regarding the kind of material allowed in verb projection raising configurations (further examples illustrating verb projection raising in GE can be found in Den Besten and Broekhuis 1992; Broekhuis 1992: 190):

(50) **DPs and PPs in verb clusters:**

a. Dink jy ek sal kan in Pretoria bly? AF
Think you I will can in Pretoria stay
'Do you think I will be able to get a place to stay in Pretoria?'
(Robbers 1997: 82)

a'. %Ek sal nou kan twee boeke betaal.
I will now can two books pay
'I will now be able to pay for two books.' (Robbers 1997: 77)

a''. *Sy sal graag wil die boek lees.
she will gladly want the book read
'She would be happy to read the book.'
(Robbers 1997: 78; my paraphrase)

b. dat Jan {naar Wenen} heeft willen {*naar Wenen} gaan DU
that Jan {to Vienna} has want-ipp {*to Vienna} go
'that Jan wanted to go to Vienna' (Veraart p.c.)

b′. dat Jan {een huis} wil {*een huis} kopen
that Jan {a house} wants {*a house} buy
'that Jan wants to buy a house'
(Haegeman and Van Riemsdijk 1986: 419)

b″. dat Jan {het huis} wil {*het huis} kopen
that Jan {the house} wants {*the house} buy
'that Jan wants to buy the house' (Veraart p.c.)

c. %dass er nicht hätte nach Turkestan fahren sollen GE
that he not had to Turkestan go shall
'that he should not have gone to Turkestan'

c′. %dass er zumindest hätte einen Trostpreis gewinnen sollen
that he at least had a consolation prize win shall
'that he should at least have won a consolation prize'

c″. *dass er vor der Abreise hätte die Kakteen gießen sollen
that he before the departure had the cacti water shall
'that he should have watered the cacti before his departure'

d. dass er noed het soele noch Turkeschtan fahre SG
that he not had shall to Turkestan go
'that he should not have gone to Turkestan'
(Schönenberger p.c.; Haeberli p.c.)

d′. dass er vor de Abreis het sole pBlueme/t Rose guesse
that he before the departure had shall the-flowers/the roses water
'that he should have watered the flowers/roses before his departure'
(Schönenberger p.c.; Haeberli p.c.)

d″. dass er het soele da Buech gnau doerelaese
that he had shall the book carefully through-read
'that he should have read through the book carefully'
(Schönenberger p.c.; Haeberli p.c.)

e. da Jan . . . {da boek} wilt {da boek} vuor Marie kopen WF
that Jan . . . {that book} wants {that book} for Marie buy
'that Jan wants to buy that book for Marie'
(Haegeman 1992: 148)

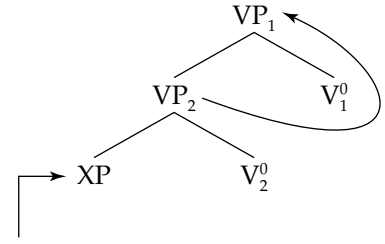
e′. da Valère wilt vele boeken lezen / een hus kopen
that Valère wants many books read / a house buy
'that Valère wants to read many books/buy a house'
(Haegeman 1998c: 261; Haegeman and Van Riemsdijk 1986: 419)

e″. da Valère willen [Marie dienen boek geven] eet
that Valère want-ipp [Marie that book give] has
'that Valère has wanted to give Marie that book'
(Haegeman 1998c: 260)

Under a head-final approach (cf. (51a)), definite objects must leave the VP prior to verb projection raising in AF, DU, and GE. For some AF and GE speakers, indefinite objects and prepositional phrases can remain inside the VP. Finally, in WF and SG, objects and prepositional phrases can be part of the projection that undergoes rightward movement. Under a head-initial approach (cf. (51b)), all XPs must leave the VP; indefinite objects and prepositional phrases can target a position lower than the higher verb in SG and WF, and in some AF and GE dialects. Definite objects can target the intermediate position in SG and WF, but they must move to a position higher than the highest verb in all other dialects:

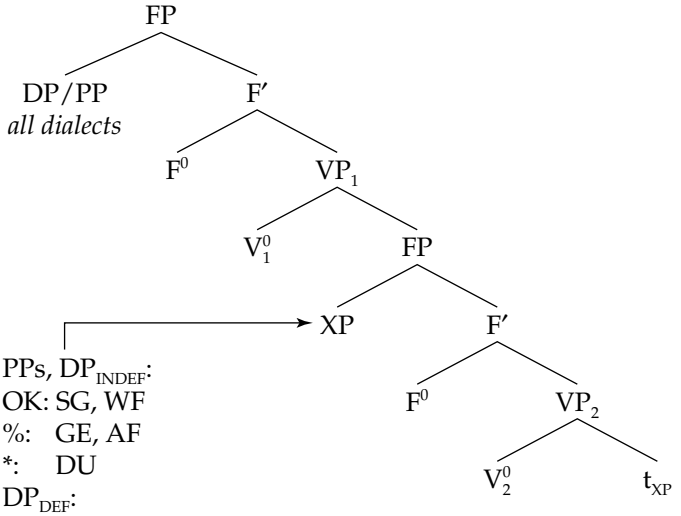
(51) **Verb projection raising with objects and prepositional phrases:**

a. **Head-final base – XP-movement account:**



t_{XP}: OK: All dialects
PP/DP_{INDF}: OK: SG, WF
%: AF, GE
*: DU
DP_{DEF}: OK: SG, WF
*: AF, DU, GE

b. **Head-initial base:**



PPs, DP_{INDEF}:
OK: SG, WF
%: GE, AF
*: DU
DP_{DEF}:
OK: SG, WF
*: All other dialects

Parts of the above distribution of objects and prepositional phrases in verb clusters can be related to inherent differences between these elements. In particular, a frequent assumption is that definite objects are subject to different licensing conditions than indefinite objects (or more accurately, the conditions differ depending on whether an object represents old or new information). In more detail, it is commonly assumed that definite objects in contrast to indefinite objects must leave the VP for semantic reasons (see, for instance, Diesing 1990a, 1996, 1997; Bobaljik 1995; among many others). Thus, if it is assumed that definite objects are required to move to a VP-external position (head-final approach) or that they must target a higher specifier than indefinite objects and prepositional phrases (head-initial approach), the difference encountered in AF and GE between definite and indefinite objects can be related to the semantic difference of the elements involved. The distribution of objects in verb clusters thus provides further evidence for this view. However, unfortunately, this semantic correlation captures only parts of the distribution. Further language-specific assumptions are again necessary to account, e.g., for the fact that definite objects can target the lower FP (in a structure like (51b)) in SG and WF, or the fact that the lower FP is unavailable for all objects in DU (and for some AF and GE speakers).

In conclusion, the verb projection raising phenomenon is not an absolute property of a language (i.e., languages do not simply allow or disallow verb projection raising structures), but the felicity of these structures depends crucially on the type of material that occurs between the verbs of a cluster. Comparing the composition of verb clusters across West Germanic, some interesting generalizations regarding the material that can occur interspersed in a verb cluster can be found. However, the distribution of verb projection raising material is also subject to language-specific properties that do not necessarily follow from other properties of grammar.

3.3 Motivation for verb-cluster movement

One of the biggest challenges verb clusters provide for syntactic theories is the fact that the orders found in verb clusters are to some extent arbitrary (though, as we have seen, there are some robust generalizations). Hence in order to develop an explanatory account for the facts noted that goes beyond the statements in tables 75.3 or 75.4, one has to find principles that motivate the verb-cluster reorderings found across languages and that exclude the structures that are unattested (both cross-linguistically and in any particular language). The issue of the motivation of verb-cluster movement has been approached by many researchers, and the general idea most analyses are built on is that verb-cluster movements are triggered by the presence of certain syntactic features or the needs of various elements to fulfill certain licensing conditions. If these features or conditions can be independently motivated, an account deriving the distribution of verb clusters by means of these features or licensing conditions would

offer an insightful explanation for the phenomenon, and hence be clearly preferable to the descriptive accounts outlined in section 2.4.

This section will focus on the issue of the motivation of verb-cluster formation, and it will be shown that, while there are numerous ways to account for the distribution of verb clusters by the assumption of features that have to be checked or licensing conditions that have to be met, there nevertheless does not seem to be a principled way to motivate differences among languages. What we will see is that generally, these features or conditions are simply stated as being present in one language vs. absent in another, or weak in one language vs. strong in another, and moreover they are not related to any other property of the particular language (group) they are postulated for. Thus, many verb cluster triggers end up as 'parameters' that capture only the facts of verb-cluster reordering in one particular language. The conclusion will be that, although perhaps 'dressed' in a nicer way than the inversion rules in tables 75.3 or 75.4, assumptions along the lines of 'language A has feature X but language B does not have feature X', or 'feature X is strong in language A but weak in language B', are nevertheless arbitrary stipulations with little or no predictive power, and hence the postulation of these assumptions contributes little to the basic questions of how verb-cluster structures are motivated and why this phenomenon exists. It should be emphasized, however, that the aim of this perhaps slightly negative discussion is not to criticize any of the existing approaches to verb clusters, but rather to point out that there are issues that have not been settled yet and hence offer an interesting terrain for further research.

To illustrate the problem of motivating verb-cluster movements, it will suffice to look at the distribution of two-verb clusters. To recapitulate, in the head-final approach, it is assumed that the 1-2 order is derived by movement, whereas in the head-initial approach, the 2-1 order requires movement. Tables 75.8 and 75.9

Table 75.8 Five language types (two verbs): head-final derivations

Language	Order: AUX-PART	Derivation	Order: MOD-INF	Derivation
GE, Frisian	2-1	No movement	2-1	No movement
DU (1 = non-FIN)	2-1/1-2	Optional movement	*2-1/1-2	Obligatory movement
Swiss-1	2-1	No movement	2-1/1-2	Optional movement
Swiss-2, DU (1 = FIN)	2-1/1-2	Optional movement	2-1/1-2	Optional movement
WF, AF	2-1	No movement	*2-1/1-2	Obligatory movement
Unattested	*2-1/1-2	Obligatory movement		
Unattested	2-1/1-2	Optional movement	2-1/*1-2	No movement possible

Table 75.9 Five language types (two verbs): head-initial derivations

Language	Order: AUX-PART	Derivation	Order: MOD-INF	Derivation
GE, Frisian	2-1	Obligatory movement	2-1	Obligatory movement
DU (1 = non-FIN)	2-1/1-2	Optional movement	*2-1/1-2	No movement
Swiss-1	2-1	Obligatory movement	2-1/1-2	Optional movement
Swiss-2, DU (1 = FIN)	2-1/1-2	Optional movement	2-1/1-2	Optional movement
WF, AF	2-1	Obligatory movement	*2-1/1-2	No movement
Unattested	*2-1/1-2	No movement possible		
Unattested	2-1/1-2	Optional movement	2-1/*1-2	Obligatory movement

summarize the distribution of two-verb clusters in the languages discussed and also list whether movement is necessary, possible, or impossible in each of the constructions (table 75.8 is from a head-final perspective, and table 75.9 is from a head-initial perspective).

The descriptive accounts offered in section 2.4 derive this distribution by rules demanding, allowing, or prohibiting the reordering of the elements involved (e.g., the head-final settings specify that AF and WF require a shift between modals and their complements, whereas the head-initial settings specify that these two languages require a shift between certain auxiliaries and their complements). As noted, these rules are arbitrary and do not offer a way of accounting for the unattested orders. That is, nothing should prevent a rule that requires (head-final) or disallows (head-initial) inversion between auxiliaries and participles; or a rule that allows inversion between auxiliaries and participles but prohibits it (head-final) or requires it (head-initial) for modals and auxiliaries. The aim of an explanatory syntactic account is thus to (i) derive the distribution in tables 75.8 and 75.9 (i.e., account for what is possible *and* what is impossible), and (ii) motivate the operations by principles independently attested (either cross-linguistically or in the particular language). The next subsections summarize and evaluate three types of approaches to verb-cluster formation in light of these two criteria.

3.3.1 Overt vs. covert movement

A common way of encoding (word-order) differences between languages is to assume that movement of a particular type applies in all languages, but that languages differ as to whether a particular movement operation is overt or covert (see, for instance, Zwart 1996 for assumptions along these lines). To accommodate West Germanic two-verb clusters, one would then have to assume the

following overt/covert settings (note that it does not matter for the discussion here if covert movement is seen as movement at LF or overt movement with pronunciation of the lower copy):

(52) **Overt/covert settings for two-verb clusters:**

a. **Head-final structure:**

GE, Frisian:	Infinitives and participles move covertly
DU (1 = non-FIN):	Infinitives move overtly, participles overtly or covertly
DU, Swiss-2:	Infinitives and participles move overtly or covertly
Swiss-1:	Infinitives move overtly or covertly, participles covertly
WF, AF:	Infinitives move overtly, participles covertly

b. **Head-initial structure:**

GE, Frisian:	Infinitives and participles move overtly
DU (1 = non-FIN):	Infinitives move covertly, participles overtly or covertly
DU, Swiss-2:	Infinitives and participles move overtly or covertly
Swiss-1:	Infinitives move overtly or covertly, participles overtly
WF, AF:	Infinitives move covertly, participles overtly

While the settings in (52) derive the possible word orders in the languages listed, the question arises whether this approach goes beyond the descriptive accounts presented in section 2.4. It seems that the two criteria mentioned above for an explanatory account are both unfulfilled. First, although the overt/covert approach accounts for what is possible across the languages discussed, it does not account for what is impossible. That is, there is no reason why there should not be a language with the settings 'participles move overtly' or 'participles move overtly or covertly and infinitives move covertly' (head-final), or the settings 'participles move covertly' or 'participles move overtly or covertly and infinitives move overtly' (head-initial). Second, the overt/covert assumptions in (52) do not correlate with any other property found in the language(s) discussed but only serve the purpose of deriving the word orders in verb clusters – i.e., they are not independently motivated and as such are as good or bad as the inversion rules in tables 75.3 or 75.4.

3.3.2 Positional approach without covert movement

A different (more recent) approach to word-order variation is what will be called the 'positional' approach here. The core idea of positional analyses is that word-order differences are not the result of a difference in the timing of movement, but rather arise from different positions an element can occupy in different languages. This approach is a direct consequence of recent expansions

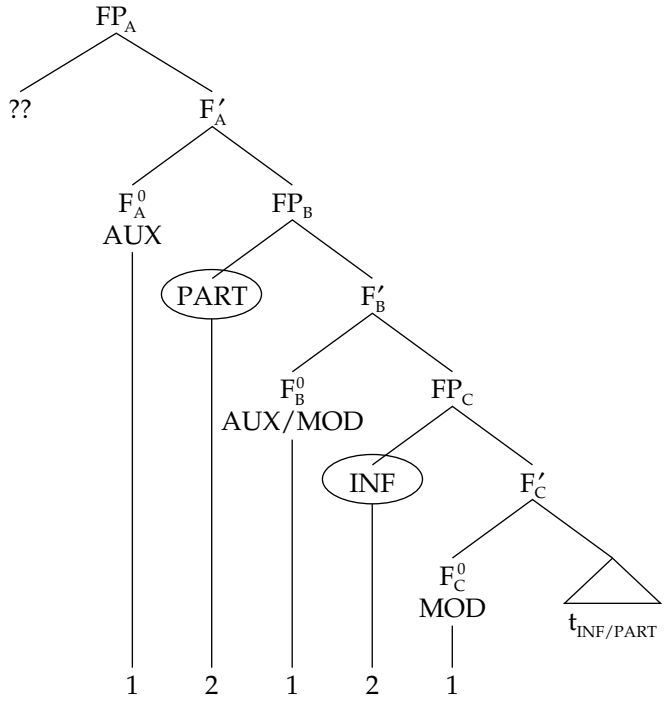
of phrase structure (as, for instance, suggested by Rizzi 1997 or Cinque 1999) and the Minimalist idea that movement is triggered by the presence of features. In particular, the increase of the number of functional projections offers new landing sites for movement, and hence ways to encode differences between languages without reference to an overt/covert distinction. The step from the traditional verb (projection) raising approach to an analysis of verb-cluster movement as movement to functional projections also (partially) solves a constant problem arising for V-to-V and VP-to-VP raising analyses – namely, the question of how movement can be motivated. In particular, head-movement (i.e., movement of a lexical head to another lexical head) has proven quite difficult to motivate since, as pointed out by Den Dikken (2000), lexical heads typically do not serve as attractors and the assumption of a featural deficiency is insufficient to account for the optionality of verb-cluster movement in many dialects.

The idea that word-order variation is the result of different positions rather than an overt/covert distinction is reflected (fully or partly) in many recent analyses of verb clusters (see Haegeman 1995a, 1998b, 1998c; Den Dikken and Hoekstra 1997; Robbers 1997; Koopman and Szabolcsi 2000; among many others). The challenge of positional analyses is to avoid overgeneration and to limit the options offered by the (in principle unrestricted) number of functional projections (i.e., although the core idea of positional analyses is that certain elements can occur in different positions in different languages, it is not the case that they can occur just anywhere). The general approach to the overgeneralization problem is to assume that one of the elements in a two-verb cluster is fixed to one (derived) position, whereas the other element is arranged around it. Haegeman (1995a, 1998b, 1998c), for instance, assumes that the positions of the participle and the infinitive are fixed, whereas the positions of the auxiliary and the modal are variable. Robbers (1997) and Zwart (1996), on the other hand, assume that the position of the auxiliary is fixed, whereas the position of the participle is variable (Zwart's account also makes use of an overt/covert distinction).

Turning to two-verb clusters, a positional account is outlined in (53). As can be seen, three functional projections are necessary to account for the word-order differences in the languages discussed. SpecFP(B) has been chosen as the designated position for participles, whereas SpecFP(C) is the position targeted by infinitives. That is, under a positional approach, participles (cross-linguistically) move to SpecFP(B) and infinitives move to SpecFP(C) in overt syntax. Modals and auxiliaries, on the other hand, are variable in that they can occur in F(A), F(B), or F(C). Thus, if the auxiliary occupies F(A), the 1-2 order is derived; if it occupies F(B) or F(C), the 2-1 order is derived. Similarly, if the modal is in F(A) or F(B), the 1-2 order is derived; if it is in F(C), the 2-1 order is derived (to limit the positions, it would be sufficient to assume that auxiliaries occupy either F(A) or F(B), whereas modals occupy either F(B) or F(C); cf. (53a)). The variation found across West Germanic can now be derived from the settings in (53b):

(53) **Positional analysis of two-verb clusters:**

a. **Structure:**



b. **Settings:**

GE, Frisian:	AUX: F(B/C)	MOD: F(C)
DU (1=non-FIN):	AUX: F(A, B/C)	MOD: F(A/B)
DU, Swiss-2:	AUX: F(A, B/C)	MOD: F(A/B, C)
Swiss-1:	AUX: F(B/C)	MOD: F(A/B, C)
WF, AF:	AUX: F(B/C)	MOD: F(A/B)

This approach is appealing, since it reduces the variation found across languages to simple claims about the position of certain elements. Despite this, the question one has to ask is whether an account involving assumptions of the form in (53) is an explanatory account. That is, does this approach make any predictions about impossible combinations, and are the assumptions in (53) independently motivated? Unfortunately, it seems that the answers are again negative. First, it is not clear under this approach why certain combinations are unattested. In particular, there are no languages/dialects that require auxiliaries to occupy F(A) only; and there are no languages/dialects that allow auxiliaries in any position but require modals to occur in F(C). Regarding the former case, one might suggest that languages that allow auxiliaries only in F(A) and not in F(B) do not exist, since overt specifier–head configurations between elements that are in some checking relation (such as auxiliaries and participles) have to be at least

possible in every language. However, this seems to be falsified by WF and AF, which allow modals only in F(A)/(B) and not in F(C) (i.e., an overt specifier–head configuration between two elements in a checking relation is *not* allowed in these languages). Thus, while the positional approach derives the possible orders, it does not provide any obvious way other than by stipulation to exclude the unattested configurations.

An answer to the second question of the explanatory value of positional approaches such as the one outlined above crucially depends on whether it is possible to assign a function or meaning to the functional projections in (53). As for F(B) and F(C), it could be assumed that these heads are the designated positions for auxiliaries (i.e., F(B) encodes, e.g., aspectual information) and modal verbs (i.e., F(C) encodes modality). Furthermore, the idea that these heads must enter into a checking relation (i.e., in particular a specifier–head relation) with a participle (SpecF(B)) or an infinitive (SpecF(C)) is a fairly standard assumption in theories that define licensing as checking in specifier–head configurations. A question, however, arises regarding the highest projection F(A): what type of information or feature is expressed by this projection? It is not obvious what the answer to this question is. A similar concern arises for F(B). Assuming that F(C) represents the base position for modals, one has to ask why modals can or must move further to F(B) in certain languages.

This question becomes an even more important issue if we look more closely at the way positional analyses (in particular, pure surface positional analyses that dispense with covert movement) handle optionality. Although positional analyses are built on the claim that certain elements can occur in different positions (both within one language and across languages), on closer inspection, this optionality seems in fact to be inherently inconsistent with a pure positional approach. To illustrate this problem, a concrete example will be examined in more detail. As we have seen above, in DU and Swiss-2, modals and auxiliaries can occur in any of the functional heads postulated (i.e., they can either precede or follow the participle and infinitive). There are two ways to derive this optionality. First, it can be assumed that modals and auxiliaries do not have universally designated positions but are inserted in different positions in different languages and/or constructions. Second, modals and auxiliaries are base-generated (universally) in designated positions (i.e., modals in F(C) and auxiliaries in F(B)) and undergo further movement in some languages. Regarding the first option, it should be noted that this does not provide a way to relate the assumption about where elements are inserted in a particular language to any other property (even the idea that the functional projections in (53) are related to notions such as aspect or modality would be given up in this approach). Thus, since this option is entirely descriptive, in that it simply states the order of elements in a clause, it lacks any explanatory value and hence does not provide any insight into the distribution of verbal elements.

According to the second option, modals and auxiliaries are inserted universally in the lower positions; in DU and Swiss-2, however, these elements have

a choice of moving on or remaining in their base positions. Since in a pure positional account no covert movement is available, it must be the case that all licensing/checking requirements are met in surface positions. For DU and Swiss-2 modals and auxiliaries, this means that since these elements can stay in the lower positions (i.e., in F(C) or F(B), in the 2-1 orders), they must also be licensed in the lower positions (otherwise, the 2-1 orders should be ungrammatical, given that covert movement is unavailable). However, if this is the case, a serious question arises for the orders that involve movement. What triggers this movement? The conclusion one must draw is that this movement must be untriggered and cannot be caused by any licensing/checking requirement. If there were such a requirement, it would not be met in the case where movement does not occur (again, since this approach rejects covert movement). Thus, under these premises, movement as in DU or Swiss would have to be movement that is not motivated by any syntactic licensing requirement. The only way licensing could be built into such an approach is if it is assumed that the 1-2 order and the 2-1 order involve crucially different features or properties that must be licensed in different positions. However, the works on verb clusters seem to agree that apart from word order there is no difference between examples showing the 1-2 order and those showing the 2-1 order (furthermore, this claim would lead one to conclude that the constructions corresponding to *John must leave* are entirely different constructions in WF and GE, despite the fact that they mean the same).

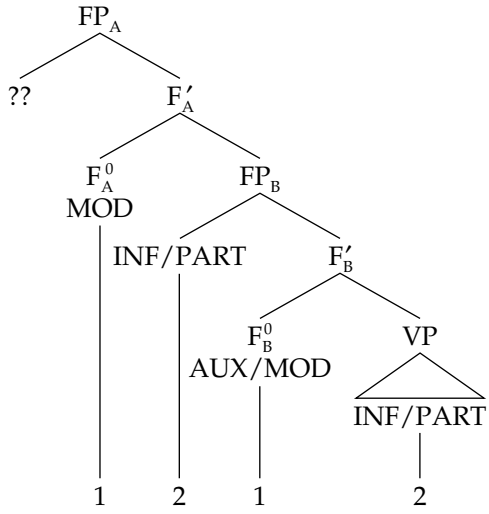
To conclude, a positional approach that is based on the claims that (i) there is no covert movement, and (ii) movement is motivated by feature checking, leads to a paradox that can only be solved by giving up one of the two assumptions. If the second assumption is given up – i.e., if movement is not considered to be motivated – the assumptions in (53) reduce to stipulations about whether certain elements can or cannot precede other elements. Hence, an account along these lines would not go beyond simple descriptive statements about the word order in verb clusters, and therefore cannot be seen as superior to the descriptive accounts outlined in section 2.4. The second option – i.e., a positional account that allows covert movement – seems more promising, and will therefore be discussed in some more detail in the next subsection.

3.3.3 Positional approach with covert movement

In a combined positional and overt/covert account, the minimal structure for two-verb clusters would be as in (54). In (54), auxiliaries occur in F(B), infinitives and participles move overtly or covertly to SpecFP(B), and modals can occupy either F(A) or F(B). Thus, if VP-movement is covert, the 1-2 orders are derived; if VP-movement is overt, the 2-1 order is derived in the auxiliary–participle construction, and either the 1-2 or the 2-1 order in the modal–infinitive construction, depending on the position of the modal. The settings necessary to account for the distribution of two-verb clusters in the languages discussed are listed in (54b):

(54) **Positional analysis of two-verb clusters and covert movment:**

a. **Structure:**



b. **Settings:**

GE, Frisian:	MOD in F(B); overt movement
DU (1 = non-FIN):	Non-fin MOD in F(A); overt/covert
DU, Swiss-2:	MOD in F(A) or F(B); overt or covert movement
Swiss-1:	MOD in F(A) or F(B); overt movement
WF, AF:	MOD in F(A); overt movement

As these settings show, the advantage of a combined positional and overt/covert system over an account as outlined in section 3.3.1 (i.e., an account that makes use of only the overt/covert distinction to account for differences between constructions and languages) is that a single overt/covert setting is sufficient in (54) for all constructions (and languages), and no construction-specific stipulations are necessary to derive differences between auxiliary–participle constructions and modal–infinitive constructions. Nevertheless, the system in (54) involves two types of parameters that have to be set for each language: an option between overt and covert movement and an option between two positions for modals. The two positions for modals are essential to account, for instance, for the difference between GE and WF. In both languages, overt VP movement takes place, which guarantees that auxiliary–participle constructions appear in the 2-1 order. However, to derive the 1-2 order in modal–infinitive constructions in WF and AF but not in GE (by keeping the claim that VP movement is overt in these languages; if it were overt for participles but covert for infinitives in WF and AF, we would end up again with a system such as the one in (52)), two positions for modals are necessary.

To return to the major question of this section, we now have to ask again whether a system such as (54) meets the criteria of an explanatory account. Let

us first consider if a positional account involving overt and covert movement can exclude the unattested cases. In the scenario in (54), these would be languages with obligatory covert movement, and languages with overt or covert movement for participles but obligatorily covert movement for infinitives. Thus, to exclude these scenarios, all one has to do is to add a ban on obligatorily covert movement and a requirement that the overt/covert parameter is set uniformly for all constructions in one language. Thus, while these assumptions would have to be evaluated with respect to other constructions (in particular, they must be tested in three-verb clusters), it is important to note that this account appears to be the most successful one in providing a way to approach this overgeneralization problem.

Without engaging in an endless discussion of larger verb-cluster constructions, there are, however, two concerns that cast some doubt on the straightforwardness of the account outlined in (54). First, the system in (54) crucially relies on the assumption that cross-linguistically, auxiliaries occur in a fixed position, whereas modals and main verbs have a choice. It is not easy to see why there should be this distinction. In particular, the difference between modals and auxiliaries does not seem to follow from any obvious property of these elements, and hence one could easily imagine the opposite situation (it is also important to note in this respect that this difference between modals and auxiliaries is essential to exclude the impossible orders, as suggested above). The second question the account in (54) is faced with is whether the settings can be independently motivated or whether they only serve the purpose of deriving (two-)verb clusters. One way to motivate the two functional projections in (54) is to assume that FP(B) is the projection responsible for the licensing of auxiliaries (F(B)) and main verbs (SpecF(B)), whereas FP(A) is the projection responsible for the licensing of modals.[18] Under this assumption, modals which start out in F(B) or a lower VP move (overtly or covertly) to F(A) to check whatever 'modal' features have to be checked. Thus, in WF and AF, for instance, modals move overtly, whereas in GE and Frisian, they move covertly. However, assuming that much, a re-evaluation of the point that has been mentioned as an advantage of this system seems necessary. Although no construction-specific settings are necessary under this approach for auxiliaries, infinitives, and participles, and a general overt/covert setting is sufficient for VP movement, the distribution of modals does require additional assumptions. In particular, GE and Frisian require different timing settings for VP movement (which must be overt) and movement of modals (which must be covert). Thus, the claim that there is a uniform overt/covert setting should be qualified; in particular, different timing settings must be stipulated for modals, on the one hand, and main verbs, on the other hand. To conclude, although the system in (54) appears attractive in its restrictiveness, it nevertheless – like the other approaches sketched – involves crucial stipulations that do no more than state the orders of verbal elements in a cluster.

In sum, the discussion in this section has shown that to account for the distribution of West Germanic two-verb clusters, all three approaches outlined above

must make crucial reference to category-specific assumptions (in terms of either the timing of movement or the position a particular category targets). In particular, what seems to be unavoidable is the assumption of two differences that so far have not been correlated with any other (universal or language-specific) property: (i) an overt vs. covert difference or different positions for different categories within one language (i.e., an element occurs in FP(A) vs. FP(B) depending on the category of the element, such as modal, auxiliary, etc.); and (ii) an overt vs. covert difference or different positions for elements of the same category in different languages (i.e., an element of a particular type occurs in FP(A) vs. FP(B) depending on the language). To conclude, while it is undoubtedly the case that descriptive accounts such as the ones presented in tables 75.3 and 75.4 are unattractive for their lack of explanatory value, it is not clear at the current stage of the research on verb clusters that it is trivial (or possible at all) to come up with an alternative that does not suffer from these very same inadequacies.

3.4 The issue of directionality

A central question in many works on West Germanic verb clusters is the question of whether a head-initial or head-final approach can be considered as superior (for works that directly address the issue of directionality see, for instance, Kaan 1992a, 1992b; Koster 1994; Den Dikken 1994, 1995d, 1996; Den Dikken and Hoekstra 1997; Zwart 1996; Robbers 1997; Haegeman 1998c; Koopman and Szabolcsi 2000; Ackema 2004). In this section, some of the issues and problems that have been raised in the discussions of the directionality issue will be highlighted.

As the illustrations of the various options to derive verb-cluster configurations have shown (see in particular section 3.1), the answer to the directionality question does not lie in success vs. failure of the (mechanical) derivation of verb-cluster patterns. Both a head-final and a head-initial approach have the tools to create the right word orders by movement. Rather, one has to look for an answer by considering questions of the explanatory value of the approaches under consideration. The common questions that have been raised in this respect are again the two questions utilized in the previous section. First, is one of the two approaches superior in that it not only accounts for what is possible but also accounts for what is impossible (universally and in any particular language)? Second, is one of the two accounts superior in that it not only provides possible derivations but also offers motivations for the operations postulated? The works cited above claim to have positive answers to these questions. Den Dikken (1994, 1995d, 1996) investigates the scope properties in WF verb clusters, and argues for the superiority of a head-initial approach. Zwart (1996) discusses the distribution of verb clusters in a number of West Germanic languages and dialects, and concludes that the variation found across West Germanic is best accounted for in a head-initial approach. The same conclusion is reached by Robbers (1997) for AF and by Haegeman (1998c) for WF. Since Zwart's analysis covers a range of languages and constructions, and the directionality issue appears to be the foremost

goal of Zwart's contribution, it will be used here as a 'straw-man' for head-initial approaches. Zwart's contribution is also noteworthy in that it not only offers an analysis for various verb-cluster constructions, but also provides an explicit comparison between the head-final and the head-initial approach that takes into account the questions raised above. To present the directionality debate, Zwart's analysis and critique of head-final approaches will be summarized first (section 3.4.1). Section 3.4.2 will then provide a discussion and comparison of the head-initial approach with a head-final approach. The conclusion will be that certain questions pointed out by Zwart are important challenges – not, as Zwart concludes, solely for head-final approaches, but rather for accounts of verb clusters in general.

3.4.1 Zwart (1996)

The constructions Zwart concentrates on and provides an analysis for are the auxiliary–participle construction and the modal–auxiliary–participle construction (i.e., the constructions showing the greatest variability in DU; see table 75.2). The examples in (55–57) summarize the distribution of these verb clusters. To recapitulate, as is shown in (55), the order between the two verbs in an auxiliary–participle construction is free (but see Zwart for some remarks concerning dialect preferences). In modal–auxiliary–participle constructions (cf. (56)), the unmarked orders are 1-2-3 and 3-1-2, and some speakers also accept the 1-3-2 order. Furthermore, Zwart discusses the distribution of particles in these constructions. As is illustrated in (57), the generalizations regarding particle placement are: (i) the particle has to follow the object; and (ii) the particle has to precede the verb it is associated with:[19]

(55) **Auxiliary–participle construction (with particle verb):**
   a. dat Jan {*uit} het boek {uit} heeft {uit} gelezen (1-2)
      that Jan {*out} the book {out} has {out} read
      'that Jan has read/finished the book'
   b. dat Jan {*uit} het boek {uit} gelezen {*uit} heeft (2-1)
      that Jan {*out} the book {out} read {*out} has
      'that Jan has read/finished the book'

(56) **Modal–auxiliary–participle construction:**
   a. dat Jan het boek moet hebben gelezen (1-2-3)
      that Jan the book must have read
      'that Jan must have read the book'
   b. dat Jan het boek gelezen moet hebben (3-1-2)
      that Jan the book read must have
      'that Jan must have read the book'
   c. %dat Jan het boek moet gelezen hebben (1-3-2)
      that Jan the book must read have
      'that Jan must have read the book'
   d. *All others (some dialects marginally allow 3-2-1).

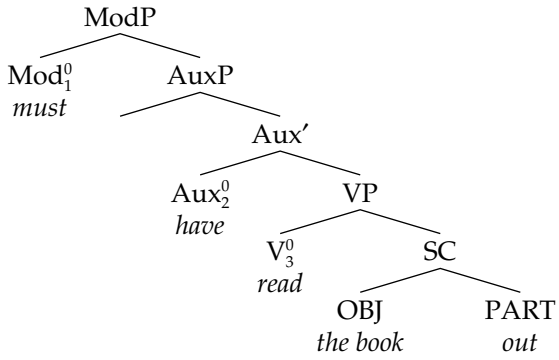
(57) **Modal–auxiliary–participle construction (with particles):**

a. dat Jan {*uit} het boek {uit} moet {uit} hebben {uit} gelezen (1-2-3)
that Jan {*out} the book {out} must {out} have {out} read
'that Jan must have read/finished the book'

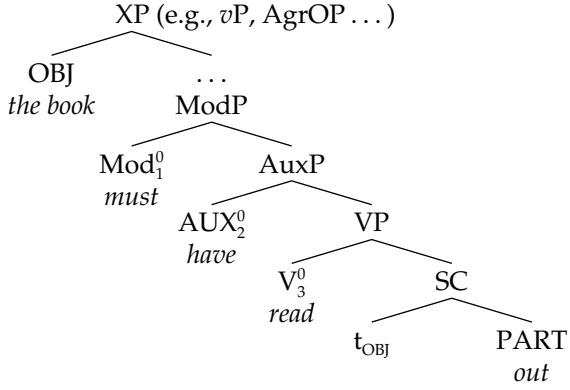
b. dat Jan {*uit} het boek {uit} gelezen {*uit} moet {*uit} hebben (3-1-2)
that Jan {*out} the book {out} read {*out} must {*out} have
'that Jan must have read/finished the book'

Let us now turn to Zwart's analysis of the clusters in (55–57). The core assumption in Zwart's approach is that – starting from a basic structure as in (58a) – a number of 'licensing' operations (i.e., movements to specifier positions of functional projections to check features) have to apply. First, the object obligatorily moves to an object licensing position (e.g., Spec AgrOP), which is the highest licensing position in the cluster (i.e., it is above the licensing positions of particles and participles, but lower than the licensing position of the subject; cf. (58b)). This is a fairly straightforward assumption, except that (in contrast to what is generally assumed for object shift in Germanic) this movement has to apply obligatorily for all objects (i.e., it is not sensitive to notions such as definiteness, old vs. new information, etc.):

(58) a. **Base structure:**

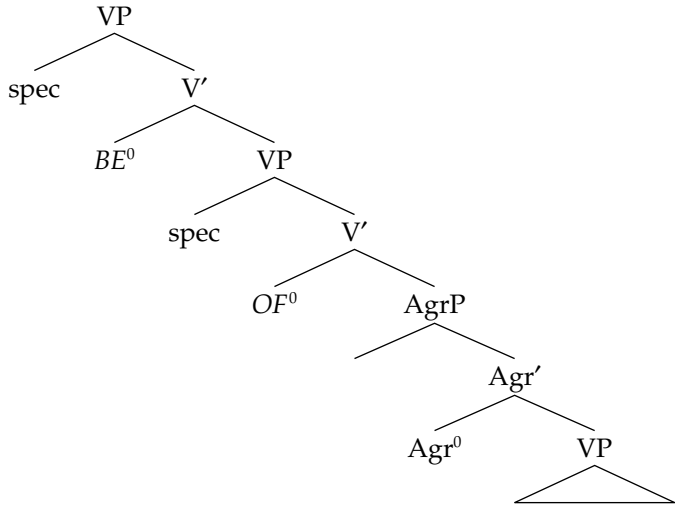


b. **Object movement:**

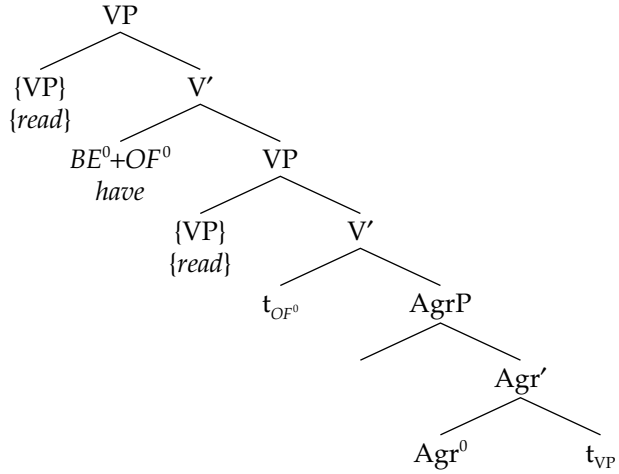


The second and most innovative licensing operation is the one that applies to participles. According to Zwart, participles also move obligatorily; however, they can move to one of two positions in DU. Following Kayne (1993), Zwart assumes that the auxiliary *have* is composed of two heads: *OF* and *BE* (cf. (59a)). The complement of *OF* is a small clause consisting of an AGR phrase, which in turn selects a lexical projection (an NP in *He has a book*, or a VP as in *He has read a book*). The derivation proceeds as follows. First, *OF* incorporates into *BE* and the complex *BE+OF* is pronounced as *have*. Second, the (remnant) VP (i.e., the participle) moves to either the specifier of *OF* or the specifier of *BE* (in DU).[20] Assuming that *have* is pronounced in the position of *BE*, the two orders in (55) are then the result not of movement vs. non-movement of participles, but rather of the two different landing sites for participle phrases (cf. (59b)):

(59) a. **Complex *have*:**

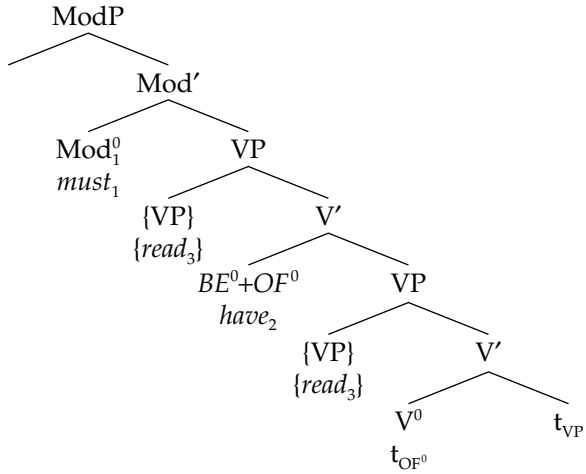


b. **Participle movement:**

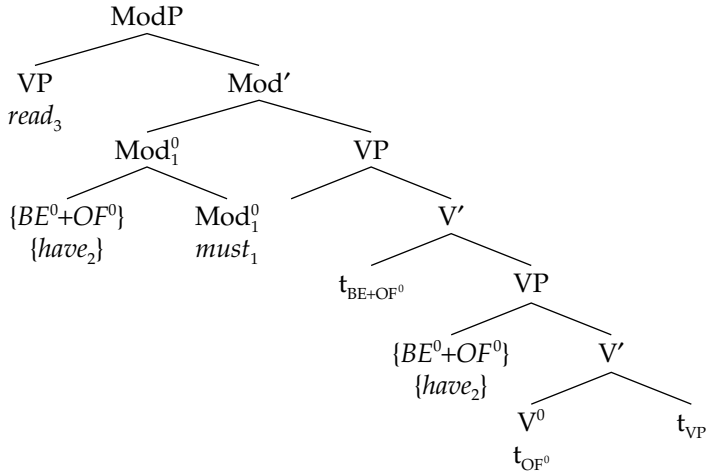


This analysis carries over straightforwardly to the 1-2-3 and 1-3-2 order in modal–auxiliary–participle constructions (cf. (60a); AgrP is ignored from now on since, it does not play a crucial role in the analysis). However, additional assumptions are necessary to account for the 3-1-2 order and to exclude the 2-1-3 and 2-3-1 orders (which do not occur for this construction in any of the West Germanic languages/dialects; see table 75.2). Regarding the 3-1-2 order, Zwart suggests that infinitives overtly or covertly adjoin to the selecting modal verbs, and that this mechanism of adjunction transfers the licensing ability of the adjoining element to the host head. Thus, in (60b), the infinitive auxiliary (i.e., the *BE+OF* complex) adjoins to the modal, and hence the modal becomes a licenser for participles. In DU, infinitive incorporation is covert, whereas in a language like GE, it is overt (but see below):

(60) a. **Modal–auxiliary–participle construction – 1-2-3 and 1-3-2:**

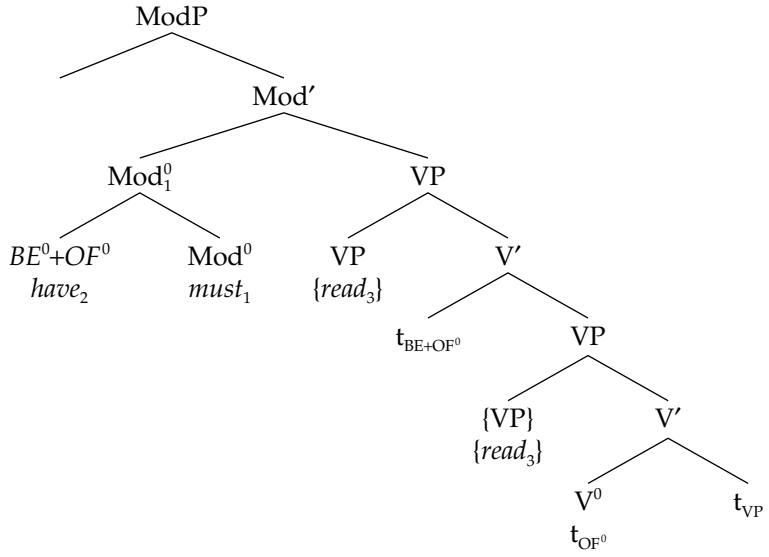


b. **Modal–auxiliary–participle construction – 3-1-2:**



Note that transferring the capacity to license participles to the modal head does not mean that the lower licensing positions are unavailable. Since Zwart treats incorporation of the infinitive into the modal head in (60b) as an obligatory process – i.e., it applies in all the constructions in (56) (but it is necessarily covert in DU) – the fact that participles can occur in the lower positions in (56a) and (56c) leads to the conclusion that covert incorporation simply increases the number of licensing positions (or in other words, covert incorporation extends the licensing domain but does not force a particular position where licensing has to take place). There is one exception, however: as Zwart notes, the lower specifiers become unavailable as licensing positions for participles when the auxiliary incorporates overtly. Thus, in all languages, it is the case that the participle has to precede the auxiliary when the auxiliary (overtly) precedes the modal. (61) illustrates the potential structure that is unattested across West Germanic and that is excluded in Zwart's account by the assumption that the licensing transfer is obligatory and licensing positions are deactivated when overt adjunction takes place:

(61) **Unattested 2-1-3:**

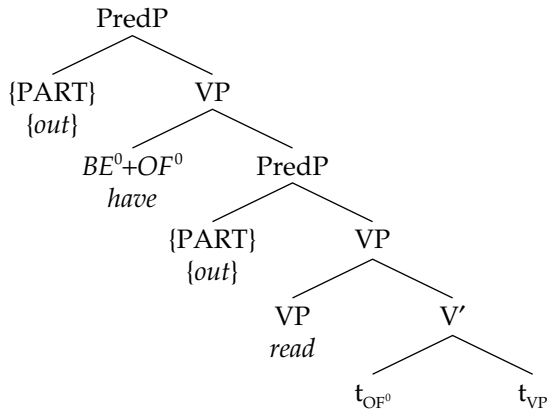


Finally, let us now turn to the third licensing operation: the licensing of particles. In the same spirit as above, Zwart assumes that particles obligatorily move to a particle-licensing position (e.g., PredP). The location of PredP is in principle flexible; however, it has to obey the following constraints: (i) it is lower than the object licensing position; and (ii) it is higher than the overt position of the verb with which the particle is associated. To be more specific, Zwart suggests that the PredP is projected above the projection that hosts the licensing verb. The licensing capacity can again be transferred. If the licensing verb is in a specifier position of an XP (as, e.g., the participle in (60)), the licensing capacity is transferred

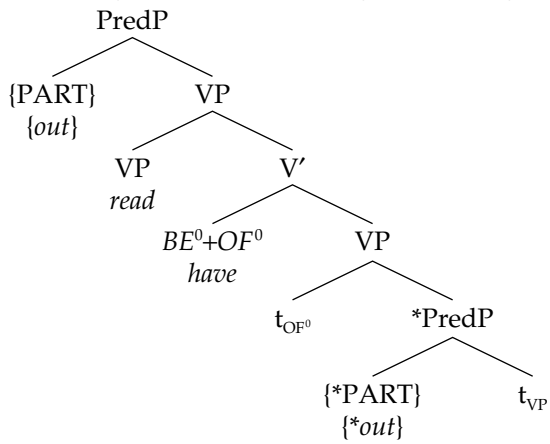
to the head X^0 of that projection (cf. the VP in SpecVP in (62a), which transfers the licensing capacity to (the trace of) OF^0). Further incorporation of X^0 into higher heads extends the domain where PredPs can be projected (i.e., incorporation of *OF* into *BE* in (62a) allows the projection of PredP above the VP headed by *OF+BE*). Similarly, if *OF+BE* incorporates (overtly or covertly) into a higher head (e.g., a higher modal), PredP would be licensed above the XP hosting this higher head. In contrast, if the verb the particle is associated with moves overtly, PredP can only be generated above the XP hosting the (original) licensing verb. As shown in (62b), if the participle occurs in the higher specifier, PredP can only be projected above the VP hosting the participle – the lower position becomes unavailable. These assumptions thus account for the fact that particles can be further up the tree than the (overt position of the) verb they are associated with, but not further down:

(62) **Particle licensing:**

a. **Licensing transfer – licensing verb in lower position:**



b. **Licensing transfer – licensing verb in higher position:**



To conclude, the attractiveness of Zwart's account is that the system excludes the ungrammatical cases discussed and that the movement operations in verb clusters are motivated by (presumably universal) licensing conditions for the elements involved. It thus appears that the account meets both criteria mentioned at the beginning of this section that are necessary for it to qualify as an explanatory account. However, to conclude that the account is in fact superior, one has to go a step further – i.e., it has to be shown that alternative accounts lack these two properties. Zwart's contribution to this comparison is given in (63). (Note that Zwart does not present (63) as a critique of one particular analysis but rather as general weaknesses of head-final approaches. Thus, not all points necessarily apply to all head-final analyses.)

(63) **Zwart's critique of OV approaches** (1996: 238ff.):
   a. There is no consistent direction of adjunction, either across continental West Germanic dialects, or even within particular continental West Germanic dialects.
   b. There is no fixed phrase-structure level of the category adjoined.
   c. It is not clear what triggers the various movements, in the sense that there is no understanding how particular asymmetries are to be explained (for instance, the asymmetry between infinitives and participles, the former adjoining to the left and the latter to the right in a number of dialects (e.g., Luxemburgish)).
   d. The parameterization makes no reference to the *timing* of the movements (i.e., either in overt syntax or in covert syntax), which is generally considered to be a major source of parametric variation (see, e.g., Chomsky 1993).
   e. It is unclear why, in the Germanic SOV languages, multi-verb constructions show such a variety of word orders within the cluster, whereas in the Germanic SVO languages multi-verb constructions invariably show strictly 'ascending' orders.
   f. It is unclear why certain phenomena (the IPP effect, verb projection raising) are sensitive to the surface order of the members of the verb cluster.
   g. The analysis relies on a phrase structural split among the Germanic languages for which there is no independent empirical basis.

Before discussing these points in detail and evaluating the critique of head-final approaches Zwart has offered, it has to be noted that despite the straightforwardness of Zwart's system, there are also minor inconsistencies and empirical problems that should be taken into account when comparing Zwart's approach with an alternative head-final approach (and in particular when evaluating the two approaches against the critique raised).

The first adjustment concerns the licensing of particles. The claim is that the overt position of the verb in which the capacity to license originates determines

the range of licensing positions. Crucially, these licensing positions must be above the overt position of the licensing verb (see (62)). An immediate question that comes to mind is how these assumptions can account for the stranding of particles in verb-second configurations. That is, as shown in (64), particles must remain in sentence-final position when the main verb (i.e., the licensing verb) moves to second position. If it is indeed the overt position of the verb that counts, these facts are unexpected:

(64) **Verb-second:**
a. dat Jan zijn moeder {op} belt
that Jan his mother {up} calls
'Jan calls his mother up'
b. Jan {*op} belt zijn moeder {op}
Jan {*up} calls his mother {up}
'Jan calls his mother up'

There are various ways to deal with this problem. One option would be to assume that verb-second movement of the verb is a type of A'-head-movement (along the lines of the relativized HMC suggested in Den Dikken and Hoekstra 1997) which does not affect the licensing of particles. A different solution would be to assume that particle licensing is not (directly) dependent on the verb the particle is associated with, but rather is subject to certain locality conditions on particle movement. In particular, all that seems necessary is to assume that the particle has to be able to c-command its trace in overt syntax (see Robbers 1997 for this suggestion). Thus, if the VP containing the trace of the particle moves to a position higher than the landing site of the particle, this condition cannot be met and the structures are excluded. If, however, only the verb moves to a position higher than the particle (as in (64b)), the particle continues to c-command its trace and the structures are licensed. The advantage of this account is that the vague notion of licensing 'transfer' could be dispensed with. In what follows, this revised account of particle placement will be used.

The second problem of Zwart's account is the claim that infinitives can only move covertly in DU (cf. (60); if overt movement were possible, the 3-2-1 order would be expected in (60), contrary to fact). While this assumption accounts for the orders in three-verb clusters, it does not suffice for two-verb clusters, which can involve the 2-1 order in modal–infinitive constructions (i.e., infinitives can move overtly in these constructions). Thus, an additional assumption is necessary to capture this fact. However, since the 2-1 order, which is only possible in finite two-verb clusters (Rutten 1991; Den Besten and Broekhuis 1992; Robbers 1997; Koopman and Szabolcsi 2000; among others), is considered to be a marked word order by some speakers (Marcel den Dikken, p.c.,) one might set this fact aside.

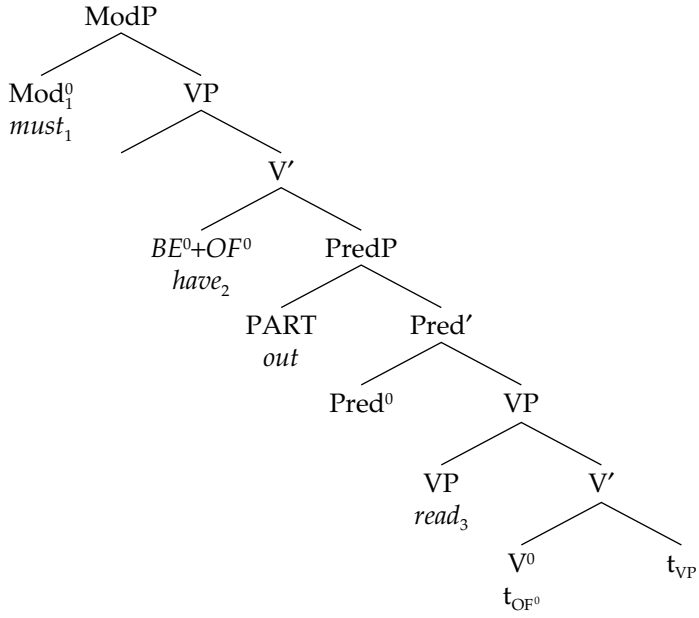
A third and important point concerns the mechanism of licensing transfer. Recall that Zwart claims that overt adjunction disables the licensing capacity of lower heads. This claim seems problematic for at least two reasons. First, this assumption does not hold generally in Zwart's system. In particular, there is an inconsistency between the loss of the licensing capacity in (61) – i.e., when the auxiliary overtly incorporates into the modal (lower licensing positions are lost) – and the retention of the licensing capacity in (59b) – i.e., when *OF* incorporates into *BE* and is pronounced in the higher position (lower licensing position is retained). Thus, the (already rather ad hoc) assumption that overt movement behaves crucially differently from covert movement appears even less justified, since it holds only for cases in which the auxiliary incorporates into the modal. Second, Zwart suggests that movement of the auxiliary as in (60b) may in fact be overt movement with obligatory pronunciation of the lower copy (in the spirit of the copy theory of movement; cf. Bobaljik 1995; Brody 1995b; Groat and O'Neil 1996; Pesetsky 1997). If this analysis were adopted, the consequence would be that the licensing capacity of various heads is in fact determined in the PF component. While a PF approach to verb-cluster formation is in principle an option that one might pursue to account for the distribution of verb clusters (see Wurmbrand 2000), the claim that PF choices have an influence on the syntactic licensing conditions would not be compatible with the system Zwart suggests. Since (i) there is no obvious reason why licensing should be subject to this overt/covert constraint, and (ii) it holds only for very specific cases in Zwart's system (note also the point above that suggested that this assumption should be dispensed with for the licensing of particles), it appears that this assumption does no more than restate that the 2-1-3 order is not possible.

Finally, a minor question which does not seem to be problematic for the account as it stands, but nevertheless has certain consequences which should be pointed out, concerns the derivation of one of the examples in (57a) (the relevant order is repeated below as (65a)). The claim is that in (65a), the licensing projection for the particle is projected between the VP headed by *BE* and the VP headed by *OF* (cf. (65b); note that participles have to move overtly in Zwart's analysis and hence the lowest position the participle can occur in is the specifier of *OF*). A similar case can be construed for modal–auxiliary–participle constructions. A question that comes up in this context is whether this intervening head is problematic for the incorporation of *OF* into *BE* or the auxiliary into the modal. A priori, nothing seems to exclude step-by-step incorporation; the only consequence that could affect the analysis is that in these cases, the specifier positions of the projections below and above PredP are not equidistant any more:

(65) **Modal–auxiliary–participle construction (with particles):**

a. dat Jan het boek moet hebben uit gelezen (1-2-3)
that Jan the book must have out read
'that Jan must have read/finished the book'

b. ***OF-BE* incorporation:**



To conclude this overview of Zwart's analysis, the ingredients of the account are summarized in table 75.10 (including the assumptions that are necessary to accommodate the problems mentioned above). The table also distinguishes (as far as it is possible to determine) between assumptions or conditions that (presumably) hold universally and those that are language-specific.

3.4.2 The head-final and head-initial approach in comparison

To compare the head-initial analysis with a head-final analysis, an outline of an account of DU verb clusters based on a head-final structure will first be provided. The assumptions necessary for DU are: (i) particles do not move (or only move string-vacuously; see the discussion in section 3.1.3); (ii) participles move optionally to the right; (iii) infinitives move obligatorily to the right; (iv) verb-cluster movement can affect either minimal or maximal categories and is subject to a strict locality condition; and (v) objects move obligatorily to a specifier position. Point (v) will insure that objects are not part of the verb cluster (the position of objects will be ignored in the diagrams below). The examples in (55) (repeated here as (66)) are derived as follows. In (66b), no movement occurs; the elements appear in their base positions. The examples in (66a) are derived as in (67): the object leaves the VP; and then either the lower verb (as in (67a)) or the lower VP (as in (67b)) moves (optionally) to the right. Both movement operations yield the 1-2 order; however, in the first case, the particle is stranded (i.e., occurs to the left of the auxiliary), whereas it is carried along with the verb in the second case. The impossible positions of the particles in (66) follow from the assumption that particles do not move (either to the right or to the left):

Table 75.10 DU verb clusters in a head-initial account (Zwart 1996 revised)

Properties	Zwart's approach (revised)
Basic structure	• Universally VO
Size of moved categories	• X^0 and XP
Particles	• Licensed in SpecPredP (universal) • PredP is below AgrOP (universal?) • Licensing has to be overt (West Germanic) • Particle has to c-command its trace (universal?)
Participles	• Licensed by *OF* or *BE* (universal) • Licensing has to be overt (West Germanic; universal?) • Have to be licensed in the specifier position of the VP that includes the overt copy of the auxiliary • Exception: when *have* is pronounced in BE^0, the specifier of OF^0 is also a licensing position
Infinitives	• Licensed by modal (universal) • Covert X^0-adjunction (DU) • Exception: finite two-verb clusters (overt adjunction possible)
Objects	• Licensed in SpecAgrOP (universal) • Licensing has to be overt (West Germanic) • AgrOP is higher than all VPs/ModPs, etc. (DU)
*2-1-3 (MOD-AUX-V)	• Licensing conditions of participles
*2-1-3 (DU)	• No overt X^0-movement of infinitives (DU)
*2-3-1 (DU)	• No XP-movement of infinitives (DU)
Universal *2-1-3	• ?? No X^0-movement of 2 unless 3 moves as well

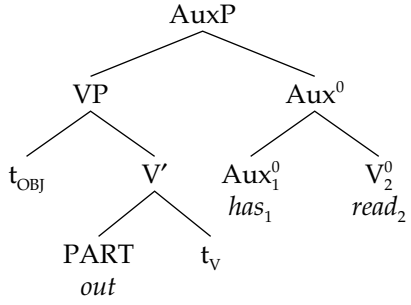
(66) **Auxiliary–participle construction (with particle verb):**

a. dat Jan {*uit} het boek {uit} heeft {uit} gelezen (1-2)
that Jan {*out} the book {out} has {out} read
'that Jan has read/finished the book'

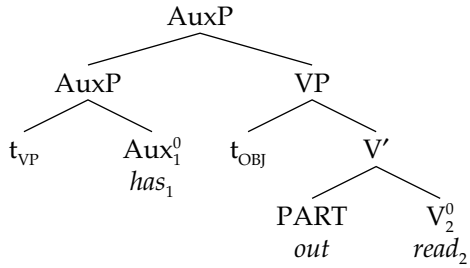
b. dat Jan {*uit} het boek {uit} gelezen {*uit} heeft (2-1)
that Jan {*out} the book {out} read {*out} has
'that Jan has read/finished the book'

(67) **Two-verb cluster:**

a. **Optional participle movement (X^0):**



b. **Optional participle movement (XP):**



The examples involving a modal–auxiliary–participle construction are repeated in (68). The 3-1-2 order is straightforwardly derived by X^0-movement of the infinitive. Given that particles do not move (or only move string-vacuously), it also follows that the only place the particle can occur is immediately preceding the lowest verb (cf. (69a)). Note that movement of 2 – i.e., the infinitive – is obligatory in DU; thus the order 3-2-1 is not possible. XP-movement of the infinitive would yield the 1-3-2 order, which is attested in certain dialects (cf. (56c)).[21] The more challenging constructions are the ones in (68a). There are four possible derivations: (i) two applications of X^0-movement, which yields the order particle-1-2-3; (ii) two applications of XP-movement, which yields the order 1-2-particle-3; (iii) XP-movement of the higher verb and X^0-movement of the lower verb, which yields the order 1-particle-2-3; and (iv) X^0-movement of the higher verb and XP-movement of the lower verb, which yields the order particle-3-1-2. These derivations are illustrated in (69b–e), respectively:

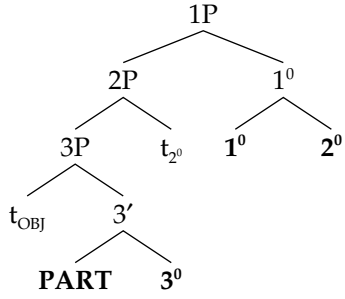
(68) **Modal–auxiliary–participle construction:**

a. dat Jan {*uit} het boek {uit} moet {uit} hebben {uit} gelezen (1-2-3)
that Jan {*out} the book {out} must {out} have {out} read
'that Jan must have read/finished the book'

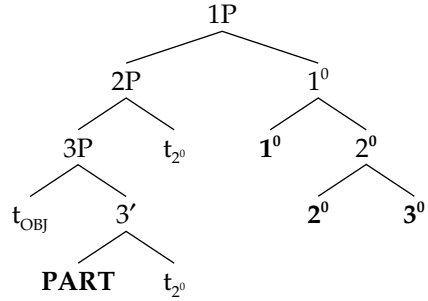
b. dat Jan {*uit} het boek {uit} gelezen {*uit} moet {*uit} hebben (3-1-2)
that Jan {*out} the book {out} read {*out} must {*out} have
'that Jan must have read/finished the book'

(69) **Modal–auxiliary–participle construction:**

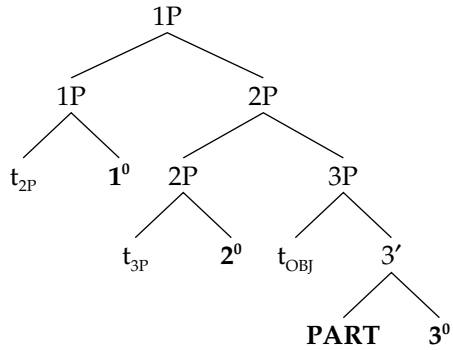
a. **Particle-3-1-2 – 1 X^0-movement:**



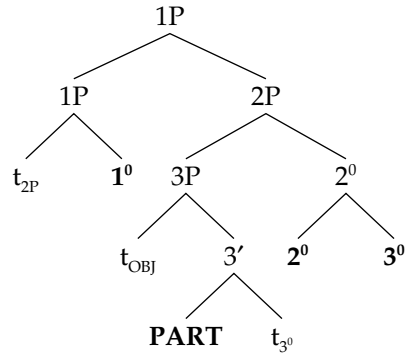
b. **Particle-1-2-3 – 2 X^0-movements:**



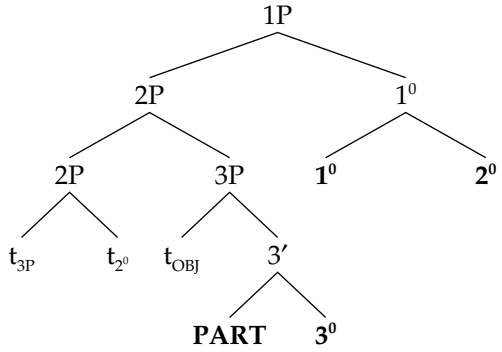
c. **1-2-particle-3 – 2 XP-movements**



d. **1-particle-2-3 – 1 X^0, 1 XP-movement**



e. **Particle-3-1-2 – 1 X^0, 1 XP-movement**



Note that under this analysis, the direction of adjunction is uniform (i.e., to the right). Thus, Zwart's first point of criticism in (63a) does not seem to be justified (furthermore, as we have seen in section 3.1.1, all other orders can also be derived by uniform right-adjunction in a head-final approach if reordering involves phrasal movement). To discuss the other points in (63), let us now compare the two approaches. The assumptions of the head-final approach are summarized in table 75.11, together with the assumptions of Zwart's account.

As can be seen in table 75.11, the two approaches both make use of head and phrasal movement, and both involve obligatory object movement. Hence, on these points, the accounts do not differ, and neither account can be seen as superior or more economical than the other.[22] Similarly, both accounts require a stipulation regarding finite two-verb clusters, and hence this point also does not enter into the comparison (however, see Koopman and Szabolcsi 2000 for an analysis that incorporates this fact). Regarding the other assumptions, a comparison is not an easy task (if possible at all); in particular, the analyses are based on underlying assumptions that are not shared by the proponents of the approaches that are compared. One such assumption is the claim that structures have to be compatible with Kayne's (1994) LCA, which would prohibit head-final structures and rightward movement. Note, however, that the fact that Zwart's analysis

Table 75.11 DU verb clusters: head-final vs. head-initial approach

Properties	OV approach	Zwart's approach (revised)
Basic structure	• Directionality	• Universally VO
Size of moved categories	• X^0 and XP	• X^0 and XP
Particles	• Do not move or only move string-vacuously	• Licensed in SpecPredP (universal) • PredP is below AgrOP (universal?) • Licensing has to be overt (West Germanic) • Particle has to c-command its trace (universal?)
Participles	• Move optionally	• Licensed by *OF* or *BE* (universal) • Licensing has to be overt (West Germanic; universal?) • Have to be licensed in the specifier position of the VP that includes the overt copy of the auxiliary • Exception: when *have* is pronounced in BE^0, the specifier of OF^0 is also a licensing position
Infinitives	• Move obligatorily • Exception: finite two-verb clusters	• Licensed by modal (universal) • Covert X^0-adjunction (DU) • Exception: finite two-verb clusters (overt adjunction possible)
Objects	• Move obligatorily (e.g., SpecAgrOP)	• Licensed in SpecAgrOP (universal) • Licensing has to be overt (West Germanic) • AgrOP is higher than all VPs/ModPs, etc. (DU)
*2-1-3 (MOD-AUX-V)	• Locality condition on verb-cluster movement	• Licensing conditions of participles
*2-1-3 (DU)	• Locality condition on verb-cluster movement	• No overt X^0-movement of infinitives (DU)
*2-3-1 (DU)	• Infinitives move obligatorily in DU	• No XP-movement of infinitives (DU)
universal *2-1-3	• Locality condition on verb-cluster movement	• ?? No X^0-movement of 2 unless 3 moves as well

conforms to the LCA, whereas head-final approaches obviously conflict with this view, does not demonstrate that this approach is superior. What Zwart's account demonstrates is that the facts can be described within a system invoking the LCA. If one is independently committed to that framework, then Zwart's approach shows the range of ancillary assumptions necessary to derive the facts. However, if one is not independently persuaded by the LCA (see, for instance, the works on scope by Büring and Hartmann 1996, 1997b and Fox and Nissenbaum

1999, which have shown that the LCA might be too strong), table 75.11 shows that Zwart's arguments alone are not persuasive on this matter.

Similarly, the claim that the uniformity of structures presents an advantage under a head-initial approach has to be balanced against the non-uniformity of overt vs. covert settings. To give an example, under an approach involving directionality, languages have to set the directionality parameter but do not have to involve any settings, for instance, for particles (particles do not move, and hence they occur to the right of the verb in English, whereas they occur to the left of the verb in GE and DU). Under an approach involving a uniform base, languages do not have to set any directionality parameter, but they have to involve an overt vs. covert setting for particles (in English, particles do not move or move covertly, whereas in GE and DU, they obligatorily move overtly). Since the overt/covert settings are arbitrary, the directionality differences found between 'head-final' and 'head-initial' languages are as stipulated in the head-initial approach as they are in the head-final approach (i.e., there is no deep reason for the claim that movement is overt in GE and DU, whereas it is covert in English – as there is no reason for the claim that GE and DU are head-final). Thus, while the idea of a uniform base structure is certainly attractive, it does not solve the problem that languages are different; it simply shifts the burden of explanation to a different area. In other words, at the stage of our current understanding, under both the head-initial and the head-final approach, these directionality differences among languages have to be represented somewhere in the system as stipulations – i.e., as irreducible facts about languages that cannot be explained but simply must be learned. However, importantly, neither approach appears to be superior with respect to the way it handles these facts.

The final two points to be considered in this section are the two by now familiar questions of whether either approach is superior in motivating the operations suggested, and whether either approach is superior in providing an account of the impossibility of certain structures. To begin with the latter, the head-final approach can account for the fact that the 2-1-3 order is not found cross-linguistically by the assumption that verb-cluster movement, as in table 75.2, is strictly local and cannot skip intervening heads or projections (cf. Haegeman 1992; see section 3.1.1). Under the head-initial approach, it is less clear how this fact can be accommodated. While Zwart suggests a way to exclude the 2-1-3 order in DU and in modal–auxiliary–participle constructions in general (however, see the discussion at the end of the previous section regarding Zwart's account of participle licensing, which the account of the prohibition of the 2-1-3 order is crucially based on), this account does not carry over to other languages, and in particular to languages that allow or require overt movement of infinitives. As noted in table 75.11, this order can only be excluded if the system includes an assumption such as 'X^0-movement of 2 is only possible if 3 moves as well', which is of course possible, but is unmotivated in that it a priori does not follow from any other property of grammar (such as locality).

Finally, to compare the approaches with respect to the motivation of the operations again proves a rather delicate issue. While proponents of head-initial

approaches often claim that movement to specifiers is per se more motivated than rightward movement (which, like V-to-V movement, has no apparent motivation), this claim is also subject to debate. As discussed in section 3.3, it is in principle correct that feature-driven movement to specifier positions is motivated in that it has a definable cause – the presence of features that have to be checked. However, one also has to ask whether the features themselves are motivated. If the features triggering movement are not motivated by any other syntactic or semantic property and are only postulated for the constructions or languages they are needed for, they boil down to simple 'word-order' features, which can hardly be claimed to be motivated (see also Koopman 1984 for this point). Thus, feature checking or movement to specifier positions per se does not solve the motivation problem; it simply shifts the burden of explanation from the question of how movement is motivated to the question of how particular features are motivated (including distinctions such as weak vs. strong features). Regarding the current comparison of the head-final and the head-initial approach in table 75.11, one has to conclude that both approaches require language-specific and category-specific assumptions that are not motivated by other properties of grammar or the particular language. To give a concrete example, the claims that infinitives undergo covert X^0-movement whereas participles undergo overt phrasal movement (head-initial approach), or the claim that participles move optionally whereas infinitives move obligatorily (head-final approach), simply serve the purpose of deriving the order of verb clusters and do not correlate with other properties of these elements. While under the head-initial approach the movement operations are triggered by the need to check certain features, the assumption of licensing projections and features which are only evidenced by word-order properties, in conjunction with the arbitrary overt/covert or weak/strong distinction, suffers from the same arbitrariness and lack of motivation as the assumptions in the head-final approach. In other words, the stipulated licensing operations simply mask the fact that at the core of any account of the distribution of verb clusters are language-specific stipulations. In this sense, the head-initial approach cannot be seen as superior to the head-final approach – both types of accounts have to invoke crucial assumptions that only target the word order in verb clusters. While most researchers will undoubtedly find one type of 'arbitrariness' more attractive (or perhaps less bothersome) than the other, this preference is not sufficient to establish the superiority of either the head-final or the head-initial approach.

4 Restructuring

4.1 The verb raising–restructuring connection

In an extensive study of infinitives, Gunnar Bech (1955) developed one of the first characterizations of infinitival complements in GE. Bech showed that infinitives fall into two classes: infinitives that form an independent clausal domain and

infinitives that do not exhibit clausal behavior. He labeled the former class *kohärente Infinitive* 'coherent infinitives', the latter *inkohärente Infinitive* 'incoherent infinitives'. The first study of the two classes of infinitives in a generative framework was provided by Evers (1975a, 1975b). Evers observed that the split among infinitival constructions in DU and GE correlates with a reordering process of the verbal elements in an infinitival construction. He proposed that this reordering is the result of a process of verb raising which applies in certain infinitival clauses but not in others. Evers's analysis – which laid the groundwork for most later analyses of clause structure in GE and DU – is the first work that builds on the correlation between mono-clausality and verb movement. In particular, he suggests a structure pruning principle which applies to the S-node of infinitives that have lost their head (i.e., by movement of the embedded verb to the higher clause). The formulation of Evers's Guillotine Principle is given in (70):[23]

(70) **Guillotine/S-pruning Principle** (Evers 1975a: 147):
An S that has lost its head (i.e., its V-constituent) does not survive.

Thus, in Evers's account, verb raising – i.e., the formation of a complex verb consisting of the matrix verb and the infinitive – creates a sentence that has lost its head, and therefore the S-node cannot survive and is deleted.

At the same time, Aissen and Perlmutter (1976) and Rizzi (1976) observed that in Italian and Spanish, certain infinitives lack clausal properties.[24] That is, while in most cases infinitives constitute a boundary for processes that are restricted to apply within one clause (such as clitic climbing, passive), certain infinitives are transparent for the same processes. Aissen and Perlmutter suggest that certain infinitives undergo a process of 'clause union' with the matrix clause and hence cease to function as independent clauses. Similarly, Rizzi proposes that what is special about infinitives lacking clausal properties is that they have undergone a process of 'restructuring'. In Rizzi's analysis, like Evers's, the close relation between clause union or restructuring and some form of verb-complex formation is essential. In particular, Rizzi suggests that restructuring is an optional rule according to which the embedded infinitive and the matrix verb are reanalyzed as one complex verb. This process of restructuring then again transforms a bi-clausal structure into a mono-clausal one. In contrast to DU, however, the claim that the verbs in a restructuring construction form a complex head is less straightforward for Italian. While the verb cluster in DU cannot be separated by any elements other than particles, suggesting that there is indeed a very tight (e.g., head-to-head) relation between the verbal elements, phrasal elements which cannot be argued to be incorporated into the verbs may intervene between the matrix verb and the infinitive in Italian. As Rizzi notes, clitic climbing (cf. (71a)), object preposing (cf. (71b)), and auxiliary switch (cf. (71c)) are possible in cases where adverbs show up between the two verbs. Rizzi therefore suggests that "Restructuring creates a syntactic constituent 'verbal complex', and that this constituent cannot be simply a V. . . . Italian syntax makes use of a syntactic category, distinct from V, dominating non-lexical verbal compounds" (Rizzi 1982a: 38):

(71) **Italian – verb raising and adjacency** (Rizzi 1982a: 38):
   a. Lo verrò subito a scrivere.
      it-cl I-will-come at-once to write
      'I will come to write it at once.'
   b. Gli stessi errori si continuano stupidamente a commettere.
      the same errors SI continue-3PL stupidly to make
      'People continue to make the same errors in a stupid way.'
   c. Maria è dovuta immediatamente tornare a casa
      Maria is must immediately return at home
      'Maria has had to come home immediately.'

Since head raising creates X^0 categories rather than X' categories, it is not clear how Rizzi's syntactic complex verb could be implemented in a more recent Government and Binding- or Minimalist-style analysis of head-movement. To account for the discontinuity of the two verbs found in Romance restructuring infinitives (while keeping Rizzi's assumption that the infinitive and the matrix verb form a complex head), two types of analyses have been proposed: excorporation and covert movement. The first approach (see Den Dikken 1990; Roberts 1991a; Guasti 1992, 1993, 1997) is based on examples such as the one in (72) from Italian, in which a matrix causative and an embedded verb precede a floating quantifier associated with the matrix subject. Under the assumption that the floating quantifier originates in a position above the base position of the causative, the example in (72a) provides evidence for overt movement of the infinitive to the matrix predicate and further overt movement of both verbs to the left of the floating quantifier. Assuming the infinitive incorporates into the higher verb and the complex verb then undergoes further movement to the left, (72b) can then be taken to show that the matrix verb excorporates from the complex head:[25]

(72) **Italian – causative constructions** (Guasti 1997: 136):
   a. I professori facevano commentare tutti quel libro a Ugo.
      the professors make comment all that book to Ugo
      'The professors all made Ugo comment on that book.' (my paraphrase)
   b. I professori non fanno più commentare tutti quel libro a Ugo.
      the professors NEG make anymore comment all that book to Ugo
      'All the professors do not make Ugo comment on that book any more.'

The second type of analysis is based on the idea that restructuring constructions involve *covert* head-movement (the major approaches are summarized in section 4.3.2). The main reason for the assumption of covert verb raising is theory-internal. In approaches where it is assumed that restructuring infinitives are full clauses (see section 4.3.2), a mechanism is required to unite the matrix and the embedded clause in order to create the clause-union effects. Since head-movement is a standard tool to deactivate projections or barriers (see, for instance, Chomsky 1986a; Baker 1988a) this process has thus proven useful in the context of restructuring constructions to achieve the lack of clause-boundedness

effects. A further reason that has been given repeatedly to motivate verb raising in restructuring constructions is the observation that the infinitival tense is deficient in these constructions (tense deficiency can be observed, for instance, from the impossibility of temporal modification of the embedded event in a restructuring infinitive, or from the fact that the embedded event has to be interpreted as simultaneous with the time of the matrix event). On the basis of this observation, Guéron and Hoekstra (1988) and Bennis and Hoekstra (1989) suggest that verbs have to be in a local relation with a tense head, which is generally achieved via movement of the verb to the closest tense head. What is special about restructuring constructions is that the infinitival tense head is deficient and thus not capable of licensing the infinitival verb. Hence, the verb (or the infinitival tense) has to move to the matrix clause.

It is important to note that both reasons – the deactivation of barriers and the need to be tense licensed – for a special verb raising operation in restructuring constructions apply only in so-called 'bi-clausal' approaches to restructuring (i.e., in analyses in which the infinitival complement has a clausal status at D-structure). For approaches that treat restructuring infinitives as non-clausal (e.g., VP) predicates throughout the derivation, the issue of covert verb raising reduces to 'normal' verb raising in a simple clause, and no special restructuring verb raising has to be assumed. The two types of approaches and the issue of verb raising in restructuring constructions will be discussed in more detail in section 4.3.

Besides the questions of whether and how verb raising applies in restructuring infinitives, the study of restructuring/clause union has yielded many interesting and important observations regarding clause structure, the nature of verbal categories, and general issues of the organization of grammar. Three of the main research questions that have been addressed are: (i) the determination and characterization of the class of restructuring infinitives; (ii) the structure of restructuring infinitives; and (iii) the motivation for restructuring or clause union. The next sections give an overview of the major insights and analyses.

4.2 *The class of restructuring predicates*

In most studies on restructuring, it has been noted that the class of restructuring predicates varies across languages and also shows some variation among speakers of one language. As shown in Wurmbrand (2001), large parts of this variation can be accounted for if infinitival constructions are not simply divided into restructuring vs. non-restructuring infinitives, but involve a finer-grained classification. For instance, it is shown there that GE distinguishes between four classes of infinitival constructions, each with its own syntactic and semantic properties. While passive and non-focus scrambling pick out one class of infinitival constructions, pronoun fronting and focus scrambling pick out a different class. Similarly, in DU, remnant extraposition singles out a different class of predicates than verb raising (both in their original senses) and the IPP effect.

Despite the existence of these subgroupings and the variation encountered, one can nevertheless observe a certain semantic cohesion to the classes of restructuring

Table 75.12 The grades of restructuring

Type of verb	Grade of restructuring	Degree of restructuring
Modal verbs	Generally among restructuring predicates	Highest
Aspectual verbs	Generally among restructuring predicates	
Motion verbs	Generally among restructuring predicates	
Causatives	Generally among restructuring predicates	
try, manage, dare	Some degree of restructuring (some languages)	
(Other) irrealis, implicative verbs	Minimal degree of restructuring (some languages)	
Propositional verbs	Generally not among restructuring predicates	
Factive verbs	Generally not among restructuring predicates	Lowest

predicates. Table 75.12 lists different classes of infinitival-taking predicates according to their 'degree of restructuring'. As the table shows, restructuring is determined on a scale rather than by a rigid binary distinction (both within one language and cross-linguistically). That is, if a language exhibits restructuring effects with a predicate lower down in the list in table 75.12, all predicates above that predicate can also function as restructuring predicates (however, the opposite does not hold). Infinitives selected by modal verbs (*must*, *may, can*, *want*, etc.) motion verbs (*come*, *go*, *return*), aspectual verbs (*begin*, *continue*, *finish*), and causative verbs (*let*, *make*) are typically among the class of restructuring verbs. Verbs like *try, manage*, and *dare* are also core restructuring verbs, although in fewer languages (e.g., they are typical restructuring verbs in GE and DU, but only marginally allow restructuring in Romance). Going further down the list, irrealis and implicative constructions show some restructuring effects, although much less so (again both within one language and across languages) than the predicates listed in the higher rows of table 75.12. Finally, propositional and factive constructions generally prohibit any restructuring properties. While the scale in table 75.12 provides a first approximation to the classification of infinitival constructions, a cross-linguistic study of the subgroupings (in particular the determination of how far down different restructuring properties are licensed in different languages) is still outstanding.

The fact that the class of restructuring predicates shows semantic cohesion as well as variation and apparent arbitrariness is reflected in the general tension between two basic directions authors take regarding the question of how the class of restructuring predicates is determined. One type of approach considers the regularities of the class of restructuring predicates as the basic cases of restructuring, and language and speaker variation are assigned a special status or set aside. According to this view, restructuring is motivated through a semantic (and/or thematic) property found among the class of restructuring verbs. Another type of approach treats restructuring as a language-specific and irregular phenomenon, and the cohesion among the class of restructuring predicates is

Table 75.13 Syntactic vs. semantic approaches to restructuring

Restructuring	References

considered as an accident. According to this view, restructuring is generally considered as a lexical property that is assigned (arbitrarily) to a subclass of infinitive-taking verbs and parametrically restricted to certain languages. The major references addressing the question of whether restructuring is (mainly) a lexical/syntactic or (mainly) a semantic phenomenon are summarized in table 75.13.[26]

As is often the case, it seems that the truth lies somewhere in between. While the class of restructuring predicates displays a certain degree of uniformity regarding the semantic properties of the predicates involved, the semantics of a configuration alone does not seem to be sufficient to determine whether a construction allows or disallows restructuring. Rather, syntactic and language-specific factors have to be taken into account to successfully characterize the restructuring phenomenon.

4.3 The structure of restructuring infinitives

Central to most works on restructuring is the question of what the structure of a restructuring infinitive is. The various approaches fall into two general groups, which are labeled here as mono-clausal vs. bi-clausal approaches. According to mono-clausal approaches, a sentence with a restructuring infinitive is a single clause throughout the derivation and a restructuring infinitive never constitutes an independent clausal domain. According to bi-clausal approaches, the clause-union effect is attained derivationally. Restructuring infinitives and non-restructuring infinitives start out with the same syntactic structure; however, a further application of restructuring (to be made precise below) alters the structure and/or properties of restructuring infinitives in a way that ultimately renders the clause boundaries ineffective. The advantage of mono-clausal approaches is that no mechanism of restructuring is necessary and that no additional language- or construction-specific assumptions have to be made to account for the transparency of restructuring infinitives. Since there is no representation or stage of the derivation in which a sentence with a restructuring verb consists of two clauses, the issue of unifying the clauses does not arise. The challenge for approaches of this sort is to motivate the existence of different initial structures for infinitival

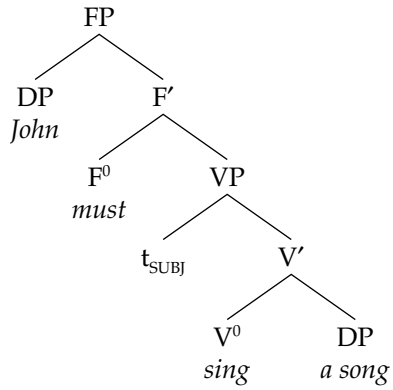
complements. The main motivation for bi-clausal approaches is the idea of uniformity of phrase structure; i.e., (control) infinitives project a TP, CP, etc., irrespective of the syntactic or semantic content of these projections. The challenge for approaches of this sort is to provide evidence for the initial clausal structure of restructuring infinitives and to characterize and motivate the operation of restructuring.

4.3.1 Mono-clausal approaches

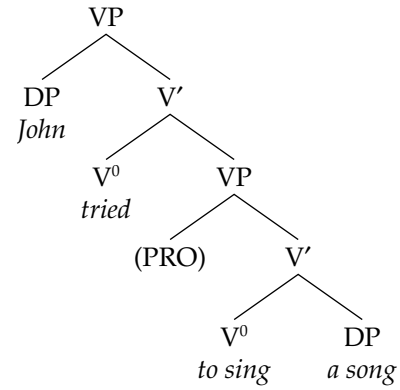
The essential claim of mono-clausal approaches is that non-restructuring infinitives are generated as clausal complements, whereas restructuring infinitives are smaller categories (typically it is assumed that they are VP complements, as in (73)). Importantly, a restructuring infinitive is not derived from a non-restructuring infinitive in these approaches:

(73) **Mono-clausal approaches:**

a. **Functional restructuring:**



b. **Lexical restructuring:**



The main questions raised and addressed by mono-clausal approaches are whether restructuring verbs are lexical or functional categories, whether there is an embedded infinitival (PRO) subject, and how the difference between VP infinitives (restructuring) and CP/IP infinitives (non-restructuring) is motivated. Regarding the first question, Cinque (1997a, 1997b, 2004) argues that all restructuring configurations are of the form in (73a). In Wurmbrand (2001), on the other hand, evidence from GE is provided for the claim that a structure such as (73a) is inadequate to capture all restructuring constructions, and that certain predicates cannot be treated as raising predicates but are best analyzed as lexical categories combining with VP complements, as in (73b). The arguments provided come from systematic differences between lexical and functional predicates regarding their thematic properties, scope properties, and syntactic properties such as extraposition and the IPP phenomenon.

The second question – whether restructuring constructions and infinitival constructions in general include an embedded PRO subject – has been a long-standing issue in both the syntactic and the semantic literature. The perhaps

more common approach is that control infinitives are clauses (CPs) syntactically and propositions semantically, since the infinitival complements are interpreted with an infinitival subject. This view, however, is not the only way to approach this question. In particular, considering the semantic properties of different infinitival constructions, many works have shown that a uniform treatment of all control infinitives seems untenable. Rochette (1988), for instance, proposes that the size of an infinitive corresponds to its semantic category: CP infinitives denote *propositions*, IP infinitives denote *events*, and subjectless VP infinitives denote *actions*. In standard Lexical Functional Grammar (LFG), control infinitives are considered as subjectless VPs in syntax and propositions in semantics (cf. Bresnan 1982b). Similarly, Chierchia (1984a, 1984b, 1989) and Chierchia and Jacobson (1986) argue that control infinitives are properties – i.e., subjectless predicates – in syntax and semantics and become associated with a subject later on in context by means of a semantic control principle. On the basis of Chierchia's work, Wurmbrand (2001, 2002) shows that this semantic view receives additional support from the syntactic properties of these constructions. In particular, the A-movement and binding properties of restructuring infinitives in GE strongly suggest that no embedded subject is present to block movement and to bind embedded anaphors.

The last question – the motivation for two distinct structures of infinitival constructions – is indirectly connected to the second question. Following the idea that structure and meaning are closely related (i.e., that syntactic structure translates directly into the meaning of a construction), the different sizes of restructuring infinitives and non-restructuring infinitives simply reflect the different semantic properties of these constructions. For instance, as mentioned in section 4.1, many researchers agree that restructuring infinitives are tense deficient, and hence this property motivates the lack of a TP. Similarly, restructuring infinitives are often considered as subjectless predicates semantically (see the references in the previous paragraph), which, assuming again that semantic properties of this sort are reflected in the syntactic structure, would mean that the infinitive is represented by a VP-type complement rather than an IP or a CP. Table 75.14 presents a selective summary of mono-clausal approaches.

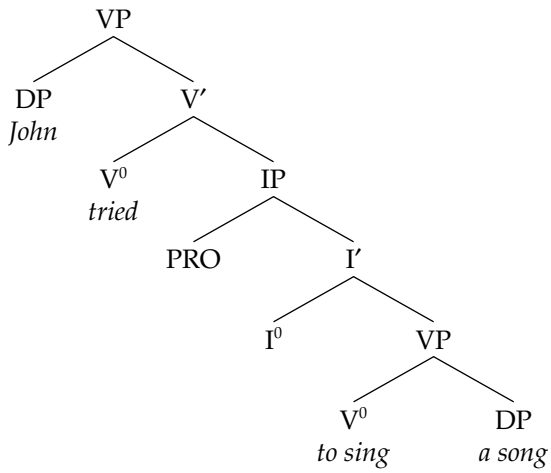
Before turning to bi-clausal approaches, it should be mentioned for completeness that there are also approaches that are somewhere in between mono-clausal

Table 75.14 Mono-clausal approaches

Property	References
Restructuring infinitives are base-generated VPs	Strozer 1976, 1981; Zagona 1982; Cremers 1983; Chierchia 1984a, 1984b, 1989; Picallo 1985, 1990; Haider 1986a, 1986b, 1991b, 1991c, 1993; Di Sciullo and Williams 1987; Rochette 1988, 1990a, 1999; Rosen 1989, 1990; Moore 1990, 1994; Rutten 1991 (some infinitives); Rosengren 1992; Broekhuis et al. 1995 (some infinitives); Cinque 1997a, 1997b, 2004; Wurmbrand 1998a, 1998c, 2001

and bi-clausal approaches. A number of works develop what one might want to call a reduced clausal approach (cf. Tappe 1984; Fanselow 1989; Li 1990a; Rooryck 1994a; and in some sense Wurmbrand 2001). The basic idea of this approach is that a sentence with a restructuring infinitive essentially involves a bi-clausal structure; however, restructuring infinitives nevertheless differ from non-restructuring infinitives in the size of the infinitival complement. In particular, it is assumed that restructuring infinitives lack a CP boundary (cf. (74)):

(74) **Reduced clausal approach:**



4.3.2 Bi-clausal approaches

The central idea of bi-clausal approaches is that restructuring infinitives start out as clausal (CP) complements and that the clausal status of restructuring infinitives is altered by one or more of the following mechanisms: structure-changing operations, head-movement, or topicalization. According to the first set of approaches, restructuring infinitives involve a special structure-changing process that transforms or reanalyzes a CP complement into a VP complement. Evers (1975a) suggests a pruning principle, Rizzi (1978, 1982a) postulates a restructuring rule, Haegeman and Van Riemsdijk (1986) assume a reanalysis process, and Von Stechow (1990) speculates that restructuring infinitives might be created by deletion of the CP and IP nodes.[27] The common property of these approaches (see also table 75.15) is that restructuring infinitives start out as sentential complements, then get reanalyzed or lose various projections in the course of the derivation, and finally end up as VP complements. Arguments generally raised against structure-changing processes of this sort are that they cause a violation of the Projection Principle (Chomsky 1981, 1982, 1986b) and that they are to a large degree arbitrary rules.

The second (and predominant) mechanism to derive clause union is head-movement such as verb raising. The variety of head-movement analyses share one common property and assumption: it is assumed that some verbal head of

Table 75.15 Structure-changing approaches

Restructuring infinitives	References

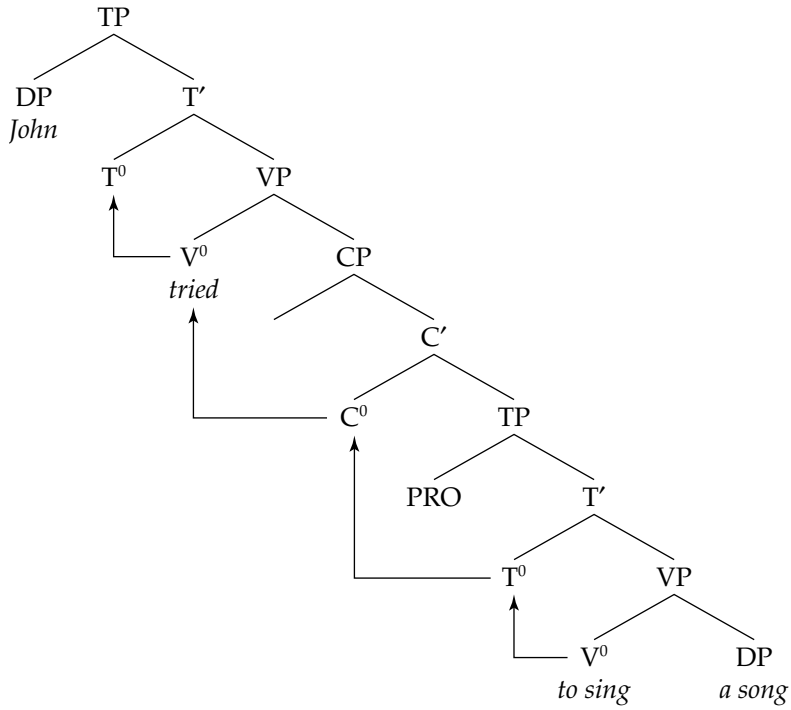
the infinitive moves (overtly or covertly) to the matrix predicate (cf. (75)), and that this movement renders the infinitive transparent, either for government by the matrix verb (cf. Evers 1975a, 1975b; Rizzi 1978, 1982a; Baker 1988a) or for further movement of other elements from the infinitive (such as DPs, clitics):

(75) **Head movement approaches:**



As mentioned above, since overt verb raising raises serious empirical questions, many authors thus claim that some form of covert or abstract head-movement applies to restructuring infinitives. One set of approaches assumes that head-movement in restructuring infinitives does not apply in overt syntax but takes place in the covert component (i.e., as LF-incorporation of the infinitive;

Table 75.16 Head-movement approaches

Mechanisms	References
Overt verb (infinitive) raising; or formation of a complex V	Evers 1975a, 1975b; Rizzi 1978, 1982a; Haider 1986a, 1986b, 1991b, 1991c, 1993; Prinzhorn 1987, 1990; Sternefeld 1990; Rutten 1991; Guasti 1992, 1993, 1996b, 1997
Covert verb (infinitive) raising	Grewendorf and Sabel 1994; Gonçalves 1998
Overt verb raising + pronunciation of lower copy	Roberts 1997b
Overt raising of embedded T/INFL (without the infinitive)	Kayne 1989b, 1990, 1991; Roberts 1993b; Bok-Bennema and Kampers-Manhe 1994; Terzi 1996a
AgrS+T raising	Rooryck 1994a
Covert AgrO-raising	Sabel 1996b

cf. Sternefeld 1990; Grewendorf and Sabel 1994; Gonçalves 1998). The second set of approaches assumes that head-movement in restructuring infinitives does take place in overt syntax, but that for various reasons, this movement is not reflected in the (phonological) output of the structure. First, adopting a version of the copy theory of movement in which either copy may be accessible to PF or LF, Roberts (1997b) suggests that head-movement applies overtly, but that in the phonological component, the tail rather than the head of the chain is pronounced. Second, many authors assume that the head that undergoes movement is not the actual infinitival verb but rather the (abstract) infinitival tense or Agr-node. This form of overt (though abstract) head-movement thus creates a complex head in restructuring constructions but at the same time leaves behind the infinitival verb (cf. Kayne 1989b, 1990, 1991; Roberts 1993b; Bok-Bennema and Kampers-Manhe 1994; Rooryck 1994a; Sabel 1996b; Terzi 1996a). Finally, there are approaches that assume that overt head-movement of the infinitive takes place, followed by further excorporation of the higher verb (cf. Roberts 1991a; Guasti 1992, 1993, 1997). The major head-movement approaches are listed in table 75.16.

A general question head-movement approaches are faced with is how deficient projections are licensed. If there are no relevant properties or features, the building of vacuous structure would be prohibited according to many syntactic theories. Thus, assuming that verb raising is triggered by the need to check features and the infinitival tense head is incapable of doing so, the tense head presumably lacks tense features, and a different reason has to be found for the presence of a TP.

Apart from this problem of how the presence of a featureless projection can be motivated in a restrictive theory of syntax, head-movement approaches that consider the lack of tense as the trigger for restructuring are faced with a number of other questions. For instance, if head-movement takes place covertly (i.e., if the infinitive only becomes transparent at LF), one might wonder how overt

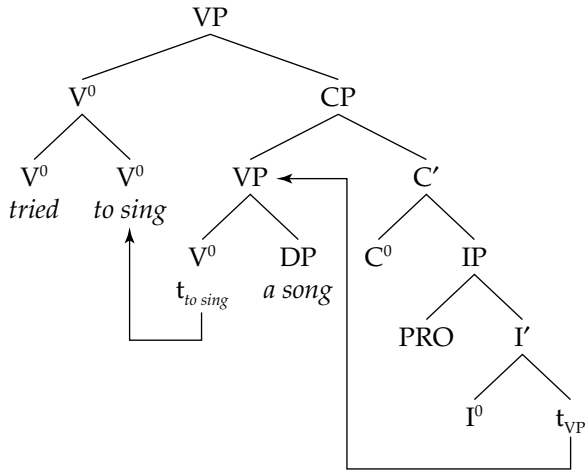
restructuring properties such as clitic climbing, long object movement, or auxiliary switch are licensed. Roberts (1997b) notes this problem and hence suggests the modification to covert movement described above, namely that verb raising is always overt, but that languages pick different copies for pronunciation. A further question concerns an asymmetry found in many languages between V-to-T movement in finite clauses and V-to-T movement in restructuring infinitives. Most authors assume that in Italian, (short) verb movement takes place overtly (cf. Kayne 1989b; Belletti 1990). In particular, it is claimed that the ordering of verbs and adverbs indicates that short overt verb movement applies in finite clauses as well as in infinitives (and crucially, in restructuring as well as non-restructuring infinitives). Since, according to head-movement approaches, infinitival T in restructuring infinitives is deficient and hence cannot check features, this short overt movement of the infinitival verb in a restructuring infinitive has to target a functional head other than T (in order to avoid the rather unattractive claim that the tense head in a restructuring infinitive, despite being unable to license the infinitive, nevertheless attracts it). An interesting question for these approaches is then why finite verbs undergo overt movement to T, whereas the non-finite verb in a restructuring infinitive – which by assumption also has to move to the finite T of the higher predicate – can move to some infinitival head overtly, but can only undergo covert movement to the matrix T. While these questions are not insurmountable, they seem to point to the special nature of head-movement in restructuring infinitives.

Finally, the most serious problem for the claim that the lack of tense is the trigger for restructuring is that this claim appears to be too strong. In Wurmbrand (2001), it is shown that not all tenseless infinitives are restructuring infinitives. While the lack of tense is indeed a necessary condition for restructuring, it is not a sufficient one; to qualify as a restructuring infinitive, other properties have to be met as well. Thus, the question arising for head-movement approaches is how restructuring can be excluded in certain tenseless infinitives (and – depending on the answer to this question – how the embedded verb can be tense licensed in a tenseless non-restructuring infinitive). To accommodate these problems, one might suggest that restructuring infinitives are [+tense deficient], whereas non-restructuring infinitives (whether tenseless or tensed) are [–tense deficient]. Note however, that this modification seems to defeat the original idea that head-movement is motivated by the tense properties – that is, it essentially dissociates head-movement from the actual tense properties of a construction, and hence the notion of 'tense deficiency' is reduced to a lexical diacritic marking restructuring (as, for instance, suggested by Sabel 1996b). Thus, it appears that one is forced to conclude that head-movement is not motivated by the tense properties of infinitival constructions, but that the sole purpose of head-movement in restructuring infinitives is to derive restructuring in a bi-clausal structure.

The final mechanism to derive clause union goes back to Burzio (1986), who suggested that the CP boundary of a restructuring infinitive is bypassed by moving the embedded verb phrase to the matrix clause (this approach can thus

be seen as the ancestor of the more recent remnant movement approaches to restructuring by Hinterhölzl 1997, 1998, 1999 and Koopman and Szabolcsi 2000). Furthermore, Baker (1988a), Sternefeld (1990), Grewendorf and Sabel (1994), and Sabel (1996b) pursue a mixed head-movement plus topicalization approach. In these approaches, it is assumed that head-movement is required in restructuring constructions; however, it cannot proceed through the embedded C^0. Rather, head-movement applies after the embedded VP or AgrOP has undergone topicalization to the embedded SpecCP (cf. (76) for a simplified structure). Questions arising for this approach are mainly questions about the motivation of these topicalization operations:

(76) **Topicalization plus head-movement:**



4.4 The motivation for restructuring

The last question addressed briefly in this overview is why certain infinitives but not others trigger restructuring. Some approaches to this question have already been touched upon in passing in the previous sections. For instance, many mono-clausal approaches involve the assumption that restructuring verbs are auxiliary-like in that they are less thematic than full verbs, are part of the functional structure of the clause, or are simple predicates semantically that correspond to VPs or similar projections syntactically (see table 75.17 for references). In bi-clausal approaches, the question has to be asked in a slightly different way, namely why restructuring mechanisms (such as reanalysis, deletion of projections, head-movement, topicalization, etc.) can apply in only a subgroup of infinitival constructions. As mentioned, a common view that occurs throughout the works on restructuring is that restructuring verbs or restructuring infinitives are in some way or another deficient, and hence either lack certain projections (mono-clausal approaches) or require support from the matrix clause, which, for instance, can be achieved by head-movement. Li (1990a), for instance, assumes

Table 75.17 Motivation for restructuring

Motivation	References
Restructuring verbs are not (fully thematic) lexical verbs	Strozer 1976; Napoli 1981; Zagona 1982; Picallo 1985, 1990; Prinzhorn 1987, 1990; Rochette 1988, 1990a, 1999; Rosen 1989, 1990; Rutten 1991; Cinque 1997a, 1997b, 2004; Roberts 1997b (but see note 26)
Restructuring involves argument or event structure unification	Napoli 1981; Rochette 1988, 1990a, 1999; Rosen 1989, 1990; Rosengren 1992; Haider 1993; Kiss 1995
Restructuring infinitives are tense deficient	Guéron and Hoekstra 1988; Rochette 1988, 1990a, 1999; Bennis and Hoekstra 1989; Rutten 1991; Broekhuis 1992; Guasti 1992, 1993, 1996b, 1997; Roberts 1993b, 1997b; Bok-Bennema and Kampers-Manhe 1994; Haegeman 1994; Rooryck 1994a; Wurmbrand 1997, 1998a, 1998c, 2001; Gonçalves 1998

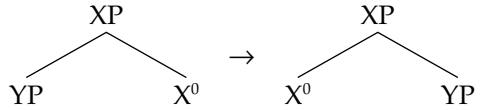
that restructuring infinitives involve a deficient 'dummy' INFL; Sternefeld (1990) argues that restructuring infinitives lack an embedded complementizer position, whereas non-restructuring infinitives involve a complementizer (which can be empty); and many researchers follow the idea that restructuring infinitives are deficient for tense. Table 75.17 summarizes some of the major proposals that suggest motivations for restructuring.

While the semantic properties allow us to make important generalizations about the nature and class of restructuring infinitives, it also has to be emphasized again that this is only a part of the picture. In particular, many differences among languages in the distribution of restructuring classes do not easily fall out from the semantic properties, and it is essential to take into account syntactic properties and other language-specific properties as well. However, as this short summary will hopefully have shown, while many important observations have been made regarding the syntactic and semantic properties of restructuring infinitives, there are also many questions that are still open, and hence the issue of restructuring provides an interesting and potentially very fruitful area for further research.

5 Appendix

5.1 Head-final derivations (inversion)

(77) **Head-final inversion rule:**



iff the conditions in table 75.18 hold.

Table 75.18 Inversion rules (head-final base)

Language	Inversion rules	Optionality	Other
AF	X is a modal	Obligatory	• *Will*: modal • Passive participles: optional 3-LEFT
DU	A: Y is an infinitive B: Y is a participle	A: Obligatory B: Optional	• Inversion is optional in finite 2-verb clusters • Participles: optional 3-LEFT
Frisian	No inversion	–	–
GE (Standard)	X is an auxiliary and Y is a modal	Obligatory	• *Will*: modal or auxiliary
GE/Austrian dialects	Y is a non-main verb infinitive	Optional	• AUX-MOD-V: optional 3-LEFT
Swiss dialects	A: X is an auxiliary and Y is a modal B: Y is an infinitive	A: Obligatory B: Optional	• Optional 3-LEFT • 3-2 inversion only if 2-1 inversion
WF	A: X is an operator (MOD, TENSE, NEG) and Y is an infinitive B: X and Y are auxiliaries	A: Obligatory B: Optional	• Present: [±TENSE] • MOD-AUX-V: optional 3-LEFT

(78) **DU – head-final inversions** (data from Rutten 1991; Zwart 1996; Robbers 1997):

a. **AUX-PART** (optional inversion of participle (B)):
dat Jan het boek gelezen heeft /heeft gelezen (2-1/1-2)
that Jan the book read-2 has-1/has-1 read-2

b. **MOD-INF** (optional inversion in finite 2-verb clusters (A; special)):
dat Jan het boek lezen kan /kan lezen (2-1/1-2)
that Jan the book read-2 can-1/can-1 read-2

c. **MOD-MOD-V** (obligatory inversions of infinitives (A)):
dat Jan morgen zal/moet kunnen werken (1-2-3)
that Jan tomorrow will/must-1 can-2 work-3 (*All others)

d. **AUX-Mod-V** (obligatory inversions of infinitives (A; IPP = infinitive)):
dat Jan het boek heeft kunnen lezen (1-2-3)
that Jan the book has-1 can-2 read-3 (*All others)

e. **MOD-AUX-V** (optional inversion of participle (B); obligatory inversion of infinitive (A); optional 3-LEFT):
dat Jan Marie kan hebben gezien (1-2-3)
that Jan Marie can-1 have-2 seen-3
dat Jan Marie kan gezien hebben (1-3-2)
that Jan Marie can-1 seen-3 have-2
dat Jan Marie gezien can hebben (3-1-2)
that Jan Marie seen-3 can-1 have-2

(79) **GE (Standard) – head-final inversions:**

a. **AUX-PART** (no inversion (PART is not a modal)):
weil er das Buch gekauft hat /*hat gekauft (2-1/*1-2)
since he the book bought-2 has-1/*has-1 bought-2

a′. **AUX-INF** (no inversion (INF is not a modal)):
weil er das Buch kaufen wird /*wird kaufen (2-1/*1-2)
since he the book buy-2 will-1/*will-1 buy-2

b. **MOD-INF** (no inversion (INF is not a modal)):
weil er das Buch kaufen muß /*muß kaufen (2-1/*1-2)
since he the book buy-2 must-1/*must-1 buy-2

c. **MOD-MOD-V** (no inversions (MODs are not auxiliaries)):
weil er es kaufen können will (3-2-1)
since he it buy-3 can-2 wants-1 (*All others)
weil er es kaufen können wird (3-2-1)
since he it buy-3 can-2 will-1 (*will* = modal)

d. **AUX-Mod-V** (obligatory inversion of AUX and MOD):
weil er es hat kaufen können (1-3-2)
since he it has-1 buy-3 can-2 (*All others)
weil er es wird kaufen können (1-3-2)
since he it will-1 buy-3 can-2 (*will* = auxiliary)

e. **MOD-AUX-V** (no inversions (V/AUX are not modals)):
weil er es gekauft haben muß (3-2-1)
since he it bought-3 have-2 must-1 (*All others)

f. **AUX-AUX-V** (no inversions (V/AUX are not modals)):
weil es gekauft worden ist (3-2-1)
since it bought-3 been-2 is-1 (*All others)

(80) **GE/Austrian (dialects) – head-final inversions:**

a. **AUX-PART** (no inversion):
weil er das Buch gekauft hat /*hat gekauft (2-1/*1-2)
since he the book bought-2 has-1/*has-1 bought-2

a′. **AUX-INF** (no inversion (INF is main verb)):
weil er das Buch kaufen wird /*wird kaufen (2-1/*1-2)
since he the book buy-2 will-1/*will-1 buy-2

b. **MOD-INF** (no inversion (INF is main verb)):
weil er das Buch kaufen muß /*muß kaufen (2-1/*1-2)
since he the book buy-2 must-1/*must-1 buy-2

c. **MOD-MOD-V** (optional inversion of infinitive; no main verb inversion; no 3-LEFT environment):
weil er es kaufen können will (No inversions: 3-2-1)
since he it buy-3 can-2 wants-1
weil er es will kaufen können (Inversion: 1-3-2)
since he it wants-1 buy-3 can-2

d. **AUX-Mod-V** (optional inversion of infinitive; optional 3-LEFT; no main verb inversion):

weil er es hat kaufen können (Inversion: 1-3-2)
since he it has-1 buy-3 can-2
weil er es wird kaufen können (Inversion: 1-3-2)
since he it will-1 buy-3 can-2
weil er es kaufen können hat (No inversions: 3-2-1)
since he it buy-3 can-2 has-1
weil er es kaufen können wird (No inversions: 3-2-1)
since he it buy-3 can-2 will-1
weil er es kaufen hat können (3-LEFT and inversion: 3-1-2)
since he it buy-3 has-1 can-2
weil er es kaufen wird können (3-LEFT and inversion: 3-1-2)
since he it buy-3 will-1 can-2

e. **MOD-AUX-V** (optional inversion of infinitive; no 3-LEFT environment):
weil er es gekauft haben muß (3-2-1)
since he it bought-3 have-2 must-1
weil er es muß gekauft haben (Inversion: 1-3-2)
since he it must-1 bought-3 have-2

f. **AUX-AUX-V** (no inversions):
weil es gekauft worden ist (3-2-1)
since it bought-3 been-2 is-1 (*All others)

(81) **SG (dialects) – head-final inversions** (data from Schönenberger 1995, p.c.; Hsiao 1999; Haeberli p.c.):[28]

a. **AUX-PART** (no inversion (PART is not a modal or an infinitive)):
das t chatz fisch gässe hät /*hät gässe (2-1/*1-2)
that the cat fish eaten-2 has-1/*has-1 eaten-2

b. **MOD-INF** (optional inversion (B)):
das t chatz fisch ässe mues /mues ässe (2-1/1-2)
that the cat fish eat-2 must-1/must-1 eat-2

c. **MOD-MOD-V** (optional inversion of infinitives (B); optional 3-LEFT):
das er . . . wil chöne vorsinge (2 inversions: 1-2-3)
that he . . . wants-1 can-2 sing-3
das er . . . wil vorsinge chöne (1 inversion: 1-3-2)
that he . . . wants-1 sing-3 can-2
das er . . . vorsinge wil chöne (3-LEFT and inversion: 3-1-2)
that he . . . sing-3 wants-1 can-2
das er . . . vorsinge chöne wil (No inversion: 3-2-1)
that he . . . sing-3 can-2 wants-1

d. **AUX-Mod-V** (obligatory inversion of AUX/MOD (A); optional inversion of infinitive (B); optional 3-LEFT):
das de Jonas hät müese schwimme (A and B: 1-2-3)
that the Jonas has-1 must-2 swim-3
das de Jonas hät schwimme müese (A: 1-3-2)
that the Jonas has-1 swim-3 must-2
das de Jonas schwimme hät müese (3-LEFT and A: 3-1-2)
that the Jonas swim-3 has-1 must-2

e. **MOD-AUX-V** (optional inversion of infinitive (B); optional 3-LEFT):
wil er si mues gsee ha (B: 1-3-2)
since he her must-1 seen-3 have-2
wil er si gsee ha mues (No inversions: 3-2-1)
since he her seen-3 have-2 must-1
wil er si gsee mues ha (3-LEFT: 3-1-2)
since he her seen-3 must-1 have-2

f. **AUX-AUX-V** (no inversions (3-LEFT also yields 3-2-1)):
das de Hans gwäält worde isch (No inversions: 3-2-1)
that the Hans elected-3 been-2 is-1

(82) **WF – head-final inversions** (data from Haegeman 1994: 511, 517, 1995a: 59, 1998c, p.c.):

a. **AUX-PART** (no inversion):
da Valère dienen boek gelezen oat /*oa gelezen (2-1/*1-2)
that Valère that book read-2 had-1/*had-1 read-2

b. **MOD-INF** (obligatory inversion with modal (= operator)):
da Valère dienen boek *kuopen wilt /wilt kuopen (1-2/*2-1)
that Valère this book *buy-2 wants-1/wants-1 buy-2

c. **MOD-MOD-V** (obligatory inversion with modals (= operator)):
dan ze dienen boek kosten willen kupen (1-2-3)
that they this book could-1 want-2 buy-3

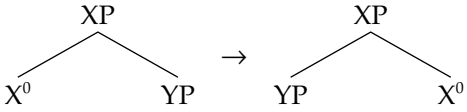
d. **AUX-Mod-V** (obligatory inversion with modal (= operator); obligatory inversion with AUX when operator (i.e., when [+TENSE/+NEG])):
da Valère willen Marie dienen boek geven eet (2-3-1)
that Valère want-2 Marie that book give-3 has-1
da Valère ee willen Marie dienen boek geven (1-2-3)
that Valère has-1 want-2 Marie that book give-3
da Valère oa willen Marie dienen boek geven (1-2-3)
that Valère had-1 want-2 Marie that book give-3
da Valère nooit en-ee willen Marie dienen boek geven (1-2-3)
that Valère never NEG-has-1 want-2 Marie that book give-3
?*da Valère willen Marie dienen boek geven oat (?*2-3-1)
that Valère want-2 Marie that book give-3 had-1
?*da Valère nooit willen Marie dienen boek geven en-eet (?*2-3-1)
that Valère never want-2 Marie that book give-3 NEG-has-1

e. **MOD-AUX-V** (inversion with modal (= operator); optional 3-LEFT):
dat Jan . . . moe gezien een (Inversion: 1-3-2)
that Jan . . . must-1 seen-3 have-2
da Jan . . . gezien moet een (3-LEFT: 3-1-2)
that Jan . . . seen-3 must-1 have-2

f. **AUX-AUX-V** (optional inversion of AUX&AUX):
da Jan gekozen geworden is (No inversions: 3-2-1)
that Jan elected-3 been-2 is-1
dat Jan is gekozen geworden (Inversion: 1-3-2)
that Jan is-1 elected-3 been-2

5.2 Head-initial derivations (inversion)

(83) **Head-initial inversion rule:**



iff the conditions in table 75.19 hold.

Table 75.19 Inversion rules (head-initial base)

Language	Inversion rules	Optionality	Other
AF	X is an auxiliary	Obligatory	• *Will*: modal • Passive participles: optional 3-LEFT
DU	A: Y is a participle B: X is finite and Y is a main verb	A: Optional B: Optional	• Participles: optional 3-LEFT
Frisian	X and Y are verbs	Obligatory	
GE (Standard)	X and Y are verbs, except when Y is an auxiliary and Y is a modal[a]	Obligatory	• *Will*: modal or auxiliary
GE/Austrian dialects	A: Y is a participle B: Y is a main verb C: Y is an infinitive	A: Obligatory B: Obligatory C: Optional	• Infinitives: optional 3-LEFT across a higher auxiliary
Swiss dialects	A: Y is a participle B: X is a modal	A: Obligatory B: Optional	• Optional 3-LEFT • 1-2 inversion only if 2-3 inversion
WF	A: X is a [–TENSE] auxiliary B: Y is a main verb participle	Obligatory	• Present: [±TENSE] • NEG, PAST: [+TENSE] • Participles: optional 3-LEFT across a modal

Note: To avoid the 'except' clause in the rule for GE, one could state instead the following three obligatory rules: A: Y is a participle; B: Y is a main verb; C: X is a modal. These rules would guarantee inversion in all but auxiliary–modal constructions, but would also involve a significant amount of redundancy.

(84) **DU – head-initial inversions** (data from Rutten 1991; Zwart 1996; Robbers 1997):

a. **AUX-PART** (optional inversion of participle (A) or main verb (B)):
dat Jan het boek gelezen heeft /heeft gelezen (2-1/1-2)
that Jan the book read-2 has-1/has-1 read-2

b. **MOD-INF** (optional inversion of main verb (B)):
dat Jan het boek lezen kan /kan lezen (2-1/1-2)
that Jan the book read-2 can-1/can-1 read-2

c. **MOD-MOD-V** (no inversions):
dat Jan morgen zal/moet kunnen werken (1-2-3)
that Jan tomorrow will/must-1 can-2 work-3 (*All others)

d. **AUX-Mod-V** (no inversions (IPP = infinitive)):
dat Jan het boek heeft kunnen lezen (1-2-3)
that Jan the book has-1 can-2 read-3 (*All others)

e. **MOD-AUX-V** (optional inversion of participle; optional 3-LEFT):
dat Jan Marie kan hebben gezien (1-2-3)
that Jan Marie can-1 have-2 seen-3
dat Jan Marie kan gezien hebben (1-3-2)
that Jan Marie can-1 seen-3 have-2
dat Jan Marie gezien can hebben (3-1-2)
that Jan Marie seen-3 can-1 have-2

(85) **GE (Standard) – head-initial inversions:**

a. **AUX-PART** (obligatory inversion (PART is not a modal)):
weil er das Buch gekauft hat /*hat gekauft (2-1/*1-2)
since he the book bought-2 has-1/*has-1 bought-2

a′. **AUX-INF** (obligatory inversion (INF is not a modal)):
weil er das Buch kaufen wird /*wird kaufen (2-1/*1-2)
since he the book buy-2 will-1/*will-1 buy-2

b. **MOD-INF** (obligatory inversion (INF is not a modal)):
weil er das Buch kaufen muß /*muß kaufen (2-1/*1-2)
since he the book buy-2 must-1/*must-1 buy-2

c. **MOD-MOD-V** (obligatory inversions (MODs are not auxiliaries)):
weil er es kaufen können will (3-2-1)
since he it buy-3 can-2 wants-1 (*All others)
weil er es kaufen können wird (3-2-1)
since he it buy-3 can-2 will-1 (*will* = modal)

d. **AUX-Mod-V** (obligatory inversion of MOD and V; no inversion of AUX and MOD):
weil er es hat kaufen können (1-3-2)
since he it has-1 buy-3 can-2 (*All others)
weil er es wird kaufen können (1-3-2)
since he it will-1 buy-3 can-2 (*will* = auxiliary)

e. **MOD-AUX-V** (obligatory inversions (V/AUX are not modals)):
weil er es gekauft haben muß (3-2-1)
since he it bought-3 have-2 must-1 (*All others)

f. **AUX-AUX-V** (obligatory inversions (V/AUX are not modals)):
weil es gekauft worden ist (3-2-1)
since it bought-3 been-2 is-1 (*All others)

(86) **GE/Austrian (dialects) – head-initial inversions:**

a. **AUX-PART** (obligatory inversion of main verbs (B) or obligatory inversion of participle (A)):
weil er das Buch gekauft hat /*hat gekauft (2-1/*1-2)
since he the book bought-2 has-1/*has-1 bought-2

a'. **AUX-INF** (obligatory inversion of main verbs (B)):
weil er das Buch kaufen wird /*wird kaufen (2-1/*1-2)
since he the book buy-2 will-1/*will-1 buy-2

b. **MOD-INF** (obligatory inversion of main verbs (B)):
weil er das Buch kaufen muß /*muß kaufen (2-1/*1-2)
since he the book buy-2 must-1/*must-1 buy-2

c **MOD-MOD-V** (obligatory inversion of main verb (B); optional inversion of infinitive (C)):
weil er es kaufen können will (3-2-1)
since he it buy-3 can-2 wants-1
weil er es will kaufen können (1-3-2)
since he it wants-1 buy-3 can-2

d. **AUX-Mod-V** (obligatory inversion of main verb (B); optional inversion of infinitive (C; IPP = infinitive); optional 3-LEFT across AUX):
weil er es hat kaufen können (1-3-2)
since he it has-1 buy-3 can-2
weil er es wird kaufen können (1-3-2)
since he it will-1 buy-3 can-2
weil er es kaufen können hat (3-2-1)
since he it buy-3 can-2 has-1
weil er es kaufen können wird (3-2-1)
since he it buy-3 can-2 will-1
weil er es kaufen hat können (3-1-2)
since he it buy-3 has-1 can-2
weil er es kaufen wird können (3-1-2)
since he it buy-3 will-1 can-2

e. **MOD-AUX-V** (obligatory inversion of main verbs (B) or obligatory inversion of participle (A); optional inversion of infinitive (C)):
weil er es gekauft haben muß (3-2-1)
since he it bought-3 have-2 must-1
weil er es muß gekauft haben (1-3-2)
since he it must-1 bought-3 have-2

f. **AUX-AUX-V** (obligatory inversions of participles (A)).
weil es gekauft worden ist (3-2-1)
since it bought-3 been-2 is-1 (*All others)

(87) **SG (dialects) – head-initial inversions** (data from Schönenberger 1995, p.c.; Hsiao 1999; Haeberli p.c.):[29]

a. **AUX-PART** (obligatory inversion of participle (A)):
das t chatz fisch gässe hät /*hät gässe (2-1/*1-2)
that the cat fish eaten-2 has-1/*has-1 eaten-2

b. **MOD-INF** (optional inversion (B)):
das t chatz fisch ässe mues /mues ässe (2-1/1-2)
that the cat fish eat-2 must-1/must-1 eat-2

c. **MOD-MOD-V** (optional inversion with modals (B); optional 3-LEFT):
das er . . . wil chöne vorsinge (No inversions: 1-2-3)
that he . . . wants-1 can-2 sing-3
das er . . . wil vorsinge chöne (1 inversion: 1-3-2)
that he . . . wants-1 sing-3 can-2
das er . . . vorsinge wil chöne (3-LEFT: 3-1-2)
that he . . . sing-3 wants-1 can-2
das er . . . vorsinge chöne wil (2 inversions B: 3-2-1)
that he . . . sing-3 can-2 wants-1

d. **AUX-Mod-V** (optional inversion with modal (B); optional 3-LEFT):
das de Jonas hät müese schwimme (No inversions: 1-2-3)
that the Jonas has-1 must-2 swim-3
das de Jonas hät schwimme müese (B: 1-3-2)
that the Jonas has-1 swim-3 must-2
das de Jonas schwimme hät müese (3-LEFT: 3-1-2)
that the Jonas swim-3 has-1 must-2

e. **Mod-AUX-V** (obligatory inversion of participle (A); optional inversion with modal (B); optional 3-LEFT):
wil er si mues gsee ha (A: 1-3-2)
since he her must-1 seen-3 have-2
wil er si gsee ha mues (A & B: 3-2-1)
since he her seen-3 have-2 must-1
wil er si gsee mues ha (3-LEFT: 3-1-2)
since he her seen-3 must-1 have-2

f. **AUX-AUX-V** (obligatory inversion of participles (A) (3-LEFT also yields 3-2-1)):
das de Hans gwäält worde isch (2 inversions A: 3-2-1)
that the Hans elected-3 been-2 is-1

(88) **WF – head-final inversions** (data from Haegeman 1994: 511, 517; 1995a: 59; 1998c; p.c.):

a. **AUX-PART** (obligatory inversion of main verb participles):
da Valère dienen boek gelezen oat /*oa gelezen (2-1/*1-2)
that Valère that book read-2 had-1 /*had-1 read-2

b. **MOD-INF** (no inversion):
da Valère dienen boek *kuopen wilt /wilt kuopen (1-2/*2-1)
that Valère this book *buy-2 wants-1 /wants-1 buy-2

c. **MOD-MOD-V** (no inversions):
dan ze dienen boek kosten willen kupen (1-2-3)
that they this book could-1 want-2 buy-3

d. **AUX-Mod-V** (obligatory inversion when AUX is [–TENSE] (NEG = [+TENSE])):
da Valère willen Marie dienen boek geven eet (2-3-1)
that Valère want-2 Marie that book give-3 has-1
da Valère ee willen Marie dienen boek geven (1-2-3)
that Valère has-1 want-2 Marie that book give-3
da Valère oa willen Marie dienen boek geven (1-2-3)
that Valère had-1 want-2 Marie that book give-3
da Valère nooit en-ee willen Marie dienen boek geven (1-2-3)
that Valère never NEG-has-1 want-2 Marie that book give-3
?*da Valère willen Marie dienen boek geven oat (?*2-3-1)
that Valère want-2 Marie that book give-3 had-1
?*da Valère nooit willen Marie dienen boek geven en-eet (?*2-3-1)
that Valère never want-2 Marie that book give-3 NEG-has-1

e. **MOD-AUX-V** (obligatory inversion of main verb participle; optional 3-LEFT):
dat Jan . . . moe gezien een (Inversion: 1-3-2)
that Jan . . . must-1 seen-3 have-2
da Jan . . . gezien moet een (3-LEFT: 3-1-2)
that Jan . . . seen-3 must-1 have-2

f. **AUX-AUX-V** (obligatory inversion of main verb participle; inversion with AUX):[30]
da Jan gekozen geworden is (A and B: 3-2-1)
that Jan elected-3 been-2 is-1
dat Jan is gekozen geworden (B: 1-3-2)
that Jan is-1 elected-3 been-2

NOTES

1 The notion of 'unmarked' word order is crucial to distinguish verb clusters from constructions like stylistic fronting in Icelandic or VP topicalization.

2 As will be shown in section 2.3, these languages allow word orders that cannot be treated as basic word orders under either a head-final or a head-initial base structure. Thus, these languages clearly involve verb-cluster reordering (in certain constructions) independently of what one assumes to be their base structure.

3 According to a preliminary study conducted by Peter Ackema, there is some potential variation among Frisian speakers regarding the possibility of the IPP effect in descending orders. However, the empirical situation is not clear at this point; in particular, as pointed out by Germen de Haan (p.c.), there is a strong influence from DU which interferes with the data.

4 Not considered for this overview are causative and perception verb constructions, or double-auxiliary constructions of the form *John will have left*, since these constructions are less discussed in the literature.

5 For this basic illustration of the orders attested in verb clusters, the distribution of objects in verb clusters will be ignored. One might imagine that inversion in cases such as (10b, c, d) should result in a structure in which the object occurs between the verbs of a cluster; similarly, without further assumptions, the object should occur after the lowest verb in the structures in (11). However, despite the fact that both expectations are generally not borne out (but see section 3.2), these facts do not challenge the types of inversion suggested in (10–11). An important ingredient of head-initial structures is that in the West Germanic languages, material that is generated to the right of the lowest verb (such as objects) undergoes obligatory movement to some position further to the left. In the course of this overview, this property will be discussed in detail; however, for the present discussion, it might be useful for the reader to simply imagine that the object is not in its base position but somewhere to the left of the cluster (in both the head-initial and the head-final structures).

6 The rules do not capture double-participle constructions in DU as listed in table 75.2. The reason why this construction is ignored is that no systematic empirical characterization is available at this point. For one, constructions involving the auxiliary *geworden* are generally considered as marked and rejected by most DU speakers. Furthermore, while the 1-3-2 order is attested for the *get*+PART construction (Robbers 1997: 124), it is not clear at this point what the status of the other orders in this construction is. Thus, the rules given in table 75.3 and in table 75.4 below might have to be modified after establishing the empirical situation for this construction.

7 The formulation of the inversion rule as in table 75.3 (in particular the assumption that the rule is sensitive to modals rather than to infinitives) receives further support from the fact that modals also invert with non-verbal complements in AF (see Robbers 1997: 167–171).

8 The Swiss data in these examples are from Haeberli (p.c.) and partly also from Hsiao (1999, 2000).

9 But see Den Dikken 1989, Den Besten and Broekhuis 1992, Coppen and Klein 1992, IJbema 1997, and Koopman and Szabolcsi 2000, for instance, for exactly that position – i.e., a pure phrasal movement approach.

10 To account for the optionality of particle stranding (cf. (32b) and (32f)) it has to be assumed that either excorporation is possible or that incorporation can occur before or after verb-cluster formation. Since the structure of particle constructions is a topic on its own, a detailed discussion cannot be provided here. See Neeleman (1994a), Den Dikken (1995c), and references therein for in-depth discussions.

11 For the present discussion, the structure of these infinitival constructions will be left unspecified; in particular, no label is assigned to the remnant constituent in (34). See section 4.

12 The exact landing site of the object (i.e., whether it is higher or lower than the higher VP) is ignored here since it is orthogonal to the question addressed.

13 In fact, particles can appear to the left of certain elements (namely stranded prepositions), which has been taken as support for a movement analysis of particles and against the claim that particles are immovable (cf., for instance, Zwart 1997a). However, since these reduced elements are the only categories that can appear between a particle and a verb, the conclusion that particles undergo leftward movement should also be drawn with some caution. An alternative view would be to assume that

particles and other preposition-like elements undergo syntactic or phonological cliticization; if this process occurs in the phonological component, the order between a particle and a stranded preposition could be seen as a phonological ordering effect, and hence these constructions would not provide evidence for syntactic movement.

14 Assuming that phrasal movement in verb clusters is some form of extraposition, it is expected that this form of movement does not have to target the closest XP on the right but can attach to a higher projection, as long as no clause boundary is crossed. Thus, movement of VP-2 in (42b) across XP would be unproblematic unless the latter is a CP. Since not all infinitival constructions allow the remnant movement operation in (41a, b) (in particular, factive and propositional infinitives prohibit this configuration), the presence vs. absence of a CP (like the suggested presence vs. absence of the XP in (42)) could be seen as the crucial property that distinguishes infinitives allowing a remnant movement construction from ones that prohibit it (see Wurmbrand 2001 for an analysis along these lines).

15 Note that the main issue of this section is simply to determine how different structures can be derived. The question of why certain things move or do not move will be addressed in section 3.3.

16 Although technically speaking, the term 'verb projection raising' is no longer the correct description of these constructions in light of (certain) head-initial approaches, it will be kept here as a descriptive label for constructions of the form 'V-1 . . . [XP V-2]'.

17 As mentioned below table 75.7, the prohibition against stranding of particles holds only for idiomatic particles; particle constructions with a transparent meaning readily allow particle stranding in AF (cf. Robbers 1997), and under the right focus conditions, also in GE and SG (see Wurmbrand 1999b and Ackema 2004 for discussions of this distinction). In DU and WF, however, both types of particles can be stranded. The statements in the text should thus be seen as referring only to idiomatic particles.

18 The claim that movement to functional projections is motivated by the need to check features is itself based on an assumption which appears to be controversial. What kind of features do verbs, modals, auxiliaries, etc., check? Features commonly assumed are so-called V-features. Although it seems that these rather vague features do no more than account for movement in the absence of any other good reason (see also Koopman 1984 for a similar observation regarding features such as [±AFFIX]), it will be granted for the discussion here that movement that is triggered by these kind of features is 'motivated' movement.

19 Unfortunately, the paradigm is incomplete and it is not entirely clear what the options regarding particle placement are in the 1-3-2 order. According to Marcel den Dikken (p.c.), particles can occur to the left or to the right of 1 in the 1-3-2 order. However, since these intuitions have not been confirmed by a speaker of this dialect, the facts are only noted preliminarily at this point.

20 This is not an entirely correct description of Zwart's analysis, since Zwart leaves open (1996: 249) the phrase-structure status of the participle (i.e., whether the element that moves to Spec*OF/BE* is a head or a phrase). The reason – according to Zwart – is that clausal complements are not carried along when the participle moves to its licensing position. However, this problem can of course be avoided (by keeping the assumption that participle movement is XP-movement) if the clausal complement undergoes prior movement to a position above the VP but below the landing site of the participle (see Hinterhölzl 1997, 1998, 1999 and Koopman and Szabolcsi 2000 for extensive

use of this option). Since this remnant movement approach seems to be more in the spirit of Zwart's proposal than the rather ad hoc assumption that heads move into specifier positions, the participle movement will be represented as VP movement, with the understanding that additional movements might have occurred that pre-emptied the VP.

21 As noted in note 19, it is not entirely clear where particles can go in this order. If speakers of this dialect share Marcel den Dikken's intuition that particles can occur to the right or to the left of 1 in the 1-3-2 order, one of the options for particles as discussed in the text would have to be eliminated – i.e., particles could then not be considered as immobile, but one would have to pursue an analysis according to which particles undergo string-vacuous movement (see section 3.1.3).

22 One of Zwart's critiques of the head-final approach which is mentioned repeatedly in the article is that both head- and phrasal movement are necessary to derive verb clusters. Although the account presented in the text indeed involves both head- and phrasal movement, it is important to note that this is not necessarily the only way to derive DU verb clusters under a head-final approach. It has been chosen here since it appears to be the most straightforward option. However, as we have seen in section 3.1.3, it is possible – under certain assumptions about particles – to derive the word-order patterns exclusively by phrasal movement in the head-final approach. Thus, Zwart's claim is not entirely correct. Furthermore, it should be noted that Zwart's own analysis crucially involves both head- and phrasal movement. Thus, it seems that this point of criticism is not justified.

23 Evers attributes this principle to a proposal made by Kuroda in an unpublished paper (cited in Ross 1986).

24 Both articles were subsequently republished. References below are to the newer versions.

25 Note, however, that this conclusion holds only under the particular assumptions stated in the text. One question of debate, for instance, is the claim that floating quantifiers mark the trace position of the subject (see Bobaljik 1998 and references therein for arguments against this position). Furthermore, excorporation could be dispensed with, assuming the relativized HMC approach suggested in Den Dikken and Hoekstra (1997).

26 The lists of references are selective and no claim is made that they exhaustively represent the works on restructuring. In many cases, only works that explicitly address the questions or issues under consideration will be mentioned. Roberts (1997b) is listed in both categories in table 75.13, since restructuring verbs are characterized as non-theta-assigners in his article; however, at the same time it is stated that this property is essentially a language-specific lexical property that does not necessarily correlate with the thematic and semantic properties of the verbs involved.

27 Von Stechow does not commit himself to any assumption about the initial structure of restructuring infinitives (i.e., whether they are base-generated VPs or reduced CPs). However, since he talks about potential deletion of PRO and sentential nodes, his reference is included here.

28 The rules yield Swiss-1 in two-verb clusters; see notes to table 75.2.

29 Again, the rules yield Swiss-1 in two-verb clusters; see notes to table 75.2.

30 The current formulation of the rule predicts that inversion with the higher AUX is subject to the [–TENSE] restriction. If this is empirically incorrect, the rules will have to be modified.

4 Conclusion

1 Introduction

Verb particle constructions (also known as 'phrasal verbs' and 'serial verb constructions') are collocations of a verb and another element, like *call+up* in (1). These constructions are productive and well discussed in the Germanic languages. Recently, Hungarian has received increased attention. The theoretical challenge posed by verb particle constructions is rooted in the relation between the particle and other elements in the verb phrase. Ad Neeleman (p.c.) sketches the problem roughly as follows:

(i) Does the particle form an initial constituent with the verb or with a VP-internal DP/PP?
(ii) What determines the position of the particle with respect to the verb and VP-internal DPs/PPs? If the particle forms an initial constituent with the verb, does it separate by verb movement or movement of the particle? If it forms an initial constituent with a VP-internal DP/PP, does it combine with the verb through incorporation or reanalysis?

Verb particle constructions also pose a methodological problem. Following native speakers' intuitions, various V+X combinations have been called particle constructions in the literature. Incidentally, those constructions exhibit largely inconsistent patterns of behavior, especially from a comparative perspective, and a unified account of all such constructions is virtually impossible. Lüdeling (2001) calls this a 'delimitation problem'.

In the generative tradition, problems of this sort are solved in a theoretical, not an empirical way. An explanatory theory must determine class membership of an element or configuration on the basis of its properties, and not on pretheoretical, intuitive groupings. Thus, many authors have singled out a class of core V+P combinations as particle constructions (e.g., Emonds 1972a). This strategy will be adopted here too, with references to other approaches where there is significant disagreement.

1.1 Distributional properties

1.1.1 English-type particle movement

In English, particles may break up the otherwise obligatory adjacency of the verb and its NP object (Emonds 1972a; Fraser 1976; Stowell 1981; Kayne 1985; Johnson 1991; Den Dikken 1995c; Dehé 2001; Gries 2002; Neeleman 2002):

(1) a. He called his friend up.
b. He called up his friend.
c. *He called from Boston his friend.

The mobility of the particle, as illustrated in (1a) vs. (1b), is often referred to (especially in early generative literature) as 'particle movement'. This is the most salient property of the construction in the Germanic VO languages. Apart from English, it has been discussed in great detail for Norwegian (Taraldsen 1983; Åfarli 1985; Den Dikken 1995c), but also for Icelandic (Collins and Thráinsson 1996); see Svenonius (1996) for a comparative discussion:

(2) a. Vi slapp ut hunden. Norwegian
we let out the-dog
b. Vi slapp hunden ut.
we let the-dog out
'We let out the dog.'

Swedish (Toivonen 2001) and Danish (Herslund 1984) particles are considerably more restricted in their distribution. In Swedish, simple, unmodified particles precede an NP object; in Danish, the particle follows NP:

(3) a. Matts kastade in soporna. Swedish
Matts threw in the-garbage
'Matts threw in the garbage.'
b. *Matts kastade soporna in.
Matts threw the-garbage in

(4) a. *Han knugede sammen sine hænder. Danish
he clasped together his hands
b. Han knugede sine hænder sammen.
he clasped his hands together
'He clasped his hands together.'

1.1.2 Particles and V2

In the Germanic OV languages, particles (known also as 'separable prefixes') are always left-adjacent to the main verb in final position. No constituent other than a verb may follow the particle. This is illustrated with Dutch stranded prepositions

in (5) (see on Dutch: Koster 1975; Van Riemsdijk 1978a; Hoekstra et al. 1989; Booij 1990; Bennis 1991; Neeleman and Weerman 1993; Neeleman 1994a; Den Dikken 1995c; Koopman 2000a; on German: Stiebels 1996; Wurmbrand 1998b; McIntyre 2001; Zeller 1999; Müller 2002a; Lüdeling 2001; on Afrikaans: Le Roux 1988):

(5) a. de brief waar Jan zijn moeder in uit nodigt — Dutch
the letter that Jan his mother in prt. invites
b. *de brief waar Jan zijn moeder uit in nodigt
the letter that Jan his mother prt. in invites
'the letter in which Jan invites his mother'

When the verb occupies the clause-initial (V2) position, the adjacency of verb and particle is broken up: the particle must be stranded in final position (6). V2 also separates the verb from the particle in VO languages, as in Toivonen's (2002) Swedish example (7):

(6) a. Jan nodigt zijn moeder uit. — Dutch
Jan invites his mother prt.
b. *Jan uit nodigt zijn moeder.
Jan prt. invites his mother
'Jan invites his mother.'

(7) De gamla kyrkorna räckte inte till. — Swedish
the old churches-the reached not to
'The old churches were not enough.'

1.1.3 Particles and V raising

In V-raising contexts (see chapter 75), Dutch particles show up either left-adjacent to the verb they lexically depend on, or left-adjacent to the verbal complex (example adapted from Koster 1975):

(8) a. omdat hij mij probeert op te bellen
because he me tries up to call
b. omdat hij mij op probeert te bellen
because he me up tries to call
'because he tries to call me up'

1.1.4 Modification

English particles may be modified by PP-modifiers like *right*. Modified particles cannot break up the adjacency between verb and NP object (example adapted from Emonds 1972a):

(9) a. They brought the bottle right up.
b. *They brought right up the bottle.

A similar constraint holds for Norwegian: modified particles must follow NP (Åfarli 1985):

(10) a. *Jon sparka langt ut hunden.
Jon kicked far out the-dog
b. Jon sparka hunden langt ut.
Jon kicked the-dog far out
'Jon kicked the dog far out.'

In Dutch, simplex particle modifiers block incorporation of the particle into the verbal complex (example adapted from Den Dikken 1995c):

(11) a. dat Jan de bal pal over heeft geschoten
that Jan the ball right over has shot
'that Jan has shot the ball right over'
b. *dat Jan de bal pal heeft over geschoten
dat Jan the ball right has over shot
c. *dat Jan de bal heeft pal over geschoten
that Jan the ball has right over shot

1.2 Morphological properties

Morphologically, particle verbs exhibit a paradoxical behavior: they behave like a single, word-level unit with respect to certain rules of derivation and composition, while inflectional affixes always attach to the verb in exclusion of the particle (Bolinger 1971; Groos 1989; Booij 1990; Guéron 1990; Hoeksema 1991; Johnson 1991; Neeleman and Weerman 1993; Stiebels and Wunderlich 1994; Zeller 1999; Van Marle 2002; Müller 2002a; Lüdeling 2001).

1.2.1 Derivational morphology

Verb particle combinations allow the formation of both nouns and adjectives, as illustrated for English[1] and Dutch below. In English, morphological derivation usually requires adjacency of verb and particle:

(12) a. his dusting off of the table
b. *his dusting of the table off
c. the dusted off table

(13) a. op- merke- lijk Dutch
up notice able
'remarkable'
b. uit- sterv- ing
out die ing
'extinction'

At least in some cases, the resulting constructions show strong signs of being word-level entities, as evidenced by a heavily constrained operation like German *un*-prefixation (cf. section 3.3.4):

(14) a. das un- ab- geschickte Manuskript
the un off sent manuscript
'the unsent manuscript'

Particles are also, quite regularly, involved in the formation of verbs from non-verbal stems (Stiebels 1996; Booij 2002; McIntyre 2002):[2]

(15) a. tough out
dumb down
b. soldier on
horse around

1.2.2 Inflectional morphology

Inflectional affixes always attach to the verb, excluding the particle. This is true for both the V-particle and the particle-V languages:

(16) a. He look- ed up the information.
b. *He look- up- ed the information

(17) a. Er ist ein- ge- gangen. German
He is in pref gone
'He/It has died.'
b. *Er ist ge- ein- gangen.
he is pref in gone

1.3 Syntactic category

For the Germanic languages, there is some consensus in the literature that verbal particles are prepositional elements (Emonds 1972a; Van Riemsdijk 1978a; but see also Zeller 1999; Lüdeling 2001; and Toivonen 2001 on non-P particles, and Koopman and Szabolcsi 2000 on Hungarian).

According to Emonds (1972a), almost all postverbal particles in English, and most well-behaved particles in the other Germanic languages (cf. Åsdahl Holmberg 1976; Booij and Van Santen 1998; and Van Marle 2002 on some ill-behaved examples) have transitive preposition counterparts. Below, *over* is used as a transitive preposition with an NP object in (18a), as an intransitive (adverbial) preposition in (18b), and as a particle with alternating position in (18c) vs. (18d):

(18) a. They were flying over New York.
b. They came over for a moment.
c. He has taken over the government.
d. He took the government over.

Particles appear in a number of typical PP environments. First, verbs selecting for directional adverbials may take either a full PP or a particle (19a). Second, particles show up in the PP-*with*-NP construction (19b). And third, particles, like PPs, are allowed in locative inversion constructions (example adapted from Emonds 1972a):

(19) a. Why do you glance at Mary/down/in/away/up/back/etc.?
b. Off with his head.
c. Down rolled the carriage.

1.4 Particle functions

The grammatical function of particles is a matter of debate and strong disagreement in the literature. This is to a large extent due to what Lüdeling (2001) calls the 'delimitation problem': different theories give rise to a different delimitation of the data (see sections 2 and 3). Therefore the most salient sets of data, which have been used to support various competing theories, will be sketched in a pretheoretical way here: thematic structure, aspect, focus, and information structure. (For detailed discussion, see Bolinger 1971; Fraser 1976; Neeleman 1994a; Den Dikken 1995c; Olsen 1995, 1998; Stiebels 1996; McIntyre 2001; Zeller 1999; Müller 2002a; Dehé 2001; Koopman and Szabolcsi 2000; Lüdeling 2001; Toivonen 2001; Dehé et al. 2002.)

1.4.1 Thematic structure

Verbal particles can appear in a variety of thematic contexts. Some particles satisfy (often directional) selected positions. In this type of construction, the reference object of the corresponding preposition usually remains implicit, and varying degrees of idiomaticity may result, as in German example (20), adapted from Stiebels (1996):

(20) a. Sie stellt die Skulptur auf den Tisch. (full PP)
she puts the sculpture on the table
'She puts the sculpture on the table.'
b. Sie stellt die Skulptur auf. (particle)
she puts the sculpture on
'She erects the sculpture.'

Other particles correspond to unselected modifiers of the verbal predicate. Such particles tend to introduce additional arguments into the thematic structure of a sentence. In (21), a possessor relation and its arguments are introduced by the particle (cf. section 3.3.4; example adapted from Stiebels 1996):

(21) a. Sie liest (Bücher).
she reads books
'She reads (books).'

b. Sie las sich ein breites Wissen an.
she read refl. a broad knowledge at
'She learned a lot by reading.'

1.4.2 Aspect

In some contexts, particles may have an aspectual import. The best-known group of aspectual verb particle constructions introduces a resultative meaning, as in Swedish example (22), from Toivonen (2001):

(22) Hon drack upp mjölken på en timme.
she drank up the-milk on an hour
'She drank up the milk in an hour.'

In other contexts, particles are related to an imperfective, ongoing action reading (23a), an inchoative reading (23b), a partial action reading (23c), etc. (cf. Bennis 1991; Verkuyl and Zwarts 1992; Van Hout 1996; Stiebels 1996; Zeller 1999):

(23) a. Jan heeft/is door gelopen. Dutch
Jan has/is on walked
'Jan kept up a pace.'
b. Der Skin hat los- getreten. German
the skinhead has prt. kicked
'The skinhead started kicking.'
c. Er brät das Fleisch an. German
he fries the meat prt.
'He fries the meat lightly.'

1.4.3 Hungarian particles and aspect

In Hungarian, verbal particles show some very clear interactions with aspect. First, some particles are inherently perfective. Those prefer a preverbal position (Vörös 1980; Kiss 1987):

(24) János (épp) ette meg az ebédet amikor a postás csengetett.
János just ate up the lunch-acc when the postman rang
'János was just finishing lunch when the postman rang.'

Lexically unspecified particles acquire an aspectual reading related to their position, and to the information structural organization of the clause. On a neutral intonation, and with the focus field empty, a postverbal particle is related to progressive aspect (25a) white preverbal unfocused particles are related to perfective aspect (25b) (example from Kiss 1987):

(25) a. János ment fel a lépcsőn.
János went up the stairs-on
'János was going upstairs.'

b. János fel ment a lépcsőn.
János up went the stairs-on
'János went/has gone upstairs.'

1.4.4 Hungarian particles and focus

The position of Hungarian particles is also determined by focus. Focused constituents appear in the focus field, left-adjacent to the finite verb (see chapter 26). Unstressed particles occupying that position mark neutrality with respect to focus (Kiss 1987; Brody 1990b; Koopman and Szabolcsi 2000):

(26) a. Haza mentem.
home go-past-1sg
'I went home.'
b. ÉN mentem haza.
I go-past-1sg home
'It is me who went home.'

In the presence of auxiliaries, and in restructuring environments, the particle may appear to the left of the verbal complex. This option exists for neutral focus (27a, b). In the presence of a focused constituent (27c), the particle appears left-adjacent to the verb it depends on:

(27) a. Haza fogok menni.
home will-1sg go
'I will go home.'
b. Haza fogok akarni menni.
home will-1sg want go
'I will want to go home.'
c. ÉN fogok akarni haza menni.
I will-1sg want home go
'It is me who will want to go home.'

1.4.5 English particles and information structure

The topic-focus structure of a sentence has an influence on the position of particles in English too (Bolinger 1971; Fraser 1976; Dehé 2001). The neutral order with respect to focus is *particle > NP*. This order allows the projection of focus:

(i) to NP in an answer to (28a);
(ii) to VP in an answer to (28b); and
(iii) to the whole sentence in an answer to (28c) (example adapted from Dehé 2001):

(28) a. What did Durban turn off?
b. What did Durban do?
c. What happened?
He turned off the camera.

On the other hand, NP objects belonging to the background information of the sentence precede the particle. This generalization also captures the widely known fact that unstressed pronouns always precede the particle (29b):

(29) a. 'What did Durban do with the camera?'
Durban turned the camera/it off.
b. *Durban turned off it.

2 Lexicalist and semi-lexicalist accounts

The lexicalist position in its purest form holds that verb particle constructions are formed in the lexicon, and enter the syntactic derivation as a single projecting head. It has been pioneered by Chomsky (1975a: VII-444), who claims that "*called^up* is a *Verb* in *John^called^up^his^friends*, though perhaps not in *John^called^up^the^stairs*, etc."

Lexicalism is supported by two major classes of data. First, verb particle combinations may undergo morphological derivations (Johnson 1991; Neeleman and Weerman 1993; Stiebels and Wunderlich 1994). And second, the meaning and selectional properties of verb particle constructions are idiosynchratic to an extent that might not be expected from genuinely syntactic constructions.

The central problem faced by the lexicalist position is the separability of particle and verb. Given the Principle of Lexical Integrity, syntactic rules may not refer to subconstituents of words. In the case of verb particle constructions under lexicalism, this is exactly the case.

Proponents of the lexicalist position have therefore postulated:

(i) modifications to the strict version of Lexical Integrity; and
(ii) conditions under which violations of strict lexical integrity are indeed forced by independently motivated constraints.

Two families of assumptions can be found related to the weakening of Lexical Integrity. One class of theories postulates a level of morphologically maximal projection below the word level that is visible to the syntactic component. The other class of theories allows the formation of complex words in syntax. It must be stressed that especially the latter strategy is often applied by authors who would not consider themselves lexicalists. However, since syntactic word formation is certainly there to account for data supporting the lexicalist position, the technical device will be sketched under this heading.

The separation of the particle is usually related to constraints on verbs merging with inflectional affixes.

2.1 *Morphological maximality*

Although the assumption of lexically stored, complex-word verb particle constructions is widespread (see Zeller 1999; Lüdeling 2001; Dehé et al. 2002), for a

critical assessment of the literature), the morphosyntactic mechanisms allowing for their separation are not always discussed in much detail.

An elaborated proposal can be found in Stiebels and Wunderlich (1994) and Stiebels (1996). According to them, the lexicon is not just a list of words. It incorporates powerful generative mechanisms involved in the derivation of argument structure and morphology.

As for verb particle constructions, it is assumed that UG provides for a (parametrically activated) morphological template that generates syntactically transparent X-V compounds:

(30) $[Y^{+max}\ V]$

(30) expresses the intuition that some elements, if they occupy a position left-adjacent to a verb, are morphologically maximal. It is important to bear in mind that, according to this proposal, the properties of particles are not specified in individual lexical entries. They are derived as a consequence of the configuration (30).

The generative template (30) interacts with a Visibility Condition stating that morphologically maximal constituents must be visible. In other words, morphologically maximal constituents must remain at the periphery of the word they are part of, and the rules of syntax can freely refer to them.

Turning now to particle verbs in derivational morphology, Stiebels and Wunderlich's (1994) proposal derives a systematic bracketing paradox. Stiebels (1996: 48ff.) is completely explicit in her conclusion that, strictly speaking, there are no particle verbs in derivational morphology. She gives the following German example:

(31) a. [ein [[führ]$_V$ ung]$_N$]
b. *[[ein^{+max} [führ]$_V$] ung]$_N$
in lead suff
'introduction'

While (31b) would be expected semantically and, even more so, by the spirit of lexicalism, it is not well-formed in Stiebels and Wunderlich's theory. The reason is that the particle is forced to be morphologically maximal by (30), yet it would not be visible inside the nominalization. In (31a), on the other hand, the particle is attached to N, not V, as a non-maximal constituent of a regular compound.

Elegant as it is, notice that this account trades away one of the central arguments offered in favor of lexicalism: the existence of morphologically derived verb particle combinations does not show anything regarding their syntactic representation in verbal contexts.

2.2 *Syntactic word formation*

If the availability of verb particle combinations in derivational morphology does not imply that particle-verbs are morphological constructs in all contexts, the

lexical-semantic and morphological properties of the construction can still be considered evidence in favor of a quasi-lexicalist analysis. Such an analysis could be reconciled with Lexical Integrity by the assumption of a syntactic word-formation mechanism.

Syntactic word formation with respect to verb particle constructions has been proposed in the literature in various different ways. Some authors constrain it to the base component of phrasal projection. Groos (1989) suggests that particles are adjoined to V at D-structure; the approach can also be found in standard textbooks like Radford (1988). Toivonen's (2001) LFG account assumes the existence of non-projecting, zero-level categories too. Neeleman and Weerman (1993) and Neeleman (1994a) defend an intermediate position. Complex predicates (of which verb particle constructions are a subclass in their theory) are derived by adjunction to V, which may happen either in morphology or at D-structure.

Others attribute the formation of adjunction structures at the X^0 level to the transformational component. All approaches involving incorporation, be it overt or covert, can be counted in this group (e.g., Van Riemsdijk 1978a; Stowell 1981; Koopman 1995).

Finally, some authors reject any form of particle incorporation, yet see the need to capture the lexicalist intuition that particle and verb are, in some sense, one word. Those authors assume reanalysis as their mechanism of choice (Taraldsen 1983; Den Dikken 1995c; Zeller 1999).

2.2.1 *Adjunction to V^0 at D-structure*

The position that preverbal elements may be adjoined to the head V^0 in Dutch was elaborated for the first time by Groos (1989). According to this proposal, adjunction to V may happen either in morphology or in syntax.

If adjunction happens in morphology, then the result is a complex word which is opaque to the rules of syntax. This is typically the case where we are dealing with morphologically derived (32a) and compounded particle-verbs (32b) (notice that Groos's analysis does not face the bracketing paradox of Stiebels's proposal):

(32) a. [[aan-drijf-] ing]
prt.-drive suff
'drive'
[[uit-drijf-] ing]
prt.-drive suff
'exorcism'

b. [[in-schrijf-] formulier]
prt.-write form
'registration form'

If adjunction happens at D-structure, then the result is a syntactically transparent, separable particle-verb.

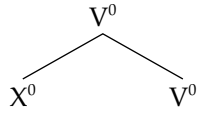
Neeleman and Weerman (1993) and Neeleman (1994a) generalize this proposal in order to account for both verb particle constructions and resultative secondary

predicates, which are realized, according to that thesis, in a configuration of adjunction to V^0. In Neeleman (1994a), it is assumed that particles project syntactically only if they must, in order to host a modifier. If they do not project, they are merged with V in morphology. However, a significant relaxation of the principle of Lexical Integrity makes these constructions transparent in syntax, thus assimilating them to D-structure adjunction as in Groos (1989).

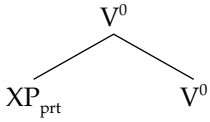
The lack of syntactic projection has a number of consequences for assimilating particles to affixes. Most importantly, they do not break up the adjacency between V and NP in English (section 1.1.1) or the adjacency of stranded P and V in Dutch (section 1.1.2, and see chapter 51), they may be morphologically derived together with the verb (section 1.2.1), and they may undergo V-raising together with V (section 1.1.3).

When the particle is modified, however, it must project syntactic structure. Consequently, it introduces a case-adjacency violation in English, and it must be stranded by V-raising in Dutch (cf. Neeleman 1994a, 2002 on some necessary auxiliary assumptions and modifications):

(33) a.



b.



2.2.2 Adjunction to V in LFG

An analysis very similar to the one proposed in Neeleman and Weerman (1993) is defended in the framework of LFG by Toivonen (2001).

Toivonen observes that the class of particles cannot be defined on the basis of grammatical functions: particles may serve several grammatical functions, and no grammatical function is served exclusively by particles (cf. section 1.4). Instead, she gives a purely distributional definition of particles.

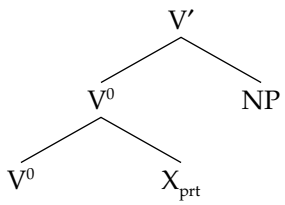
Capitalizing on the fact that full PPs in Swedish (34a) differ in distribution from particles with the same function (34b), (cf. also section 1.1.4), Toivonen claims that particles are non-projecting heads:

(34) a. Petra försöker sparka (*mot skogen) bollen (mot skogen).
Petra tries kick towards forest-the ball-the towards forest-the
'Petra tries to kick the ball towards the forest.'

b. Petra försöker sparka (bort) bollen (*bort).
Petra tries kick away ball-the away
'Petra tries to kick the ball away.'

The existence of non-projecting heads is restricted to head-adjoined positions. Thus, the configuration in (35) arises as the canonical one for particles:

(35)



2.2.3 *Particle incorporation*

Theories proposing versions of particle incorporation have a long history in the generative literature. An early version was proposed by Emonds (1972a), who classifies the 'particle movement transformation' as a 'minor movement rule' (1972a: 548, 560). Explicitly, a rule of P-incorporation was stated for the first time in Van Riemsdijk (1978a).

Both Emonds (1972a) and Van Riemsdijk (1978a) supply exclusively distributional evidence (i.e., word orders) in support of their proposals. Nevertheless, Van Riemsdijk resorts to a lexical filter in order to constrain incorporation to particles and certain postpositions (cf. Stiebels's 1996 particle template). According to Van Riemsdijk (1978a: 107), incorporation is possible only if a target position has been created by the following morphological rule:

(36) $[_V\ X] \rightarrow [_V\ [_P\ Y]\ [_V\ X]]$

Particle incorporation is assumed also in most small-class accounts that otherwise reject lexicalist assumptions. The most explicit account of particle incorporation is given in Koopman (1995). According to that theory, all particles incorporate to V for lexical reasons, but V may then excorporate.

Technically, Koopman (1995) employs a two-stage theory of incorporation. First, a head X adjoins to a c-commanding head Y. Adjunction leaves the structure syntactically transparent and excorporation possible. As a second step, the adjoined head X may be substituted for an X-receptor in Y. The result of this is syntactic opacity and the impossibility of excorporation. Receptor binding comes close to bracket erasure in standard morphological theories.

Since particles only adjoin to V, but do not bind a receptor until LF, the verb may excorporate, according to Koopman (1995).

2.2.4 *Reanalysis*

As a final option, the particle may form a complex predicate together with V by means of reanalysis. This option has been defended by Taraldsen (1983), Den Dikken (1995c), and Zeller (1999).

In Taraldsen (1983), reanalysis is assumed to apply to particles just as it applies to causative constructions, because they are identical configurations in his theory: both require the formation of a complex predicate. But reanalysis also derives a

major consequence related to Taraldsen's (1983) analysis of particle movement (section 3.3.1): if the particle forms a complex predicate together with the verb, the specifier (i.e., subject) position of its projection is rendered non-thematic, and therefore becomes eligible as a host for movement.

Notice that overt incorporation (i.e., preverbal position) is constrained to passives in Norwegian, and even there it is not obligatory (example adapted from Åfarli 1985):

(37) a. Vi har (*ut) sparka (ut) hunden (ut).
we have out kicked out the-dog out
'We have kicked out the dog.'
b. Hunden vart (ut) sparka (ut).
dog-the was out kicked out
'The dog was kicked out.'

2.3 Excorporation triggers

Except for those theories where incorporation is optional, notably Emonds (1972a) and Van Riemsdijk (1978a), both purely lexicalist and incorporation accounts must allow for excorporation of the verb, at least in the context of V2.

The force that drives excorporation is usually related to constraints on the affixation of tense and agreement markers. Koster (1975: 129) claims that only the 'tensed part of a complex verb' is targeted by Verb Second. This statement has been refined technically, but not in its spirit, since; cf. Johnson (1991), Roberts (1991a), and Koopman (1995).

Stiebels and Wunderlich (1994) and Stiebels (1996) endorse considerations relating to inflection too. However, the constraints operating in their theory apply in the lexicon and morphology, not in syntax. To start with, we are confronted with two conflicting requirements:

(i) the inflectional affix must enter into a local relation with the verb; and
(ii) the particle (being morphologically maximal) must remain visible.

In other words, affixation must not touch the position of the particle at the periphery of the verb. Therefore, a rebracketing operation is postulated, which serves two purposes: the excorporation of the particle, and the incorporation of the affix. The full derivation, adapted from Stiebels (1996: 46), is as follows:

(38) rebracketing bracket erasure
[[prt [V]] aff] → [prt [[V] aff]] → [prt [V – aff]]

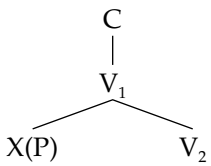
A different approach is taken by Neeleman and Weerman (1993) and Neeleman (1994a), who claim that a 'Complexity Constraint' holds for all syntactic heads (Neeleman and Weerman 1993: 460):

(39) **Complexity Constraint:**
X^0 should either be a lexical head or have a lexical head.

In other words, every X^0 must have an immediate non-branching, lexical head. Therefore the structure resulting from movement of a complex verb into an empty Comp is ill-formed, and the verb must strand the particle (Neeleman and Weerman 1993: 464):

(40) a.

b.*



3 Independent projection

Independent syntactic projection of particles is strongly supported by the mere fact that the particle and the verb can be separated. Therefore they must be visible to the movement rules of syntax, as indeed they are, even for a lexicalist. The most natural assumption, then, is that particles are also visible to phrasal projection.

3.1 Inconclusive data

Before turning to particular accounts, consider some inconclusive sets of data, which have nevertheless received considerable attention in the literature.

3.1.1 Listedness and lexical access

It is an uncontroversial fact about verb particle constructions that they exhibit varying degrees of idiomaticity. Therefore, it is a justified assumption that (at least clearly idiomatic) verb particle combinations are listed in the lexicon. But must they be listed as words?[3]

It has been established already by Emonds (1972a) (see Jackendoff 2002a on a recent rehearsal of arguments) that the idiomaticity of particle-verb combinations in no way implies that they had to be listed as words. Emonds (1972a: 549) quotes obligatorily non-contiguous phrasal idioms as evidence:

(41) a. John took his students to task.
*John took to task his students.

Furthermore, processing experiments seem to show that verb particle combinations (even idiomatic ones) have composite lexical entries: both the verb and the particle in idiomatic constructions prime their non-idiomatic counterparts (see Schreuder 1990, Hillert and Ackerman 2002, Lüdeling and De Jong 2002, and Urban 2002 for a summary and critical assessment).

3.1.2 Gapping

Fraser (1976) claims that gapping treats verb plus particle as a unit and gives examples like the following in support of this claim:

(42) a. He sped up the street and (full PP)
she ~~sped~~ up the hallway.
b. *He sped up the process and (particle)
she ~~sped~~ up the distribution.

In a review of Fraser (1976), Kroch (1979) points out systematic exceptions to this constraint, quoting particles which allow for polar oppositions (43a). In addition, Dixon (1982) observes that gapping is much less likely to be ungrammatical with the order <NP – particle>:

(43) a. Jones pulled the old tablecloth off and
Peters ~~pulled~~ the new one on.
b. *Jones pulled off the old tablecloth and
Peters ~~pulled~~ on the new one.

Gapping therefore does not show anything about the projectional status of particles (cf. Johnson 1991 and Zeller 1999 for discussion; see also chapter 29).

3.1.3 Fronting and stress

It is sometimes claimed (on the basis of Fraser 1976) that particles lack the full range of stress distinctions. However, this is true only for idiomatic verb particle combinations (44b). In transparent constructions (44a), the particle can be contrasted with another particle belonging to the same semantic class. This is most clearly the case in clefts (cf. Wurmbrand 1998b, 1999b; Lüdeling 2001; Capelle 2002; Müller 2002b; and see chapter 61):

(44) a. Where he should take the garbage is IN, not OUT.
b. *What/how . . . he should take them is over not out.

Similarly, topicalization of Dutch and German particles depends on semantic, not structural factors. If the particle has a certain degree of semantic independence, as Lüdeling (2001) puts it, it topicalizes just fine (45a). Idiomatic particles, on the other hand, resist topicalization (45b):

(45) a. Zurück werde ich mit Lufthansa fliegen. German
back will I with Lufthansa fly
'I will fly back with Lufthansa.'
b. *Ab handeln wir das Thema heute nicht mehr.
off deal we the issue today not more
intended: 'We will not exhaust this topic today.'

3.1.4 Particles and resultatives

Following an observation by Neeleman and Weerman (1993), it is sometimes claimed that particles and resultative predicates (see chapter 58) do not productively

co-occur, because they compete for a single structural slot. Where a particle and a resultative do seem to coincide, as below in (47), Neeleman and Weerman claim that the apparent secondary predicate is a modifier. Consider first a standard contrast from Neeleman (1994a):

(46) a. dat Jan het meisje op- belt
that Jan the girl up calls
'that Jan calls the girl up'
b. dat Jan het meisje gek belt
that Jan the girl crazy calls
'that Jan calls the girl crazy'
c. *dat Jan het meisje gek op belt
that Jan the girl crazy up calls

However, this is not the only option considered in the literature. Den Dikken (1995c) offers a book-length discussion of well-formed verb particle constructions involving an additional, predicate-like element in several languages (sections 3.3.2 and 3.3.3). For the moment, suffice it to give the following Dutch example from Den Dikken (1995c: 76). According to him, the poor grammaticality of *wh*-movement militates against an analysis of the AP *rood* 'red' as a modifier:

(47) a. dat ze de schuur rood over hebben geschildered
that they the barn red prt have painted
'that they painted the barn up red'
b. ??Hoe rood/Wat voor kleur hebben ze de schuur over geschildered?
how red/what for color have they the barn over painted

Ad Neeleman (p.c.) replies that predicates added to verb particle constructions do not have the transitivizing effect which is typical of resultatives: they consistently fail to introduce any argument in addition to the ones licensed by the verb particle unit. Furthermore (47b) does not support Den Dikken's (1995c) position without particular assumptions on the structural description of the construction at hand: in principle, resultatives can be questioned.

In sum, the question whether *rood* in (47a) is a resultative secondary predicate or a modifier, and, more generally, whether (46c) and (47a) are instances of the same configuration, is another manifestation of Lüdeling's (2001) delimitation problem and its standard solution. Neeleman's theory predicts that (47a) involves a modifier; Den Dikken's assumptions suggest an analysis as a resultative. Without particular assumptions on the theory of grammar, the contrast between (46c) and (47a) does not decide among the two options.

3.2 Dutch postpositions

A milestone in the analysis of verb particle constructions is Van Riemsdijk's (1978a) discussion of Dutch PPs. Although, building on Emonds (1972a), he

defined particles as intransitive prepositions, he nevertheless prepared the ground for the small-clause analysis.

The crucial set of data involves Dutch motional postpositions, which are identical to transitive particle constructions at the level of the phonetic string:

(48) NP > P > V

Van Riemsdijk (1978a) observes that, while motional postpositions can be argued without doubt to be complement-taking Ps, they share with particles their affinity to split from their complement and join the verbal complex. He explains the similarity with the claim that both particles and motional postpositions may incorporate to V.

The constituency of the postposition with its complement can most clearly be observed in extraposition structures (see chapter 25). The PP complement of the postposition (49a) cannot be extraposed without the postposition – (49b) vs. (49c):

(49) a. omdat hij [bij de tandarts vandaan] gebeld had
because he at the dentist's from called had
b. *omdat hij vandaan gebeld had bij de tandarts
because he from called had at the dentist's
c. omdat hij gebeld had [bij de tandarts vandaan]
because he called had at the dentist's from
'because he had called from (at) the dentist's'

P-incorporation can be observed in restructuring environments (50a) and where adverbial phrases separate the postposition from its NP complement (50b):

(50) a. omdat hij *de boom* [probeert] *in* te klimmen
because he the tree tries in to climb
'because he tries to climb the tree'
b. omdat zij *de boom* [op blote voeten] *in* klommen
because they the tree on bare feet in climbed
'because they climbed the tree barefoot'

In sum, it is possible for a P to take a complement, and to incorporate to the verb too. These two properties are the main ingredients of the small-clause analysis.

3.3 Small clauses

The small-clause analysis of verb particle constructions (see chapter 58) was first introduced by Taraldsen (1983) for Norwegian, and then applied to English by Kayne (1985). A thorough comparative discussion of verb particle constructions from the perspective of small clauses is Den Dikken (1995c).

3.3.1 Norwegian subject effects

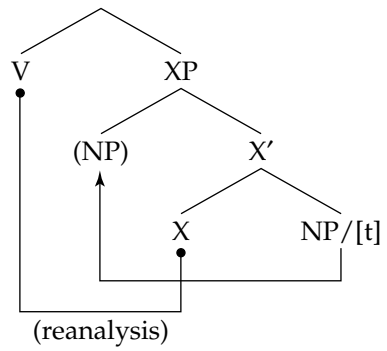
Norwegian (51) exhibits a positional alternation of particle and NP like English (1). Taraldsen (1983) observes that causative constructions (49) show the same alternation:

(51) a. Vi har sparka ut hunden.
we have kicked out the-dog
b. Vi har sparka hunden ut.
we have kicked the-dog out
'We have kicked out the dog.'

(52) a. Vi lot løslate fangene.
we let release the-prisoners
b. Vi lot fangene løslate.
we let the-prisoners release
'We made the prisoners be released.'

Taraldsen suggests that both constructions should be treated alike, and that they should be assigned the structure in (53):

(53)



This analysis is supported by the observation that the direct object NP acquires subject-properties when it precedes the particle.

Take first a construction containing a particle, an NP object, and a PP embedding a pronoun bound by the subject of the sentence, as in (54a). As expected, the bound pronoun introduces a violation of Principle B:

(54) a. ?*Vi viftet vekk myggen fra oss.
we waved away the-mosquitoes from us
b. Vi viftet myggen vekk fra oss.
we waved the-mosquitoes away from us
'We waved the mosquitoes away from us.'

The Principle B effect disappears when the NP object precedes the particle. This suggests that the object NP defines a binding domain as an accessible subject, once it has moved across the particle. It also supports the assumption that the direct object c-commands the pronoun.

Second, Norwegian has a class of purpose clauses which are obligatorily controlled by a subject. Again, NP objects may act as controllers if, and only if, they precede a particle:

(55) a. *Vi jaget ut ulven for å gjenfinne sin tapte frihet.
we chased out the-wolf to find again its lost freedom
b. Vi jaget ulven ut for å gjenfinne sin tapte frihet.
we chased the-wolf out to find again its lost freedom
'We chased out the wolf in order for it to find its lost freedom again.'

Taraldsen (1983: 242ff.) concludes that these effects follow from the structure of the construction: the NP object in transitive particle constructions indeed occupies a (non-thematic) subject position when it precedes the particle – the specifier of P.

Movement into that position is constrained to particles (and excluded for regular prepositions) because only particles undergo reanalysis with the verb, forming a complex predicate. As a consequence, the particle does not assign a subject theta-role to its specifier, and the Projection Principle no longer excludes it as a movement target.

3.3.2 Complex constructions

Kayne (1985), Guéron (1990), and, in great detail, Den Dikken (1995c) discuss constructions containing a particle plus another predicative constituent, like (56). These constructions are called complex particle constructions in Den Dikken (1995c):

(56) a. We made John out a liar.
b. John turned out intelligent.
c. They put the books down on the shelf.

First, Kayne (1985) adds to Taraldsen's observations the fact that the pre-particle position in simple particle constructions acts as a left branch, constraining A'-movement in English. Left-branch effects support a small-clause analysis, because they would be unexpected if the NP were a right-branch complement to V:[4]

(57) *What did they look [the information [about [t]] up]?

Guéron (1990) points out that this left-branch effect holds for the particle-final order only. If the particle precedes, then extraction from inside NP is grammatical (Guéron's bracketing):

(58) Who did you write [up [a paper [about [t]]]]?

Importantly, both Kayne (1985) and Guéron (1990) defend the claim that the particle forms a constituent with NP in transitive particle constructions.

Svenonius (1992) further supports this claim with an observation about ellipsis (see chapter 29). In English, no more than two constituents may be left behind by gapping (59). This constraint, however, does not 'see' the particle in transitive particle constructions (60) (example from Den Dikken; note that the gapping

examples are ungrammatical if the particle precedes the NP, which Den Dikken 1995c attributes to obligatory reanalysis of V+particle under that order):

(59) a. John eats with chopsticks and Mary ~~eats~~ with a fork.
b. John eats spaghetti and Mary ~~eats~~ chop suey.
c. *John eats spaghetti with chopsticks and Mary ~~eats~~ chop suey with a fork.

(60) Turn [the oxygen off] with your knee and ~~turn~~ [the acetylene on] with your elbow.

Now turn to complex constructions. PP predicates following the particle in complex constructions form a constituent with the particle: they can be pied-piped by *wh*-movement (cf. Stowell 1981; example from Den Dikken 1995c; notice that examples like (61) are rejected by some speakers for, it seems, stylistic reasons; cf. Den Dikken 1995c: 2):

(61) a. [Down on which shelf] did they put the book?
b. [Out to whom] did they send a schedule?

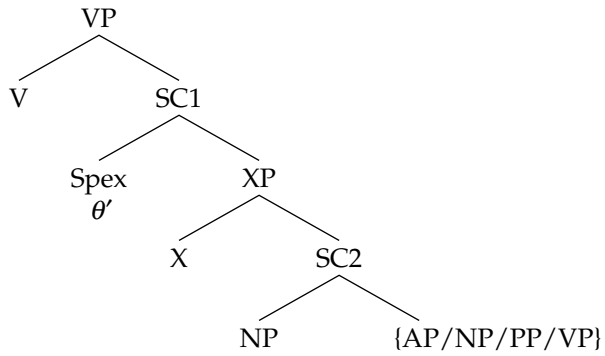
And this constituent may also include the NP object, as evidenced again by gapping (Svenonius 1992; example from Den Dikken 1995c):

(62) Send [the documents back to the CIA] by mail and ~~send~~ [the secret memos up to the White House] by courier.

3.3.3 The structure of predication

Den Dikken (1995c: 269) concludes his discussion by assigning the structure in (63) to complex particle constructions:

(63)



He then relates this structure to further predicative contexts, most notably to triadic, causative, and applicative constructions (see chapters 58, 21, and 6). According to Den Dikken (1995c), the structure in (63) is a central ingredient of predication structures in UG. It is left to parametric choice whether particles are overt, covert, or affixal. Recently, this type of approach has been taken up in the framework of VP shells; cf. Nicol (2002).

At this point, the small-clause analysis coincides in spirit with virtually all other analyses of verb particle constructions. Recall that Stiebels and Wunderlich (1994) and Stiebels (1996) posit their particle template (30) as a generative device of UG, and particles play a central role in the derivation of predicate-argument structures in their theory.

Particles are also related to resultative secondary predication in Neeleman and Weerman (1993) and Neeleman (1994a). Both constructions are considered manifestations of a single configuration underlying complex predicates (see chapter 58): adjunction to the head V (33a, b).

For recent discussion of this line of argument, see Wurmbrand (1999b), Zeller (1999), Koopman and Szabolcsi (2000), Lüdeling (2001), Nicol (2002), and Müller (2002a) for an HPSG account.

3.3.4 Argument licensing and morphology

The small-clause analysis of particles has been supported from a different perspective in Kratzer (1993). In the context of a discussion of adjectival passives (see chapter 2), she observes that certain verb particle combinations in German behave as if they were heads, and others as if they were phrases. As a test, she uses the negative prefix *un-*, which cannot attach to phrasal hosts. In the following example, the verb particle combinations have exactly the same meaning. Yet only one of them allows for *un*-prefixation. Kratzer (1993) claims that it is the necessarily phrasal status of the particle in (64b) which bans prefixation:

(64) a. das un- ab- geschickte Manuskript
the un off sent manuscript
'the manuscript that wasn't sent off'
b. *das un- weg- geschickte Manuskript
the un off sent manuscript
'the manuscript that wasn't sent off'

Now consider the particle *ab* in a little more detail. Even in combination with the same verb, *ab* can be fully transparent, or idiomatic:

(65) a. den Dreck vom Auto ab- waschen (transparent)
the dirt from-the car off wash
'to wash the dirt off the car'
b. das Geschirr ab- waschen (idiomatic)
the dishes off wash
'to do the dishes'

Lüdeling (2001) observes that *un*-prefixation to the participle of *abwaschen* is possible only on the idiomatic reading:

(66) a. der Teller ist un- ab- gewaschen
the plate is un off washed
'the plate is unwashed'

b. *das Auto ist un- ab- gewaschen
the car is un off washed
'the car is unwashed'

Similar considerations hold for topicalization (section 3.1.3): it is excluded for idiomatic particles. Both Kratzer (1993) and Lüdeling (2001) conclude that transparent verb particle combinations must be phrasal, even when they are embedded morphologically.

In a further step, Kratzer (1993) argues that idiomatic particles may head phrases and project syntactic argument positions, too. In the following example, the indirect object is licensed by the particle, as the contrast between (67b) and (67c) shows:

(67) a. weil sie die Antwort flüsterten
because they the answer whispered
'because they whispered the answer'
b. *weil sie ihm die Antwort flüsterten
because they him the answer whispered
c. weil sie ihm die Antwort zu- flüsterten
because they him the answer to whispered
'because they whispered the answer to him'

The particle-verb *zuflüstern* can form an immaculate adjectival passive, conserving the dative in (68a). But *un*-prefixation renders that construction ungrammatical (68b). This indicates that particle+V is a phrasal construct. Kratzer (1993) argues that it must be phrasal, because the particle projects an argument position:

(68) a. die Antwort war ihm zu- geflüstert
the answer was him to whispered
'the answer had been whispered to him'
b. *die Antwort war ihm un- zu- geflüstert
the answer was him un to whispered

Now notice that the same holds even for idiomatic/listed constructions: if the particle introduces an argument, it must project syntactic structure, and *un*-prefixation is banned:

(69) a. Das Lob schmeichelt ihm.
the praise flatters him
'The praise flatters him.'
b. Sie schmeichelt ihm das Land ab.
she flatters him the land off
'She wheedled the country out of him.'
c. Das Land war ihm ab- geschmeichelt.
the country was him off flattered
'The country has been wheedled out of him.'

d. *Das Land war ihm un- ab-geschmeichelt.
the country was him un off flattered

3.4 Particles and functional categories

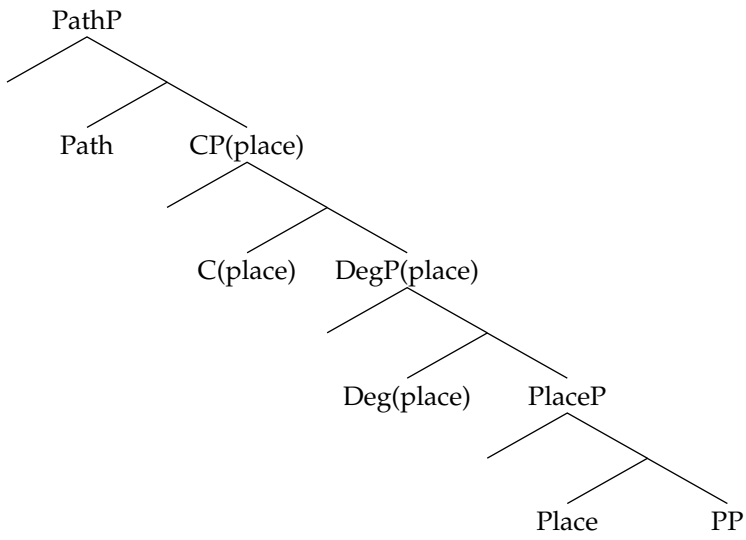
Starting with the introduction of functional prepositions in Van Riemsdijk (1990), the question about functional structure around particles has gained considerable importance. In particular, it has been asked whether particles are lexical or functional elements, and which functional elements can be found with particles, if any.

There seems to be some agreement that particles do not project the full functional structure of regular PPs. Indeed, the lack of functional structure has been claimed to explain data which were attributed to the lack of any syntactic projection in earlier proposals (Zeller 1999; Koopman 2000a). The main asset of such an approach is that it allows us to ascribe the morpholexical properties of verb particle constructions to structural deficiency (lack of functional projections), and yet maintain the autonomy of syntax (no weakening of Lexical Integrity).

3.4.1 Split PPs

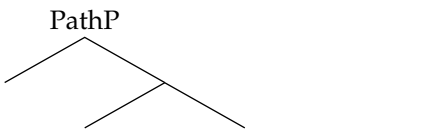
On the basis of the distributional patterns in Dutch PPs, and of the conceptual structures proposed by Jackendoff (1990b), Koopman (1993, 2000a) arrives at a universal template for the structure of prepositional phrases. According to her, local PPs incorporate (among others) a projection hosting material referring to places, a projection hosting degree expressions, and a maximal functional projection. Directional PPs are analyzed as projections of a directionality head which takes a local PP in its complement:

(70)

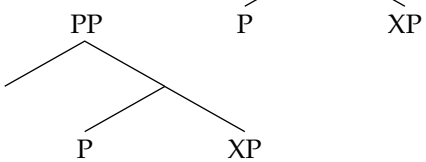


According to Koopman (1993, 2000a), particles differ from full prepositional phrases in that functional categories are absent from their projection. Thus, idiomatic particles are analyzed as bare PPs, and directional particles as PathPs embedding a bare PP:

(71) a.



b.



This analysis predicts, first, that particles may incorporate to V: no head intervenes between the particle and the verb. It also predicts that NP objects to particles are not assigned case (cf. Emonds 1972a on particles as intransitive prepositions). The absence of PlaceP predicts that particles do not license Dutch R-pronouns (see chapter 51; example from Koopman 2000a):

(72) a. *Ik heb *nergens* op-gepakt.
I have nothing+R up-picked
b. Ik heb *niets* op-gepakt.
I have nothing up-picked
'I picked up nothing.'

Furthermore, the absence of a DegP predicts that particles cannot be modified by degree expressions (example from Koopman 2000a):

(73) a. Hij heeft het *vlak/*pal op-gepakt.
He has it right up-picked
'He picked it right up.'

However, the latter constraint especially has been observed to give rise to rather significant exceptions (cf. Emonds 1972a for English; Den Dikken 1995c and Neeleman 1994a for Dutch; and see section 1.1.4). Most of the observable patterns are accounted for in Koopman's (2000a) rich structural architecture. However, they would not be called particle constructions if they involved the projection of functional prepositions.

3.4.2 Case and reference

The question about a functional layer above particles may also be addressed from the perspective of case and reference. This position is taken by Zeller (1999).

First, consider a regular local preposition like German *aus* 'from'. Semantically, the preposition denotes a relation between a reference argument and a location. Syntactically, the reference object is licensed by the verb (by which it is assigned accusative case), and the location by the preposition (which assigns dative):

(74) Peter trinkt das Bier aus dem Glas. (full PP)
Peter drinks the beer from the glass
'Peter drinks the beer from the glass.'

By contrast, particle *auf* does not support two arguments (see Stiebels 1996 for an exhaustive description, including many different patterns):

(75) a. Peter trinkt das Bier aus. (particle)
Peter drinks the beer from
'Peter drinks up the beer.'
b. Peter trinkt das Glas aus.
Peter drinks the glass from
'Peter drinks up the glass.'
c. Peter trinkt das Bier (*das Glas) aus (*das Glas).
Peter drinks the beer the glass from the glass
d. Peter trinkt das Bier aus dem Glas aus.
Peter drinks the beer from the glass from
'Peter drinks up the beer from the glass.'

This contrast can be explained on the assumption that prepositions, but not particles, project the functional structure necessary to license case. Thus, whether or not a particle assigns a thematic role to an argument, it might be claimed that all nominal arguments of a verb particle construction depend on the verbal domain to receive case. On the further assumption that the verb does not assign dative in the example above, the observed contrast follows (see Zeller 1999; Koopman 2000a; see also Emonds 1972a and Van Riemsdijk 1978a on the intransitivity of particles).

Incidentally again, particles show anything but consistent behavior in this respect. The term 'verb particle construction' covers too many distinct elements and configurations to allow for a single, consistent analysis. To give just one example, compare simple and (morphologically) complex directional particles in German, as discussed by McIntyre (2001) and Zeller (1999). Complex particles are formed of a regular particle, plus one of the deictic prefixes *hin-* (away from speaker), *her-* (toward/in proximity with speaker), and *da-* (here/there). It turns out that complex particles pattern with full PPs with respect to their referential properties. Zeller (1999) argues that, if reference is a property of the functional

domain, then complex particles must project functional categories. In contrast to simple particles (76b), they introduce reference to locations (76a):

(76) a. Hier strömt Gas heraus.
here streams gas HER-out
'Gas is escaping (out of some contextually salient entity).'
b. Hier strömt Gas aus.
here streams gas out
'Gas is escaping somewhere here.'

When simple particles do introduce reference to a location, it is usually a prototypical location specified in the lexical entry of the particle-verb, like the mailbox in (77a) below. Complex particles introduce specific local reference again, overriding the prototypical location (77b):

(77) a. Ich habe heute drei Briefe ein- geworfen.
I have today three letters in thrown
'I have posted three letters today.'
b. Ich habe heute drei Briefe hinein- geworfen.
I have today three letters HIN-in thrown
'I have thrown three letters into something today.

And finally, complex directional particles imply that a contextually relevant distance is traversed by the reference object. As a result, (78b) means that the ring is given away by the agent. Simple particles do not give rise to such an implication – the ring most naturally ends up on the agent's own finger (78a):

(78) a. den Ring an stecken
the ring at stick
'put on the ring'
b. den Ring dran stecken
the ring DA-at stick
'put the ring on something'

As for the presence of functional projections, then, particles exhibit strongly inconsistent behavior.

4 Conclusion

In retrospect, it might seem that firm conclusions about verb particle constructions have not been reached. This impression is caused to a large extent by what Lüdeling (2001) calls the 'delimitation problem', and which has recently been discussed also in Toivonen (2001) and Zeller (1999), among others: what native speakers perceive as a verb particle construction, a particle-verb, a phrasal

verb, etc., in a given language does not have consistent phrase structural or functional properties, and therefore does not have a single representation in an explanatory theory.

The strategy which has been followed, explicitly in some and implicitly in most accounts, is to single out consistently behaving subclasses of data. Those subclasses and their properties are then dealt with in independently established explanatory contexts, in line with the elimination of the notion of a 'construction' from grammatical theory in general.

More than establishing insights about an intuitive, yet inconsistent concept, this strategy has indeed been successful in devaluing 'verb particle constructions' as a notorious counter-example to the modular organization of the language faculty.

NOTES

I profited a lot from extended discussions of this topic with Jochen Zeller during the late 1990s. Helpful comments on various versions in different formats were made by Hilda Koopman, Katharina Köhler, Andrew McIntyre, Ad Neeleman, an anonymous reviewer, and the residents at NIAS during the fall of 1996. Special thanks to Henk van Riemsdijk, who made this chapter possible in the first place.

1 Ad Neeleman (p.c.) points out that the prenominal constituent *dusted off* is not necessarily an adjective. Verbal prenominal modifiers do exist in English, and the adjectival modifier *very* is excluded in (i). However, particles do exhibit an exceptional behavior, since other postverbal constituents are excluded in this configuration (ii):

   (i) *a very dusted off table

   (ii) *a thrown at him ball

2 These examples are sometimes analyzed as involving conversion of N or A to V, before the particle is attached (e.g., Booij 2002). For the position that particles and prefixes may indeed be verbalizing affixes, see Selkirk (1982).

3 See Di Sciullo and Williams (1987) on general considerations on listedness and wordhood.

4 Notice that the complex predicate analysis can account for the data too, yet at the price of invoking additional mechanisms, like movement operations in Johnson (1991); see also Neeleman and Weerman (1999: ch. 2). In principle, the same applies to Guéron's (1990) and Den Dikken's (1995c) analyses, which generate NP as a complement to the particle. Only under Kayne's (1985) assumptions are left-branch effects a very natural consequence.

6 Conclusion

1 Introduction

In most of the languages of Indo-European origin, constituent questions are formed by fronting an interrogative pronoun or a phrase which is headed by an interrogative determiner. Following common usage, we will refer to these as '*wh*-pronouns' and '*wh*-phrases', and to the transformational process of constituent question formation as '*wh*-movement'. In terms of more recent syntactic theorizing, a *wh*-element is assumed to land in a designated position which is provided by the functional vocabulary of the language. Clause structure involves at least the lexical layer of the V-system, on top of this the functional layer of the I(nflectional) system, and on top of that the functional layer of the C(omplementizer)

system. *Wh*-phrases are moved from the domain of the V-system, in which they function as arguments or adjuncts of any sort, to the specifier of CP (Spec, CP). This movement is shown in (1):

(1) $[_{CP}$ *wh*-phrase$_1$ $[_{C'}$ C $[_{IP}$ $[_{VP}$ . . . t_1 . . .]]]]

The *wh*-phrase leaves a trace (t). The chain which is formed by *wh*-movement has roughly the following characteristics: if the *wh*-phrase corresponds to an argument, the trace is in an A(rgument) position, while the *wh*-phrase itself is in a non-A- or A'-position. The *wh*-phrase is semantically an operator which binds the trace, which in turn is interpreted like a logical variable. In natural language, the operator is usually a phrase which consists of the operator proper, the pure *wh*-part, and a restrictive part. Thus, *who* is composed of the features [wh] and [person], *what* is composed of [wh] and [thing], *which student* is composed of [wh] and [student], etc. Once the operator is in Spec, CP, it has scope over the proposition expressed by IP. The proposition contains a trace, and is thus an 'open' proposition. As such it does not express a truth-value but rather a property. The sentence containing a trace corresponds to a lambda-abstracted formula, λx [. . . x . . .]. If a referring expression is inserted via lambda-conversion, a truth-value is yielded. According to standard semantic assumptions (cf. Karttunen 1977), a constituent question is taken to be the set of true propositions expressed by [. . . x . . .], where the variable x is restricted in the familiar ways. Strictly speaking, the feature [wh] is not itself an operator that could bind a variable. According to standard assumptions, the *wh*-phrase also involves an existential operator. This operator is actually responsible for variable binding. By involving existential quantification, the question makes a commitment to the existence of an entity which corresponds to the phrase which is missing from the clause. As Chomsky (1977b) has shown, *wh*-movement is only one manifestation of a larger class of movements which comprises topicalization, relativization, clefting, comparative formation, etc. Here we will confine ourselves to question formation by *wh*-movement and its immediate correspondents. These immediate correspondents are the actual topic of this chapter.

The point is that not all *wh*-phrases undergo movement, while at the same time their interpretation seems to remain the same as if the phrase had been moved. In the *wh*-moving languages this is shown in multiple questions. One *wh*-phrase moves to Spec, CP, while all the others remain 'in-situ', i.e., where we assume the corresponding arguments would have been inserted, as is seen in the parallelism between (2a) and (2b):

(2) a. Who bought **what** for **whom**?
    b. Who bought **flowers** for **his wife**?

The question in (2a) is interpreted as if it was composed of three questions: 'Who bought something for someone?', 'What was bought by someone for someone?', and 'For whom was something bought by someone?' The *wh*-phrases in situ

seem to also be operators which at some level of representation bind variables like the moved operator. The question is how syntactic theory can meet this semantic intuition.

Next to this phenomenon there are languages in which constituent questions are never formed by *wh*-movement. *Wh*-phrases rather remain in situ. This is shown by Cole and Hermon's (1994) Chinese example in (3):

(3) Meige ren dou maile shenme (-ne)?
everyone all buy what PARTICLE
'What did everyone buy?'

Shenme remains in situ, but there is the possibility of using the particle *ne*, which indicates that we are dealing with an interrogative. One can imagine that *shenme* may be allowed to stay in situ just because *ne* already does the job of marking the clause as a *+wh* clause.

Finally, there are languages in which both the in-situ and the movement strategy seem to be options which exist side by side. French is said to be a language in which a *wh*-phrase may remain in situ. However, the English and German examples in (4b, c) also seem to function as normal information-seeking questions under certain circumstances:

(4) a. Jean a vu qui?
Jean has seen whom
'Whom has Jean seen?'
b. John saw who?
c. Der Hans hat wen gesehen?
the Hans has whom seen

Apart from these cases, various languages are found in which the *wh*-operator moves only part of the way to the final scope position. The actual scope position is occupied by another and more neutral *wh*-element. This case, which has become more widely known as 'partial movement' through McDaniel (1989), is exemplified by the German sentence in (5):

(5) Was glaubst du, wann er kommt?
what believe you when he comes
'When do you believe that he will come?'

We observe that the attitude verb *glauben*, which does not tolerate a *wh*-complement at all, nevertheless tolerates one in this case. The reason seems to be that the interrogative force of the embedded *wh*-clause is neutralized by the presence of the higher *wh*-element *was*. This element, occasionally called a '*wh*-expletive', obviously directs the scope of the actual *wh*-operator *wann* to the matrix scope position. Partial *wh*-movement in the *wh*-moving languages constitutes a special

case because the lower *wh*-phrase is not in situ at all. It rather has undergone short movement (to the closest Spec, CP). We will briefly return to partial movement in section 5.4, in connection with data from Bengali in which it is *wh*-in-situ that seems to be involved in a similar process.

The chapter is organized as follows: section 2 presents a brief overview of the phenomena that have played a central role in the earlier theory of LF-movement within GB theory (Chomsky 1981). This theory has largely accepted the conclusion that *wh*-scope is achieved by covert Move α, but that this movement is special in being less constrained than overt movement. Section 3 turns to a first important critique of the classical LF theory, which has culminated in the proposal that certain constraints on movement may be invisible at LF because it is not the *wh*-phrase proper that undergoes movement but rather the whole island that contains this phrase. This has become known as LF 'pied-piping'. Section 4 introduces unselective binding in some detail, as it is an account that many researchers at present take to be able to replace the earlier movement account. Since unselective binding predicts island-free *wh*-scope, it is able to overcome the conceptual problem of the movement asymmetry found in GB. In section 5 we will turn in some detail to *wh*-in-situ in South Asian languages, in particular in Bengali. The *wh*-in-situ phenomenon in these languages has so far received less attention than the one in the more Eastern languages (Chinese, Japanese, Korean). It will be shown that the South Asian languages can shed new light on the phenomenon because they allow different strategies of *wh*-scoping, one of which seems to be covert movement, while there is also overt movement as well as something that resembles partial movement. The materials discussed in section 5 are mainly from Bayer (1996: ch. 7), but new data are frequently introduced, and the account also goes beyond what has been suggested in earlier work.

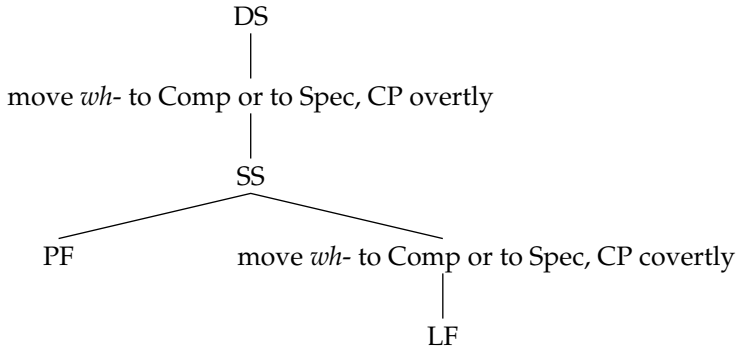
2 The phenomenon in the context of LF theory

Our goal in this section is to provide the basic facts and problems of *wh*-in-situ in both multiple interrogatives and *wh*-in-situ languages, and to recapitulate what the classical GB approach of LF-movement contributed toward an explanation. We will first turn to multiple interrogatives in *wh*-moving languages, and then turn to *wh*-in-situ languages.

2.1 Multiple interrogatives

The classical account of multiple interrogatives in the late 1970s and in the 1980s has been to assume a syntactic level of logical form (LF) which serves as the input to semantic interpretation. LF represents a structurally disambiguated syntactic form in which a *wh*-in-situ phrase may receive a proper interpretation by being moved to the domain in which the overtly moved constituent has already been located since S-structure:

(6) ***Wh*-movement in overt and in covert syntax in the GB model:**



A sentence like (7a), *Who bought what?*, is then analyzed as in (7b), where *who* has been moved either to Comp or in – later versions of the theory – to Spec, CP overtly, while the in-situ phrase *what* has been moved covertly. According to Aoun et al. (1981), *what* would adjoin to the phrase which is in scope position in overt syntax. This leads to an LF representation as in (7):

(7) a. Who bought what?
b. $[_{CP}$ what$_2$ who$_1$ $[_{IP}$ t_1 $[_{VP}$ bought $t_2]]]$
c. Jim . . . a book, Mary . . . flowers, and Clarissa . . . shoes.

In (7), Spec, CP is something like a 'super-operator' into which the in-situ *wh*-phrase has been absorbed, and which can bind also the traces that have been left by LF-movement. The semantics is roughly 'For which y and for which x is it the case that x bought y?' A felicitous answer that could satisfy this question would provide equally for both parts of the missing information; i.e., an answer like (7c) would semantically translate into two processes of λ-conversion.

The GB-inspired account of multiple interrogatives has very strongly been an account in terms of the Empty Category Principle (ECP). The ECP requires that a non-pronominal empty category be either lexically governed – i.e., governed by a lexical head – or antecedent-governed. Overt movement is under the control of the ECP and under the control of subjacency, the latter being a somewhat weaker constraint which requires that not more than a single cyclic node be crossed at a time. To see what is going on, one has to contrast cases of overt *wh*-movement with cases of *wh*-in-situ, where the relevant *wh*-phrases appear in boldface:

(8) a. ??**What** did you find evidence that Jim has bought?
b. Who found evidence that Jim has bought **what**?

(9) a. ??**What** do you know where we bought?
b. Who knows where we bought **what**?

(10) a. ??**Who** did you get jealous after I had spoken to?
b. Who got jealous after I had spoken to **who**?

(8), (9), and (10) show in the (a)-cases effects of the Complex-NP-Constraint (CNPC), the *Wh*-island Constraint, and the Condition on Extraction Domain (CED) respectively. It is a stable and remarkable observation that comparable effects of degradation are absent in the corresponding cases of *wh*-in-situ (the (b)-sentences). If we conceive of *wh*-in-situ as a covert version of the operation Move α, we are led to the conclusion that LF-movement is less constrained than overt movement.[1] Precisely this has been the message of the majority of work in the context of GB theory. On the other hand, much evidence was produced that LF-movement of the relevant sort is constrained by the ECP. Most prominent are the superiority facts. As the contrast between (11a) and (11b) shows, the subject *wh-* has to move overtly and the object *wh-* covertly, not the other way around:

(11) a. Who bought what?
b. *What did who buy?

If the LFs of these examples are as in (12), there is an explanation in terms of the ECP:

(12) a. $[_{CP}$ [what$_2$ [who]$_1$]$_1$ $[_{IP}$ t$_1$[$_{VP}$ bought t$_2$]]]
b. $[_{CP}$ [who$_1$ [what]$_2$]$_2$ $[_{IP}$ t$_1$[$_{VP}$ bought t$_2$]]]

In order to understand what is going on here, one has to recognize that the covert adjunction to the overtly moved phrase leaves the index of the latter unaffected; i.e., we don't get multiple indices, as we shall see has been suggested in another theory of multiple interrogatives. In (12a) *who* governs its trace locally. *What* has been moved to Spec, CP and has been adjoined to *who*. As a consequence of this, *what* is unable to antecedent-govern its trace. The trace is, however, lexically governed by the verb. Thus, no ECP violation can arise. In (12b), however, the lexically governed NP *what* has been moved to Spec, CP overtly, and the subject *wh*-phrase *who* has been adjoined to it at LF. In this case, the trace of *what* is licensed as usual, but the trace of *who* is not antecedent-governed. As one can see, by virtue of the indexing convention, *who* fails to c-command its trace. Since the subject is not the sister of a lexical head, its trace is in conflict with the ECP.

Let us next turn to *wh*-in-situ languages where the core results of the classical LF account in terms of an ECP-based explanation could be neatly replicated.

2.2 Wh-*in-situ languages vs.* wh-*moving languages*

The classical LF theory of *wh*-in-situ was inspired by Huang's (1982a) groundbreaking work on the Logical Form of Chinese. In Chinese as well as in many other languages, interrogative phrases remain where other arguments are. Nevertheless, the sentences are interpreted as constituent questions. ECP effects

could not be found in connection with *wh*-subjects. This was attributed to a difference between Chinese and English according to which the subject is lexically governed in Chinese but not in English. ECP effects could, however, be found in the possible scope positions of argument and adjunct *wh*-phrases. The celebrated case appears in (13a). (13b, c) are the two virtual LFs (which we represent here with English words) that could be derived when the *wh*-in-situ phrases are associated with either the embedded clause or the matrix clause:

(13) a. Ni xiang-zhidao [Lisi **zeme** mai-le **shenme**]?
you wonder Lisi how buy-ASP what
b. How$_1$ do you wonder [what$_2$ Lisi t_1 bought t_2]?
c. What$_2$ do you wonder [how$_1$ Lisi t_1 bought t_2]?

Given this state of affairs, (13a) should be ambiguous. As a matter of fact, however, (13a) is unambiguous. The only reading it can have is (13c). (13b) is ruled out by the ECP: the trace of *zeme* 'how' is not lexically governed. If it fails to be antecedent-governed, as is the case in (13c), it violates the ECP. On the other hand, subjacency seems to be violable. As the attested reading of (13a), (13c), indicates, the expectable *wh*-island effect (cf. ??*What do you wonder how we could repair?*) is absent. The conclusion that at LF the ECP is active but subjacency is not is corroborated by data like those in (14). (14a, b) show that LF *wh*-movement is also possible out of relative clauses and complex NPs:[2]

(14) a. Ni zui xihuan [piping shei de shu]?
you most like criticize who DE book
'Who do you like books that criticize?'
b. Ni renwei [shei de hua zui piaoliang]?
you think who DE picture most pretty
'Who do you think that pictures of are most pretty?'

Huang's findings about Chinese *wh*-in-situ were important motivation for a syntactic level of LF in general and for a specific view of LF in particular. This view, which forms the standard view of LF in GB theory, says that LF derivations are constrained by the ECP but not by subjacency. Together with May (1977, 1985) it formed the core of the LF theory of GB. It lead to the widely accepted conclusion that the LF of a sentence which involves a quantifier or a *wh*-in-situ element is transformationally derived from S-structure in the sense of Move α, but that the transition from S-structure to the level of LF, as shown in (6), is somehow less constrained than the transition from D-structure to S-structure.

3 Pied-piping

The classical explanation of *wh*-in-situ did not remain unanswered. Apart from independent attempts of showing that LF is fully under the control of subjacency

(cf. Bayer 1990a, 1996; Reinhart 1991a), Nishigauchi (1986, 1990), Choe (1987), and Pesetsky (1987a) have argued that LF subjacency is largely invisible due to large-scale pied-piping. The following Japanese sentence (from Pesetsky 1987a) should show a subjacency violation because *nani-o* appears in a relative clause, but it is well-formed:

(15) Mary-wa [[John-ni nani-o ageta] hito-ni] atta-no?
Mary-TOP John-DAT what-ACC gave man-DAT meet-Q
'For which thing x did Mary meet a man who gave x to John?'

The central fact that supported the idea that it is not the *wh*-item (*nani-o*) per se which is moved but rather the whole island that contains it is the way such a question must be answered. It turns out that a felicitous answer has to repeat the island in which the relevant operator occurs:

(16) a. */?? Konpyuutaa desu
computer COP
'It is a computer.'
b. [[konpyuutaa-o ageta] hito] desu
computer-ACC gave man COP
'It is the man who gave a computer (to him).'

This finding has inspired an analysis of *wh*-in-situ according to which it is not that the operator proper that is moved out of an island at LF, but rather that the entire island is moved. In (15) the phrase to be moved at LF would be the entire NP headed by *hito-ni*, as reflected in the answer (16b).[3] Nishigauchi (1990: ch. 3) proposes a pied-piping analysis according to which there is first CP-internal *wh*-movement which marks CP as *+wh*; then there is movement of the *+wh*-marked CP to the specifier of NP, which has the effect of assigning the feature *+wh* to the complex NP; in a final step, this complex *+wh*-marked NP moves to the specifier of the matrix CP.

The restriction on possible answers is also found with respect to the English multiple questions in (8b), (9b), and (10b), repeated here as (17–19):

(17) Who found [evidence that Jim has bought what]?
a. **Bill** (found) evidence that Jim has bought **a gun**.
b. ***Bill . . . a gun.**

(18) Who knows [where we bought what]?
a. **Bill** (knows) where we bought **a copy of Chomsky (1981)**.
b. ***Bill . . . a copy of Chomsky (1981).**

(19) Who got jealous [after I had spoken to who]?
a. **Bill** (got jealous) after I had spoken to **Madonna**.
b. ***Bill . . . Madonna.**

The obvious extension of Nishigauchi's theory would be to mark the islands in (17–19) analogously as *+wh* via the percolation convention. Moving them to Spec, CP at LF would then avoid the familiar subjacency problem. There are, however, at least three aspects which should shed a critical light on this analysis. First, as Huang (1982a), Nishigauchi (1990), and others have noticed, there are restrictions which disallow certain occurrences of *wh*-phrases in islands. In Japanese it is, for example, impossible to have the *wh*-element inside a definite NP; cf. (20a). Likewise it is impossible to have an adverbial *wh*-phrase like *naze* 'why' in a complex NP, as shown in (20b):

(20) a. *Kimi-wa [[dare-ga kai-ta] kono hon]-o yomi masi-ta ka?
you-TOP who-NOM write this book-ACC read -Q
'You read this book that who wrote?'
b. *Kimi-wa [[kare-ga naze kai-ta] hon]-o yomi masi-ta ka?
you-TOP he-NOM why write book-ACC read -Q
'You read book that he wrote why?'

These cases need extra restrictions which do not follow from the general approach. (20a) could be taken care of by the name constraint (cf. Fiengo and Higginbotham 1981), according to which a definite NP (a 'name') must not contain a variable; (20b) could be ruled out by extra assumptions relating to the ECP, but if *naze* is replaced by *dooiu riyuu de* 'what reason for', the sentence becomes acceptable. Thus, it cannot be the adjunct nature of the *wh*-constituent which is responsible for the restriction. Second, as Von Stechow (1996) has pointed out, it is not obvious how the LFs produced by LF pied-piping could be interpreted semantically. (15), for instance, asks for the identity of thing such that a man gave it to John, not for the identity of some man. Nishigauchi (1990: 52) argues that such questions ask in fact for the entity referred to by the island, here . . . *hito-ni*, "by making crucial use of" the thing(s) which the entity gave to John. As he nevertheless admits in his note 24, an answer simply identifying a person would not be appropriate. Thus, the island must somehow be left by the in-situ operator at some level of representation which serves as input to the semantic component. A third point is that the LF component is predicted to have extra power which is unattested in (most cases of) overt movement. Thus, as Webelhuth (1989) observes, a phrase whose head is not overtly marked as *+wh* can hardly serve as an identifier of a *+wh* clause (cf. 21a, b). Witness in this context also examples of *wh*-infinitive pied-piping in German (21c) or the lack of it (21d, e), which have been discussed in Van Riemsdijk (1985):

(21) a. I wonder [$_{+wh}$ [$_{+wh}$ whose books] we should read].
b. *I wonder [$_{-wh}$ [$_{-wh}$ books by whom] we should read].
c. Ich frage mich [$_{+wh}$ [$_{+wh}$ [$_{+wh}$ mit wem]$_1$ [es t_1 aufzunehmen]]$_2$ dir t_2
I wonder REF with who it up-to-take for-you
ein Bedürfnis wäre].
a need would-be
'I wonder with who to enter into a competition would be a need for you.'

d. *Ich frage mich [$_{-wh}$ [$_{-wh}$ [es mit wem aufzunehmen]]$_2$ dir t_2
I wonder REF it with who up-to-take for-you
ein Bedürfnis wäre].
a need would-be

e. *Ich frage mich [$_{-wh}$ [dir [es mit wem aufzunehmen] ein
I wonder REF for-you it with who up-to-take a
Bedürfnis wäre]].
need would-be

Examples in which the left edge of the *wh*-phrase is not overtly ocupied by a *+wh* expression seem to be only possible where no overt movement could occur.[4]

There have been attempts to come to grips with the semantic problem while retaining the essential insights of the pied-piping analysis. With respect to (9b) one could, for instance, argue that the analysis proceeds in two steps. First, the entire *wh*-CP headed by *where* is moved to an A'-position, then the operator proper (*what*) is moved out of the island. It has in fact been suggested that A'-movement of a phrase XP causes XP to lose its status as a barrier (cf. Fiengo et al. 1988).[5] As a matter of fact, however, this way of coping with the subjacency problem at LF turns out to be problematic. First of all, adjunction or movement to Spec, CP would be a wild card for getting rid of barrierhood that seems far too unconstrained to cope with the data. Second, there is strong evidence that something like the exact opposite must be the case. Movement of XP to Spec, CP usually bleeds subextraction from XP. Since Ross (1986), this has been known as the 'freezing effect'. German V-second clauses give direct evidence that neither overt movement nor covert movement can proceed from phrases that have been moved to Spec, CP. (22a) shows a grammatical case in which movement proceeds from a phrase in A-position. (22b) shows that once the *was-für* phrase has been moved to Spec, CP, this turns out to be impossible. (22c) shows the same is true for covert movement, assuming for the moment that the *wh*-element in Spec, CP would be 'absorbed' by the matrix *wh*-element:

(22) a. Was$_1$ glaubst du [daß der Hans [t_1 für Leute] kennengelernt hat?
what think you that the Hans for people come-to-know has
'What kind of people do you think that Hans has come to know?'

b. *Was$_1$ glaubst du [[t_1 für Leute]$_2$ (daß) der Hans t_2 kennengelernt hat?

c. *Wer glaubt [[was für Leute]$_2$ (daß) der Hans t_2 kennengelernt hat?
who believes what for people that the Hans come-to-know has

Thus, debarrierization-by-A'-movement seems to be unfeasible.

The above criticism of the pied-piping solution of the *wh*-in-situ problem does not undermine the insights that it has contributed to further theorizing. Although various aspects of pied-piping are still obscure, the approach has been successful in shaping our understanding of *wh*-movement, *wh*-in-situ, and related constructions in the area of quantification, negation, etc. Criticism may focus on two

aspects that have played a role in the discussion. The first is that the morphosyntactic operations underlying the pied-piping mechanism must be more severely constrained. It is, for instance, unclear by which operations the NP *evidence that Jim has bought what* in (17) could ever acquire the *+wh* feature. The process seems to be very much restricted to those cases in which we find the relevant (*wh-*) feature either in the specifier – say, in Spec, DP (*whose mother*) – or in the complement of a functional or semi-functional head such as P. In the latter case, features of the complement of P may raise to P, essentially marking the whole PP with whatever operator features are in the complement. Thus, a PP like *about who* is simply a *+wh* phrase, as various analyses have independently suggested. This would rule out a number of cases for which Nishigauchi has nevertheless assumed pied-piping. This criticism is directly related to a second point, namely that pied-piping is not called for and should therefore not be used if *wh*-scope is already overtly determined. For instance, if the particle *-ne* in (3) or *was* in (5) or *-no* in (15) all mark the structure of which they are the head as *+wh*, then it is unnecessary and should therefore not be possible to move the purported 'real' *wh*-phrase to the specifier of this Q-particle. In the cases considered so far, Q-scope is already overtly marked. Thus, there could only be two reasons for moving an in-situ *wh*-phrase to its specifier: (i) the formation of an operator-variable chain; (ii) feature checking. However, neither reason seems very strong. As we shall see shortly, the *wh*-phrase needs to be decomposed into various parts among which one assumes an existential operator of which there is no evidence that it has to be put exactly into Spec, CP. Thus, the formation of an operator-variable chain could well be an independent issue that does not enforce movement of the *wh*-in-situ phrase (including islands) to Spec, CP. Second, it is far from clear that the feature structure of a *wh*-element in situ is exactly the same as the feature structure of a *wh*-element in Spec, CP or of the CP's head C which is marked *+wh*. It cannot be an accident that many languages use *wh*-words not only in interrogatives but also in relatives and for the expression of indefinites.[6] Thus, a scoped *wh*-phrase or a Q-particle in sentence-peripheral scope position can have an extra feature that might be missing from a *wh*-in-situ element. If that is the case, however, there is no reason for the *wh*-in-situ element to undergo movement to the scope position in order to get its *wh*-feature checked. Viewed from the perspective of the moved *wh*-phrase, it would rather seem that the *wh*-phrase in Spec, CP needs to reconstruct into its underlying position, in order to associate its non-interrogative feature complex with licensing heads that are independent of question formation proper.[7] If this is correct, movement of the *wh*-in-situ element to the specifier of the Q-scope marker is an unnecessary and therefore undesirable operation, a consequence of principles of economy by which movement is to be avoided if constraints can be satisfied without it. The proposal that *wh*-in-situ does not involve any movement at all is, of course, much older. The process in which the scoped element associates with one or more in-situ elements in its c-command domain has become known as 'unselective binding'. This is the phenomenon as well as a class of approaches that will be considered next.

4 Unselective binding

It is a trademark of many head-final languages to have a suffixal morpheme at the right edge of a phrase that counts as an interrogative. In Japanese, for instance, the morpheme *-ka* appears at the end of an interrogative sentence.[8] However, as example (23) from Nishigauchi (1990: 10) shows, it appears both in yes/no questions and in constituent questions:

(23) Tanaka-kun -wa [dare-ga nani-o tabe-ta -**ka**] oboe-te- i-masu -**ka**?
Tanaka -TOP who-NOM what-ACC eat -Q remember is -Q
'Does Tanaka know who ate what?'

The sentence-final Q-morpheme *-ka* turns the matrix clause into a yes/no question, but we see that once *-ka* minimally heads a structure in which *dare*, *nani*, etc., appear, these are interpreted like *wh*-phrases. As Nishigauchi (1990: ch. 4) says, referring to Kuroda (1965), *dare*, *nani*, etc., do not themselves have an interrogative feature. They are rather 'indeterminate' pronouns. They are interpreted as non-interrogative in combination with other particles (among which *-ka* again), once *-ka* is missing as a clause-final head:[9]

(24) Dare-mo-ga nani-ka o tabe-te-iru
everyone-NOM something ACC eating is
'Everyone is eating something'

Thus, one may argue that the actual interrogative feature must head the clause, if an interrogative meaning should be generated. In (24), *dare* combines with the conjunctive particle *-mo* to form a universal quantifier, while *nani* combines with the disjunctive particle *-ka* to form an existential quantifier. One could argue that in (23) it is pure pronominal forms that mimic a *wh*-phrase by being c-commanded and bound by the peripheral element *-ka*.[10] The *wh*-phrases and *wh*-pronouns of the European languages would – according to this picture – be simply blends of heterogeneous features just like negative indefinite quantifiers, which are standardly taken to be fusions of a feature of negation and an indefinite of some sort.[11] *Wh*-in-situ languages of the kind we have been looking at show in a sense more clearly than the *wh*-moving languages how questions are built up semantically: there is a disjunctive operator, typically residing in the final head of the clause, which carries the interrogative (+*wh*) force. If there is a saturated proposition in its scope, the operator ranges over the truth-values 1 and 0.[12] Assuming now that indeterminate pronominals correspond to information gaps whose range is restricted by features such as PERSON, THING, TIME, PLACE, etc., or whatever is added via an NP with restrictive qualities, then the disjunctive operator will range over 'open' propositions. A constituent question is then composed of the disjunctive operator ranging over the set of propositions defined by the possible values the variable(s) can take. In that case, the formats

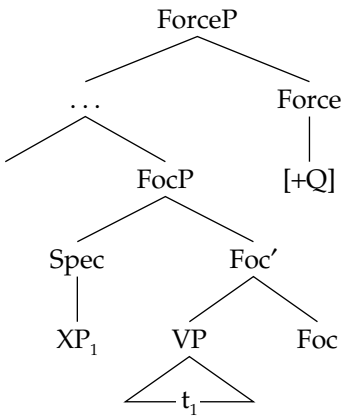
for yes/no questions and for constituent questions are roughly as in (25a) and in (25b) respectively:

(25) a. $\lambda p\ [p \vee \neg p]$
b. $\lambda p\ \exists x, [p = [\ldots x \ldots] \vee p = \neg [\ldots x \ldots]]$

The set of propositions in (25b) is a function of the number of the individuals in the discourse universe that may replace the variable(s) while yielding a true proposition.[13] For example, in a universe with the three individuals Mary, Susan, and Fred (besides John), a question like *Who did John see?* would translate into the set of disjunctions {[john saw mary] ∨ ¬[john saw mary], [john saw susan] ∨ ¬[john saw susan], [john saw fred] ∨ ¬[john saw fred]}.

Following Rizzi (1997), Jayaseelan (2001b) proposes a structure for interrogatives in which the actual *wh*-operator resides in a clause-peripheral phrase, the ForceP, which hosts the illocutionary force feature of the sentence. Unlike in older approaches, which assume *wh*-in-situ more literally, the variable and its restrictor are put in – or in Jayaseelan's implementation moved into – the focus projection that is in head-final languages usually found to the left of the verb. Simplifying Jayaseelan's proposal, the structure is as in (26):

(26)



As the embedded clause in (23) shows, there can be multiple occurrences of pronominals which may associate with the operator in the head of the ForceP. If it can be maintained that indefinites and indeterminates are pure variables which are existentially bound by a default operation, as Heim (1982) has suggested, then it is perhaps not necessary to move anything to the clause-peripheral position. The familiar subjacency problem of LF-theory as exemplified in (8–10) as well as in (15) – all repeated here as (27–30) for convenience – would disappear, because in all these cases there is a *+wh* operator in either the left- or the right-peripheral position, which (i) has scope over the in-situ elements that need to be bound, and (ii) identifies the clause as a *+wh* type in the sense of Cheng's (1997) typing hypothesis:[14]

(27) a. ??**What** did you find evidence that Jim has bought?
b. Who found evidence that Jim has bought **what**?

(28) a. ??**What** did you know where we bought?
b. Who knows where we bought **what**?

(29) a. ??**Who** did you get jealous after I had spoken to?
b. Who got jealous after I had spoken to **who**?

(30) Mary-wa [[John-ni nani-o ageta] hito-ni] atta-no?
Mary-TOP John-DAT what-ACC gave man-DAT meet-Q
'For which thing x did Mary meet a man who gave x to John?'

If movement is a last-resort operation to guarantee convergence at the interfaces of grammar, unselective binding would be preferred over movement. Movement would not be required for feature checking (especially if the 'in-situ' element has no relevant *wh*-feature), and thus movement would be punished. In spite of this, however, and for independent reasons, LF-movement has still been assumed in certain cases in which *+wh* scope is indicated overtly. We will turn now to a review of the arguments in favor of such movement.

4.1 Adjuncts

It was shown in (20b), which is repeated below as (31), that despite the occurrence of the Q-particle *ka* in clause-final position, the structure is ill-formed. The adjunct *naze* is obviously bound by *ka*, but nevertheless fails to associate with it in such a way as is necessary to form a normal constituent question:

(31) *Kimi-wa [[kare-ga naze kai-ta] hon]-o yomi masi-ta ka?
you-TOP he-NOM why write book-ACC read -Q
'You read book that he wrote why?'

As is widely known, similar restrictions have been reported time and again in various languages. French, which tolerates *wh*-in-situ questions, is said to have a ban against *pourquoi* 'why' in situ:[15]

(32) a. Tu as vu qui?
you have seen whom
b. (*)Tu es venu pourquoi?
you have come why

Does this suggest that the ECP is at work? Both *naze* and *pourquoi* would be ungoverned and could be subject to a constraint that requires the identification of a trace at LF.[16] As a matter of fact, however, things are less straightforward. We have already said that (20b) improves if *naze* is replaced by *dooiu riyuu de*

'what reason for', which is certainly not more governed than *naze*. Similarly, as Aoun (1985: 24f.) points out, the restriction on *pourquoi* in situ in French is more subtle than the ECP would allow us to predict. Aoun reports that in (32b) *pourquoi* may in fact remain in situ but only if it is interpreted as "purposive." This is the reason for putting the asterisk in brackets. Thus, should (32b) count as grammatical, a felicitous answer would be as in (33a) but not as in (33b):

(33) a. pour étudier la géométrie
to study geometry
b. parce que je suis malade
because I am sick

Similarly, quoting Dominique Sportiche's judgments, Aoun reports that *comment* 'how' may remain in situ, but only at the cost of a restricted interpretation according to which the answer may refer to an instrument but not to a manner:

(34) a. Tu as ouvert la porte comment?
you have opened the door how
b. avec une clef
with a key
c. *lentement
slowly

The facts that are reported from English *wh*-in-situ suggest that manner *how* is also excluded, or at least not favored. The following are from Reinhart (1998: 44f.):

(35) a. ?Who spoke how?
b. *Who fainted when you behaved how?

While (35a) could be interpreted with an 'instrumental' *how*, (35b) cannot. Whatever the subtleties are exactly which may be involved here, two things are clear: (i) if *how* and *why* are changed to *which/what way* and *for which reason* respectively, the sentences improve dramatically; and (ii) *wh*-in-situ is always tolerated in case the *wh*-element is 'referential'. To see this, consider the following examples, of which (36a) is Reinhart's:

(36) a. Who fainted when you behaved what way?
b. Who got excited when/because you went where?
c. Who told you about sea-gulls that can be observed when?

What way, *where*, and *when* are clearly no more governed in these examples than *pourquoi*, *how*, and *naze* in the ill-formed questions above. Thus, the ECP in its standard formulation seems to be an unlikely candidate to explain the differences. What could be an alternative? Reinhart (1998: 45), referring to Szabolcsi

and Zwarts (1993), says that *wh*-adverbials differ from *wh*-NPs because they do not have an 'N-set' and therefore no 'N-role' or variable; *wh*-adverbials rather denote functions ranging over higher-order entities. There is an implicit requirement that *wh*-in-situ in multiple questions must meet the formation of pairs, triplets, etc., of entities. It is unclear, however, how Reinhart's suggestion would be able to integrate time and place adverbials.

This returns us to something quite elementary that is reminiscent of Rizzi's (1990b) notion of a 'referential theta-role'. It seems rather easy to pair up persons with time points or places, while it is much harder to think about manners or reasons in similar ways so as to come up with pairs of persons and manners or persons and reasons. This can be achieved, however, with the help of a *which*-phrase. According to Pesetsky (1987a), *which*-phrases denote operators which are discourse-linked ('D-linked') in the sense that speaker and hearer have a fixed set of entities in mind which matter in the discourse.[17] If a number of reasons or manners are under debate, these are represented as a set of individuals from which subsets can be drawn. This suggests that the relevant difference does not rest on the argument/adjunct distinction but is rather a matter of individuation. Applying *which* presupposes a set denoted by the common noun. In purely logical terms, the difference can hardly be captured, as there seems to be no essential difference between the restrictive parts of *who* (*wh* **person**), *when* (*wh* **time**), *where* (*wh* **place**), *how* (*wh* **manner**), and *why* (*wh* **reason**). The difference is conceptual in the sense that we think about a (finite) countable set of individuals (persons, moments of time, and places) in connection with *who*, *when*, and *where*, but perhaps not in connection with *how* and *why*. The latter need to be transformed into a syntactic form which enforces the formation of a set of individuals. Thus, although there might well be a variable that can in principle correspond to *how* and *why*, extra work needs to be done in order to invoke the idea that it should.

It follows that the difference in grammaticality of acceptability is in all likelihood not as clear cut as we were sometimes led to believe. The fact that judgments usually oscillate between ?, ??, ?*, and * shows exactly this. This explains why the pairing of individuals is easier in (35a) than in (35b): assume a set of persons and a set of modes in which these persons speak. It would be easiest to postulate an instrumental reading, as reflected in answers like *John spoke by using a microphone, Mary by using a megaphone, and Olivia simply by shouting at the top of her voice*. It seems to be harder to invoke a similar pairing for (35b): first of all, the set itself must be formed on the somehow less straightforward basis of a fixed set of manners of behavior, and second, this set must be computed as a function of intervals of time in which the behavior took place. Why should this be totally impossible? Perhaps it is just difficult. Replacing *how* by *what way* obviously reduces the set-formation problem by ostensively presupposing a fixed set. Once *wh*-in-situ in *wh*-moving languages is understood better, this reasoning may help explain the contrast between the two answers in (33) in relation to the (grammatical version of the) question *Tu es venu pourquoi?* For the time being, however, it remains unclear why it should be easier to invoke a set of purposes than a set of causes.

The status of *wh*-movement vs. *wh*-in-situ in French has been investigated in much detail in Obenauer (1994). According to Obenauer, overt *wh*-movement to Spec, CP is obligatory in French only where the speaker fails to have a set of elements in mind which could function as appropriate values for the variable left behind. This is the case if the *wh*-operator is not 'D-linked'. Whenever a *wh*-phrase remains in situ (although the language permits movement to Spec, CP, as is the case in French), an appropriate value must be associated with the variable, which belongs to a certain domain (cf. Obenauer's (51), 1994: 314). The difference can be made clear by the contrast between the function of *comment* 'how' in a formulaic question such as *Bonjour! Comment tu vas?* 'Hello! How are you?', and an information-seeking question such as a doctor's inquiry about the health of a patient, *Alors, comment tu vas aujourd'hui?* 'Well, how is it going today?'. As Obenauer points out (1994: 321f.), *wh*-in-situ is an option in the last case, but not in the first: *Alors, tu vas comment aujourd'hui?* vs. **Bonjour! Tu vas comment?* The speaker clearly has a set of options in mind when asking an information-seeking question, but this is hardly the case in the usual ritual exchanges, as has repeatedly been observed and described in research on linguistic pragmatics.[18] The constraints on adjuncts mentioned in connection with (34c) and similar examples may well be derived in a theory that makes crucial reference to the set of alternatives that can readily be invoked in discourse. The asymmetry between the instrumental and the manner interpretation would then be reduced to the fact that alternative instruments for the opening of doors are more readily invoked by the speaker than alternative manners of door-opening.

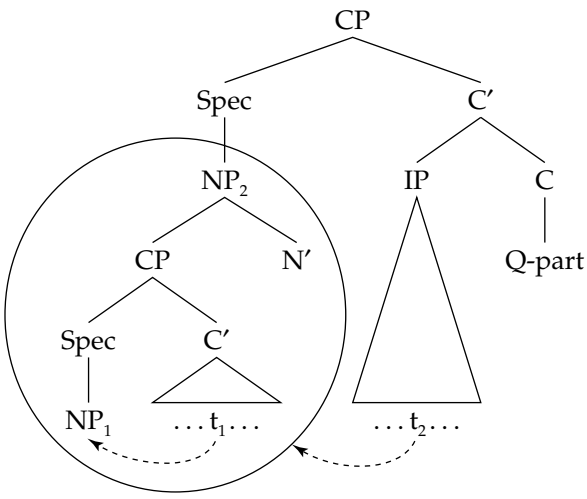
Returning to *wh*-in-situ in Japanese for a moment, what could be the reason for the deviance of (20b)? Why should there be problems in computing a relation between the Q-particle *ka* and the adjunct *naze* 'why'? There is no problem in doing so in sentences where *naze* is not in an island. A simple explanation in terms of the ECP cannot be given, because (37) is grammatical (see Nishigauchi 1990: 101):[19]

(37) Kimi-wa [[kare-ga dooiu riyuu-de kai-ta] hon]-o yomi masi-ta ka?
you-TOP he-NOM what reason for write book-ACC read -Q
'You read (a) book that he wrote why?'

If *why*, *how*, and *naze* may induce a set-formation problem that *who*, *what*, *nani*, etc., as well as *for which reason*, *what way*, *dooiu riyuu-de*, etc., do not, we might find an explanation in Nishigauchi's theory. Recall that he suggested that neither (20b) nor (37) is directly a request for a reason, but rather a request for a reason in terms of a book that someone has written for this reason. This requires a proper set of reasons such that it can be computed as a function of the book(s) that have been written for these reasons. If the present suggestion is tenable, we predict that such a function can be computed on the basis of a countable set of reasons as expressed by an NP, but not or hardly so on the basis of an expression that does not readily permit set formation via individuation, such as the adverb *naze*.

This explanation is rather different from the one that has been suggested by Nishigauchi himself. According to Nishigauchi, the unselective binding account of *wh*-in-situ requires LF-movement to the specifier of the Q-particle *ka* (or *no*). The idea is that the element in situ does not only have to be bound by *ka* but must also be governed by it. This is achieved by covert movement, as shown in (38). Islands are normally not seen because of large-scale pied-piping. In a complex NP such as [[*kare-ga dooiu riyuu-de kai-ta*] *hon*] 'book(s) that he wrote for what reason', Nishigauchi claims that the NP *dooiu riyuu* can have a *+wh* feature by virtue of having a +N feature. If the NP headed by this N moves to the specifier of the relative clause, and the relative clause itself is in the specifier of the nominal headed by *hon*, the entire complex NP ends up as a *+wh* phrase. This phrase is said to undergo covert movement to the specifier of the Q-particle, which is in the position of a clause-final complementizer:

(38)



The reason why *naze* is out if it occurs in the complex NP (NP_2) should be that it lacks a +N feature and that, as a consequence, it cannot derive the *+wh* feature that is needed for NP_2 to count as a *+wh* phrase. Translated into later stages of the theory of movement, Nishigauchi's theory requires feature percolation within islands such that islands can be attracted by the Q-particle. From what is known about feature migration (e.g., within Grimshaw's 1991 theory of projection extension), however, neither one of the movements shown in (38) seems to be obvious without strong assumptions about phrase structure, in particular about the availability of specifier positions which are never activated in overt syntax.[20]

Summarizing, accounts of *wh*-in-situ have tried to overcome certain difficulties in connection with subjacency and the ECP. The subjacency problem is that violations appear to be missing where we expect them under a theory of movement. The ECP problem is that the constraints on adjuncts appear too heterogeneous to

make the classical ECP account feasible. There seem to be promising alternatives which avoid these problems. Unselective binding without any movement, if defensible, would account for the discrepancy between overt and covert movement with respect to subjacency. A semantic theory which draws the proper distinction between 'referential' and 'non-referential' adjuncts could be capable of taking care of certain residues of the ECP account that cannot be maintained in a grammar that has ceased to employ the notion 'government'.[21] The above suggestions remain vague, but it seems to be clear enough in which direction the right solutions can be expected to be found. The restrictions on *wh*-in-situ adjuncts seem to be linked to the availability of proper sets of discourse entities. By this question we are naturally led to questions about the role of discourse in the formation of questions and in the licensing of *wh*-in-situ in general. We will therefore now turn to the phenomenon of D(iscourse)-linking.

4.2 D-linked and non-D-linked wh*-phrases*

In an influential article (Pesetsky 1987a), David Pesetsky has argued that both the LF-movement theory and the theory of unselective binding are correct, and that they take care of different sets of constructions. Pesetsky refers to the LF-movement theory as "Chomsky-style" and to the unselective binding theory as "Baker-style." We have already seen what the former is like. The latter, going back to Baker (1970), essentially says that there is one super-operator in a scope position which binds multiple occurrences of phrases which share its feature. In the case of *wh*-in-situ, either a head like Japanese *ka* is in C, which c-commands multiple *wh*-phrases in situ, or one *wh*-phrase is in Spec, CP, from where it c-commands an arbitrary number of *wh*-phrases in situ. In each case, the *+wh* operator has the capability of binding all occurrences of the relevant phrases in situ. This is usually expressed by indices. Thus, a Baker-style representation of *Who read what?* would be as in (39a); a more up-to-date version would be an LF as in (39b), where there is a distinction between the head C, the specifier of CP, and where a copy of the phrase in Spec, CP is retained in subject position:

(39) a. $[[_{\text{Comp}}\ Q_{i,j}\ \text{who}_i]\ t_i\ \text{read}\ \text{what}_j]$
b. $[_{\text{CP}}\ \text{who}\ [_{\text{C}'}\ [_{\text{C}^\circ}\ +wh]_{i,j}\ [\text{who}_i\ \text{read}\ \text{what}_j]]]$

According to (39), *what* never actually moves. It is rather 'absorbed'.[22] The reason why both Chomsky-style movement and Baker-style non-movement are needed is that there are empirical differences which, according to Pesetsky, culminate in the notion of D(iscourse)-linking. Certain *wh*-phrases stay in situ and get bound in the sense of (39), in case they are not novel in the discourse but rather make reference to a set which is already activated in the minds of the interlocutors. *Wh*-phrases for which this is not true have to undergo Chomsky-style LF-movement. Only in the second case should we see constraints on movement, including subjacency effects. How does one know whether some *wh*-phrase is D-linked or not? The standard cases Pesetsky suggests are *which* phrases, whereas *wh*-pronouns

such as *who*, *what*, *where*, etc., tend to belong to the non-D-linked camp (although he also provides examples for which this is not true; cf. (42) below).

The theory is mainly developed with an eye on superiority. The Superiority Condition (cf. Chomsky 1973) requires that in a structure . . . X . . . [. . . Y . . . Z . . .], the relation between X and Z is blocked if there can also be a relation between X and Y, and Y is superior to (i.e., 'higher' in the tree than) Z. Given that Y and Z are of the same syntactic type (e.g., *wh*-phrases), superiority falls under Relativized Minimality (cf. Rizzi 1990b) or the Minimal Link Condition (cf. Chomsky 1995c: section 4.5.5). Pesetsky derives it from a ban on crossing (vs. nested) dependencies. Superiority accounts for the contrast in (40):

(40) a. Who read what?
b. *What did who read?

Since, due to the asymmetry between subject and object which clearly holds in English, *who* is 'superior' to *what*, if *what* moves while *who* stays, the Superiority Condition is violated. However, the constraint violation seems to be absent or at least ameliorated in (41b), where *who* and *what* are replaced by overtly D-linked material:

(41) a. Which child read which book?
b. (?)Which book did which child read?

In the following example from Pesetsky (1987a: 109) there is no overt mark of D-linking, but the context makes it clear that both the set of transistors and the set of holes is fixed:

(42) I know that we need to install transistor A, transistor B, and transistor C, and I know that these three holes are for transistors, but I'll be damned if I can figure out from the instructions *where what* goes!

The expected order would be *what goes where*. Thus, there can also be D-linking without a visible morphosyntactic reflex. According to Pesetsky, D-linked *wh*-phrases are not quantifiers and get licensed by Baker-style unselective binding. Non-D-linked *wh*-phrases, however, are quantifiers. They must adjoin to CP (formerly S'). (40b) would be ruled out by the Superiority Condition itself, or by some other more abstract constraint that entails superiority. Given cases like (42), it may be difficult to decide in each case what the stage of the discourse is in which such interrogatives may be uttered. Pesetsky suggests, however, that there are *wh*-phrases which can never be D-linked. They are "aggressively non-D-linked." According to Pesetsky, aggressive non-D-linking can be forced by attaching an intensifier like *the hell* or *on earth* to the *wh*-phrase, or *ittai* in Japanese.[23] Superiority effects seem to arise in Japanese as soon as *ittai* is used; an example appears in (43b), where the *ittai* phrase is hierarchically not the closest to the C-node marked by *no*. Similarly, subjacency

effects resulting from the CNPC show up – as in (44b) – which are otherwise notoriously absent in Japanese:

(43) a. [Ittai dare-ga] nani-o tukamaeta -no?
the-hell who-NOM what-ACC caught -Q
b. ??Dare-ga [ittai nani-o] tukamaeta-no?

(44) a. Mary-wa [[John-ni nani-o ageta] hito-ni] atta-no?
Mary-TOP John-DAT what-ACC gave man-DAT met-Q
b. *Mary-wa [[John-ni ittai nani-o ageta] hito-ni] atta-no?
Mary-TOP John-DAT the-hell what-ACC gave man-DAT met-Q

It is suggested that intensifiers also constrain pied-piping in English. It is implied that in (45) the containing NP or PP turns out to be islands:

(45) a. Pictures of whom cost the most at the sale?
b. *Pictures of whom the hell cost the most at the sale?

(46) a. I wonder what the hell he is talking about.
b. *I wonder about what the hell he is talking.

If these tests show what they are supposed to show, either grammatical sentences in which *wh*-in-situ appears in an island must be relegated to D-linking, or it must be assumed that the entire island undergoes LF pied-piping. The evidence that intensifiers show something interesting about island effects at LF is unfortunately rather weak. The impression is that in English, French, and German the use of intensifiers is a root phenomenon or can be linked to the root by virtue of logophoricity (*I don't know what the hell I should do here*). There are in addition phrase-structural reasons which in English block attachment to constituents larger than a simplex *wh*-pronoun. Phrases like *which book the hell* are, for instance, impossible for most speakers of English. Pesetsky himself notices problems with *wh*-in-situ:

(47) a. Who the hell caught what?
b. *Who caught what the hell?

(48) a. Où (diable) est-il allé?
where the-devil is-he gone
b. Il est allé ou (*diable)?

There is no obvious reason why LF raising of the *wh*-phrase in situ should be blocked in (47b) and (48b). There are no familiar problems with movement involved. Notice also that slight changes in Pesetsky's example in (46a) remove its acceptability, a fact which suggests that we are dealing with a root or at least root-related phenomenon; the same is true in German, as the examples in (50) show:

(49) a. ??The president wonders what the hell we were talking about.
b. *It is unclear what the hell he should talk about next.

(50) a. Ich möchte wissen, was zum Teufel er hier zu suchen hat.
I want (to) know what to-the devil he here to search has
'I want to know what the hell he has to do here.'
b. *Der Präsident möchte wissen, was zum Teufel wir hier zu suchen haben.
the president wants (to) know what to-the devil we here to search have
c. *Es ist unklar, was zum Teufel er hier zu suchen hat.
it is unclear what to-the devil he here to search has

Obviously the intensifiers *the hell* or *zum Teufel* can appear in an embedded *wh*-clause only under the special conditions of direct discourse and certain embedding predicates that guarantee direct discourse transparency. If the intensifier has to be in the left periphery in order to activate a specific phrase (ForceP?) which signals a certain illocutionary act, its ill-formedness in situ or its non-appearance in an island, as in **Who bought a book that fascinated who the hell?*, may not be related to constraints on LF-movement at all.[24] Constraints like those underlying the data in (49) and (50) are also discussed in Obenauer (1994: 313). Obernauer observes that while the predicates *savoir* and *trouver* permit *wh*-complements, they fail to license *wh-diable* clauses, as in **Je sais tres bien où diable elle a mis les clés* '*I know very well where the hell she has put the keys' or **J'ai trouvé où diable elle a mis les clés* '*I have found out where the hell she has put the keys.' According to Obenauer, by using *où diable*, the speaker commits himself to the view that there is no clear value or no value at all for the variable related to *où*. This is in conflict with the selectional requirements of the matrix predicate in question. Pesetsky's account has revealed interesting properties of *wh*-in-situ, in particular about D-linking, but it has not really excluded alternatives to the LF-movement analysis. This leaves us with 'Baker-style' unselective binding throughout, but then we still wonder how the superiority effects should be derived.

An important insight about multiple interrogatives emerges from Erteschik-Shir (1990), where it is claimed that multiple questions always ask for a pairing of individuals. Thus, in (51) *who* and *what* are never interpreted independently but rather as a set of people who have eaten a set of foods:

(51) Who ate what?

Building on Chierchia (1991), this has led Hornstein (1995) to a syntactic account of multiple interrogatives in which superiority violations are reduced to cross-over violations. The dependent or 'functional' interpretation of a *wh*-pronoun is expressed by Hornstein as an NP of the form [pro N], in which pro and N may carry different indices: N carries its own referential index, while pro carries the

index of another NP which functions as the 'generator' of a set of individuals restricted by N. This can be seen in the familiar *wh*/QP-interactions:

(52) a. What did everyone say?
b. Who said everything?

(52a) yields a pair-list interpretation, as reflected in an answer like *John said he will travel to Italy, Mary said that she will help her father, and Susan said that she will prepare for her exam*. (52b), however, does not. An answer to (52b) could only be something like *John (said everything)*. Hornstein represents the LFs of these examples as follows:

(53) a. $[_{CP}$ what$_1$ $[_{IP}$ everyone$_2$ $[_{IP}$ t_2 say $[$pro$_2$ $t_1]]]]$
b. $[_{CP}$ who$_1$ $[_{IP}$ everything$_2$ $[_{IP}$ $[$pro$_2$ $t_1]$ say $t_2]]]$

The LF in (53a) asks for a set of things that have been said, but with the requirement that this set of things is a function of having been said by x. Now x is bound by a universal quantifier. The assumption is that the universal quantifier acts as a 'generator'.[25] This gives rise to the pair-list interpretation. The same could be true of (53b), where *everything* would be the generator for the relevant set of people corresponding to *who*. As one can see, however, this interpretation would give rise to a weak crossover (WCO) effect: being co-indexed with pro$_2$, the trace t_2 is not A-free. Of course, this is dependent on the configuration that is assumed for [pro t], an issue that has to be left aside here. Therefore the pair-list interpretation is not available.

Returning now to multiple questions and the superiority effect observed, we notice that the same account can be used. According to Chierchia (1991), *wh*-pronouns like *who* and *what* can function as generators. Let us then consider the examples in (54) and their respective LFs in (55):

(54) a. Who bought what?
b. *What did who buy?

(55) a. $[_{CP}$ who$_1$ $[_{IP}$ t_1 bought $[$pro$_1$ what$]]]$
b. $[_{CP}$ what$_2$ $[_{IP}$ $[$pro$_2$ who$]$ bought $t_2]]$

Again, (54a/55a) attains the functional reading which Erteschik-Shir has claimed to be obligatory in multiple interrogatives, while (54b/55b) is excluded under this interpretation due to a WCO-violation. What, then, about *which*-questions and their property of not showing the superiority effect? Hornstein suggests that *which*-phrases are inherently D-linked and can generate the relevant set by themselves and without first moving to an operator position (Spec, CP). According to his theory, (56) is well-formed because it does not involve a binding problem:

(56) Which book did which man review?

Since speaker and hearer have a certain set of books and a certain set of men in mind (Pesetsky 1987a: 107f.), no extra linking mechanism as instantiated by the binding of pro has to be invoked. Thus, the construction escapes the WCO problem.

An advantage of the WCO theory of *wh*-in-situ is that it allows an explanation for the problem of cross-linguistic variation that has troubled comparative research for quite some time. It has been assumed in earlier GB-oriented work that German as well as Japanese and other languages are 'non-configurational', in the sense that they fail to show a verbal projection distinct from the sentence itself. The widely accepted present view is that these languages are configurational but have in addition the scrambling property. There are still debates as to what drives scrambling, but it seems that scrambling exploits a projection option of the grammar for reasons of information packaging in discourse organization. Languages of this type generally do not show superiority effects, or at least not in the way English and other strict-word-order languages do. Consider the Japanese example (57b) and the German example (58b), both of which lack the superiority effect:

(57) a. Dare-ga nani-o tabeta no?
who-NOM what-ACC ate Q
b. Nani-o dare-ga tabeta-no?

(58) a. Wer hat was gegessen?
who has what eaten
b. Was hat wer gegessen?

Assume now that scrambling can move the object across the subject to an A-position or to some other position which is distinct from an operator position. Then the position targeted by scrambling would be the one which counts for variable binding. According to the WCO theory, this would leave the variable A-free, as the little pro which is used to establish the functional reading would not be crossed by the overt movement that establishes the operator/variable chain. Consider the LF of (58b) in (59):

(59) $[_{CP}\ Was_2\ [_{C'}\ hat\ [_{IP}\ t_2\ [[pro_2\ wer_1]\ [t_2\ gegessen]]]]]$

This account of the lack of German superiority in terms of WCO is corroborated by the fact that, due to scrambling, WCO effects are generally less often visible in German than in English. To see this, consider the examples in (60). (60a) shows that WCO is clearly active in German. The lack of WCO in (60b) is then obviously connected to the fact that scrambling bleeds the forbidden binding configuration. Notice that German does not permit scrambling from a finite CP (although there are grammatical cases of scrambling from infinitival complements).[26] Thus, cross-over cannot be avoided in (60a). It can be avoided in (60b), however, because the scrambling operation that precedes *wh*-movement is confined to the simplex clause:

(60) a. *[$_{CP}$ Wen$_2$ [$_{C'}$ glaubt [$_{IP}$ seine$_2$ Mutter [$_{CP}$ (t_2) [$_{C'}$ daß [$_{IP}$ niemand t_2
who(m) thinks his mother that nobody
ausstehen kann?
stand can
'Who(m) does his mother think that nobody can stand?'
b. [$_{CP}$ Wen$_2$ [$_{C'}$ hat [$_{IP}$ t_2 [seine$_2$ Mutter [t_2 angerufen]]]]]?
who(m) has his mother called

German obviously does not show the lexical D-linking effect between pure w-pronouns and *welch*-phrases (*which*-phrases) one would expect in Pesetsky's theory. According to Wiltschko (1997a), there is another *wh*-construction in German which, so she argues, is incompatible with D-linking: the *was-für* construction. *Was-für* questions ask for the kind or nature of something. They are usually infelicitous in a context where a delimited set of individuals is already under debate. Consider the pair of examples in (61):

(61) a. Was für eine Oper möchstest du hören?
what for an opera want you hear
'What kind of an opera do you want to hear?'
b. Welche Oper möchtest du hören?
which opera want you hear
'Which opera do you want to hear?'

(61a) can hardly be asked in a context where the choice is only between *Cosi fan tutte*, *Lohengrin*, and *Tosca*. In such a situation the D-linked question (61b) is appropriate. If a *was-für* question should be used here at all, it would have to involve a partitive construction, as in *Was für eine von diesen Opern möchtest du hören?* (61a) is appropriate if the choice is between kinds of operas; say opera seria, German romantic opera, Italian verismo, etc. In order to demonstrate superiority effects as resulting from non-D-linking, Wiltschko uses among others the examples in (62). According to her judgments both sentences are deviant and have the mark *?:[27]

(62) a. (*?)Was für Opern mögen denn was für Menschen?
what for operas like PRT what for people
b. (*?)Was für Futter fressen denn was für Tiere?
what for food eat PRT what for animals

An example of Wiltschko's which is indeed deviant appears in (63):

(63) *Was für einen Jungen$_1$ wird sein$_1$ Bruder besuchen?
what for a boy-ACC will his brother-NOM visit

The question is whether its ill-formedness can be attributed to a WCO violation. It could be the case that it is simply semantically odd because it asks for a kind

of boy in connection with the definite NP *sein Bruder*. It needs little stretching to find examples in which the functional interpretation of the subject NP becomes prominent. In such a case, the ill-formedness disappears, with respect to both binding and superiority:

(64) a. Was für eine (Art) $Oper_1$ sollte ihr_1 Komponist mindestens zwei
what for a (kind) opera should its composer at-least two
Wochen vor der Uraufführung fertiggestellt haben?
weeks before the premiere completed have
'What kind of opera should have better been completed by its composer two weeks before the premiere?'

b. Was für eine (Art) $Oper_1$ könnte welcher Komponist geschrieben
what for a (kind) opera could which composer written
haben?
have
'What kind of opera could have been written by which composer?'

This repeats the negative result for a clear test of a morpholexical distinction in D-linking.

For the WCO theory to work, it is necessary that the *wh*-in-situ phrase leaves the VP by short scrambling. Various authors (e.g., Müller and Sternefeld 1993) have argued that *wh*-phrases cannot undergo scrambling. One must distinguish, however, between intermediate positions and terminal landing sites: if the scrambled phrase lands in pre-VP position, the acceptability is generally degraded, for the plausible reason that *wh*-phrases in situ must occupy a potential focus position. The net effect of scrambling is, however, to move material out of such a position. Using scrambling for targeting an intermediate position before the occurrence of operator movement is quite a different issue. One should not exclude the possibility that D-linking effects can be revealed by *wh*-scrambling, as Wiltschko (1997a) has suggested. For the time being, however, it seems impossible to show how the status of *was-für* and *welch*-questions could be distinguished beyond the purely theoretical assumptions underlying the *wh*-scrambling analysis. Notice that when the particle *denn* is used as an overt sign of the VP boundary, as suggested by Diesing (1992b), the landing of the *wh*-phrase in the scrambling position leads to a bad result in each of the cases under consideration:

(65) a. Wer hat denn welche/was für Opern geschrieben?
who has PRT which/what for operas written

b. *Wer hat welche/was für Opern denn geschrieben?

The requirement seems to be in each case that the unmoved *wh*-phrase remains in VP, which roughly means that it remains in the focus projection.

To conclude this section, no forceful argument in favor of LF-movement of the *wh*-in-situ element has appeared so far. In each of the cases considered, there was either a Q-particle in scope position, in whose c-command domain the in-situ

element could be interpreted as an existentially bound variable, or there was one *wh*-phrase in Spec, CP, which identifies the clause as a *+wh* clause, say, by spec–head agreement. In that case, there is again a *+wh* head which would c-command all occurrences of *wh*-in-situ. There were still examples of *wh*-in-situ like the French example (32a), *Tu as vu qui?* 'You have seen whom?' Since these are restricted to root contexts, we can assume that they involve a silent Q-particle that binds the *wh*-phrase in situ.[28] We have seen that for those cases for which Pesetsky claimed LF-movement because they are aggressively non-D-linked, other mechanisms can be motivated. We have considered in some detail an analysis by which superiority violations, as in **What did who say?*, can be reduced to WCO violations.[29] The considerations so far have reached a point in favor of unselective binding. This squares with much current research on *wh*-constructions, e.g., Aoun and Li (1993c), Cole and Hermon (1994, 1998b), and Sabel (1998), as well as with conclusions that are necessitated by the adoption of the Minimalist Program as formulated in Chomsky (1995c). Nevertheless, the unselective binding solution of the *wh*-in-situ problem has also received criticism. The next section is devoted to an evaluation of this criticism.

4.3 Is unselective binding affected by a semantic problem?

The received story of unselective binding is strongly influenced by one central proposal of Discourse Representation Theory (DRT) and closely related models (Kamp 1981a; Heim 1982; Kamp and Reyle 1993), according to which indefinites are not themselves generalized quantifiers, as in earlier semantic theories and in the earlier approaches in terms of quantifier raising (QR), but rather variables which get bound by the default operation of existential closure. The DRT-approach squares with the standard semantic analyses of interrogatives, such as Karttunen (1977), where *wh*-phrases are essentially seen as indefinites. A sentence like (66a) – taken from Reinhart (1997) – translates into the semantic representation (66b), which designates the class of propositions such that there is at least one European country of which the property of having a queen can be truly asserted:

(66) a. Which European country has a queen?
b. λP (∃x (European country (x) & P = ^(x has a queen) & true (P)))

True answers to (66a) are *England (has a queen)* and *The Netherlands (has a queen)*. Consider now multiple questions. As is known from examples (8–10), which are repeated below as (67–89), multiple questions can be formed such that the unmoved *wh*-phrases can be left in a syntactic island:

(67) a. ??**What** did you find evidence that Jim has bought?
b. Who found evidence that Jim has bought **what**?

(68) a. ??**What** did you know where we bought?
b. Who knows where we bought **what**?

(69) a. ??**Who** did you get jealous after I had spoken to?
b. Who got jealous after I had spoken to **who**?

If the indefinite NPs corresponding to the *wh*-in-situ elements have to undergo regular *wh*-movement, the grammar has the undesirable property that was broadly accepted in the GB framework, namely that the derivation of LF from S-structure is somehow less constrained than the derivation of S-structure from D-structure. However, the situation is troubled by various additional aspects that have to be taken into account for the classical LF theory and the QR analysis to work. While quantifiers such as [*every* . . .] generally observe syntactic islands, indefinites such as [*a* . . .], [*some* . . .], and also [*two* . . .], [*three* . . .], etc., seem to be able to escape from any island.[30] In classical LF theory, they would have to undergo 'island-free QR', as Reinhart (1997) calls this process. As we have seen already, unselective binding seems to be an attractive possibility for avoiding the derivational complications GB and earlier versions of syntactic theory were troubled with. *Wh*-in-situ questions would then generally be analyzed such that the phrase in situ stays exactly where it is born, and is simply co-indexed with the Q-particle or *+wh* marked C-position that c-commands it. This amounts to Baker-style representations, as we have already seen in (39), and which we repeat here as (70) for convenience.

(70) a. $[[_{Comp}\ Q_{i,j}\ who_{\ i}]\ t_i$ read $what_j]$
b. $[[_{CP}$ who $[_{C'}\ [_{C^\circ}$ *+wh*$]_{i,j}$ $[who_i$ read $what_j]$

As Reinhart (1997) shows, representations which make use of unselective binding can be connected with Karttunen's semantics in the same way as representations which make use of covert *wh*-movement of the earlier analyses we have already discussed. Assuming unselective binding, the example on which (39) rests – (71a) – would come out as (71b):

(71) a. Who read what?
b. λP (∃xy (person (x) & P = ^(x read y & thing (y)) & true (P)))

Here the existential operator associated with the feature structure of the initial (overtly moved) *wh*-item may have as many indices (x, y, . . .) as there are *wh*-phrases in the clause. Crucially, the restrictive clause remains in situ. Abstracting away from the subject for the moment, this squares with Chomsky's suggestion in the Minimalist Program that the only thing that actually moves to or retains a scope position at the C-I-interface ('conceptual-intentional interface') of the grammar is the operator proper, i.e., the operator feature rather than the restrictive part.[31]

However, Reinhart (1992, 1997, 1998) has argued that this analysis, although attractive from a syntactic point of view, cannot be maintained because it yields

wrong entailments. Let us therefore take a look at those arguments of Reinhart's which pertain to *wh*-in-situ. The multiple question in (72) and its informal and formal LF representations in (73) and (74) are taken from Reinhart (1997: 359):

(72) Who will be offended if we invite which philosopher?

(73) **The unselective binding analysis:**
   a. For which <x,y>, if we invite y and y is a philosopher, then x will be offended.
   b. λP (∃<x,y> (P = ^((we invite y & philosopher (y)) → (x will be offended)) & true (P)))

(74) **The QR analysis:**
   a. For which <x,y>, y is a philosopher, and if we invite y, then x will be offended.
   b. λP (∃<x,y> (philosopher (y) & P = ^((we invite y) → (x will be offended)) & true (P)))

(73) gives the unselective binding analysis according to which the restrictive clause ('y is a philosopher') appears inside the antecedent of the conditional. According to Reinhart, this analysis is too permissive, as it yields the wrong entailment that we can invite anybody – including non-philosophers – and still make the conditional true. (74), on the other hand, gives the QR analysis according to which the restrictive clause appears outside the antecedent clause of the conditional. Here it is a prerequisite for the conditional to come out as true that the invitee is indeed a philosopher. This squares with our semantic intuitions. What exactly goes wrong in (73)? Reinhart says that according to the unselective binding analysis in (73) an appropriate answer could well be *Lucie will be offended, if we invite Donald Duck*, although we all understand that Donald Duck is not a philosopher. This means that whatever truth-value is ascribed to the restrictive clause, the conditional will come out as true. This consequence can be checked by the truth-table of propositional logic, of which (75) mentions the relevant parts for convenience:

(75)

p	**q**	**p & q**	**p → q**
1	1	1	1
1	0	0	0
0	1	0	1
0	0	0	1

Assume that the conditional's antecedent is composed of the conjunction of the true proposition that we invite Donald Duck and the false proposition that Donald Duck is a philosopher. By the conjunction rule in the third column, this makes the antecedent false. But this will now suffice to make the conditional true, as one can see by inspecting the last two lines of the implication column under p → q.

If the argumentation based on the semantic analysis of interrogatives is correct, there is now a dilemma. Our intuitions about the meaning of multiple questions and their acceptable answers require a movement analysis of the indefinite in the sense of QR; on the other hand, a movement analysis is undesirable for well-motivated syntactic reasons. In the case at hand, the indefinite would have to be lifted out of the conditional's antecedent. This antecedent has the status of an adjunct, and – as expected – overt movement gives a bad result:

(76) *Who$_1$ will Lucie be offended, if we invite t_1?

In the best of all worlds, the indefinite attains wide scope without movement. Thus, an operation other than QR must be available. Reinhart proposes choice functions (CF) as such a possibility. The idea is that the existential closure operation that has been suggested by DRT, in order to bind the variable corresponding to an indefinite NP, does not bind an individual variable, but rather a function that selects an entity of such and such a kind from a (non-empty) set. Recall that the unselective binding analysis in (73) was such that ∃ can bind any occurrence of a variable (i.e., the indefinite) co-indexed with it. If, however, ∃ is restricted to binding only a function that selects such and such, the restriction of the variable can be captured without moving the entire existential NP out of the clause, as the QR analysis would require. Under Reinhart's proposal, the LF of (72), *Who will be offended if we invite which philosopher?*, turns into (77), of which (77a) is again the informal and (77b) the Karttunen-style formal LF:

(77) **The CF analysis:**
   a. For which <x,f>, if we invite f(philosopher), then x will be offended.
   b. λP (∃<x,f> (CH(f) & P = ^((we invite f(philosopher)) → (x will be offended)) & true (P)))

This LF expresses that we are looking for a person x and a function f which selects only philosophers such that if we invite anyone selected by f, x will be offended. One can see that by this move, the proper scope of the existential operator outside the antecedent of the conditional (i.e., the syntactically offended island) can be captured without actually moving the relevant NP out. If the relevant model is such that Donald Duck is not a philosopher, an answer like *Lucie will be offended, if we invite Donald Duck* will not be appropriate, because it cannot make the conditional true.

This leads to the delicate part of Reinhart's theory: is the conditional false or is it simply undefined? Recall that the unselective binding approach was criticized because it was said to be overly permissive. If the restrictive clause is part of the conditional's antecedent clause, any value for the proposition 'y is a philosopher', not only the intuitively favored value 1 but unfortunately also value 0, will make the conditional come out true. By the conjunction rule (p&q), the CF approach will convert any conditional that yields the value 1 into 0, if the

existentially quantified part ∃f . . . CH(f) fails to attain the value 1. This much is straightforward. The question is whether the unselective binding approach is really doomed to failure unless CFs are admitted. One should note that the adoption of CFs supplies the semantic language with extra power, a step which needs motivation beyond the solution of the scope of indefinites. The immediate worry about LFs such as (73b) – λP (∃<x,y> (P = ^((we invite y & philosopher (y)) → (x will be offended)) & true (P))) – is that they fail to reflect the assertion/presupposition division of the corresponding natural-language expression. The proposition that y is a philosopher is at no point under debate. So it seems to be wrong to use this presupposed information on a par with the asserted information for the computation of the truth-value of the whole sentence. Assuming that we do not use this background information in computing the meaning of the conditional, the information of the restrictive clause would have to appear in the discourse context. If the truth of it is denied, as is the case when we allow Donald Duck into the relevant set of individuals the question in (72) is about, we witness a presupposition failure. But presupposition failure is essentially a pragmatic problem, and it seems to be undesirable to pack presuppositions in such a way into LF that they cannot be distinguished from the asserted material. Reinhart (1997: fn. 19) refers to this problem. Although it seems to be acknowledged there that *wh*-expressions are presuppositional, and that presuppositions belong to pragmatics, she nevertheless rejects accounts along the lines which have been sketched above, because "associating presuppositions with existentially quantified NPs is highly problematic within any of the familiar semantic systems, as it disables basic entailments" (1997: 360). Unfortunately, an evaluation of this claim would go beyond the scope of the present chapter. So the issue has to be left unresolved.[32]

The positive result that has emerged from the preceding discussion is that *wh*-in-situ in multiple questions does not force a QR-analysis and its consequences of violating syntactic constraints on movement. In principle, unselective binding can deal with all sorts of cases of *wh*-in-situ, not just with the D-linked ones that Pesetsky had in mind. The discrepancy we saw between the (a)- and (b)-cases of examples (8–10) ceases to be a problem, once we can maintain that the LF of *wh*-in-situ is not necessarily established by movement. The question of this section, namely 'Is unselective binding struck by a semantic problem?', can in principle be answered negatively, at least if it can be maintained that variable binding is not per se syntactic. The semantics of unselective binding may, however, have to be modified in the direction suggested by Reinhart's introduction of CFs, if it turns out that the simpler approach of existential closure of individual variables is not sufficient.

So far it seems that for the purposes of *wh*-in-situ, the LF-movement approach can be abandoned entirely. We have seen that in the languages considered up to this point there is either overt movement of a *wh*-phrase to Spec, CP, which can then license occurrences of other *wh*-elements in situ, or there is a functional Q-particle from the outset, which binds *wh*-elements in situ. Both kinds of binding can be characterized as unselective and 'island-free'; i.e., in none of the cases can

we observe subjacency restrictions, although there are – as we have seen – other restrictions that could, however, be reduced to conditions on well-formedness that lie outside bounding theory. We will in the next section take a look at *wh*-in-situ languages for which the simple picture developed so far does not seem to hold, i.e., for which we may nevertheless want to maintain derivations of *wh*-scope in terms of covert movement.

5 *Wh*-scope in Bengali: a case study

Most of the material in this section is from Bengali and has been discussed in Bayer (1995, 1996: ch. 7; 1999b). Much pertains to other languages from the South Asian linguistic area. Bengali, together with Assamese, Oriya, Southern Hindi (Dakkini Hindi), and Marathi, is particularly interesting, however, as it shows a mixture of types of sentential complementation. While the Dravidian languages are strictly head-final and consequently have clausal complements (with a final complementizer) to the left of the matrix verb, Bengali and the other Eastern Indo-Aryan languages mentioned in the set have in addition complements (with an initial complementizer) to the right of the matrix verb, like *ki*-clauses in Hindi and various other languages from Northern India. This duality in complement types interacts in interesting ways with the scope of *wh*-in-situ. The questions that emerge from this situation are of general importance for the present theorizing about *wh*-in-situ.

5.1 Simplex interrogatives and the lack of a Q-morpheme in constituent questions

Bengali has a clitic-like sentence-internal or sentence-final element *ki* that serves as an interrogative marker to form yes/no-questions, but this *ki* (meaning 'what') is optional and seems to be confined to the root clause. An example appears in (78a). As happens with the interrogative morpheme in other languages such as Japanese, this *ki* can be missing in root clauses. Obviously question intonation can make up for the use of a Q-morpheme. Alternatively, the clause can be followed by the tag *ki na* (literally 'what not'). This tag is able to type the clause in such a way that it can be used in a context that requires a *+wh* complement. This is shown in (78c). (78d) shows that in a context where a *+wh* complement is required, neither the naked IP *ram ca khabe*, nor the IP (which contains the internal Q-particle *ki*), is sufficient:

(78) a. Tumi (ki) ca kinecho?
you Q tea bought
'Did you buy tea?'

b. Tumi ca kinecho(ki na)?
you tea bought Q NEG
'Did you buy tea or not?'

c. Se jiggeS korche [ram ca khabe ki na].
(s)he question makes Ram tea drinks Q NEG
'(S)he is asking whether Ram will take tea.'
d. *Se jiggeS korche [ram (ki)ca khabe].
(s)he question makes Ram Q tea drinks
'(S)he is asking whether Ram will take tea.'

These data suggest that non-root interrogative clauses must be overtly typed as *+wh*, and that neither the internal *ki* nor a zero Q-morpheme would be able to do this job.

Constituent questions never appear with an interrogative marker that may overtly type the clause as *+wh* or indicate the scope position of the *wh*-item. The examples in (79) show nothing but the *wh*-words (actually 'k-words') *ke*, *ka-ke*, etc. The appearance of the interrogative particle *ki* as in (80) makes the sentences ungrammatical:

(79) a. Ke eSeche?
who come-has
'Who has come?'
b. Tumi kake dekhecho?
you whom saw
'Who did you see?'
c. Tomar bondhu kEno aSe ni?
Your friend why came NEG
'Why did your friend not come?'

(80) a. *Ke eSeche ki?/*Ke ki eSeche?
b. *Tumi kake dekhecho ki?/*Tumi kake ki dekhecho?
c. *Tomar bondhu kEno aSe ni ki?/*Tomar bondhu kEno ki aSe ni?

The *wh*-words are uniquely used for the formation of constituent questions. As is the case in Hindi and other related languages, relative operators are morphologically distinct. Thus, *wh*-words in Bengali and related languages obviously do not rely on a separate typing element. As in many other languages, various members of the *wh*-series can be turned into *–wh* indefinites by attaching extra morphemes.[33]

There are three possibilities for *wh*-phrases in situ to reach a scope position: (i) adjunction in the sense of QR, given that there is no obvious Spec, CP landing site as in the Western languages; (ii) feature attraction by an element in scope position, which, however, in Bengali would have to feature a zero morpheme; (iii) covert *wh*-movement as initially suggested by Huang (1982a) for Chinese.[34] Option (i) has been argued for by Mahajan (1990) with respect to Hindi. Mahajan suggested, however, that the *wh*-phrase has to adjoin such that it will be governed by a *+wh* complementizer, an assumption that had also been made in Nishigauchi (1990). But neither in Hindi nor in Bengali do we ever see a

morphological realization of such a complementizer (unlike in Japanese). Thus, we would have to postulate a zero morpheme as under option (ii). As our earlier discussion in section 4 has shown, the presence of a Q-particle or some other *+wh* occurrence normally allows unselective binding. As a consequence, it is unclear why there should in addition be movement, provided that the indefinite's restrictive part can stay in situ, and the actual process of variable binding is independent as suggested by DRT. Assuming that in the presence of an unselective binder there is no movement, subjacency effects are not expected. If we see subjacency effects, this would be evidence in favor of option (iii), i.e., covert movement of the *wh*-element to scope position. Let us see what kind of evidence Bengali offers.

5.2 Subjacency

Consider first the adjunct clause introduced by *karon* 'because' in (81):

(81) a. Amar mon kharap [karon ram durga pujay aSbe na].
my mind bad because Ram Durga-Puja-atcome-will NEG
'I am annoyed because Ram will not show up for (the festival of) Durga Puja.'
b. *Tomar mon kharap [karon ke durga pujay aSbe na]?
your mind bad because who Durga-Puja-atcome-will NEG
'You are annoyed because who will not show up for Durga Puja?'

As the ill-formedness of (81b) shows, *ke* does not seem to obtain scope over the matrix clause.[35]

Let us next consider relative clauses. Here one should notice that there are two types of relative clauses: correlative relatives, which appear obligatorily to the left and are followed by the main clause in which the relativization operator is picked up by a demonstrative pronoun or NP;[36] and right-hand relatives, which can form a complex NP together with a 'head' NP. Examples of correlatives appear in (82) and (83):

(82) a. Je behala-y thake Sey lokTa kal phon koreche.
who Behala-in lives this man yesterday phone did
'The man who lives in Behala rang up yesterday.'
b. *Je kothay thake Sey lokTa kal phon koreche?
who where lives this man yesterday phone did
'The man who lives where rang up yesterday?'

(83) a. Jake ram Taka diyeche take ami nemontonno korechi.
whom Ram money gave him I invitation did
'I invited the one that Ram gave money to.'
b. *Jake ram koto Taka diyeche take tumi nemontonno korecho?
whom Ram how-much money gave him you invitation did
'You invited the one that Ram gave how much money to?'

From a correlative relative clause, a *wh*-in-situ phrase can obviously not obtain scope. This restriction cannot be reduced to a restriction such as the name constraint, because changing the verb *korechi* in (83) to the habitual form *kori* 'I (usually) do' leads to a non-specific interpretation of the NP on which the relative depends: 'I invited whoever Ram gave money to.' Nevertheless, a *wh*-phrase would not be allowed in such a relative either. This impression is supported by the next examples, which show that questioning out of right-hand relatives which are part of complex NPs and are clearly indefinite is likewise impossible:

(84) a. Ekjon lok je behalay thake kal phon koreche.
a man who Behala-in lives yesterday phone did
'A man who lives in Behala rang up yesterday.'
b. *Ekjon lok je kothay thake kal phon koreche?
a man who where lives yesterday phone did
'A man who lives where rang up yesterday?'

(85) a. Ami Ekjon lokTake jake ram Taka diyeche nemontonno korechi.
I a man whom Ram money gave invitation did
'I invited a man who Ram has given money to.'
b. *Tumi Ekjon lokTake jake ram koto Taka diyeche
you a man whom Ram how-much money gave
nemontonno korecho?
invitation did
'You invited a man who Ram has given how much money to?'

These data contrast with data from Malayalam, discussed in Jayaseelan (2001b), where Japanese-style relative clauses can be formed in which the *wh*-element occupies the left edge of the phrase:

(86) Aarə ezhuti-(y)-a kawita waayicaa kuTTi karaññu?
who wrote REL poem read child cried
'The child that read the poem that who wrote, cried?'

It seems that the phrase headed by *waayicaa* is in the specifier of *kuTTi*, the phrase headed by *kawita* is in the specifier of *waayicaa*, and the phrase headed by *ezhutiya* is in the specifier of *kawita*. If *aarə* types [*aarə*] as +*wh*, the recursive embedding will lead to +*wh*-marking of the big phrase headed by *kuTTi*. The situation is analogous to English *whose mother's dog's flea collar*, which is also +*wh* specifier recursion. There is no need for extraction, and in fact overt extraction is blocked in any such case. The same situation holds in Bengali prenominal gerunds like in *hindi jana lok* (Hindi knowing man, 'man who knows Hindi'). Overt extraction of *hindi* by scrambling is impossible, but it can be replaced by a *wh*-phrase as in (87):

(87) Tumi [[kon bhaSa jana] lok -ke] nemontonno korecho?
you which language knowing man-ACC invitation did
'You invited a man who knows which language?'

Most plausibly, the entire phrase headed by *lok-ke* is *+wh* and can access sentential scope. No extra devices like a Q-particle seem to be needed. This impression is corroborated by the syntax of PPs. PPs are postpositional, and overt movement of the NP is impossible. Thus, the *wh*-element *kar* in (88b) or (88c) must gain scope without leaving the PP:

(88) a. *Kar$_1$ ram [t$_1$ Satte] kotha bolte cae?
who Ram with talk say wants
b. Ram [kar Satte] kotha bolte cae?
Ram who with talk say wants
'Who does Ram want to talk to?'
c. [Kar Satte]$_1$ ram t$_1$ kotha bolte cae?
who with Ram talk talk say wants

If one follows the idea that covert movement affects nothing but the *wh*-phrase proper or even nothing but the *wh*-feature (cf. Chomsky 1995c), there is a massive problem for the movement account. Covert movement would ignore a constraint that is absolute in comparison with the known gradual loss of acceptability observed in typical subjacency violations (in English). The postulation of a silent Q-morpheme that could serve as a licenser of *wh*-in-situ offers no alternative, as it would be far too unrestrictive (cf. (81) and (82–85)). If Bengali does not have a *wh*-scope marker, the conclusion must be that the island itself acquires the feature *+wh* and is subsequently moved to scope position; i.e., there is covert pied-piping. As already indicated by (88c), overt movement shows exactly this.

Bengali has a number of infinitival adjuncts which prefer to stay in clause-internal or topicalized position. Extraposition seems to be tolerable, but leads to marked constructions. These adjuncts may contain *wh*-phrases. The answers to such questions preferably repeat the island, which we have seen is a typical sign of pied-piping. Consider the examples in (89–91), where (b) is the question and (c) the answer:

(89) **Past participial (PPT) adjunct:**
a. [Bhat kheye] ronjit ghumote jabe.
rice eat-PPT Ranjit to-sleep go-will
'Having eaten rice, Ranjit will go to sleep.'
b. [Ki kheye] ronjit ghumote jabe?
what eat-PPT Ranjit to-sleep go-will
'Ranjit will go to sleep having eaten what?'
c. bhat ??(kheye).
rice eat-PPT
'(Having eaten) rice.'

(90) **Imperfective participial (IMP) adjunct:**
a. [KagojTa poRte poRte] ronjit kotha bolchilo.
paper read-IMP read-IMP Ranjit talk said
'Ranjit talked while reading the newspaper.'

b. [Ki poRte poRte] ronjit kotha bolchilo?
what read-IMP read-IMP Ranjit talk said
'Ranjit talked while reading what?'
c. KagojTa ??(poRte poRte)
paper read-IMP read-IMP
'(While reading) the newspaper.'

(91) **Conditional (COND) adjunct:**
a. [Tumi kolkatay gele] tomar ma khuSi hobe.
you Calcutta-to go-COND your mother happy become-will
'If you go to Calcutta, your mother will be happy.'
b. [Tumi kothay gele] tomar ma khuSi hobe?
you where go-COND your mother happy become-will
'If you go where, your mother will be happy?'
c. Kolkatay ??(gele).
Calcutta-to go-COND
'(If I go) to Calcutta.'

In (89b) and (90b), the *wh*-word *ki* may reside in the specifier of the adjunct; by virtue of this, the *+wh* adjunct can access a scope position. It is not so clear how this reasoning would carry over to (91b), where the *wh*-word *kothay* is not the leftmost category.

The same situation holds in (92), which involves a reason clause. It shows that *wh*-in-situ may be licensed not only in non-finite adjuncts but also in finite ones. (92) involves the final head *bole*, which here has the meaning of 'because':

(92) [[Ram kobe aSbe na] bole] tomar mon kharap]?
Ram when come-will NEG because your mind bad
'You are annoyed because Ram will when not show up?'

As we shall shortly see, the head *bole*, which can also head an argumental clause, is compatible with the interrogative force of an operator. Therefore one can assume that after local raising of the *wh*-word *kobe*, the entire *bole*-adjunct will be marked *+wh*. Thus, *kobe* does not obtain *wh*-scope by island-violating LF-movement, but rather by pied-piping the entire adjunct.[37] How it is possible that the *bole*-clause is 'recognized' as *+wh* although its complement contains a non-peripheral *wh*-word is not quite clear. It looks as if this *wh*-word can access the projection of *bole* by virtue of covert movement.

Before presenting more evidence to this effect, let us pause here and ask which form covert *wh*-movement could take, given the evidence presented so far.

5.3 What is covert wh-*movement?*

Wh-in-situ languages like Japanese have taught syntacticians a lesson that semanticists have learned from investigating the composition of generalized

quantifiers.[38] Languages which employ a Q-scope marker show explicitly what the *wh*-moving languages (mainly) hide, namely the partition between the *wh*-feature and the 'rest', which is again composed of something like an existential quantifier and a semantic restriction. In terms of Kamp's DRT and Heim's (1982) contribution to semantic theory, a *wh*-phrase being an indefinite NP would not itself carry an existential quantifier; it would rather be a variable which gets bound by some default operation such as existential closure. Ignoring this for the moment, *wh*-phrases like *where*, *which student*, or *which student of linguistics* decompose as in (93):

(93)

***Wh*-feature**	**Quantifier**	**Restrictive clause**
+wh	∃	λx time (x)
+wh	∃	λx student (x)
+wh	∃	λx student of linguistics (x)

In LF representations, these atoms of meaning have to be systematically separated. Languages which employ a Q-scope marker or *+wh*-typing morpheme have already done half the work in their visible representation by overt separation of the interrogative *wh*-feature from the rest. Languages which employ *wh*-phrases have to move them to a functional position. In the Minimalist Program (Chomsky 1995c), it is suggested that the C-head of CP may bear a feature *+wh* which attracts a *wh*-phrase whose *+wh* feature gets checked and is subsequently deleted. Movement is such that the trace left behind is actually a full but inaudible copy of the moved phrase. If what happens to the moved part also happens to the copy, checking off the *wh*-feature will lead as well to checking off the *wh*-feature in the copy. This leads to the structure in (94), where RC is short for 'restrictive clause':

(94) $[_{CP}$ ~~*+wh*~~ ∃ RC $[_{C'}$ *+wh* $[_{IP} \ldots$ ~~*+wh*~~ ∃ RC $\ldots]]]$

Assuming with Chomsky (1995c) that deletion may apply to this structure in such a way that the RC does not belong to the operator position, but rather stays in situ or elsewhere (i.e., the RC is essentially 'reconstructed'), the resulting structure is as in (95):

(95) $[_{CP}$ ~~*+wh*~~ ∃ ~~RC~~ $[_{C'}$ *+wh* $[_{IP} \ldots$ ~~*+wh*~~ ∃ RC $\ldots]]]$

Were it not for the quantifier, we would have almost the surface structure of a Japanese constituent question. If we now assume with DRT that the *wh*-phrase does not literally contain ∃, but that ∃ gets introduced by a default operation, it will disappear from both Spec, CP and the material in situ, and it will rather appear in a scope position immediately below the *wh*-operator.[39] Since indefinites are in this theory restricted variables, the ∃ in situ would be replaced by the variable x, and an existential quantifier would be inserted. Following Heim (1982: 138ff.), ∃ is adjoined to the nuclear scope of quantifiers, which we can for

concreteness take to be IP (although the nuclear scope may in various cases be smaller than that). Assume that *wh*-operator, existential operator, and restricted variable are connected by a selection index. These changes lead to the LF in (96):

(96) $[_{CP}$ ~~+*wh* RC (x)~~ $[_{C'}$ +*wh* $[_{IP}$ $\exists_1$ $[_{IP}$ . . . ~~+*wh*~~ RC (x_1) . . .]]]]

So much for the simplest kind of constituent questions formed by movement. What about *wh*-in-situ in those cases where there is no overt *wh*-scope marker? In this case the derivation starts with nothing but the *wh*-phrase. Crucially, this phrase will not be attracted by anything. But since it involves a *wh*-feature, which has been identified in section 4 as involving a disjunctive operator, this operator feature has to move to a scopal position. If it does not, the disjunctive operator will appear at the C-I interface as a meaningful but uninterpreted part. Thus, movement of this kind takes the form of 'semantically driven' movement, an option that Chomsky (1995c) tried to discard entirely. Let us here adopt the view that semantically driven movement exists nevertheless.

The next question is how the *wh*-operator proper can access a scope position. In the simplest case, the features of some lexical item could just split up, and the *wh*-feature could raise and adjoin to IP, IP being the syntactic form of the proposition and the proposition being the required scope domain. If we do not wish to introduce feature movement (Move-F) as an island-free operation, something slightly fancier must happen, at least in those cases in which we have seen a discrepancy between overt and covert movement. This brings considerations close to Nishigauchi's theory of LF pied-piping. Move-F or raising to Spec, XP within a potential island will have the effect of turning the entire island into a +*wh* phrase. This phrase, for example a Bengali PP, will undergo covert movement, again in contradiction to the Minimalist stipulation that covert movement cannot be phrasal movement, but it is now obvious why it makes sense to accept this consequence. The *wh*-phrase – and certainly an island in which it may arise – will have to fission into proper parts that allow the *wh*-feature to take scope and to type the clause in the sense of Cheng (1997). The residue, namely the restricted variable (which perhaps is inside an island), has to split off and reconstruct into its base position. This can be achieved by the copy-and-deletion mechanism Chomsky (1993, 1995c) has suggested for overt movement. The fissioning of features is not an issue in languages that employ a separate Q-morpheme in scope position and make use of unselective binding, because the *wh*-feature is already represented by an autonomous lexical element. For overt *wh*-movement, the Minimalist account proposes a *wh*-attractor in C which checks off the *wh*-feature of the attractee. Covert *wh*-movement cannot escape the prerequisites of the standard account of interrogative semantics. This can only mean that after being adjoined to IP, the moved phrase has to fission accordingly.

Let us suggest that this can be achieved by what Rizzi (1990b, 1991b) has called 'dynamic agreement' in his 'criterion approach'. The relevant part is this: if an operator-headed phrase is moved to an operator position, it must agree with a

corresponding head position. If no such head position is there, the phrase in XP-position will have to identify it. This amounts to claiming that semantically driven XP-adjunction can *create* a spec–head configuration as shown in (97), where +F stands for the relevant feature of XP that defines the dynamically created F-projection:

(97) $XP_{+F}\ [_{YP} \ldots t \ldots] \Rightarrow [_{FP}\ XP_{+F}\ [_{F'}\ F^0\ [_{YP} \ldots t \ldots]]]$

Semantically complex phrases, such as *kar Satte* 'with whom' in (88b) or *kon bhaSa jana lok* 'man who knows which language' in (87), which carry the *+wh* feature, can then adjoin to a scope domain (here YP) and identify a *+wh* projection by dynamically agreeing with a functional head. The moved phrase can fission into the *wh*-part and the 'rest', which will reconstruct in the same way as under overt movement. Also the existential closure procedure (which is a covert operation anyway) can apply in analogy to derivations with overt movement.

This implementation of covert movement is extremely close to what is believed to hold in overt movement. It is crucially free of the subjacency problem that has haunted LF theory up to Chomsky's theory of feature movement.[40] An important aspect is that this account also avoids the problems of Nishigauchi's (1990) LF pied-piping theory, which has been criticized by Von Stechow (1996) for its "non-transparent" LF. As Von Stechow pointed out, Nishigauchi's theory would have to be supplemented with additional mechanisms to arrive at what he calls a "transparent" LF. The present proposal is in fact quite close to Von Stechow's. There is an important difference, however. Von Stechow suggests pied-piping as an overt though invisible operation in the sense of Watanabe (1992b). Once the pied-piped material is in Spec, CP, the *wh*-part proper is extracted from the pied-piped island. This step, whose sole motivation rests in the desire to derive a transparent (i.e., interpretable) LF, is admittedly in violation of subjacency.[41] The conflict with subjacency does not arise for the present proposal, the crucial difference being that the *wh*-phrase proper is isolated not by movement but rather by the combination of spec–head agreement and the copy-and-delete mechanism: the pied-piped phrase must carry a *+wh* feature in order to identify a *+wh* head. This head will ultimately bind into the island which at LF appears in reconstructed position. Subjacency remains untouched.[42]

In the next subsection, data about transclausal *wh*-scope in Bengali will be presented which can be explained by covert *wh*-movement but hardly by the overly powerful device of a zero Q-scope marker.

5.4 Complement types, directionality, and wh*-scope*

Bengali is a typologically well-behaved head-final language with respect to one type of its sentential complements, but it appears to be not quite well-behaved with respect to another type. Consider the pair of examples in (98), where it is indicated that complementizers (or complementizer-like elements) can be

involved in these constructions or not, depending on certain conditions which are not central to the present discussion:

(98) a. Ora [[ram aSbe] (bole)] Suneche.
they Ram come-will (C) heard-have
'They have heard that Ram will come.'
b. Ora Suneche [(je) [ram aSbe]].
they heard-have (C) Ram come-will
'They have heard that Ram will come.'

The apparently optional C-elements are unrelated in status as well as origin: *bole* is the past participle of the verb *bola* 'to say'. Its sentence-final appearance is a natural consequence of the fact that it is a verb that has been grammaticalized into a functional subordinating head. Verba dicendi as complementizers, traditionally called 'quotatives', are an areal phenomenon and appear in all Dravidian and Eastern Indo-Aryan languages, and languages that have close contact with them. *Je*, on the other hand, is formally identical with the relativization operator *je*. There is a tendency in the languages under consideration to move such operators ('j-words') overtly to clause-initial position.[43] The two types of complements are in almost perfectly complementary distribution. While the extraposition of *bole*-complements is highly marked (and for some speakers impossible), topicalization of *je*-initial complements invariably leads to ungrammaticality.[44]

As may be expected, the two construction types are subject to different constraints. Most prominently, they differ with respect to the scope of in-situ operators contained in these complements. This is demonstrated by the scope of *wh*-in-situ. Consider first the example in (99):

(99) Ora [ke aSbe] Suneche. (Ambiguous)
they who come-will heard-have
i. 'They have heard who will come.'
ii. 'Who have they heard will come?'

As indicated by the translations in (i) and (ii), (99) can be understood either as a declarative – i.e., with the *wh*-expression having narrower scope than the matrix clause – or as a direct question – i.e., with the *wh*-expression having scope over the matrix clause. The structural ambiguity can be resolved by prosodic means. If *ke* does not carry a main accent, and there is a falling contour on *Suneche*, the declarative reading in (i) will result. If *ke* does carry a main accent, and there is a rising contour on *Suneche*, the direct-question reading results. Apart from intonation, there is no morphological sign of a surface scope marker that could guide the interpretation. Assuming that the clauses have to be typed clause-peripherally, the *wh*-item by itself could have targeted either Spec, CP of the embedded clause or Spec, CP of the matrix clause. The two readings in (99i) and (99ii) are assigned the disambiguated LF-representations in (100a) and (100b) respectively:

(100) a. Ora [$_{VP}$ [$_{CP}$ ke$_i$ [$_{C'}$ [$_{IP}$ e$_i$ aS-be]]] Sune]-che.
b. [$_{CP}$ ke$_i$ [$_{C'}$ [$_{IP}$ Ora [$_{VP}$ [$_{CP}$ e$_i$ [$_{C'}$ [$_{IP}$ e$_i$ aS-be]]] Sune]-che]]].

The same scope ambiguity is achieved when the final complementizer *bole* is present. Thus, (101) shows the same ambiguity as (99):

(101) Ora [[ke aSbe] bole] Suneche. (Ambiguous)
they who come-will C heard-have

Consider next the scope of a *wh*-operator in an embedded clause that appears to the right of the matrix verb. Only one reading is possible, namely the narrow-scope reading:

(102) Ora Suneche [ke aSbe]. (Unambiguous)
they heard-have who come-will
i. 'They have heard who will come.'
ii. NOT: 'Who have they heard will come?'

In contrast with the examples in (99) and (102), there is no way of achieving a wide-scope interpretation of *ke* by prosodic means. Even if *ke* receives the main accent and there is a rising contour, no interrogative interpretation will result.[45] There must be a strong syntactic factor that prevents a sentence such as (102) from being associated with the LF given in (103b):

(103) a. Ora Suneche [$_{CP}$ ke$_i$ [$_{C'}$ [$_{IP}$ t$_i$ aSbe]]].
they heard-have who come-will
b. *[$_{CP}$ ke$_i$ [$_{C'}$ [$_{IP}$ Ora Suneche [$_{CP}$ t$_i$ [$_{C'}$ [$_{IP}$ t$_i$ aSbe]]]]].
who they heard-have come-will

As (104) shows, the presence of *je* is always incompatible with a *wh*-element in IP:

(104) *Ora Suneche [je [ke aSbe]].

One could argue that *je* prevents the *wh*-element from raising to Spec, CP because it disallows feature sharing with *+wh*. But under this explanation it would still be an open question why the *wh*-phrase cannot take scope in a clause further up.

The scope contrast between the two clause types can also be observed in cases where the semantic selection of the matrix verb disallows interpretive ambiguity. Take *bhab-* 'think' as the matrix verb. Its subcategorization is roughly the same as for English *think*, *believe*, or for German *denken*, *meinen*, *glauben*. These verbs select a *–wh* complement, as shown by the ill-formedness of **You thought who will build a house.* Notice now the difference between (105a) and (105b):

(105) a. Tumi [[ke baRi korbe] (bole)] bhabcho?
you who house make-will (C) think
'Who do you think (that) will build a house?'

b. *Tumi bhabcho [ke baRi korbe].
you think who house build-will
*You think who will build a house.

The complement type which fits into the pattern of head-finality allows the *wh*-in-situ item to scope out of the scope of the domain of the verb *bhab-*. This is the only way of getting the sentence grammatical. Nothing of this sort seems to be possible in (105b); i.e., the 'deviant' complement forces the *wh*-in-situ element to take narrow scope. This makes the semantic selection violation unavoidable. Thus, the earlier intuitions about ambiguity are now corroborated by intuitions about grammaticality.

How can this be explained? Within the GB framework, a natural conclusion could have been that the (*je-*) clause in the position to the right of the verb is extraposed, and that as a consequence it is in an A'-position from which no extraction can take place.[46] However, there are reasons to believe that the post-verbal complement has never been anywhere else, and that it cannot have been adjoined to IP by an extraposition rule. (106) demonstrates that the 'extraposed' clause is c-commanded by NPs in the matrix clause. Otherwise the pronoun *take* could not get the attested bound variable interpretation:

(106) Tumi prottekTa cheleke$_i$ bolecho [$_{CP}$ ke take$_i$ durga pujo-Y notun
you each boy say who him Durga Puja-at new
jama kapoR debe].
clothes give-will
'You told each boy who will give him new clothes at (the festival of) Durga Puja.'

Similar data are reported from Hindi in Dayal (2000). The same must be true for (107), where the focused NP – indicated by capital letters – must be c-commanded by the focus particle *Sudhu* 'only':

(107) Ami Sudhu bolechi [$_{CP}$ je RAM aSbe na].
I only said that Ram come-will not
'I only said that it is RAM who will not come.'

Having established that the postverbal (*je-*) complement appears in its underlying position and is in all likelihood directly selected by the matrix verb, as seems to be the case in a Dutch or German *dat-/daß*-CP, let us now return to the scope of *wh*-in-situ as exemplified in (99–105). Free insertion of a zero Q-scope marker appears to be consistent with the intuitions about *wh*-scope in (99), (101), and (105a), which are repeated here as (108–110) without glosses:

(108) Ora [ke aSbe] Suneche. (Ambiguous)
i. 'They have heard who will come.'
ii. 'Who have they heard will come?'

(109) Ora [[ke aSbe] bole] Suneche. (Ambiguous)
i. 'They have heard who will come.'
ii. 'Who have they heard will come?'

(110) a. Tumi [[ke baRi korbe] (bole)] bhabcho?
'Who do you think will build a house?'

A silent typing particle or scope marker could be inserted either at the edge of the embedded (*bole-*) clause or at the edge of the matrix clause. In (108/109) we get scope ambiguity, due to the fact that the verb *Sona-* 'hear' is semantically consistent with both *+wh* and *–wh*. Insertion in the embedded clause in (110a) would, of course, lead to a clash with semantic selection by the attitude verb *bhab-*. Thus, we observe only the wide-scope reading.

The problem is how to prevent the same mechanism from applying to the constructions in (102) and in (105b), repeated here as (111–112):

(111) Ora Suneche [ke aSbe]. (Unambiguous)
i. 'They have heard who will come.'
ii. NOT: 'Who have they heard will come?'

(112) b. *Tumi bhabcho [ke baRi korbe].
'*You think who will build a house.'

There is no reason why a silent typing particle or scope marker could not be inserted in the matrix clause. This would give us the unattested wide-scope reading in (111ii) and predict grammaticality for (112b). One can be sure that such a device would give the grammar far too much expressive power. In fact, a scope 'marker' that never marks anything visibly or audibly seems to be a very odd construct to begin with.

Our suspicion would be strengthened if there still were something like a lexical reflex of *wh*-scope available in the language, and if the presence of such an item would trigger wide scope from postverbal CPs. Evidence that points in this direction is indeed available in Bengali. To see this, consider the minimal expansions of (102) and (105), seen in (113) and (114) respectively:

(113) Ora **ki** Suneche [ke aSbe]?
they Q heard-have who come-will
'Who have they heard will come?'

(114) Tumi **ki** bhabcho [ke baRi korbe]?
you Q think who house make-will
'Who do you think will build a house?'

In these examples, *ki* 'what' has been inserted in the matrix clause. Section 5.1 has already identified this element as a clause-internal optional marker for disjunctive scope.

There is a controversy over whether the *ki* in (113) and (114) and the corresponding element *kyaa* in Hindi would be properly characterized as a scope marker.[47] Both examples obviously fall under what Van Riemsdijk (1983b) has called the Correspondence Effect and McDaniel (1989) the Partial Movement construction. Dayal (1994, 2000) has argued that in Hindi – and therefore certainly in Bengali, etc., too – *ki* is in an argument position. It is a nominal that occupies the A-position that otherwise is reserved for the complement-CP. This CP, which contains the *wh*-element to obtain wide scope, is adjoined but co-indexed with *ki*. In Dayal's theory, the *wh*-in-situ item *ke* in (113) and (114) would not covertly move toward *ki*, nor would *ki* unselectively bind *ke*. Dayal rather argues that *ke* obtains wide scope by virtue of being in the CP that is co-indexed with *ki*, and by the fact that *ki* takes (local) scope over the clause in which it appears. Thus, (114) does not directly ask 'for which person x do you think that x will build a house'; this reading is rather a consequence of the semantic composition of the question (i) 'For which proposition y did you think that y is true?' and (ii) 'For which person x is it true that x will build a house?', where y equals (ii). The details of Dayal's theory are not central to the present discussion about *wh*-in-situ. For the issues at hand it is important to see, however, that once Q-scope is indicated overtly, the positioning of the complement postverbally ceases to be an obstacle to wide *wh*-scope from such clauses. This point is quite elementary, and one can remain neutral with respect to the theoretical particulars of a direct scope-marking approach or the indirect dependency approach.

Given that we find partial movement in the South Asian *wh*-in-situ languages under discussion, it is not surprising to also find overt movement. Although Bengali is in its core properties a typical *wh*-in-situ language, many speakers accept sentences with an overt displacement of a phrase into the matrix clause. The following example from Bayer (1996) is broadly accepted by native speakers:

(115) Tumi [ki oSukhe]$_i$ bhabcho [$_{CP}$ je ram t_i mara gEche]?
you which illness-of think that Ram die went
'Of which illness do you think that Ram died?'

Such movement is never possible from adjoined clauses, i.e., from CPs with an expletive correlate (*e kotha* 'this news' or 'this story') or from pure adjuncts. This is shown in (116a) and (116b):

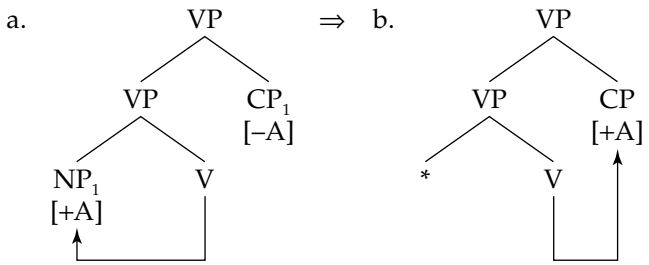
(116) a. *Tumi [ki oSukhe]$_i$ [e kotha]$_j$ bhabcho [$_{CPj}$ je ram t_i mara gEche]?
b. *Ke$_i$ tumi k:adcho [karon t_i mara gEche]?
who you weep because die went
*'Who are you weeping because died?'

Overt movement in (115) shows that the postverbal complements from which we have seen *wh*-in-situ elements cannot attain wide scope are truly arguments and must be L-marked by the matrix predicate, although they appear in an atypical

position. The ban on wide scope of *wh*-in-situ in (111) and (112) thus cannot be attributed to the purported adjunct status of the complement CP.

Bayer (1996, 1997) argues that the constraint on *wh*-scope follows from the fact that the CP in right-hand position is exceptionally selected by virtue of deletion of the expletive nominal that seems to be responsible for the appearance of such clauses in the first place. Once the licensing element is deleted, the adjoined CP acquires argument status by now being directly L-marked by the matrix predicate. This process, which amounts to the shifting of the argument position, seems to be highly motivated and diachronically rooted not only in Indo-Aryan but also in West Germanic. The transition is as in (117), where A stands for 'argument', * for the deletion site, and the arrow for L-marking:

(117) **A-Shift:**



Given the assumption that head-final order is a possible word-order choice and is not necessarily derived from head-initial order, as suggested by Kayne (1994), the VP in (117b) that results from A-shift can be argued to constitute a barrier for movement in head-final languages. The verb in head-final languages L-marks its object to the left. L-marking to the right as in (117b) is exceptional.[48] If, as a result of this, VP becomes a barrier, the ban against wide scope of the *wh*-in-situ element in (111) and (112) follows. Self-driven movement will target the closest available scope position, a position which may be a specifier created in the derivation, as in (97). Under this view, wide scope can only be made possible if the numeration involves an attractor.

This is the case in overt movement, as in (115). Assume that (115) involves some feature +F in a functional position associated with the matrix VP, not necessarily a *+wh*, since *–wh* phrases may also move in this fashion. This position, which has the qualities of an A-position, must be lexicalized, and it can be lexicalized if it overtly attracts a +F phrase. The CP from which the *wh*-phrase moves is L-marked, thus not an island. Transclausal movement in languages of that type appears to be different from movement into clause-peripheral positions, such as Spec, CP. The landing site is clause-internal (although scrambling operations may apply in addition). Thus, transclausal movement leads into an 'in-situ' position, and not to a typical *wh*-operator position, which would automatically type the clause as a *+wh* CP.[49] If this is correct, actual scoping must still follow this process of overt displacement. (115) would end up with the LF in (118), where overt movement is indicated with a solid and covert movement with a broken line:

(118) $[_{CP}$[ki oSukhe]$_1$ $[_{C'}$ +*wh* $[_{IP}$ tumi $[_{FP}$ $t_1$$[_{F'}$ +F $[_{VP}$ bhabcho $[_{CP}$ je ram t_1

mara gEche]]]]]]]

By assumption, the matrix clause of (111) does not contain an appropriate feature. Self-driven LF-movement would have to target Spec, CP of the matrix clause without first going through FP. This is, however, made impossible due to the barrier status of the matrix VP. In (119), the VP barrier is set up by the verb's exceptional L-marking, which blocks wide scope of *ke*:

(119) $[_{CP}$ [ke]$_1$ $[_{C'}$ +*wh* $[_{IP}$ tumi $[_{VP}$ bhabcho $[_{CP}$ je t_1 baRi korbe]]]]]

The so-far-established view of SOV word order and *wh*-in-situ has been challenged by Simpson and Bhattacharya (2000, 2003). Following Kayne's (1994) proposal of a universal spec–head–complement order, Simpson and Bhattacharya suggest that the position which hosts the *wh*-phrase in Bengali is in fact "high in the C-domain as in other languages" (2003: 140). *Wh*-phrases move into this focus-related Spec, CP. Thus, no further (covert) movement is required. But why does it still look as if the *wh*-phrase were in situ? The reason is that, according to Simpson and Bhattacharya, the true nature of the *wh*-phrase is "heavily disguised" by remnant material moving still higher than the *wh*-phrase. The wide-scope interpretation of *ke* in (108) – i.e., reading ii – would be derived as follows:

(120) a. [ke aSbe] Raise *ke* to Spec, CP →
who come-will

b. $[_{CP}$ ke_1 $[t_1$ aSbe]] Merge *Suneche* →
who come-will

c. Suneche $[_{CP}$ ke_1 $[t_1$ aSbe]] Merge subject →
heard-have who come-will

d. ora Suneche $[_{CP}$ ke_1 $[t_1$ aSbe]] Raise CP to Spec, CP →
they heard-have who come-will

e. $[_{CP}[_{CP}$ ke_1 $[t_1$ aSbe]]$_2$ [ora Suneche t_2]] Raise subject →
who come-will they heard-have

f. $[ora_3$ $[_{CP}[_{CP}$ ke_1 $[t_1$ aSbe]]$_2$ $[t_3$ Suneche t_2]]]
they who come-will heard-have

As one can verify in this derivation, the CP in (120b) is +*wh*, and *ke* is in a proper scope position. Pied-piping the entire +*wh* CP into the specifier of the dominating CP, as in (120e), will turn this CP into a +*wh* CP. The word order observed in (108) is achieved by raising the subject (which may be +topic) to some higher position. Thus, wide-scope *wh* is achieved without movement of the *wh*-word proper but rather by clausal pied-piping. The narrow scope of *ke* that has been observed in (111) and (112) is the result of the +*wh* CP not undergoing raising to Spec, CP of

the dominating CP. For wide scope to be blocked in (108) (i.e., reading i), the agreement mechanism in Spec, CP has to be interrupted by prosodic means, which have already been mentioned in the text following (99).

Simpson and Bhattacharya's proposal is interesting because it seems to rest on more parsimonious assumptions than previous accounts: there is no word-order parameter. Bengali is underlyingly like English. There is no covert movement of *wh*-phrases or -features, there is only overt movement (cf. Kayne 1998). On the other hand, various new questions arise:

(i) How can one speak of clause-peripheral typing in the sense of Cheng (1997) if the *wh*-phrase is linearly next to the verb and can be preceded by any amount of residual material in the clause which seems in no obvious way displaced?

(ii) If the *wh*-element must be in a focus position (which is assumed to be associated with Spec, CP) in order to gain scope, how can it still undergo scrambling or even be base-generated in a position which is remote from the verb, as is often the case?

(iii) Given that *wh*-phrases in Spec, CP have reached a scope position and can therefore not be 'absorbed' (cf. Baker 1970), how is it possible that (121) is grammatical and therefore must allow a multiple question reading?

(121) Ke bhabchilo [je ronjit ka -ke bhalobaSe]?
who thought C Ranjit who-ACC loves
'Who thought that Ranjit loves whom?'

Kayne (1998: 173) realized that multiple *wh*-questions may pose a problem for his overt-movement account. He suggests that the scope of the 'in-situ' *wh*-phrase is reached by overt movement of an empty operator which is associated with this phrase. One prediction that Kayne makes is that scoping by empty operator movement, which in his system is overt movement, should be possible only from domains from which PF-visible overt movement can take place. As (115) shows, the *je*-CP is exactly such a domain. The device which is suggested will then predict that the *wh*-phrase in (111) can take wide scope. This prediction is wrong. So the problem of how to account for multiple questions as in (121) remains.

(iv) From languages like English and German, it is clear that material in Spec, CP disallows subextraction. As shown in Bayer (1999b), however, this is possible from the purported Spec, CP position in Bengali.

(v) It is largely unclear what the trigger could be for the remnant material which has to move, often recreating what has been identified as the unmarked SOV order.

(vi) Related to the last point are questions about learning and parsing, because the predicted structures involve far more movements than assumed so far. If the proposed movements have any relation to the parser, there will be predictions about linguistic performance (acquisition, on-line comprehension, aphasic language, etc.), according to which *wh*-in-situ is tougher than overt

wh-movement without disguising remnant movement. Such predictions do not in all likelihood conform to empirical findings.

It looks as if Simpson and Bhattacharya's proposal is the beginning of an interesting new alternative to covert *wh*-movement. At the moment, however, it suffers from certain problems, which may well be overcome once the nature of SOV languages and especially the spec–head relation are better understood.

5.5 Summary

Where does this leave us? Our earlier discussion about multiple questions in *wh*-moving languages as well as *wh*-in-situ languages has shown that much of the burden of former LF-movement and its problematic status in syntactic theory can be shifted to unselective binding, i.e., to a mechanism that does not require movement. The discussion of *wh*-in-situ in Bengali, a language that is representative for relevant aspects of grammar that are found in various other South Asian languages as well, has shown that the world might be a bit more complex. The scope of *wh*-in-situ elements is not as free as could be expected under island-free scope. In fact, *wh*-scope seems to be under the control of subjacency. We have in addition seen that the language does not have any overt *wh*-scope marker or typing particle like Japanese. If these two facts allow us to draw conclusions, the conclusion should be that Bengali *wh*-in-situ reaches scope by covert movement.

A proposal has been made as to how scoping may take place. The proposal was more concrete in the details of *wh*-head identification and reconstruction than in the aspects of movement proper, intermediate landing sites, etc. What has been arrived at is a proposal that keeps overt and covert movement together as closely as possible. The LF representations that are achieved by both types of movement and the copy-and-deletion mechanism, which are assumed to apply uniformly, resemble the LFs achieved by unselective *wh*-binding in all the relevant details. At LF the different scoping strategies collapse into a single form that consists of a *+wh* head which types the clause and marks the scope of the interrogative, a restricted variable, and an existential operator that binds this variable.

Although Bengali and closely related languages are said to be *wh*-in-situ languages, the language seems to freely make use of other scoping strategies too. Bengali employs some version of partial movement as well as overt movement. Interestingly, both strategies enter the picture exactly where covert *wh*-movement is inhibited. Scoping by partial movement or overt movement is not used in those complements which are typologically 'well-behaved', i.e., in (*bole*-) clauses in canonical preverbal position, although scrambling from *bole*-clauses is certainly possible.[50] *Wh*-scope from these complements seems to rest entirely on covert movement. If Simpson and Bhattacharya are right, *wh*-elements in preverbal position have taken scope exactly where we see them, and no further process is necessary.

A mixed picture of *wh*-scoping is not unusual at all. Wahba (1991) has shown that Iraqi Arabic can use overt movement, covert movement, and partial movement

side by side. Cole and Hermon (1994) discuss evidence from a variety of languages which suggests that the scoping strategies are much less homogeneous across closely related languages and even within a single language than syntacticians working in GB theory have assumed. They observe that Imbabura Quechua has overt *wh*-movement, while Ancash Quechua has either overt or covert *wh*-movement. In Ancash Quechua both (122a) and (122b) are possible:

(122) a. May-man-taq$_i$ [José munan [María t_i aywanan -ta]]?
where-to-Q José wants María will-go -ACC
'Where does José want María to go?'
b. [José munan [María may-man$_i$ aywanan -ta]]?
José wants María where-to will-go -ACC
'Where does José want Maria to go?'

In (122a), the Q-morpheme *taq* seems to be responsible for the attraction of the *wh*-phrase *may-man*. In (122b), no such morpheme appears. Cole and Hermon observe both subjacency and ECP effects in Ancash overt movement, but no such effects in the in-situ cases. Their conclusion is that the latter involve a silent Q-particle which is located in C(OMP) and unselective binding. Following Aoun and Li (1993c), they assume a null *wh*-operator in Spec, CP which binds the in-situ phrase in the sense of variable binding. Nevertheless, internally headed relatives in Ancash Quechua do show island effects. Cole and Hermon argue that for interrogatives the language has a zero *wh*-operator which allows '*wh*-indexing', essentially making movement superfluous, while it lacks a corresponding operator for internally headed relatives. Thus, scope must be achieved in relatives by covert movement.

The discussion of *wh*-movement, partial *wh*-movement, and *wh*-in-situ in Cole and Hermon (1998b) focuses on Malay, a language where all three types seem to coexist peacefully. According to their analysis, *wh*-in-situ is licensed by a visible or invisible operator which serves as an unselective binder. But why should the language make use of the other two options – full as well as partial movement – in addition? Cole and Hermon suggest that the variation reduces to certain lexical options which exist in Malay but not in pure in-situ languages, such as Chinese, or in pure movement languages, such as English. Pure movement languages have *wh*-words of the form [OP+Var] – i.e., lexical combinations of operator and variable features – whereas pure in-situ languages have only [Var] type pronouns – i.e., pronouns which lack the operator feature. This would explain why they do not undergo movement but have to rely on an external operator. Malay is said to involve both options: the feature OP either stems from the lexicon as part of the relevant pronoun, or is generated separately in Spec, CP, in which case the pronoun is a variable that gets bound by OP. This leaves the third option, partial movement. Here one can observe island effects not only between the trace and the spelled-out operator, but also between the spelled-out operator and its ultimate scope position.[51] The partial movement chain is island-sensitive by definition. The covert chain results, according to Cole and Hermon,

from the fact that there is an expletive which must be replaced by covertly moving the OP-feature of the head of the overt chain upwards. They also consider the possibility that OP-movement is forced by the Proper Binding Condition. In any of these cases, island sensitivity is predicted.

The discussion of *wh*-in-situ in South Asian languages suggests three things. First, languages are unlikely to always fall into the simple +/− *wh*-movement parameter that the linguistic theory of the 1980s had suggested. Mixed strategies seem to exist, for some of which one might want to explore to what extent they interact with variations in word order. Second, a uniform account of *wh*-in-situ in terms of unselective binding by a Q-particle runs the risk of importing too much permissivity. Especially where one cannot observe an overt sentence-peripheral Q-morpheme that could function as an unselective binder, one may want to take a close look at the morphosyntax of the variables that are supposed to get bound. In various cases there might be good reasons for them to still undergo movement, although this movement would be abstract or, for that matter, overt but disguised by other factors. Third, at least in those cases where subjacency effects can be observed, movement operations seem to be involved. It is likely that for the grammar of *wh*-in-situ, licensing by unselective binding and licensing by covert movement may not be very different. The difference seems to largely reduce to the morpholexical inventory of the language.

6 Conclusion

The present survey of *wh*-in-situ has taken its start from ideas which were central to GB theory and which still have an influence on current theorizing. The main points were that there is a parameterization that splits languages into *wh*-moving and *wh*-in-situ languages, that *wh*-scope is always reached by movement which may be either overt or covert, and that the latter is not under the control of subjacency. It has later been shown that it is far from obvious that in all cases of *wh*-in-situ, the *wh*-phrase in situ has to move. The innovation came from two sides: (i) from the idea that more than the *wh*-phrase proper may undergo movement – i.e., the pied-piping which can be observed in overt movement could as well be assumed for LF-movement; and (ii) from the insight that a *wh*-phrase is composed of elements that may not be co-represented in one and the same phrase across languages. According to this line of thought, the interrogative force may rest in a clause-peripheral functional position, while the element in situ is not an interrogative operator at all, but rather a kind of variable that is in construction with the peripheral interrogativizer. Another option could be that the element in situ is indeed a *wh*-phrase, whose interrogative potential can, however, not be activated unless it moves to a scope position where it can also identify an interrogative head. The shift from GB syntax to Minimalism introduced the concept of derivational economy, which takes movement to be a last-resort operation that is needed for convergence in core syntax. Movement is

reduced to feature movement, unless (PF-)convergence forces generalize Pied-Piping. In order to explore the space between *wh*-in-situ and alternative possibilities of *wh*-scoping, the Indo-Aryan language Bengali was chosen. Languages like Bengali are interesting for a number of reasons:

(i) They normally do not have an overt clause-peripheral Q-particle (comparable to Japanese *ka* or *no*).
(ii) Although they are strictly head-final languages, they show postverbal CPs in certain types of relatives and clausal complements. Together with certain kinds of adjuncts, these are strict islands for *wh*-in-situ, a fact which can hardly be explained under the assumption of a generally available mechanism of unselective binding by an ever invisible Q-particle or by overt movement of an empty operator.
(iii) They allow – to some extent – for both overt and partial movement. Typically such movement is seen where abstract scoping is blocked. On the basis of this evidence, it was suggested that there may be different kinds of movement in one and the same language.

Revived interest in word order, which has received an important impulse through Richard Kayne's work, is likely to uncover much about *wh*-scope and *wh*-in-situ which has so far escaped proper understanding. The variation around the syntax of *wh* will certainly stay with linguistic research for a long time.

NOTES

1 The discrepancy between overt and covert movement with respect to subjacency is not the only unattractive aspect of the classical LF-theory. If covert *wh*-movement could move the entire *wh*-phrase to COMP, we would expect a repair of the Principle C violation that exists in sentences in which a pronoun c-commands a co-indexed name. This is not the case, however, as (i) shows. Only overt movement as in (ii) will repair the defect (see Comorovski 1996: ch. 4 for discussion):

(i) *Who said that he_1 liked [how many pictures that $John_1$ took]?

(ii) [How many pictures that $John_1$ took] did you say that he_1 liked?

2 *De* is roughly speaking a functional element that turns the phrase to its left into a modifier of the phrase to its right.
3 Due to the fact that Japanese is a pro-drop language, the dative can be missing.
4 Notice, however, that there are also examples like Ross's (1986) widely known:

(i) the report [[the height of the lettering on the covers of which]$_1$ the government prescribes t_1]

for which it is unclear why it would not be blocked by:

(ii) the report [[which]$_1$ the government prescribes the height of the lettering on the covers of t_1].

5 Something similar is proposed by Von Stechow (1996). The difference is that – partially following Watanabe (1992b) – Von Stechow suggests that there is pied-piping but that it is still an operation of overt movement, 'invisible overt movement', so to say. At LF, the operator proper is moved out of the pied-piped phrase. For instance, the operator *nani-o* of (15) would have to appear in the specifier of the Q-operator ('interrogativizer') *no*.

6 Examples abound in the Germanic languages. In English we find *which*-relatives next to *that*-relatives. The same is true for German w-relatives vs. d-relatives. Consider also *was*/*wos* in the relatives of Southern German dialects as well as in Yiddish (cf. Lowenstamm 1977) or *pu* 'where' in modern Greek. *Wh*-words which are not in the scope of an interrogative head usually adopt extra morphemes in order to count as indefinite pronouns. Consider here German, which is in this respect more consistent and richer than English:

(i)	a.	wer	'who'	irgendwer	'someone'
	b.	was	'what'	irgendwas	'something'
	c.	wann	'when'	irgendwann	'sometime'
	d.	wo	'where'	irgendwo	'somewhere'
	e.	wohin	'where-to'	irgendwohin	'somewhere-to'
	f.	woher	'where-from'	irgendwoher	'somewhere-from', etc.

Interestingly, many of the pure w-words (from the left-hand column) can be colloquially used as indefinites even though the disambiguating morpheme *irgend* is missing. Examples are given in (ii):

(ii) a. Ich habe schon **wen** gesehen, der den neuen Roman von Grass hatte.
'I have already seen someone who had the latest novel by Grass.'
b. Wenn **wer** anruft, sag ihm, ich sei nicht zuhause.
'If someone calls, tell him that I am not at home.'
c. Vielleicht sind sie **wohin** gefahren, um einzukaufen.
'Perhaps they went somewhere to go shopping.'

This phenomenon, to which we will return, seems to be extremely wide-spread. Cf. Haspelmath (1997) for a typological investigation.

7 Cf. Jayaseelan (2001b).

8 In (15), *-no* has a similar function.

9 We have already seen similar examples from German; cf. note 6.

10 Almost the same is found in Malayalam, a genetically unrelated Dravidian language. As Jayaseelan (2001b) and Hany Babu (1999) point out, *-um* as in *John-um Bill-um* 'John and Bill', resembles Japanese *-mo* and is conjunctive, while *-oo*, as in *John-oo Bill-oo* 'John or Bill', resembles Japanese *-ka* and is disjunctive.

11 Consider German *nichts*, which derives from OHG *niwiht*, which decomposes into NEG+(some)thing.

12 Many languages form yes/no questions with disjunctive tags such as 'or not', 'did(n't) XP', etc. Swiss-German simply uses the tag *oder* 'or', which seems to be an elliptic and grammaticalized form of *oder nicht* 'or not'. Highly suggestive is also the

English *wh*-operator *whether*, which stems from *wh+either*. Cf. Higginbotham (1993: 217ff.) for discussion of the semantics of disjunctive questions with *whether* as decomposing into *wh*, *either*, and *or*. One should note that the application of a tag imposes a bias toward an affirmative answer in certain languages but not in all.

13 The semantics sketched here is compatible with the standard analyses in Hamblin (1973) and Karttunen (1977), but especially with the partition approach initiated by Groenendijk and Stokhof (1982); see also Higginbotham (1993), as well as Bayer (2004), where new evidence for the appropriateness of this approach is discussed.

14 Cheng's clausal typing hypothesis implies that all languages are alike in requiring a morphology-based assignment of a clause to the *+wh* type, if the clause should count as a *+wh* clause. Either the clause is typed by a *+wh* head (as is the case in Japanese) or it is identified as *+wh* by virtue of *wh*-movement to Spec, CP. Typing by covert movement is excluded. Where we see no relevant morphology, there must be a zero *+wh* head. We shall return to the latter proposal.

15 Similar restrictions seem to hold for German *warum* 'why'. German allows, under certain discourse conditions (D-linking; see below), in-situ questions. In this case, (i) sounds more awkward than (ii):

(i) ??Du bist warum nach Patmos gefahren?
you have why to Patmos gone

(ii) Du bist aus welchem Grund nach Patmos gefahren?
you are for which reason to Patmos gone

Notice on the other hand that German readily allows *warum* in situ in multiple questions. The following stretch of text about the role of Goethe institutes appeared in *Die Zeit* (19 August 1999):

(iii) Was ist überhaupt deutsche Kultur? Wem will die Bundesregierung sie
what is actually German culture whom wants the central-government it
warum nahebringen?
why near-bring
'What is German culture actually? Who does the government want to familiarize with it why?'

According to published judgments on English, *why* in situ should always be excluded. For a discussion of the largely unclear behavior of *why*, see Hornstein (1995).

16 That the ECP is not precisely the right instrument is suggested by the fact that *pourquoi* could be moved locally and therefore antecedent-govern its trace.

17 We will introduce D-linking in more detail below.

18 The same holds at least for English and German, where non-echo *wh*-in-situ is possible under certain circumstances:

(i) a. How are you?
b. *You are how?

(ii) a. Wie geht es dir?
b. *Dir geht es wie?

In German it would be absolutely natural to use a *wh*-in-situ question with *wie*, as in (iii), in a context in which the health of a person is already under debate:

(iii) (having spoken about the interlocutor's health or possible influences on it, say, by taking a certain drug)
. . . und danach ist es dir wie gegangen?
. . . and then it went with you how?

19 Notice that German, which we have seen allows *warum* in situ, behaves exactly the same. *Warum* cannot appear in an island, while *aus welchem Grund* can:

(i) Wer kennt Leute, die aus welchem Grund/*warum kriminell wurden?
who knows people who for which reason/why criminal became

20 In the discussion of Japanese syntax, further motivations for movement have been brought up on the basis of visible subjacency effects. These have been relegated to the overt movement of a zero operator rather than to covert movement; cf. Watanabe (1992b).

21 Doubts about the appropriateness of an ECP account with respect to adjunct movement were already uttered in Nishigauchi (1990: 97), in connection with the observation that *naze* turns out to be acceptable in certain complex-NP environments (which are not introduced here), and that this is unexpected under the ECP theory.

22 Cf. Higginbotham and May (1981) and the shorter outline in May (1985: ch. 1). As Von Stechow (1996) emphasizes, *wh*-binding alone is not sufficient. The indefinite that corresponds to the *wh*-in-situ element must be turned into a variable at LF. This is standardly done via binding by an existential quantifier, an operation that seems to be independent. The question is whether it should be characterized as syntactic movement or not. We will return to this question.

23 In French it would be *diable*, in German *zum Teufel*.

24 Largely the same constraints can be observed in German clauses with modal particles (PRT) such as *denn*, *doch*, *halt*, *ja*. These words can only appear in root clauses or in embedded clauses that may represent reported speech. In all other contexts they are extremely awkward. The following examples may serve as an illustration:

(i) a. Wo habt ihr **denn** übernachtet?
where have you PRT spent-the-night
b. Du bist **ja** verrückt!
You are PRT crazy

(ii) a. Sie wollten wissen, wo wir **denn** übernachtet hätten.
they wanted (to)know where we PRT spent-the-night had_{SUBJ}
b. Sie sagten, daß ich **ja** verrückt sei, wenn ich sie heiraten würde.
they said that I PRT crazy be, if I her marry would

(iii) a. *Es ist unklar, wo sie **denn** übernachtet haben.
it is unclear where they PRT spent-the-night have
b. *Sie bedauerten, daß ich **ja** verrückt bin, wenn ich sie heirate.
they regretted that I PRT crazy am, if I her marry

The relevant point here is that it is unclear how the cases in (ii) should be analyzed in terms of PRT-raising in any clear sense of operator movement. Since the intensifier

construction rests on the same constraints, the simplest conclusion should be that it does not involve raising either, and that the problem is actually orthogonal to the establishment of an operator-variable chain.

25 One should notice here that not all quantifiers can act as generators. No pair-list answer is possible in response to (i):

(i) What did many/most/no people bring?

26 Cf. Grewendorf and Sabel (1994), as well as Bayer and Kornfilt (1994), among others, for details.

27 Since I disagree with her judgments, I put them in brackets.

28 How this Q-operator is syntactically represented is a matter of debate. Koopman (2000a) adopts an idea of Dominique Sportiche's, according to which there is a silent Q-head which gets identified by moving the IP it selects to its specifier. One could also think about an analysis in which interrogative intonation is directly responsible for the possibility of *wh*-in-situ in languages that usually move their *wh*-elements.

29 This can in no way mean that the WCO account is free of problems, of course; cf. Haider (2000d) for critical discussion of the fact that superiority and binding violations do not always go hand in hand. Discussion of this would go beyond the scope of this chapter.

30 Consider the following examples, the second of which is from Farkas (1981):

(i) *We showed [an architect [who built [*every house in this area*]$_1$]] its$_1$ basement.

(ii) Each student has to come up with [three arguments [which show [that [*some condition proposed by Chomsky*] is wrong]]].

The universally quantified NP in (i) is unable to bind the pronoun *its* for the obvious reason that it cannot be raised from the complex NP in which it occurs. The indefinite NP in (ii) can obviously be raised out of a similar island. The case at hand is particularly interesting, as it has a natural reading according to which the indefinite is not specific: for each student there can easily be a different condition by Chomsky for which he or she has to find three arguments which show that it is wrong. This shows that the island-free scope of indefinites cannot be reduced to their name-like behavior (specificity). For further discussion of the scope of indefinites see chapter 74.

Reinhart (1997: 336) suggests that a universally quantified NP can be QRed out of its CP, but not out of a complex NP. Her examples are:

(iii) A doctor will make sure [that we give every new patient a tranquilizer].

(iv) A doctor will examine [the possibility [that we give every new patient a tranquilizer]].

If the universally quantified NP can take the indefinite of the matrix clause in its scope, the question remains, however, why a bound variable interpretation, as indicated in (v), is still unavailable or at least very hard to get:

(v) ?*His$_1$ doctor will make sure [that we give [every new patient]$_1$ a tranquilizer].

See in this connection also the examples in note 1.

31 As is widely known, any theory has to cope with the reconstruction problem that is visible in examples like:

(i) [Which picture of himself$_2$]$_1$ does John$_2$ really like t$_1$?

where it must be guaranteed that the anaphor is bound by *John* although it appears outside its c-command domain. Chomsky (1995c) gets rid of reconstruction by allowing the moved phrase to remain as a copy in situ. Different deletions apply to the copy representation at the two interfaces respectively. At the A-P ('articulatory-perceptual') interface, the in-situ copy is deleted, while at the C-I interface everything but the *+wh* operator feature is deleted, whereas the operator part is deleted from the copy. Thus, the restrictive phrase is automatically in situ and the anaphor can be standardly bound. This is shown in (ii), a representation which appears to be extremely close to what we have seen as the standard format for interrogatives in *wh*-in-situ languages like Japanese, which employ a Q-scope marker:

(ii) [Which ~~picture of himself$_2$~~] does John$_2$ really like [~~which~~ picture of himself$_2$]?

32 For independent remarks on Reinhart's argument against the in-situ interpretation of the restrictive term, see Pesetsky (2000: 110f.).

33 Examples are given in (i) and (ii); they can, however, appear only in the scope of negation:

(i) ke ('who') + o ⇒ keu ('someone', nom.)

(ii) ka + o + ke ⇒ kauke ('someone', obj.)

See also note 6.

34 A subcase of this would be 'overt' movement of a zero operator, as Watanabe (1992b) has suggested. We will briefly turn to this possibility in section 5.4.

35 (81b) should improve if the matrix clause contains another *wh*-element not in an island. In that case we get a multiple question, as shown in (i):

(i) Kar mon kharap [karon ke durga pujay aSbe na]?
whose mind bad because who Durga-Puja-at come-will NEG
'Who is annoyed because who will not show up for Durga Puja?'

There is, in fact, an improvement, indicating that *kar* can scope-license the *ke* in its island.

36 For details, consider the treatment of correlatives in Hindi in Srivastav (1991b).

37 That non-arguments allow for the percolation of a *wh*-feature is attested in adjoined PPs, but also in predicates, as the following rather puzzling German example from Trissler and Lutz (1992) shows, in which a *wh*-adverb pied-pipes the past participle along:

(i) [Wie schön geschrieben]$_1$ muß man t$_1$ haben, um eine Eins zu bekommen?
how beautifully written must one have to a one to get
'How beautifully does one have to have written in order to get an A?'

38 To be fair, with respect to negative quantifiers the point was seen at least as early as Jespersen (1924) and Bech (1955), i.e., long before the advent of contemporary linguistic semantics.

39 For both the moved *wh*-phrase and *wh*-in-situ items, we must assume that the position of the existential quantifier is identified by the *+wh* complementizer. As Jayaseelan (2001b) argues, the *wh*-operator (in his case the Malayalam interrogativizer *-oo*) must take the highest position, which he identifies as the head of ForceP, because the clause has to be identified as a question. More semantically motivated reasons for the same ordering effect come to mind readily.

40 It is conceptually more attractive than implementations that divorce overt and covert movement by attributing only overlapping but not isomorphic constraints to them. Since the pied-piping phenomenon is so ubiquitous in language, it can hardly be circumvented in the grammar of covert movement unless the discrepancy between overt and covert movement is taken to be axiomatic.

41 Cf. Von Stechow (1996: 84f.) as well as note 5; recall also that a similar proposal has already been made by Fiengo et al. (1988). See the comments in section 3 above.

42 For independent motivation concerning the syntax of focusing particles and negation, see Bayer (1996).

43 Various native speakers find fronted relative operators better than in-situ operators, but basically also tolerate the latter. Bal (1990: ch. 3.4) reports that in Oriya, which is closely related to Bengali, fronting of j-operators is obligatory as soon as the relative appears in extraposed position:

(i) a. [Jadu jaahaaku maarithilaa] se aaji aasiba. (Unextraposed (correlative))
Jadu whom had-beaten he today will-come
'He whom Jadu had beaten will come today.'
b. *Se aaji aasiba [jadu jaahaaku maarithilaa]. (Extraposed)
c. Se aaji aasiba [jaahaaku jadu maarithilaa]. (Extraposed)

Srivastav (1991c: 199) gives examples from Hindi in which the j-operator has moved to the left of the complementizer *ki*, a position which is readily analyzed as Spec, CP. Her example (26b) appears in (ii):

(ii) ek laRkii [jis-ko [ki sab pasand karte hai]]
one girl who-ACC that all like AUX
'a girl whom everybody likes'

Chung et al. (1995) analyze cases of sluicing such as *Someone called but I don't know who* as *wh*-movement plus copying of the antecedent IP (including the indefinite, which they take to be a DRT-type variable). If they are right, Bengali must allow overt *wh*-movement in its postverbal complements. Notice that the language allows sluicing, as shown by the examples in (iii):

(iii) a. Kono Ek-jon aSbe, kintu ami jani na ke.
some one-person come-will but I know NEG who
'Someone will come but I don't know who.'
b. Amake Ek-jon-er Satte kotha bolte hobe, kintu ami jani na
me one-person-GEN with talk speak be-will but I know NEG
ka-r Satte.
who-GEN with
'I will have to talk to someone, but I don't know to who.'

See Merchant (2000) for a proposal that would allow cases of PP pied-piping as in (iiib) to be covered in the Chung et al. account.

44 See Bayer (1999b) and references therein for various details which cannot be provided here.

45 This effect seems to be without exception in all South Asian languages which show postverbal CPs.

46 See Mahajan (1990) for argumentation along these lines with respect to Hindi *ki*-clauses, where the scope of *wh*-phrases is constrained accordingly. Mahajan argued that the *ki*-complement originates as a left sister of V, and that overt extraction is possible from there. After the complement is (obligatorily) extraposed, it is in an A′-position. The S-structure that has been reached would then disallow LF-movement from the extraposed CP.

47 The interested reader is referred to individual contributions in Lutz et al. (2000); see also Sabel (1998: ch. 4).

48 It is not exceptional in head-initial languages, of course, with serious consequences. See Bayer (1996) for cross-linguistic evidence with respect to transclausal scope.

49 Sabel (1998) suggests a feature-based parameterization according to which languages can choose between a ±strong *wh*-feature and a ±strong focus feature. According to Sabel, an in-situ language like Bengali, which shows *wh*-movement to a quasi 'in-situ' position, would have a +strong focus feature but a –strong (weak) *wh*-feature. According to conventional assumptions, some movement to a *wh*-scope position would in this case still be required.

50 Relevant data – not only from Bengali – can be found in Bayer (1999b).

51 Consider the following contrast between overt, covert, and partial movement types of scope from a relative clause, where the intended reading should be a direct question:

(i) *Di mana$_i$ [kamu fikir [Ali suka [perempuan yang tinggal t$_i$]]]?
at where you think Ali like woman who lives
'You think Ali likes the woman who lives where?'

(ii) Kamu fikir [Ali suka [perempuan yang tinggal di mana]]]?

(iii) *Kamu sayang [perempuan yang Ali fikir [apa$_i$ yang telah makan t$_i$]]?
you love woman that Ali thinks what that already eat
'You love the woman who Ali thinks ate what?'

and unselective binding, V.379, V.386, V.387–407, V.424, V.426
wh-in-situ languages, III.285–7, III.291–2, III.455, IV.486
Bengali case study of *wh*-scope, V.407–26, V.427
vs. *wh*-moving languages, V.377–8, V.381–2, V.387, V.425, V.426, V.427
wh-Island Constraint, I.334, I.599, II.402, II.421, V.381
effects, III.287, III.313, III.316, III.465
immunity, IV.99–100
and *wh*-questions, III.279, III.280
wh-islands, IV.481, IV.500–1, IV.504, IV.505, IV.510, IV.527
extraction, IV.494, IV.496
PP-extraction, IV.487–8
weak, IV.482, IV.487, IV.493, IV.512–13
wh-movement, III.283, III.306, III.341, III.427, III.446, IV.8, IV.573
Chomsky, I.286, I.287, I.603–5
Clitic Left Dislocation (CLLD) and, II.678–81
and Comparative Subdeletion, I.603–7
covert, V.412–15
empty operators, III.440
focus movement like, II.274, II.297–316
Germanic, III.577, III.581
long-distance, III.450
overt, III.454
in overt and covert syntax (GB model), V.380
and past participle agreement, III.500–2
and pied-piping, III.571–2, III.578–86
question formation, V.376–7
of relative pronoun, II.339, II.359
and simple partial movement, III.441
wh-phrases, III.449
see also A′-movement; partial *wh*-movement
wh-moving languages, vs. *wh*-in-situ languages, V.377–8, V.381–2, V.387, V.425, V.426
wh-phrases, III.478, V.376
bare, III.635–6
CATEGORY value, IV.278–9
CONTENT value, IV.278–9
D-linked and non-D-linked, V.391, V.394–402
as indefinites, V.402–3, V.413
LF-scope position, III.438, III.439–40, III.442, III.444, III.449
long-distance dependency, III.448
movement, III.438–40, III.441, IV.5, IV.6
partial movement, III.443, III.460, III.479–86
and resumptive pronouns, IV.488
scope ambiguities, IV.14, IV.16
scope marking, III.438, III.475
scope relations, IV.8
scrambling, III.439
and sluicing, IV.271, IV.272–3, IV.275–6, IV.277, IV.281–6
at specifier position, III.438, III.448
and strong islands, IV.488
traces, IV.37
and weak islands, IV.488
wh-movement, III.449, III.577
wh-pronouns, V.376
wh-questions, IV.602, IV.607
vs. free relatives
and pied-piping, III.581, III.601–3
and specificational pseudoclefts, IV.369–77
vs. relative clauses, and pied-piping, III.578–80, III.596–601
